TO

DR. *RICHARD MEAD*,

Phyſician in Ordinary to HIS MAJESTY,

THIS

FIFTH VOLUME

OF THE

WORKS

OF

The Honourable *ROBERT BOYLE*

Is humbly dedicated,

By his moſt devoted and

Moſt obedient Servant,

Andrew Millar.

MEDICINA HYDROSTATICA:

OR,

HYDROSTATICKS

Applied to the

MATERIA MEDICA.

SHEWING,

How by the weight, that divers bodies uſed in phyſick have in water, one may diſcover, whether they be genuine or adulterate.

To which is ſubjoined,

A previous hydroſtatical way of eſtimating ORES.

The PREFACE.

I AM far from being fond of their practice, that affect to give pompous and promiſing titles to their books; inſomuch that my friends have ſeveral times reproached me with inclining too much to the oppoſite extreme. But yet I am not averſe from prefixing to the enſuing paper the title of *Medicina Hydroſtatica*; not only for the conveniency of citations, (which are uſually troubleſom to make in tracts that have long titles;) but becauſe too I am invited, if not authoriſed to do it, by the example of the famous and judicious Sanctorius, who ſcrupled not to prefix the name of *Medicina Statica* to a writing almoſt as ſmall, as it is ingenious, which applies the balance to ſome uſes relating to the medicinal art, perhaps not more than will be here found propoſed of the ſame inſtrument, improved by ſome additions. And it is ſcarce to be doubted, but that in this inquiſitive age, the ſagacity of the curious will make, both of what he has diſcovered, and of what I have delivered, uſeful applications, that neither he, nor I, ever thought of.

IF the chief thing I aimed at in writing, had been to gain applauſe, I would have taken a more likely way to obtain it, than by treating of a ſubject, wherein few will think themſelves concerned, (though many in reality be ſo,) and whoſe importance does not at firſt view appear. And this ſubject too the nature of it has obliged me to treat of in ſuch a way, that it will be almoſt as unpleaſant to the reader to peruſe ſo unadorned a piece, as it was troubleſom to the author to write ſo toilſom an one. And indeed, when I came to take notice of the number of particulars, that I had brought together into this little book; I did myſelf ſomewhat wonder, how I came to be prevailed with to lay out ſo much pains upon ſo uninviting a ſubject. But knowledge and health are two ſuch valuable things, that I durſt not refuſe to undergo, even a toilſom taſk; whilſt I was encouraged by the hope, that was given me, that this kind of labour may conduce ſomewhat to thoſe deſirable ends; if not otherways, yet at leaſt by exciting the more curious among phyſicians, chemiſts, and others, to enlarge their inquiries; and by helping them to remark divers things relating to medicinal bodies, that they are wont to overlook.

I HAD probably better conſulted my reputation, as well as my eaſe, if, having contented myſelf with thoſe few uncommon notions, that the reſt of the book was built upon, I had left the application made of them to particular bodies, to the induſtry of others. I ſhall not ſolicitouſly excuſe myſelf, for not having beſtowed more ornaments upon the following eſſay; ſince the nature of the ſubject, and drift of the writer, are ſufficient to juſtify the plainneſs of my ſtile to the judicious. I may have ſomewhat more cauſe to apologize for this, that I have not caſt a treatiſe about a ſubject, wherein mechanicks are ſo much employed, into the form of propoſitions, and given it a more mathematical

dreſs. But I was unwilling by that means to diſcourage thoſe many, who, when they meet with a book, or writing, wherein the titles of theorem, problem, and other terms of art, are conſpicuouſly placed, uſe to be frighted at them; and thinking them to be written only for mathematical readers, deſpair of underſtanding it; and therefore lay it aſide, as not meant for the uſe of ſuch as they.

BUT there is another thing, upon whoſe ſcore, I confeſs, I ought to wiſh for indulgent readers. For the papers compiled into this eſſay having been written in looſe ſheets, and at ſuch diſtinct times, that divers accidents intervened between them; the loſs of ſome of thoſe papers, as well as others of different natures, and my want of health, and leiſure, obliged me to change more than once my propoſed deſign, and to employ ſometimes the ſtile of a private letter, and ſometimes again that of a diſcourſe intended for the publick; by which means ſome things, and ſome expreſſions, that were ſuitable to the deſign I had, when I committed them to paper, became incongruous, when the ſcope and ſcheme of my diſcourſe were altered; eſpecially ſome parts of the copy being out of my hands, when I ſhould have adjuſted the others to them. But though theſe irregularities may keep the parts of this eſſay from being ſo coherent as they ſhould be, yet they will not prove very prejudicial to an intelligent reader, who, finding the matters of fact, and the notions to be true, may, notwithſtanding the want of an uniform contexture, make good uſe of them.

THOUGH divers little memoirs and other things, that occurred to me from time to time, whilſt I was bringing together the following papers, have inſenſibly ſwelled them into a book; yet the eſſay itſelf was in my firſt intention but a large fragment of a greater work: whereof an account is given in the letter to a friend, (that is premiſed to a paper annexed to the following eſſay) which (letter) having been intended for a kind of preface to the laſt ſcheme of the whole larger ſcheme, if the reader pleaſe to peruſe it, he will there find the riſe and ſcope of this little tract, as well as of the other parts of that deſigned book; and ſome other things, that may make it needleſs to lengthen this preamble by any thing more than two advertiſements. Of theſe, one is, that being reduced by divers unexpected and unwelcome accidents, to forego my firſt deſign, and give only two or three ſpecimens of what was intended, and more than begun; I made choice of the title of the chemical changes of bodies by coloration, as a ſample of the chemical part of the treatiſe; and I pitched upon the ſubject of this preſent eſſay, as a ſpecimen of the mechanical part of the ſame treatiſe: the other advertiſement is, that the reader may not be ſtartled, to find ſome little variations of ſpecifick gravity among ſome of the memoirs laid together in this eſſay, becauſe he will in due place be told, why ſuch things ought to be expected. And in the mean time, it may, I hope, ſuffice to ſay, that ſuch variations are neither new, nor eaſily avoidable things, in making hydroſtatical experiments, or others of affinity to them. For proof of which, to readers, that for want of having made trials themſelves, may diſtruſt what we have ſaid, I ſhall produce a couple of notable teſtimonies. The firſt is given by ſo induſtrious and diligent a mathematician, as *Merſennus** himſelf. For he candidly acknowledges, when he has occaſion to mention ſome trials of the learned *Ghetaldus*, and of the accurate French engineer monſieur *Petit*, and of his own, that the variety of weighing, which often happens to amount to ſome grains, is but like the variety of aſtronomical obſervations, which do almoſt always differ in ſome minutes or ſeconds. To which he ſoon after adds an intimation, that ſhews, that he expected not an exact uniformity between the obſervations of *Ghetaldus*, &c. already made, and the trials of an experimenter, that would examine them by making the like again. See the chapters.

To this firſt teſtimony we ſhall ſubjoin the ſecond; which is, that our famous experimenter, the lord *Verulam* himſelf, writing of a ſubject, that in ſeveral things has much affinity to ours, confeſſes, that it is not to be doubted, but that many of the bodies, which † he has ſet down in his table of their dimenſions and weights, differ in the ſame ſpecies or denomination, ſome being heavier than others; and that therefore there is ſome contingency in this affair, ſo that it is not neceſſary, that the individuals he made his trials with ſhould be exact ſtandards of the nature of their reſpective ſpecies, or ſhould (which makes directly to my preſent purpoſe) agree altogether to a tittle with experiments of other men.

BUT this ſcarce evitable imperfection of hydroſtatical and the like experiments does not hinder, but that by their help we may make good eſtimates of the weights, and bulks, of very many bodies; and among them of not a few, that belong to two ſorts of the three, that our illuſtrious author acknowledges to be reducible to his way of menſuration. And theſe eſtimates will (if I miſtake not) be found, not only preferable to thoſe, that can be of the ſame bodies by geometrical inſtruments, but (which is more conſiderable for the reader) accurate enough to be very uſeful on a great number and variety of occaſions. Which laſt clauſe I purpoſely add to inſinuate, that the hydroſtatical way of menſuration may be uſefully applied to ſeveral bodies and caſes, that do not at all ſeem to relate to the Materia Medica; as would appear by inſerting here what is delivered about metrical and about exploratory obſervations in other papers; if that were not too foreign to the enſuing eſſay, as not belonging to the ſubject, or to the deſign of it.

* *Varietas ponderandi, quæ ſæpius in quibuſdam granis contingit, ſimilis eſt varietati aſtronomicarum obſervationum, quæ ſemper ferè quibuſdem minutis, ſive primis, ſive ſecundis differunt.* Merſennus in Phænomenis Hydraulicis.

MEDICINA HYDROSTATICA:

AN

ESSAY.

CHAP. I.

I HAVE, in a former tract, endeavoured (and, as I am told in print and otherwiſe, not altogether unſucceſsfully) to make it probable, that divers, if not moſt of the real virtues (for many fabulous ones have been aſcribed to them) of gems or precious ſtones may in great part proceed from the qualities of metalline and mineral ſubſtances, that, whilſt the matter was either fluid or ſoft, were (more or leſs plentifully) incorporated with the ſtony matter, which hardned afterwards into a gem. The ſame phænomena and reflections, that led me to the opinion newly recited, induced me to think it alſo very probable, that divers boles, clays, and other earths, and much more that ſeveral minerals, which, though not looked upon as metalline ores, and ſeveral ſtones or ſtony ſubſtances, that, by reaſon of their bigneſs or opacity, or perhaps unpleaſant colours, have been judged unworthy to be numbered among gems or precious ſtones, may yet be endowed with conſiderable medical virtues; and perhaps with greater than the finer gems themſelves, becauſe in theſe deſpiſed ſtones and minerals there is often found a greater ſtore of metallick and mineral parts, which, while they were in *ſolutis principiis*, as chemiſts ſpeak, might with eaſe plentifully inſinuate themſelves into theſe more open bodies, where being ſettled, they were not locked up ſo faſt and ſtrongly, as in the nobler gems; ſuch as diamonds, rubies, ſapphires, *&c.* which are of ſo compact, and as it were glaſs-like a nature, that divers corroſive liquors, and aqua fortis it ſelf, are unable to penetrate and diſſolve them; though, as hereafter will appear, theſe inferior medical ſtones, and other minerals, may be opened by the like menſtruums.

UPON theſe grounds, I thought it might be a thing of uſe to phyſicians, as well as to divers mineraliſts and mine-workers, if I imparted to them a way of exploring many foſſils, that I do not remember I had met with, either among phyſicians or chemiſts: and though this way of exploration pretends not to diſcover directly more than one quality of the body examined by it; yet that quality, being its ſpecifick gravity, is ſo radical and conſiderable a one, that it may lead a ſagacious enquirer further than at firſt ſight one would think.

I CONSIDERED then, that the moſt pure and homogeneous kind of ſtones that we know of, and that ſeems the freeſt from all adventitious mixtures, and even * TR's, is rock-cryſtal: and therefore I pitched upon this, as the ſtandard I would employ, to make eſtimates of the greater or leſſer receſs from ſimplicity or homogeneity of the ſtones, or other ſtone-like ſubſtances, whoſe ſpecifick gravity I ſhould examine.

* Tinctures.

WE took then ſome pieces of native cryſtal, clear and colourleſs; and having carefully weighed them, firſt in the air, and then in water, we found, by computation, that pure cryſtal was to clear water of the ſame bulk as two and an half, or thereabouts, are to one: ſo that, to clear the matter by an inſtance, if we ſuppoſe an hollow cube, of braſs or other metal, to be filled as carefully as may be (for the upper ſurface will ſcarce be exactly level) with ℥j. of water, and if afterwards the cavity of the emptied veſſel be exactly filled with a cubical piece of rock-cryſtal, this ſtone will weigh ℥ij and about an half. Some of my trials, indeed, made with tender balances, repreſented the proportion of theſe two bodies with ſome petty variation. But beſides, that it is not improbable, that differing pieces of rock-cryſtal itſelf, though of equal bulk, may not be preciſely equal in ponderoſity; beſides this, I ſay, the variation I found from the newly aſſigned proportion was ſo ſmall, that having juſt intimated, that for the moſt part it rather favoured a little the ſpecifick gravity of the cryſtal, than fell ſhort of it; we may neglect it without any prejudice, worth taking notice of, to the uſe that is to be made of this proportion in this paper. And for as much as there may be ſome ſcruple, though groundleſs, made about the origin and nature of cryſtal; I ſhall add, by way of confirmation of what has been delivered, that I procured ſome ſtrong icicles, that had been faſtened to vaults, *&c.* as bodies that would be acknowledged to be true ſtones, and yet to have been in a liquid form; and having hydroſtatically examined theſe concretions, the ſpecifick gravity, though not exactly the ſame in all, appeared to be little differing from that of cryſtal; the ſolid body exceeding the weight of the fluid water, it was weighed in, about two times and an half (a little more or leſs.)

Uſe I. TO apply this fundamental obſervation to the uſes deſigned in it; when I had a mind to make a probable diſcovery (for by this way I pretend to no more) whether in a ſtone, or ſtone-like body propounded, the merely ſtony matter were more or leſs commixed with ſome adventitious ſubſtance of a metalline nature, or that of ſome other mineral more ponderous than cryſtal, I carefully weighed

it,

it, firſt in the air, and then in the water, according to the method formerly declared; and if by virtue of its ſpecifick gravity, its proportion to water of the ſame bulk exceeded the proportion of five to two (which, to avoid fractions, may be commodiouſly ſubſtituted to that often already mentioned of $2\frac{1}{2}$ to one) I concluded it probable, that the concretion had in it a portion of adventitious matter, heavier in ſpecie than cryſtal or mere ſtone: by how much more or leſs the ſolid body exceeded the weight of water equal to it in bulk, by ſo much greater or leſſer a portion of heterogeneous matter was gueſſed to be commixed with the ſtony in the propounded concrete. This may be illuſtrated, as well as proved, by the examples, that ſhould preſently follow, but that it will be fit, before I deſcend to particulars, to premiſe a paper, that concerns the whole deſign of this tract.

CHAP. II.

THOUGH the way of weighing ſolids in water hath been delivered by the ingenious *Marinus Ghetaldus*, and, out of him, by ſome few other authors; and though therefore I might excuſably diſpenſe myſelf from delivering it diſtinctly; yet ſince their books are ſcarce, and the knowledge of this way is almoſt every where ſuppoſed in theſe papers, I hold it very fit, that it ſhould once be propoſed in this tract, not only for that reaſon, but for two others. One, that a dexterous way of finding out the weight of bodies in liquors may be of far more uſe than men ſeem to be yet aware of, being capable of being made, by a little variation and improvement, of good uſe to naturaliſts, and even to chemiſts. And the other, that perhaps you will find cauſe to think, that experience and reflections on it may have furniſhed me with ſome few expedients and cautions for the better practice of this art, and for the avoiding of ſome errors, that may be very eaſily, and perhaps have been, run into, for want of the cautions here given.

The way of weighing ſinking bodies in water.

THE ſolid body, given to be examined, is to be tied about with an horſe-hair of a competent length, which hair at its other end is to be faſtened to one of the ſcales of a tender and exactly equilibrated balance; ſo that the propoſed body being exactly weighed in the air, and then immerſed in a glaſs or other fit veſſel, almoſt full of fair water, may hang freely in that liquor, being on every ſide encompaſſed by it. This done, you muſt put into the oppoſite ſcale as many weights as ſerve to bring the body hanging in the water to an exact æquilibrium with the counterpoiſe, and conſequently the beam of the balance to an horizontal ſituation. Then take out the weights newly imployed, which give you the weight of the body in the water, and deducting it from the weight formerly taken of the ſame body in the air, and by the remainder, which will be the difference of theſe two, divide the whole weight of the given body in the air, and the quotient (whether conſiſting of whole numbers, or a fraction, or both) will ſhew the proportion, in ſpecifick gravity, between the examined ſolid, and as much water as is juſt equal to it in bulk. To make this more eaſily intelligible by an example; we took a fine piece of white marble (that ſtone ſeeming the moſt pure, and moſt free from mineral tinctures of any common opacous ſtones:) this being put into a good balance, whoſe ſcales were well equilibrated, was found to weigh in the air, ℥ii. ʒiii. ℈i. grains ix. which, for conveniency of ſupputation, we reduce to 1169 Grains; then an horſe-hair was tied about this piece of marble, and the other end of the ſame hair was faſtened to one of the ſcales, under which, at a convenient diſtance, was placed a ſomewhat deep glaſs, almoſt full of fair water: in this liquor the ſtone was made to hang freely beneath the ſurface; and in the oppoſite ſcale there were put weights enough to bring it to an æquilibrium with the other; theſe weights were found, being reduced to the former denomination, to amount to 738 grains, which gave us the weight of the marble in water (which was much leſs weight than the former, becauſe the ſtone was partly ſuſtained by the water:) this being ſubſtracted from the weight of the ſame ſtone in the air, there remained 431 grains, which gave us the weight of as much as was equal to the ſtone in bulk. By this remainder the weight of the marble in the air, *viz.* 1169, being divided, the quotient was found to be 2 and $\frac{738}{1000}$, or near enough $\frac{7}{10}$ for the proportion in ſpecifick gravity of white marble to water. The *demonſtration of this practice* is founded on what *I have elſewhere given; and it may*, in another way, be found in ſome of the commentators on *Archimedes de inſidentibus humido*. Hydroſtatical paradoxes.

FOR underſtanding of the ſummary direction newly given, it may be uſeful to ſubjoin the following notes: 1. It is manifeſt by the nature of the thing, that the body, propoſed to be weighed, ought to be heavy enough to ſink in water, ſince otherwiſe its weight in that liquor being none at all, cannot be ſignificantly deducted from its weight in the air. But if there be occaſion to weigh in water a body lighter in ſpecie than it, as bees-wax, a piece of fir-wood, *&c.* it may be done, though not without ſome trouble, by joining to it a body, heavy enough to make the wax ſink with it: but this caſe belongs not to this place.

2. AN horſe-hair is made choice of for hydroſtatical operations, becauſe it is ſaid to be equiponderant to ſo much water; and though I have not found that to be ſtrictly true, yet an horſe-hair is fitter to be imployed in theſe trials, than any other ſtring I know of; and its ſpecifick weight uſually differs ſo little from that of water, that the difference may be ſafely enough neglected; and if the ſolid propoſed be too heavy to be ſuſtained by a ſingle horſe-hair, one may twiſt two, or (if need be) more of them, to make the ſtring ſtrong enough to ſuſtain the ſolid.

3. I SHALL

3. I SHALL add, that I have met with bodies, about which, by reaſon of their roundneſs, as in bullets, or of ſome other inconvenient figure, we could not well faſten an hair, or other ſtring, wherewith to tie it to the balance. Now, on ſuch occaſions, I cauſed ſome hairs to be ſo contexed, as to make a kind of a little hoop-net, whoſe meaſhes were not great enough to let the body ſlip through them. In this ſmall veſſel, whether you call it a net or a baſket, which was tied by an horſe-hair (ſingle or twiſted) to one of the ſcales, we put the ſolid body to be weighed, and proceeded in the operation, as if the body were tied but with a ſtring.

4. BUT here it muſt be carefully noted once for all, that whenſoever any hydroſtatical trial is made with an horſe-hair, there muſt be put into the ſcale, that holds the counterpoiſe, as much of the ſame hair, as can be gueſſed to be of the ſame weight with that part of the ſtring, that ſuſtains the body in the water, which appears to be above the ſurface of the water; for this liquor takes off the weight only of as much of the hair as is immerſed in it, ſo that the unimmerſed part of the ſtring adds to the weight of the ſolid hanging in water, and therefore ought to be compenſated by an equal weight put into the oppoſite ſcale.

5. WHEN I kept a balance only or chiefly for hydroſtatical trials, I found it expedient, on divers occaſions, to take off one of the ſcales, with the ſtrings belonging to it, and ſubſtitute in its room a piece of lead, or other metal, of a conical, or ſome other convenient ſhape, exactly equiponderant to the oppoſite ſcale, and at the ſame end of the ſtring to faſten one end of the horſe-hair, that tied the body to be weighed in water. And ſometimes alſo, when I did not take off one of the ſcales, I cauſed it to be perforated in the middle (yet without leſſening its weight) that ſo the body to be immerſed might hang very perpendicularly from the midſt of the ſcale. The motives, that induced me to theſe practices, cannot be ſo well ſet down in few words; and therefore ſhall be now left unmentioned, eſpecially becauſe the practices themſelves, though on ſome occaſions convenient, are not neceſſary.

6. THERE remain yet a couple of remarks, which muſt leſs than any be pretermitted, if men would avoid ſome errors, that are but too often ſlipt into by the makers of hydroſtatical trials. We are then (firſt) to take notice, that the body to be examined hang freely in the water, ſo that no part of it any where touch the bottom or the ſides of the veſſel, or reach above the upper ſurface of the water contained in it; for, if any of theſe circumſtances be not taken care of (as it happens, when we are not heedful enough) the true weight of the ſolid is ſomewhat altered; and if any corner, or other part of the body (and the like may be ſaid of the horſe-hair it is tied with) though but a ſmall one, appear above the ſurface of the water; that extant portion, being not at all ſuſtained by the liquor, adds (more or leſs) to the weight, that the immerſed body ſhould have. Care alſo muſt be had, that as nothing but the water do touch the hanging body, ſo no part of the water may touch the ſcale whence it hangs. I have ſeveral times obſerved, that immerſed bodies have been concluded to weigh more in the water than really they did; becauſe, through ſuch a want of heedfulneſs, as is not uncommon, the experimenters did not take notice, that if the ſtring were too ſhort, or the veſſel too full, the vibrating motions of the balance would, at one time or other, carry down the ſcale the ſuſpended body was tied to ſo low, as to make one part or other of it touch the ſurface of the water; ſome drops of which liquor would readily ſtick to it, and, becauſe they adhered to the nether part of it, would lie concealed from an eye that was not prying, and by conſequence would ſenſibly add to the weight of the ſcale, and make the body be thought heavier than indeed it was; which overſight muſt needs be very prejudicial, when one makes experiments, that require exactneſs.

7. BUT the moſt uſual cauſe of miſtakes in hydroſtatical trials (eſpecially ſuch as are made on ſmall bodies) wherein a little error may be greatly conſiderable, is this; that men are wont to think it ſufficient (in theſe trials) that the body to be examined be totally immerſed in the water; whereas it does not only often, but moſt commonly happen, that the given ſolid, and the ſtring that is tied about it, carry down with them divers particles of air; and perhaps too it may find and extricate others, that lay concealed in the pores of the liquor itſelf; which aerial particles faſten themſelves to the little aſperities, that they meet with on the ſurface of the immerſed bodies, in the form of bubbles, which, like ſo many little bladders full of air, endeavour to buoy up the body they adhere to; and on that account do, in proportion to their number and bigneſs, leſſen the weight, which the immerſed body would otherwiſe have in water. And therefore great care is to be had, eſpecially in nice experiments, that, by ſhaking the ſtring, and warily knocking the body againſt the ſides of the glaſs, the adhering bubbles may be diſplaced, and emerge to the top of the water. And I ſhall add a deſire, that on ſome occaſions this caution be made uſe of more than once in the ſame trials; becauſe I have ſeveral times obſerved, that now and then after the immerſed body was freed from the firſt bubbles, that appeared about it, others did ſucceed, before an end was made of weighing the body; out of ſome of whoſe unperceived cavities or pores (whether ſuperficial or lying deeper) perhaps the latent air could not eaſily on a ſudden be driven by the water. I have been the more circumſtantial in explaining the ſummarily propoſed method of weighing bodies in water, becauſe experience hath ſhewn, that it is not near ſo eaſy as upon the firſt reading of it one would preſume, to be exact in the practice of it.

HAVING obtained the weight of a body propoſed, firſt in the air, and then in water, according to the method plainly delivered; it will not be difficult to diſcover practically the proportion in weight between the ſolid and

the liquor. I ſay practically, becauſe the rule is eaſy enough, though the demonſtration is not ſo readily to be underſtood by them, that are not acquainted with the principles of the hydroſtaticks. The theorem, upon which our practice is grounded, was firſt, that we know of, delivered by the moſt ſagacious *Archimedes*, whoſe commentators have buſied themſelves in demonſtrating it in a mathematical way, as I have ſince endeavoured to do in a phyſical way, and more eaſy to naturaliſts in the hydroſtatical paradoxes. *Archimedes*'s propoſition is this, *that a body heavier than water weighs leſs in water than in the air, by the weight of as much water as is equal to it in bulk or magnitude:* whence it is not difficult to deduce a rule ſufficing for our preſent purpoſe. For if you ſubſtract the weight of the body propoſed, whilſt it is every way environed with water, from the weight of the ſame body, which it was found to have in the air; the reſidual number or difference gives you the weight (taken in the air) of as much water, as is equal in magnitude to the ſolid propoſed; ſo that having now two bodies, one firm, and the other liquid, together with the weight of each of them apart; to find their proportion, you need but divide the greater by the leſſer, and the quotient compared to one, that is, to an unit, will be the antecedent of the proportion deſired between the ſolid body and the water, which is mentioned but as it is the liquor, that is generally employed in theſe experiments, for otherwiſe the rule will hold, *mutatis mutandis*, in other liquors, as well as in water.

CHAP. III.

AND now having premiſed theſe remarks, and thereby made way for the clearer underſtanding of the ſubſequent part of this paper, we ſhall proceed to the examples, that this not unneceſſary digreſſion has diverted us from propounding.

THERE is a deeply red and opacous mineral, that commonly paſſes in the ſhops under the name of lapis hæmatites, though it ſeems to have more affinity to that, which divers authors call ſchyſtos. But whatever be the moſt proper name that belongs to it, it is an hard foſſil, which, though little uſed by our Engliſh phyſicians, is in ſeveral places abroad in great requeſt; and that not without cauſe, as far as I can judge, by what I yet know of it; and eſpecially for that ſomniferous quality, that may be obſerved in ſome of its preparations. But it is not here, though it is elſewhere, my purpoſe to deliver its medicinal virtues; but only to examine, whether, according to our method, it ought to be concluded to abound with metallick particles (perhaps but embrionated) to whoſe intermixture ſome of its virtues may probably be aſcribed. Therefore, in a very good balance, having weighed a piece of Engliſh hæmatites, that chanced to amount to about ʒiii. ʒii$\frac{1}{2}$, firſt in the air, and then in water, we found its proportion to this liquor, as $4\frac{15}{100}$ to 1. At which ponderoſity, if I had not formerly made the like experiments, I ſhould have been ſurpriſed, as you probably will be, when you conſider, that this metalline ſtone did not very much want of almoſt twice the weight of a mere ſtone of the ſame bulk. This great weight much confirmed me in the conjecture I had made, that in this lump was contained a good deal of metalline ſubſtance. And this induced me (to add that upon the by) to examine my gueſs, by ſubliming it, when finely powdered, and diligently mixt with an equal or double weight of ſal armoniac. For then having taſted, with the tip of my tongue, of this ſaffron-coloured ſublimate, I found it, as I expected, very aſtringent or ſtyptick, as divers preparations of *Mars* are wont to be; and, for further proof, having put leſs than a grain of it into a ſpoonful or two of good infuſion of galls, there was immediately produced a black, and as it were inky mixture.

LAPIS lazuli is ſometimes made uſe of by European phyſicians, but more frequently by Arabian and other Eaſtern ones, for divers purpoſes, but eſpecially to make evacuations by vomit. This emetick faculty ſeemed likely enough to belong to it upon the ſcore of a metalline ingredient; and accordingly, having examined hydroſtatically a piece, that was judged moderately rich, we found the proportion of it to an equal bulk of water, to be as 3 to 1; which argues, that, notwithſtanding its briſkneſs in operation, it contained a much leſſer proportion of metalline ſubſtance, than lapis hæmatites, or divers leſs operative minerals.

Obſervation about the loadſtone, as it is a mineral.

I ELSEWHERE ſhew, that the loadſtone may be applied to medicinal uſes; and that it emits effluvia, that are not magnetical, and may have ſenſible operations upon the body of man. On which account it was not improper to examine it hydroſtatically; by which means I found, that the weight of a lump of loadſtone, that I judged to be either Engliſh or Norwegian, was in proportion to water of the ſame magnitude, as $4\frac{93}{100}$ to 1. But of the ſpecifick gravities of loadſtones much more may be met with in another paper.

LAPIS calaminaris is often enough uſed in phyſick, eſpecially by chemiſts, to dry, and to imbibe acidities; for which uſes, I prefer it before divers more famous drugs. But, though it is wont to be employed only as an external remedy, yet ſome things, that I found in ſome uncommon chemical preparations of it, made me think, it may deſerve to be further examined and tried. A famous and not unlearned empirick, to whom I willingly communicated ſome proceſſes, that he deſired of me, when I aſked him about a medicine, whoſe ſucceſs brought him a great number of patients, for griping fluxes, and ſome dyſenterical ones, candidly diſcovered his medicine to me, and ſolemnly aſſured me, it was nothing but pure and well-ground lapis calaminaris, ſeaſonably given in a juſt doſe; as in a fitter place I have more fully declared. This made it obvious for me to conjecture, that lapis calaminaris participates of a metallick nature, as may be argued from its operation upon copper, which is thereby

turned into braſs. Wherefore weighing a piece of this foſſil, firſt in air, and then in water, it appeared to be to this liquor as $4\frac{62}{100}$ to 1.

If I had not among other papers loſt ſome, wherein I had regiſtered a good number of trials of this kind made upon differing foſſils, it would be eaſy for me to add, to the four already recited, others manifeſtly conducing to the ſame purpoſe. But preſuming, that thoſe already delivered may at preſent ſuffice, I ſhall now ſubjoin a few obſervations, whereof the firſt may become the candor and impartiality of a lover of truth, and the reſt intimate ſome further uſes of the hydroſtatical way of exploring hard and ponderous concretions, hitherto treated of.

I must not therefore forbear to admoniſh you, that, though when an hard foſſil propounded, is found to be much heavier than cryſtal of the ſame bulk; it is a very probable token, that in the ſolid concretion, there is a notable portion, greater or leſſer, of ſome metalline or other ponderous mineral body, whence its good or evil qualities, in reference to human bodies, may probably be deduced. Yet, this hinders not, but that it is very poſſible for a foſſil to be endowed with medicinal virtues, or to have noxious qualities, on the account of a portion of extraneous matter; though its ſpecifick gravity doth but little exceed that of cryſtal, or the advantage ſeem but inconſiderable. For (to paſs by other reflections) a very ſmall proportion of adventitious, metalline, or mineral ſubſtance, if it be of an operative nature, may, in ſome caſes, ſuffice to diffuſe its ſelf through the reſt of the maſs, and impregnate it with active qualities. Which may be partly illuſtrated, and partly proved, by ſome experiments, that will be hereafter met with in one of the chapters.

CHAP. IV.

Uſe II. To hint ſomewhat about the further utility of our hydroſtatical way of enquiry, I ſhall take notice in the firſt place, that it may aſſiſt us to gueſs with probability, whether a mineral body propounded, as likely to be a ſtone, or of a ſtony nature, be ſo indeed. Thus coral, for inſtance, is by ſome thought to be a plant; by others a lithodendron; but by the greater number it is reckoned among precious ſtones. In this diſſent of opinions, the ſpecifick gravity may be of conſiderable uſe. Wherefore, we thought fit to weigh a piece of choice and well coloured red coral, firſt, in the air, and then in the water, and found its proportion to the weight of as much of that liquor, to be as $2\frac{68}{100}$ to 1. So that its ſpecifick gravity much favours their opinion, who take it to be a ſtone, ſince it not only equals that of cryſtal, but ſomewhat exceeds it.

There are ſome, that will have pearls, becauſe of their hardneſs, and their being treated of by jewellers, and others that write of gems, to be of a ſtony nature. Wherefore I thought fit to examine their ponderoſity alſo. But not having now with me any trial of that kind, I ſhall ſubſtitute one that I made upon a monſtrous pearl, that was preſented me by a perſon, that took it out of the oiſter. I call it monſtrous, becauſe though it be well enough coloured, yet its ſhape is irregular, and its bigneſs extraordinary, as is alſo its weight, amounting to full 206 grains. This being weighed in water, its proportion in gravity to an equal bulk of the liquor was found to be as $2\frac{51}{100}$ to 1. So that its ſpecifick weight was much about the ſame with that of cryſtal.

There are many, that take the ſtones formed in mens bladders for as true and genuine ſtones, as thoſe that nature forms in the greater world; and ſpeak much, and ſometimes not without ground, of the great hardneſs of divers of them. But, though I deny not, that, in a laxer ſenſe, they may well enough paſs for ſtones, yet I ſhould rather call them animal ſtones, than ſimply ſtones; this name having been conſtantly and generally uſed to ſignify mineral or foſſil ſtones: which, by our way of exploration, may be eaſily diſtinguiſhed from human calculus's, and other like hard concretions, found in the bodies of ſome animals. For, having examined a good number of theſe ſtones, I found, that not only the chemical analyſes I made of them, of which I elſewhere give an account, manifeſted them, how hard ſoever they were, to be concretions belonging to the animal kingdom, not the mineral; but, by an hydroſtatical examen of divers of them, I found them to differ much in ſpecifick gravity from true foſſil ſtones. Of this you will, in its proper place, meet with ſeveral inſtances; ſo that it may here ſuffice to mention two, that now chance to come to hand; namely, that a calculus humanus weighing above ʒviſs was found to be in proportion to an equal bulk of water, as $1\frac{76}{100}$ to 1. And another, that weighed ʒiv and above an half in the air, being alſo weighed in water, appeared to be to this liquor, as $1\frac{69}{100}$ to 1.

I mention theſe ſtones as belonging to the materia medica, though they are looked upon rather as diſeaſes, of which, indeed, they are very ſad productions, becauſe a famous and experienced phyſician, that practiſed long in the *Eaſt-Indies*, and had better opportunity than almoſt any European had before him to try the virtues of bezoar, does either equal or prefer the calculi we are ſpeaking of even to oriental bezoar.

And to ſhew, that men are not the only animals, wherein ſtone-like concretions differ in ſpecifick gravity, (and ſo may be diſtinguiſhed by that difference) from cryſtal and ſuch like true ſtones; we ſhall ſubjoin two or three experiments, made upon choice bezoar ſtones, not exceeding a middle ſize, ſuch being the likelieſt not to be adulterated. The firſt of theſe weighing in the air ʒiij, and odd grains, was found to be in proportion to water of the ſame bulk, as $1\frac{47}{100}$ to 1. Another weighing ſomewhat leſs than ʒiij, was to the weight

weight of an equal bulk of water, as $1\frac{53}{1000}$ to 1. I might add divers other inſtances of the like import; and though I think them not neceſſary, yet I ſhall ſubjoin one more, becauſe it is afforded by a bezoar ſtone, taken out of another of the ſame kind: this kernel ſtone, if I may ſo call it, being weighed in the air, wanted nine grains of ʒiij, and its proportion to water of the ſame magnitude, was found to be as that of $1\frac{55}{1000}$ to 1. In all which inſtances we may obſerve, that theſe animal ſtones, not amounting to twice the weight of water, equal to them in bulk, have leſs of ſpecifick gravity by above a fifth part, than a true foſſil ſtone (ſuch as cryſtal) is wont to be endowed with.

CHAP. V.

Uſe III. THE uſe lately propoſed of our hydroſtatical way of exploration ſuggeſts to me another, which may be deduced from it as a kind of corollary.

THIS comprehends two ſomewhat differing ways of applying the obſervations we have lately mentioned. For firſt, we may by the hydroſtaticks be aſſiſted to diſcover, with probability, the reſemblance, or the difference, that may be between bodies of the ſame denomination, ſo that ſome ſubordinate ſpecies of them may perhaps be diſtinguiſhed, as well as ſeveral individuals of the ſame, or lowermoſt ſpecies. Since, for inſtance, we have found a notable difference between the ſpecifick weights of ſeveral loadſtones, that were dug up in ſeveral countries or mines; if greater number and variety of experiments of this kind were made, we ſhould poſſibly find that, *cæteris paribus*, the loadſtones of one country, or of one mine, are conſiderably heavier than thoſe of another; as, if I miſtake not, I uſually obſerved, the Norwegian and the Engliſh loadſtones to be heavier in ſpecie, than thoſe that are ſaid to come out of a warmer region, *Italy*; whoſe iſland of *Elba* abounds with mines, whereof I ſaw one intire maſs, that I judged to weigh a great many hundred of pounds. And this difference of weight between foſſils of the ſame kind, when it is conſiderable, may be of good uſe to help us to diſtinguiſh between the ſtones of the ſame loweſt ſpecies, that are proper to differing countries or mines. But, in caſe the unequal weight proceeds, as it often does, from an adventitious matter, that inſinuated itſelf into the more genuine matter of the foſſil, whilſt it was fluid or ſoft, it may much aſſiſt us to gueſs at the greater or leſſer purity of the homogeneouſneſs of the foſſil propoſed; which diſcovery may, on divers occaſions, be of no ſmall uſe to the phyſician, the jeweller, or the naturaliſt.

CHAP. VI.

Uſe IV. BUT the ſecond thing compriſed in our corollary may in divers caſes be of much greater utility and importance, as being very proper to help us to diſcern genuine ſtones, whether animal or mineral, from counterfeit ones; which too often paſs for true, to the great prejudice of phyſicians and patients, and the great loſs of lapidaries, and their cuſtomers. For as there are few qualities appertaining to ponderable bodies here below, that are ſo radicated (if I may ſo ſpeak) as their ponderoſity is; ſo there is ſcarce any quality, wherein 'tis ſo difficult for impoſtors to make a notable alteration unperceivedly, as the ſpecific gravity. I ſaid, for impoſtors; becauſe, though in ſeveral caſes, it is not ſo very difficult, to alter the ſpecifick weight belonging to this, or that kind of bodies; yet in thoſe very caſes, it may be exceeding difficult, and perhaps impractible, to make a conſiderable change in that quality, but by ſuch additions, or operations, as will make a ſenſible change in ſome other qualities too, and thereby expoſe the fallacy to be diſcovered. And this will eſpecially prove difficult in many caſes to vulgar cheats, and counterfeiters, or adulterators of gems, and other valuable minerals; becauſe the little knowledge they have of the numerouſneſs and variety of natural and artificial productions, confines them to a ſmall number and diverſity of means, to accompliſh their fraudulent deſigns. And whilſt they are intent but upon counterfeiting the more obvious qualities of things, and perhaps of eluding the known and vulgar trials men are wont to acquieſce in, they are not like to take care to maintain the ſpecifick gravity, and ſecure their adulterated wares, againſt an hydroſtatical way of examen, which, probably, they never ſo much as heard of. By this means, ſeveral pearls, for inſtance, may be diſcovered to be counterfeit, without in the leaſt injuring them. And I remember, that ſome fictitious corals, that, for divertiſement, I made, to ſhew what might be done in that kind, were, notwithſtanding their fine colour, ſhape, and gloſſineſs, eaſily diſcoverable, by their having a ſpecifick weight manifeſtly exceeding that, which belongs to natural corals.

BEFORE I knew better ways, I have ſometimes, for recreation, by the help of minium, made paſtes, or fictitious gems, which, though tranſparent, and finely enough coloured, yet, becauſe they contained ſome vitrified lead, added to the other ingredients, to promote the fuſion, were liable to be detected by an eaſy hydroſtatical trial of their ponderoſity. I have likewiſe ſeen a fair bezoar-ſtone, that ſo reſembled a genuine ſtone, that a great price was ſet upon it. But being brought me to be judged of, I made little doubt of its being counterfeit, by reaſon of its appearing to me as heavy as a mineral ſtone of that bulk; though the poſſeſſor being loth to expoſe it to an uncommon trial, I could not ſo cogently evince, that I had a clear reaſon to diſadviſe the purchaſe of it.

CHAP. VII.

Uſe V. AFTER theſe inſtances, (which are not the only, that might be alledged of this kind) the affinity of the ſubjects invites me to take notice of another uſe, or at leaſt, a variation of the former, which may be made of our hydroſtatical

ſtatical way of examining ſolids. For it may, on divers occaſions, aſſiſt us to make probable eſtimates of the genuineneſs, or the degree of purity of ſeveral bodies, that are, or may, uſefully be employed in phyſick, though they be not ſtones or minerals, provided they be heavy enough to ſink in water. For when we have once found the ſpecifick gravity of a concretion of this ſort, that we know to be genuine, and well conditioned in its kind; this degree of ponderouſneſs may ſerve us for a kind of ſtandard, whereby to judge of others of the ſame denomination, or that are ſaid to be of a like nature.

To illuſtrate a remark, that has no more of difficulty in it than this, fewer inſtances will ſuffice, (if any be neceſſary) than you will meet with in the following part of this tract, wherein they will opportunely occur. And therefore, inſtead of ſetting them down in this place, I chooſe to give you an advertiſement, that would ſurpriſe you, if I had not formerly hinted ſomewhat applicable to the ſame purpoſe, by no great variation. For that which I am about to ſerve you, is, that I think there ſhould be made a great difference between the eſtimate, that men make of ſome ſtones, to which the ſhops give the name of gems, according as the eſtimate is to be made by jewellers and goldſmiths, or by phyſicians and chemiſts. For the tradeſmen, who uſually aim but at the beauty and luſtre of the gems they would ſell, may juſtly eſteem thoſe, *cæteris paribus*, the beſt, that are in ſpecie the lighteſt, becauſe ſuch are generally more uniform as to ſenſe, and more tranſparent; and alſo receive their colour from pigments of finer parts. But, on the contrary, thoſe, that in gems ſeek mainly, if not only for the medicinal virtues, may juſtly value thoſe moſt, that are moſt ponderous; as having more plentiful portions of the metallick or mineral ſubſtances, whence the greateſt part of their virtues is, as has been formerly noted, in probability to be derived. And this difference in ſpecifick weight, in ſtones that have the ſame name given them, I ſometimes found to be far greater than one, that has not tried it would imagine; as may appear by ſome inſtances applicable to this argument, that will hereafter be met with. But yet, I would not hence infer, that even ſuch ſtones, whether tranſparent or not, as appear fine, and are but light in their kind, muſt be devoid of particles, whether metalline, or of kin to them, whence they may be endowed with conſiderable medicinal virtues. For there are mineral pigments of ſo ſubtile a nature, that ſo ſmall a quantity as will ſcarce make them ſenſibly heavier than gems that are leſs, or perhaps not at all coloured, may be diffuſed through the whole matter, and at leaſt impregnate every ſenſible part of it. This I ſhall illuſtrate by the following experiment, deviſed for that purpoſe.

Five grains of powdered zaphora, being mixed with ℥j. ʒß. of finely powdered Venice glace, and kept a full hour in fuſion in a furnace, that gives an exceeding violent fire, afforded a tranſparent maſs, that was throughout of a fine blue colour, and that deep enough; ſo that one part of the pigment ſufficed to tinge by fuſion above an hundred parts of the glaſs: and when for curioſity we made the proportion of the zaphora a little greater, taking eight grains of the pigment to ℥j. of glaſs, that is, one to ſixty; the mixture having been kept for the like time in ſtrong fuſion, the maſs was ſo deeply coloured, that the proportion of the tinging ſtuff to the reſt of the water appeared too great to make a handſom gem.

And further to manifeſt, that a quantity of metalline matter, though it be but very ſmall, may ſuffice to give a tincture, and ſo to impart a virtue to a glaſſy body, and even to gems; I ſhall add an experiment, that perhaps you will think ſomewhat ſtrange. I had long conjectured, that there was in granates, eſpecially in ſome that were deeply coloured, pretty ſtore of metalline corpuſcles of a martial nature; and that thoſe corpuſcles are more than ſufficient for the granate itſelf, into whoſe compoſition they enter, though not viſibly, becauſe of their extreme minuteneſs. Upon this ſuppoſition, I took a Bohemian, or rather German, granate, (for I never ſaw any Bohemian ſo large) that I had kept by me for a rarity, becauſe of its bigneſs and deep colour, though it was not a fine ſtone to look on, notwithſtanding its being tranſparent in thoſe edges that were thin. This being reduced to very fine powder (but not in an iron mortar, leſt it ſhould take ſomething from the metal) we exactly mixed eight grains with an ounce of finely pulveriſed cryſtalline glaſs; afterwards the mixture was kept two hours in a furnace, that gives a ſtronger fire than ordinary wind-furnaces, by which means we obtained, as I expected, a pretty uniform maſs tinged of a ſufficiently green colour, ſuch as prepared iron or ſteel gives to pure glaſs.

CHAP. VIII.

WHAT has been hitherto delivered, may ſerve to ſhew, in ſome meaſure, the uſes of our hydroſtatical way of examining drugs, upon a ſuppoſition, that they are ſolid, and neither very minute, nor too light to ſink in water. But I muſt not forbear to confeſs, and even give notice, that there are many ſimples and other ponderable ſubſtances, that may, upon good grounds, be ſaid to belong to the materia medica; which yet want one, or more, of the newly expreſſed conditions. Wherefore I muſt not conceal, that there are three things, which, though not neceſſary to the underſtanding of the uſefulneſs of the foregoing part of this diſcourſe, may, if they can be performed, much conduce to facilitate (for I dare not ſay to compleat) the hydroſtatical way of examining bodies heavier in ſpecie than water. And therefore, though I confeſs it no eaſy taſk to ſurmount the difficulties to be met with in this attempt, yet I ſhall endeavour to leſſen them as much as I can, by offering to you the expedients, that I was wont

formerly to make uſe of in the three caſes I am about to mention: namely, firſt, when the body to be examined was liquid, and conſequently could not be immediately taken hold of by an horſe-hair, or any other ſlender ſtring. Secondly, when the body propoſed was either in the form of powder, or conſiſted of fragments, that were ſo ſmall, that it was not poſſible, or at leaſt not fit, to faſten each of them to an hair, and ſuſpend it after the manner of a body of a greater bulk. And thirdly, when the ſolid to be hydroſtatically examined, though great enough in bulk to be tied about, was diſſoluble in water, and conſequently unfit to be weighed in that medium; ſince therein its gravity muſt continually decreaſe, whilſt the operation was performing.

As to the firſt of the three difficulties lately mentioned, I ſuppoſe I need not ſolicitouſly premiſe, that the liquid ſubſtance to be hydroſtatically examined ought to be heavier in ſpecie than the water, or other fluid it is to be weighed in, and of ſuch a nature, as not to be apt (at leaſt ſpeedily) to mingle itſelf with it; ſince otherwiſe the propoſed liquor will either emerge in that it ſhould be weighed in, or elſe be confounded with it, and ſo retain no diſtinct maſs or gravity.

SUPPOSING then, that the liquor to be examined, has belonging to it the two newly recited conditions, we made uſe of this expedient to explore its ſpecifick weight. We took a ſmall jar, or wide mouthed glaſs, capable of containing an ounce or two of common water, and weighing in the air, about three or four drachms (more or leſs, as occaſion requires.) This glaſs, which, for brevity's ſake, we are wont to call hydroſtatical, or elſe glaſs-bucket; we weigh very carefully once for all, firſt in the air, and then in the water, and by the difference of the weights we find, according to the known hydroſtatical method, a weight equivalent to that of the ſubſtance of the glaſs in water; ſo that ſuch a weight being put into the oppoſite ſcale of the balance, the veſſel hanging under the ſurface of the water may be conſidered as having no weight at all, that is, no preponderancy. And conſequently, the weight of a body contained in this bucket may be looked upon as that of the body itſelf in water, without being increaſed by that of the veſſel; ſo that in our inſtance, the bucket makes a maſs of quickſilver, though fluid, as ponderable as if it were coagulated into a ſolid body.

THE glaſs-bucket being thus provided once for all, we put the propoſed mercury into it, and weigh them together in the air; whence deducting the already known weight of the veſſel itſelf in the air, the reſidue gives the weight of the quickſilver alone in the air. This done by the help of an horſe-hair, we tie the bucket to one of the ſcales, (or to either end of the beam) and letting it, with the quickſilver in it, ſlowly ſink into a glaſs, or other veſſel, competently full of fair water, and hang ſo, that the bucket may not any where touch, either the bottom, or the ſides of the larger veſſel; we reduce by weights, put into the oppoſite ſcale, and added to the formerly mentioned counterpoiſe of the bucket in the water, the balance to an exact equilibrium, without raiſing the bucket quite to the ſurface of the water: this newly obtained weight of the immerſed quickſilver being deducted from its weight in the air, it is eaſy, by the known hydroſtatical method, to obtain the proportion in gravity between the given mercury and an equal bulk of water.

To expedite this operation, it may be convenient to have in readineſs (as I was wont to do) a couple of weights of lead or tin; the greater exactly equal to the weight of the glaſs-bucket in the air, and the other equal to the weight of the ſame bucket in water. For by keeping theſe two weights conſtantly in readineſs, one has at hand a counterpoiſe of the veſſel, in which ſoever of the two mediums it is employed in, which ſaves them, that have frequent occaſion to uſe the balance, much of the time, that muſt otherwiſe be ſpent to adjuſt it.

THIS advertiſement being premiſed, the lately propounded operation will be beſt underſtood by an example. We took a ſmall glaſs jar capable of holding about ℥ß. of water, and put it into one ſcale of a tender balance, whoſe other ſcale we furniſhed with a counterpoiſe, or weight equal to the glaſs. Into this little veſſel we then put ℥i, that is, four hundred and eighty grains of mercury, (affirmed to be Spaniſh, which is counted the richeſt) and the glaſs with this mercury in it was, by an horſe-hair, made to hang from one end of the ſcales into a deep glaſs veſſel of water. Whilſt it was in that ſtate, there was in the oppoſite ſcale a counterpoiſe to the glaſs itſelf in the water, ſo that the drachms and grains, that it was requiſite to add, gave us the weight of the quickſilver only, the weight of the glaſs being already accounted for. But care was firſt taken, that the open mouthed veſſel ſhould be every where environed with water, and diligently freed from adherent bubbles; and that a piece of horſe-hair ſhould be added to the counterpoiſe, to compenſate that part of the ſtring or hair tied about the bucket that was in the air, intercepted between the ſcale it was faſtened to and the ſurface of the water. By this means we found the weight of the quickſilver in that liquor to amount to 446 grains, which being ſubſtracted from the weight of the quickſilver in the air, the difference was 34 grains, by which the greater number being divided, the quotient was 14 and about $\frac{1}{10}$. So that the mercury employed in this operation, appeared to be in gravity to water of the ſame bulk, as $14\frac{1}{10}$ to 1. I ſaid the mercury employed in this operation, becauſe in former trials I ſcarce found common quickſilver, that was bought in ſhops, to weigh full fourteen times, and ſometimes ſcarce 13 and $\frac{1}{2}$ as much as a bulk of water equal to it. Whether the ponderouſneſs of our laſt uſed mercury proceeded from hence, that as ſome chemiſts extol Spaniſh mercury, as participating more than others of a golden nature, (which opinion, a trial, that I purpoſely made of that employed

employed about the late experiment, did not disfavour;) so there was in this of ours something of unfixed gold, that somewhat encreased its weight, I leave to further enquiry.

If you can command, as I cannot, the learned *Ghetaldus*'s *Archimedes promotus*, since, as I am informed, he there sets down the intensive weight of quick-silver hydrostatically found, it may be worth your while to consult that scarce book, and compare the things you may meet with there, relating to quick-silver, with what I have now delivered. To which I shall add, that this I may here give you notice of in general; that having, on chemical and other accounts, had more occasion than most men, to make trials of this sort, I did not find all running mercuries, though they did not appear adulterated, to be precisely of the same weight: nay, even distilled mercuries, if once combined with metalline bodies, and particularly, if they were animated, and drawn from fine gold, I found to differ more from common mercuries sold in shops, than these did from one another; and even between common mercuries, notwithstanding their having been distilled, we found a notable disparity. But to enlarge on this subject were improper in this place, where I mentioned the weight of mercury; but to give so clear (though but single) an instance of the way of measuring the weight of ponderous liquid bodies in water, as may warrant me to say, that, by this method, though not always with the same ease, we may explore the specifick weight of other liquors, that are in equal bulk heavier than water, and yet are indispos'd to mingle with it; such as are the chemical oils of cinnamon, cloves, guaiacum, *&c.* But the chief thing, that has made me the more circumstantial in delivering the foregoing experiment, was, that this practical direction, for weighing one liquor in another, will hereafter appear to be applicable to useful purposes; especially when we come to mention, in the following chapters, several cases, wherein liquors of a nature very different from water, may be substituted in its stead.

CHAP IX.

As for the way of examining hydrostatically the powders of sinking bodies, such as minium, putty, *&c.* or such small solids, or fragments of greater ones, as by reason of their littleness or inconvenient shape, are singly unfit to be tied with an horse-hair to the balance, as the fragments of rubies, and other precious stones, wont to be sold by weight at the druggsters or apothecaries shops; the way of discovering the weight of these in water differs not much from that lately delivered of weighing quick-silver in that liquor. For on these occasions also, we employ such a glass bucket, as was lately described; and having made it very dry, as well within, as without, we put into it the metalline calx, or other heavy powder, or a convenient quantity of the fragments of gems, or a competent number of small, though entire bodies, as pieces of native cinnabar, seed-pearl, *&c.* and proceed with these as we did with quick-silver. Only this caution is to be heedfully taken along, that we warily, and little by little, put into the bucket, whilst it is yet kept in the air, and hath the already weighed powder, or fragments in it, a convenient quantity of the same water it is to be weighed in; that the liquor may have time to insinuate itself between the dry bodies, and even the corpuscles of the powders, and expel thence the air, that was harboured in the intervals betwixt them; which little aerial portions, if not thus seasonably expelled, would, upon the immersion of the vessel, produce in the water store of bubbles, that would buoy up, or fasten themselves to the fragments, or other small bodies, and make the experiment uncertain, or fallacious. And if it be a powder, that is to be weighed, unless it be before hand throughly wetted, and thereby freed from aerial particles, and reduced to a kind of mud, there is danger, that some dry corpuscles of the powder will, when the vessel is under water, be buoyed up, and get out of it, and, floating on the surface of the incumbent water, take off from the true weight, that the immersed powder should have in that liquor.

If this way of examining bodies be carefully employed by a dexterous man, furnished with a tender balance, it may be of considerable use, not only to physicians, druggists, and apothecaries, that are conversant with the more precious kinds of sinking bodies, that belong to the materia medica, but also to lapidaries, and goldsmiths, whom it much concerns not to be imposed upon by counterfeit gems, or by other stones of price, that are not duly conditioned, in their kind. Thus the fragments of the five precious stones, that (upon what grounds I now enquire not) are made ingredients of some noble compositions, as confectio hyacinthi, *&c.* these fragments, I say, may each sort of them apart be usefully examined by their weight in water, by him, that knows the true specifick gravity of a parcel of the finest, or else of such as he judges to be fittest for his purpose. And, to add that upon the by, whereas granates are reckoned among the five medicinal precious stones, and in some pharmacopœa's are preferred to the first place, as the best; I have found so great a difference, in point of ponderosity, between European granates and American ones, whereof some were sent me as a present from *New England*, and others I myself picked plentifully enough out of an odd Americal mineral, that I suspected to contain them, that it was very obvious to think their virtues might be very different, if not as to kind, yet, at least, as to degrees. And not only such fictitious pearls as have deluded many, and sometimes even famous jewellers (as one of themselves, that was lapidary to a great monarch, confessed to me) may oftentimes by this expedient be discovered, especially if mercury (though disguised) be employed in making them; but we may probably by the same method discriminate the natural pearls of several countries and sorts,

whereof

whereof I have ſeen a far greater difference than one would expect; and I have ſomewhere yet by me natural pearls of ſuch various colours, as well as ſhapes, as have ſomewhat ſurpriſed even the curious. But becauſe it more concerns phyſicians and patients, to be able to make eſtimates of ſeed-pearl, that are on many occaſions of good uſe to health, than to know the genuineneſs of thoſe bigger ones, that are ſeldom made uſe of, but for ornament; I ſhall here mention the reſult of an experiment, which I find among my old notes to have been made by me, when I was furniſhed with very fine oriental ſeed-pearls. For having examined theſe, by the way we are now diſcourſing of, as judging them orient enough to be fit to be patterns, wherewith to compare others, we found theſe to water of the ſame bulk, $2\frac{75}{100}$ (*i. e.* $\frac{1}{4}$) to 1.

BUT in this, and in thoſe other trials, whoſe difficulty, or importance, require, that we make them as exactly, as we are able, I muſt advertiſe you, that it is not fit to truſt to the ſteadineſs of your hand in holding the balance, but that you make uſe of a gibbet (as they call it) or ſome other ſtable prop to ſupport it. For the hand often ſhakes, and makes the inſtrument, that it holds, to do ſo, and oftner grows weary before the ſcales have had time to play up and down, and at length ſettle in a determinate ſituation; wherein if you miſs of a true æquilibrium, the hand muſt undergo a new penance: whereas, when the balance hangs on a ſtable fulcrum, you have both your hands to help you, and need not be tempted by wearineſs to deſiſt, before the balance be brought to reſt in a perfect æquilibrium. The neglect or omiſſion of this practice I take to be one main reaſon (for the want of good balances, or of ſkill to uſe them, is oftentimes another) why ſo many of the experiments, that require weighing, are erroneous; as they that cautiouſly examine them (as I have ſometimes had occaſion to do) may eaſily find. And therefore (to add that, upon the by) I hope you will not make haſte to cenſure the accounts I give of hydroſtatical trials, becauſe they do not always agree with thoſe of other mens; ſince perhaps they did not employ either more diligence, or better inſtruments, than I.

CHAP. X.

THE laſt of the three caſes, formerly mentioned: namely, 'What is to be 'done, when the body to be hydroſtatically ex-'amined will diſſolve in water, or eaſily mingle 'with it?' imports a queſtion difficult and troubleſom enough to be reſolved. Nor can this examen be performed by a ſingle operation, which yet ſufficed in each of the two foregoing caſes. And having ſeriouſly conſidered the matter, the beſt expedient I could then think of was that, which divers years ago I propounded in an aſſembly of the Royal Society, and grounded on this reflection, that though the body propoſed could not be immediately weighed in water, yet we may ſubſtitute another liquor, that will not diſſolve it, and thereby inveſtigate the ſpecifick gravity, in reference to that medium; and then, by comparing the difference of thoſe two liquors in point of gravity, one may come to diſcover, what the body propoſed would have weighed in water, in caſe it could have been kept there a competent time, without having any part of it diſſolved. Conſidering then, that, except quick-ſilver, the viſible fluids we can command, are either of an aqueous, or of an oily nature; and that moſt bodies, whereof we can make ſolutions in liquors of the former, will not (at leaſt ſenſibly) ſuffer themſelves to be diſſolved by thoſe of the latter kind, whilſt a propoſed ſolid is weighing in them; we preſumed, that the moſt ſaline bodies, ſuch as alum, vitriol, ſal gem, to which may be added borax, ſublimate, *&c.* might be commodiouſly weighed in oleous liquors. Among theſe I made choice of oil of turpentine, rather than oil-olive, or any chemical eſſential oil; partly, becauſe, being of common uſe, it is to be procured in ſufficient quantity, and, being very cheap, is ſeldom adulterated, as chemical oils are too often found to be; and, partly, becauſe, being a diſtilled body, it may be preſumed to be free from aqueous parts, of which experience has ſhewn me, that common expreſſed oil is far from being deſtitute. But becauſe two liquors, that are indeed both of them oils, are wont to have diſtinct names given them in the ſhops, I ſhall here intimate, that I do not, when I have my choice, make uſe of that which many call the oil of turpentine, but of that which firſt comes over, which thoſe, that diſtinguiſh them, call the ſpirit of turpentine: I prefer this (I ſay) becauſe it is clear, almoſt like fair water; whereas, that which is called the oil, beſides that it is leſs fluid, is commonly of a yellow colour, which does leſſen its tranſparency, and may be compounded with ſome of the coloured bodies to be weighed in it.

THERE are many perſons, that would find it very difficult, and to whom, on moſt occaſions, it will not be neceſſary, to know the determinate proportion in gravity between oil of turpentine, and the ſolid that is weighed in it; and to diſcover, by the help of that gravity, what the body propoſed would weigh in water, in caſe it could be kept for a competent time in that medium, without having any part of it diſſolved therein. And therefore, though, if you deſire it, I ſhall, God permitting, annex the method of performing this taſk (which, you know, requires more calculation, than every common reader is able to go through with) to the end of this tract; yet, for the preſent it may perhaps be ſufficient, as well as fit, that I give you notice, that thoſe, that have not ſkill enough to determine, by the hydroſtaticks, the proportion between ſinking ſolids, and the liquor they are weighed in, may yet be aſſiſted by what we have delivered about oil of turpentine, to make a not unuſeful eſtimate, what is the ſpecifick gravity of divers bodies, in reference to others of the ſame, or a differing ſpecies; and by that

means, to make a probable gueſs, whether or no it be rightly conditioned; if he be but provided with one piece of the body, which he knows to be genuine or well qualified. For this may ſerve him as a ſtandard, whereby to examine other bodies of the ſame denomination, that he may have occaſion to purchaſe, or to ſell, or to employ. As, ſuppoſe a tradeſman be to buy a parcel of ſublimate, he may take an ounce, for inſtance, or half an ounce of ſome of that he knows to be good, or rightly made; then having carefully weighed it in oil of turpentine, and ſet down how much it weighs therein; if he takes an ounce, or half an ounce of the ſublimate, he would make trial of, he may weigh that, as he did the other, in the ſame liquor, wherein if it give the ſame weight with the ſtandard, it is a good ſign; but if it weighs not ſo much, it is a ſign, that it has not its full or due proportion of mercury, and too great a proportion of ſalts, whence its comparative lightneſs proceeds. The ſame way of trying may be made uſe of for the examen of mercurius dulcis, and divers other bodies, totally or partly diſſoluble in water, as of alum, which is often ſophiſticated with ſome baſer ſalt, and of Roman vitriol, which is ſometimes either counterfeited, or adulterated by the help of roch alum, and a tincture of copper. And according as the weight in oil of the body propoſed recedes more or leſs from the weight of the ſtandard, ſo the adulteration may be probably concluded to be leſſer or greater.

CHAP. XI.

BEFORE I go off from this ſubject, it is fit, that I give you notice, that the hydroſtaticks may ſupply us with another way of eſtimating the intenſive gravity of bodies, ſolid or fluid, that may on ſome occaſions be of good uſe. The way I mean is this; we take a ſolid body more than heavy enough to ſink in water, and carefully obſerve, once for all, its weight in the air; then we weigh the ſelf ſame ſolid, firſt in one of the liquors we would examine, and then in another; and ſo onwards, if there be more than two: and having noted the difference between the ſolid, and each of the liquors, it is eaſy to find, according to the practice elſewhere delivered, the ſpecifick weight of each, and the proportions betwixt them. And in regard it is but one and the ſame ſolid, that is compared to the differing liquors; whatſoever their number be, it will not be difficult to compare the ſpecifick gravities of thoſe liquors betwixt themſelves, and to diſcover, by the weight of the firſt, that of any of the others, that one pleaſes.

THE propoſed way having been but ſummarily delivered, it will not be amiſs to ſubjoin ſome remarks relating to it.

AND firſt, if you intend to employ but one ſolid in your examen of liquors, it will be neceſſary you make choice of ſuch an one, as hath a much greater ſpecifick gravity, than is neceſſary to make it ſink in water. For there are ſome liquors, that are far, perhaps twice, more ponderous than this newly named. Secondly, the body ought to be heavy enough to ſink in all liquors but quickſilver (for in that none but gold is ponderous enough to ſink.) But if your trials are to be made upon liquors, that belong to the vegetable or animal kingdom, the body you employ need not be near ſo ponderous; though it ought to be more ſo than water; becauſe (as I found by trials purpoſely made) ſome liquors, that are very ſpiritous and volatile, are yet much heavier in ſpecie than water. It is not very eaſy to pitch upon ſuch a ſingle ſolid, as may have all the qualities in reference to our purpoſes, that may be deſired in it, if it be to be made uſe of for a long time. For thirdly, beſides that, it ought not to loſe of its weight (and conſequently to change it) by the inſenſible avolation of effluvia, and that it muſt be, as was freſhly noted, of a conſiderable ſpecifick gravity. Fourthly, it ought not to be too big, or too intenſely heavy, leſt it be too heavy for a tender balance, or require too much liquor to environ it. Fifthly, it ought to be of ſuch a texture as not to be diſſolved, or corroded, by any of the ſeveral liquors, ſome of which may be ſharp and piercing menſtruums, that it is to be weighed in, and thoſe too of differing natures. Sixthly, it ſhould alſo be of ſuch a make, as is not eaſily liable to be broken, or otherwiſe ſpoiled, that it may laſt till all the deſigned experiments, though many, be made with it. Seventhly and laſtly, it is deſirable, that it ſhould be of a natural and uniform, as to ſenſe, and procurable ſubſtance; that the experiments made with it may be eaſily enough communicated to others, and, if they think fit, tried over again by them; and that, if any be judged worthy, they may be tranſmitted to poſterity.

SEVERAL bodies there are, that I looked upon as more fit than moſt others to be employed about the trials we are treating of. The chief of theſe were brimſtone, hard wax, ivory, and white marble. But though each of theſe, eſpecially if fitly ſhaped, may be of uſe on ſome particular occaſions; yet every one wanted ſome of the deſirable qualifications lately mentioned. And therefore, I made much more uſe of three other bodies, not becauſe they were ſuch as I could wiſh, but becauſe they were the leaſt remote from being ſuch, among thoſe I could procure. The firſt of theſe was a piece of amber between three and four drachms in weight, of an high yellow colour, but very tranſparent, and of an uniform texture and convenient ſhape. This was judged fit to be employed, when we were to examine the lighter ſorts of liquors, ſuch as common water, rain-water, *&c.* wine, brandy, rectified ſpirit of wine, vinegar, and the liquors drawn from it, cyder, beer, ale, urine, many waters and ſpirits diſtilled from bodies belonging to the vegetable and to the animal kingdoms. But it is not proper for the more ponderous kind of liquors, ſince it will not ſink to the bottom, but float at the top, not only of ſome liquors of the mineral kingdom (as will ere long appear) but in ſeveral liquors afforded

us by the ſaline parts of bodies belonging to the vegetable kingdom; as you will find within a few pages.

THE ſecond body I employed was a globular glaſs, which I cauſed to be blown at a lamp, and to be hermetically ſealed at the neck, which was purpoſely made very ſhort, after there had been lodged in it as much quickſilver, and no more, as we gueſſed would ſerve to ſink it in any liquor, except quickſilver. This, by reaſon of its great bulk, in reference to its weight, was fit to diſcover differences in weight minute enough between the liquors it was weighed in; and it was out of danger of being corroded, even by ſharp menſtruums; and therefore, on divers other occaſions, I preferred this inſtrument to any of the other two; but it is diſadvantaged by theſe inconveniencies, that it is difficult to be made, or procured; that it is hard to be preſerved, being very eaſy to be broken; and that partly on this account, and partly on others, it can ſcarce be a fit ſtandard in reference to ſuch obſervations, as are to be communicated to others, and tranſmitted to poſterity.

WHEREFORE for experiments, that are to be imparted and recorded, I made uſe of a ſolid, which, though heavier in ſpecie than was neceſſary to enable one to compare together the lighter ſorts of liquors, and to diſcover their minuter diſparities in point of weight, is yet a natural ſtandard, not ſubject to be broken without groſs negligence, nor to be diſſolved or corroded by the liquors it was to be immerſed in, however of various kinds, and very ſharp, and ponderous enough to ſink in all of them, except quickſilver, and yet not near ſo ponderous, as the lighteſt metals, or many metalline bodies. This ſolid I ſpeak of is rock-cryſtal, which I formerly repreſented, as for its purity, homogeneity, *&c.* fit to afford a meaſure, to which other bodies may be compared in weight, and by that means among themſelves. And of this pure concrete we employed an almoſt complete globe (weighing in the air ℥ii. ʒß. grains 3.) ſave that it had in one part of it two ſmall holes near one another, and eaſily ſtopt up with hard wax, after there had been put through them an horſe-hair, by whoſe means the ball was eaſily faſtened to the ſcale, from whence it was to hang in the water. The bigneſs of this globular body made it the more fit to diſcover the leſſer differences between liquors in point of intenſive gravity. But becauſe we may have oftentimes occaſion to know the weight of liquors, of which, by reaſon of their precioufneſs, or rarity, we can command but ſmall quantities, as it frequently happens, if we be to try the weight of chemical oils, tinctures, eſſences, *&c.* we thought fit, for ſuch liquors, to provide a piece of cryſtal, ſuch as nature had framed it, *viz.* an hexagonal priſm, with a kind of pyramid at the end, which is oppoſite to the extreme, at which it was broken off from the body it grew on. For this clear and finely ſhaped cryſtal (or what is very near of kin to it, white amethiſt) by reaſon of its oblong figure, might be commodiouſly weighed in ſo ſlender a cylindrical glaſs, as required but a ſmall quantity of liquor to cover and ſurround a conveniently ſhaped body, that weighed, in the air, but half an ounce and ſixteen grains. And to render the obſervations, made with theſe two bodies of medicinal and other liquors (for there are ſeveral of theſe trials, that belong not to this tract) the more uſeful to experimenters, I ſhall here deſire you to take notice, once for all, that the ball of cryſtal was to water of the ſame bulk, as $2\frac{57}{100}$ to 1, or thereabouts; and the priſmatical oblong piece of cryſtal was, to a quantity of the ſame liquor, equal to it in magnitude, as $2\frac{66}{100}$ to 1.

I HAVE the more particularly delivered the way of exploring the gravity of ſeveral liquors with one ſolid, becauſe there may be made of it a couple of applications, that may, on ſeveral occaſions, be of uſe, not only to chemiſts, phyſicians, and apothecaries, but to divers other experimenters, that are not of either of their profeſſions.

THESE applications do, I confeſs, belong to another paper (*viz.* an eſſay about ſome uſes of chemiſtry improved) that was written divers years ago. But ſince, by reaſon of the loſs of divers leaves of it, I know not whether, much leſs when, it will come abroad, I ſhall at preſent borrow ſome few things of it to accommodate my preſent deſign.

FIRST then, the piece of clear amber formerly mentioned, or ſome ſuch convenient body, that is not too little, nor *in ſpecie* too heavy, may ſerve the chemiſt, apothecary, and others, to make probable gueſſes of the degree of ſpirituoſity, or of thinneſs, that is to be found in many liquors belonging to the vegetable or the animal kingdom, which may be done with far leſs error by this way, than by thoſe uncertain ſigns, on which the common ways of gueſſing are wont to be grounded. For having once provided a liquor, by compariſon whereto one may ſafely make eſtimates of others of the ſame kind, or denomination, it will be eaſy, by obſerving the differing weights of the amber in ſeveral liquors to judge of the fineneſs of any of them in its kind; for, *cæteris paribus*, that is the thinneſt, or abounds moſt in ſpirituous parts, where the ſolid weighs more than in the other, as for inſtance, the amber we employed, that in water weighed $6\frac{1}{4}$ grains, in common red French wine weighed $8\frac{1}{2}$ grains, in common brandy of a pretty good ſort, ſuch as that of *Nantz*, $17\frac{1}{4}$ grains, and in vinous ſpirits highly rectified $34\frac{1}{8}$ grains. The ſame way one may employ, to judge of the ſtrength of ſpirits of vinegar, *acetum radicatum*, *&c.* but with a great difference in the application. For it may paſs for a general rule, that it is probable, that of liquors diſtilled from wine, cyder, ale, and other fermented liquors, the hydroſtatical body (if I may ſo call it) weighs more or leſs, according as the liquor it is weighed in is more or leſs ſpirituous; but, on the contrary, in acid ſpirits and liquors, the leſs the ſolid weighs, the ſtronger one may repute that liquor to be: that greater decrement of weight pro-

proceeding uſually from the greater proportion it contains of ſalts, that are not volatile.

I MUST not here pretermit one convenience of the way newly propoſed, that may, in tract of time, ſave you ſome money, and, at leaſt, will enable you to huſband better, than in the vulgar method you can, liquors, that you may have but ſmall quantities of, or that are worthy to be preſerved. For, you know, it is uſual with many chemiſts, and eſpecially thoſe, that are more circumſpect than others, to try the goodneſs of their ſpirit of wine, or brandy, or other ſpirits drawn from fermented liquors, by ſetting fire to a ſpoonful of the ſpirit to be examined, in order to ſee how much of it is totally inflammable, and how great, or little a portion of phlegm will be left behind. But, not here to mention the ſcruples I propoſe in another paper, about this way of trying ardent ſpirits, I ſhall now only take notice, that, by the newly recited way you loſe or ſpoil all that you try, and the better the ſpirit is, the greater is your loſs; whereas by the hydroſtatical way, the liquor is examined without being deſtroyed.

IT is now fit to add, that by the help of the foregoing obſervations, one may alſo make eſtimates of liquors of the ſame kind not diſtilled, whether fermented or not fermented, as ſeveral ſorts of beer, or of ale, or of cyder, or of juices of apples, or of pearls newly preſſed out. And the ſame hydroſtatical ſolid may be employed, to compare with one another in point of intenſive weight, liquors of differing kinds, as wine, beer, ale, mead, cyder, perry, verjuice, expreſſed oils, eſſential oils of different bodies, *&c.*

BUT, in caſe the liquors to be employed be very ponderous, amber will not be a fit ſolid to be examined about them; for I have found by trial, (what one would ſcarce ſuſpect) not only that it would ſwim or float in divers liquors made by ſolution of ſalts, whether in the moiſt air, or even in water, ſuch as oil of tartar per deliquium, ſolution of ſalt of tartar in as little water as may be, and ſolution of the ſalt of pot-aſhes, *&c.* But ſome diſtilled liquors would not ſuffer my pellucid amber to ſink to the bottom, as I found by trial made with oil of vitriol, with ſpirit of nitre, and even with good ſpirit of ſalt.

BESIDES, there may be another uſe made of our hydroſtatical ſolid, which may, on divers occaſions, be as ſerviceable to experiments in general, by aſſiſting them to proportion to their purpoſes, the ſtrength of the menſtruums, and other liquors they are to employ, as the former uſe is to diſtillers and apothecaries, for diſcovering the ſtrength of the already prepared liquors, that they would examine. For there are divers experiments, that either do not ſucceed, or at leaſt do not ſucceed ſo well, unleſs the menſtruums, or other liquors employed in making them, be of a determinate degree of ſtrength, (which is uſually knowable by a certain degree of intenſive weight.) This will be the more eaſily granted, if (as I have elſewhere ſhewn) the ſtrength and ſpirituoſity even of ſome liquors, whoſe chief virtue and uſe is to be good ſolvents, may yet be unfit to diſſolve, as well becauſe their ſtrength exceeds a certain meaſure, as becauſe by their weakneſs they fall ſhort of it. Of this, I remember, I gave an inſtance in aqua fortis, whoſe ſtrength, as its name intimates, is reckoned the beſt quality it can have; for I found, that if it were rectified ſo much as to make it as ſtrong as we could, or but ſomewhat leſs ſtrong than that, it would not diſſolve ſilver, but required to be weakened by an addition of water; and I found, that the menſtruum, though it were not much rectified, would not near ſo well diſſolve the filings or raſpings of crude lead, when it was moderately ſtrong and fit to diſſolve ſilver, as when it was allayed with a conſiderable quantity of water, eſpecially if afforded by rain, or by diſtillation. I ſhall add, that in making extractions from many vegetable ſubſtances for medicinal uſes, chemiſts themſelves may fall into a miſtake, when they affect to employ their moſt rectified ſpirit of wine, as the beſt menſtruum for their purpoſe: for the medicinal virtue of not a few ſuch bodies does not reſide only in what chemiſts call their ſulphur, and might perhaps more properly be called the reſinous part, which indeed is beſt diſſolved by ſuch ſpirit of wine as is carefully dephlegmed; but alſo in a more gummous, and partly perhaps almoſt mucilaginous ſubſtance, for whoſe extraction a moderately phlegmatick ſpirit is more proper, becauſe of the aqueous portion, that is mingled with the inflammable one; ſince we ſee, that ſome gummous bodies, as gum arabick, gum tragacanth, *&c.* are not diſpoſed to be diſſolved by the beſt rectified ſpirit of wine, as they are by aqueous liquors, as water, weak ſpirit of wine, *&c.* and ſome, though diſſoluble in both kinds of menſtruums, are yet leſs eaſily ſo in ſtrong ſpirit of wine, than in wateriſh menſtruums, as may be obſerved particularly in myrrh; for other inſtances applicable to theſe advertiſements belong to another paper.

AND what has been now ſaid may ſerve to perſuade you, that it may be of good uſe, on divers occaſions, to take notice of the degree of ſtrength of the menſtruum, or other liquor, we employ about this or that nice experiment; that when we have occaſion to reiterate it to the ſame purpoſe only, we may be able to bring the liquor we make uſe of to the ſame degree of ſtrength with that, which we formerly employed, and by which the deſigned effect was produced. But in experiments, that ſhould be very critically made, it will not be amiſs to bear in mind this caution, that if the liquor be very ponderous in ſpecie, as oil of vitriol, or oil of tartar per deliquium, it will be fit to put ſomething into the ſcale, from which the ſolid hangs, to make compenſation for that part of the hair, that is immerſed, ſince horſe-hair not being of the ſame ſpecifick gravity with this liquor, (though it be preſumed to be ſo with common water) is to be conſidered as a ſomewhat lighter body, capable of buoying up the ſolid a little,

a little, and therefore its comparative levity ſhould be compenſated.

CHAP. XII.

BESIDES the way we come from diſcourſing of, there is indeed another way, which we have, on divers occaſions, found uſeful to compare different liquors, that are of the ſame magnitude in point of weight. This is done by ſucceſſively filling a vial greater or ſmaller, furniſhed with a pretty long and ſlender cylindrical ſtem, to a certain ſtable mark made near the top, with the ſeveral liquors to be compared together in point of gravity.

BUT this way I muſt here do no more than name, not ſo much becauſe I ſpeak of it in a convenient place of another paper, as becauſe it is not hydroſtatical. But there is alſo another way to diſcover, whether or no two or more liquors propoſed differ in ſpecifick weight, and to make ſome not groundleſs eſtimate of their differences. This is done by a hollow cylinder of braſs, or other metal, made ſomewhat heavy at bottom to make it ſwim upright, that ſinks more or leſs in ſeveral liquors, as they are lighter or heavier, one than another. But the diligent *Merſennus* himſelf, who propoſes this way, confeſſes it to be very difficult to make ſure obſervations by it. To which I ſhall therefore add but this, that being a metal, it may be corroded by acid menſtruums; and if it be of braſs or copper it may be wrought upon or injured by urinous menſtruums too.

WHAT *Merſennus* ſaid of this inſtrument, may be applied to another, though differing from it both in ſhape and matter. For it is made of two glaſs bubbles, and a very ſlender ſtem, which is hermetically ſealed with a ballaſt in the lowermoſt of quickſilver to keep it ſteady, when partly immerſed in liquors, in which this inſtrument, like the metalline cylinder, ſinks deeper in lighter liquors, than in heavier, in a meaſure ſomewhat anſwerable to their differences in gravity. But, though I have, on ſeveral occaſions, employed theſe inſtruments, and found them not unuſeful, when I did not confine myſelf to one or two, but made uſe of ſeveral different ſizes, according to the various liquors I was to examine; yet what you may elſewhere find about this inſtrument, diſpenſes me from ſaying any more of it in this place, than that for ſome of the ends aimed at in this chapter, it is inferior to the way of examining liquors by the help of the balance.

THERE is alſo another way, that is hydroſtatical, propoſed by *Merſennus*, of weighing of liquors in water, and it is this: he bids you take a glaſs vial, to which being firſt weighed in air, and then in water, you are to adjuſt a ſtopple of wax, or cork, that will fit it exactly. This done, you are to fill the vial with the liquor you would examine, ſo that no air be left between it and the ſtopple. The veſſel thus filled you are to weigh in water, and ſubſtract from its weight there, the formerly noted weight of the glaſs itſelf in water, and alſo that of the ſtopple; which done, the remains will give the weight of the liquor propoſed in water. This method I lately chanced to find propounded by (the writer newly named) the induſtrious *Merſennus* in his *Hydraulicks*; but I remember not, that he affirms himſelf to have made uſe of it; and though it may be ſerviceable on ſome occaſions, yet I fear it will be troubleſom in practice. For (to omit ſome inconvenient circumſtances) ordinary vials, capable of containing a competent quantity of liquor, are uſually too heavy to be employed with tender balances; and common ſtopples (ſuch as *Merſennus* may be well ſuppoſed to have employed) will be ſubject to divers inconveniencies, as that they may be penetrated by ſome liquors, and corroded by others; and if they be made of cork, or of common wax, or any other ſubſtance lighter in ſpecie than water, it will not be eaſy to find its ſpecifick gravity, eſpecially ſince evaporation and other accidents make this itſelf vary; and whatever matter, vegetable or animal, it be made of, the veſſel will coſt you two operations, one to diſcover the weight of the veſſel in water, and the other that of the ſtopple, (at that time) which is troubleſom. Wherefore, when I met with this way in the ingenious *Merſennus*, it ſeemed to me more inconvenient than one, that I remember I had formerly thought of, and which I have ſometimes put in practice, by chuſing a vial not too large, and of a round figure, that being the moſt capacious under ſuch a ſuperficies, and inſtead of other ſtopples, fitting it with one of (the like) glaſs, carefully ground to the neck of it. For by this means the inconveniencies of a ſtopple lighter than water were avoided, nor would the ſtopple alter its ſpecifick gravity, either by imbibition, or evaporation; nor would it be penetrated by the moſt ſubtile ſpirits, nor corroded by the moſt fretting ones. To which may be added, becauſe in ſome caſes it may be conſiderable, that a glaſs ſtopple, as it will not be wrought on by the liquor contained in the vial, ſo it will not communicate any tincture, or extraneous quality, to the liquor; which cannot be affirmed of a ſtopple of cork or wax, in reference to ſome ſubtil and very corroſive, or otherwiſe very penetrating liquors: this hydroſtatical bottle (as for diſtinction ſake I call it) being together with its ſtopple carefully weighed, firſt in air, and then in water, (that the gravity of the whole inſtrument in that liquor may be ſettled once for all) we filled it exactly with the liquor to be examined, and ſo proceeded, as if we were to weigh quickſilver according to the manner formerly declared in the eighth chapter. The weight of the given liquor in water being thus obtained, its proportion in weight to water of the ſame bulk may be eaſily diſcovered by the way formerly delivered in the ſecond chapter (or the tenth chapter.) This way of examining liquors may, on ſomeo ccaſions, do good ſervice; and I did the rather now and then make uſe of it,

becauſe

becauſe it is applicable to all kind of liquors, whether heavier in ſpecie than water, or lighter.

If you lay aſide the ſtopple, the round ball itſelf may be made uſe of on ſeveral occaſions, inſtead of that hydroſtatical bucket formerly mentioned; for the weighing of quickſilver, and divers heavy powders, eſpecially if they be coarſe ones. But if the inſtrument be fitly ſhaped, and not too heavy, there may belong to it a greater conveniency than this. For when you have, and are willing to ſpare liquor enough to environ the little bottle, it may be uſefully ſubſtituted to the hydroſtatical bubble, with quickſilver encloſed, that I formerly recommended. For by reaſon of its exact ſtopple, it has no need of an hermetick ſeal, (which is not eaſy to be made or procured) and it is far leſs ſubject to be broken than a bubble. And yet that which I moſt made uſe of (and which weighed about ℥i. ʒiiiß. grains xix. or 709 grains) being well ſtopt with only air in it, would ſink by its own weight in water, and in liquors lighter than this, as wine, brandy, *&c.* And if it were to be employed in liquors much more ponderous than water, as aqua fortis, oil of tartar per deliquium, *&c.* it was eaſy to make it fit to be weighed in them alſo, by putting into it a quantity of quickſilver (or ſome other fit body) of a determinate weight, as two, three, or four drachms, before we ſtopped it: which ballaſt, when the operation is over, may, if it be quickſilver, be eaſily taken totally out, and kept apart for the like uſes: and the empty bottle and ſtopple may thereby become fit again, to be weighed in water and lighter liquors.

But notwithſtanding all this, becauſe glaſſes, for ſize, ſhape, and weight, fit for balances, tender enough, and furniſhed with glaſs ſtopples exactly fitted to them, are very difficult to procure; and the way itſelf is ſubject to ſome of the inconveniencies that we imputed to other ways, not long ſince mentioned: it ſeems, that generally ſpeaking, this way of finding the weight of liquors in water, is inferior for common uſe to thoſe more ſimple ones that we formerly recommended.

See the chapter.

CHAP. XIII.

Uſe VI. Having now laid down the method of weighing one liquor in another, it is allowable, and may be fit, that we ſubjoin ſome application of it; eſpecially becauſe it will become me to make good, in ſome meaſure, what I remember I formerly hinted to you, *viz.* that in the ſubſequent part of this paper, there would be delivered a further uſe, which may be counted the ſixth of the hydroſtaticks in examining medicinal bodies. And though by the inſtances we lately had occaſion to propoſe in ſome of the chapters preceding this, divers things referable to this uſe are ſet down already; yet I ſhould not content myſelf (as I now muſt do) to point at the chief heads or kinds of things referable to it, if on a ſubject that is more fertile than it ſeems, want of leiſure did not reſtrain me from deſcending to treat of the particular inſtances that belong to them.

Among the ſervices then that the hydroſtaticks may do a ſagacious phyſician, I muſt not omit one, though it has not hitherto, that I know of, been propounded by any author. And, I hope, you will not think it improper to be taken notice of here, though it do not regard only the materia medica, but is applicable (as I may elſewhere relate that I made it) to divers ſubjects that are referable to other parts of phyſiology: ſince divers bodies, that ſeem not ſo directly to regard the materia medica, as it is uſually repoſited in the ſhops of drugſters, have been in ſome times and places, and may deſervedly be now made to afford matter for remedies to a free and ingenious phyſician.

I consider then, that there are many liquors, whoſe ſpecifick gravity it may be uſeful to know, not only as it may help to diſtinguiſh genuine or well-conditioned ones from them that are not ſo, but for other good purpoſes too.

Instances of this kind may be afforded by the juices of herbs and fruits; where (according to the direction given in the laſt chapter) we firſt weigh a determinate quantity, as an ounce, or ſo many drachms in our hydroſtatical jar, or bucket; and putting ſome oil of turpentine on it, we ſink it warily into that liquor, whoſe ſpecifick gravity, in reference to refined ſilver, clear rock cryſtal, (or ſome other body, if we know it to be as pure) has been carefully found out and regiſtered: for by this means (as we have lately manifeſted) ſubſtituting this oil for common water, we may diſcover the ſpecifick gravity of liquors, not to be weighed in water, becauſe they mingle with it. And thus we may find, not only the difference in ponderoſity between the juices of plants of different kinds, as of wormwood and roſes, and ſometimes of the ſubordinate ſpecies of the ſame genius, as of abſynthium vulgare, ponticum, romanum, *&c.* and roſes, white, red, damaſk, yellow, *&c.* but we may on ſome occaſions obſerve, whether, and if at all, how far the keeping of a juice for ſome time, more or leſs, or the fermentation of it, or the putrefaction will alter its ſpecifick gravity. There are alſo other liquids uſed by phyſicians, and not ponderable in water, that may be by this way examined, as honey, vinegar, verjuice, *&c.* And by the ſame way may be alſo diſcovered and compared, the ſpecifick weight of the juices of fruits of different kinds, as of grapes, apples, pears, quinces, *&c.* and of ſubordinate ſpecies belonging to the ſame genus, as the newly expreſſed juices that make ſacks, French-wines, rheniſh-wines, *&c.* and thoſe liquors that are preſſed out of ſeveral ſorts of apples, as pippins, pearmains, John-apples, queen-apples, *&c.* And in divers of theſe, a perſon that is curious enough, may probably, by the method we have been propoſing, be enabled to take notice of the differences produced in

the ſpecifick gravity, (whoſe changes are uſually accompanied with thoſe of conſiſtence, *&c.*) in the ſeveral ſucceſſive ſtates, wherein the liquors may be found at different times, as (not to mention the juice of unripe grapes, *viz.* verjuice) the juice of ripe grapes is in very differing ſtates when it is newly preſſed out, when it begins to ferment, when it is yet but new wine, when it has attained its full maturity and perfection, when it begins to degenerate into ropy pricked wine, *&c.* and when it is abſolutely changed into vinegar, or elſe into vappa.

BUT here it ought not to be concealed from you, that in this kind of experiments, to make uſe ſucceſsfully of the hydroſtatical bucket, is a taſk difficult enough, for reaſons that a few trials will eaſily diſcover. And therefore, though I would not diſcourage the ſkilful, yet for thoſe that do not find themſelves dextrous at making experiments, I think it adviſable to employ, inſtead of the bucket, amber, or ſome other convenient hydroſtatical ſolid, or rather (which is better) a glaſs bottle and ſtopple, ſuch as we formerly deſcribed, but as large as may well be employed without overloading or injuring the balance.

CHAP. XIV.

AS I thought it was fit to give the foregoing advertiſement by way of caution in the caſes that occaſioned it; ſo having conſidered the nature and ſcope of the hydroſtatical experiments in general that belong to this eſſay, I ſhall venture to add for the encouragement of thoſe that are better furniſhed with inquiſitive minds, than with nice balances; that though in divers trials, eſpecially thoſe that are made about precious things, as gold, pearls, diamonds, and other gems, there is no relying upon any but very good and tender balances; yet, on many other occaſions, it is not neceſſary, though it be deſirable, that the ſcales we employ ſhould be extraordinary good. And this for two reaſons: firſt, becauſe many hydroſtatical experiments are ſuch, that a little variation from the exact proportion of the ſolid to the liquor, or between bodies of the ſame denomination, can lead us into no conſiderable error, or at leaſt not defeat the experimenter's main deſign; as with a balance that is not nice, one may ſufficiently diſtinguiſh between an human calculus and a pebble, or other ordinary ſtone, and between coarſe and fine, native cinnabar: and between a true guinea, or other piece of coined gold that is not very ſmall, and a counterfeit one of braſs, or any ſuch mixture, though never ſo finely gilt.

AND ſecondly, becauſe as there are few phyſical experiments, wherein mathematical preciſeneſs is neceſſary, and fewer wherein it is to be expected; ſo in many hydroſtatical trials, it is very probable, that the difference of bodies of the ſame kind, or denomination, flowing from their compoſitions and internal textures, will make a diſcernable, though but ſmall difference in their ſpecifick gravity: as in rock-cryſtal itſelf, we have found ſome pieces to be to water, as $2\frac{5}{100}$, or a little more to one; and others to be to the ſame liquor as two and ſix, or between ſix and ſeven tenths to one. And therefore, how exact ſoever the balance be, there muſt be ſome allowance made for the diverſity that may be found in the bodies themſelves that are examined, which diverſity may perhaps produce, at leaſt, as great difference in the proportions we ſeek for, as needs to be expected from a ſmall difference of tenderneſs in the balances we employ. And indeed, neither one of thoſe differences, nor the other, (nor perhaps both together) is wont to be ſo conſiderable, as to challenge much regard in phyſical experiments; or at leaſt, as to hinder it to be true, that on moſt occaſions, the hydroſtatical way of examining the ſpecifick weight of bodies, is preferable by far to any other way of doing it that as yet has been practiſed.

BEFORE I proceed to the remaining part of this eſſay, it will be worth while to obviate an objection, that I foreſee may be made by critical naturaliſts againſt the method hitherto delivered, of finding the proportion in weight betwixt a ſinking body, and water of the ſame bulk. For it ſpeciouſly may, and probably will be objected, that by this method we cannot diſcover the proportion between a ſolid body, and water in general, but only betwixt the propoſed body, and the particular water it is weighed in; becauſe there may be a great diſparity betwixt liquors that are called, and that deſervedly, common water. And ſome travellers tell us from the preſs, that the water of an eaſtern river, which if I miſtake not is *Ganges*, is by a fifth part lighter than our water.

BUT to this plauſible objection, I have two things to anſwer.

AND firſt, having had upon ſeveral occaſions the opportunity, as well as curioſity, to examine the weight of divers waters, ſome of them taken up in places very diſtant from one another, I found the difference between their ſpecifick gravities far leſs than almoſt any body would expect. And if I be not much deceived by my memory, (which I muſt have recourſe to, becauſe I have not by me the notes I took of thoſe trials) the difference between waters, where one would expect a notable diſparity, was but about the thouſandth part (and ſometimes perchance very far leſs) of the weight of either. Nor did I find any difference conſiderable in reference to our queſtion, between the weight of divers waters of different kinds, as ſpring-water, river-water, rain-water, and ſnow-water, though this laſt were ſomewhat lighter than any of the reſt. And having had the curioſity to procure ſome water brought into *England*, if I much miſremember not, from the river *Ganges* itſelf; I found it very little, if at all lighter than ſome of our common waters.

AND now I ſhall repreſent in the ſecond place, that I do not pretend, (and indeed it is not neceſſary) that the proportion, obtainable by

by our method, ſhould have a mathematical preciſeneſs. For in experiments where we are to deal with groſs matter, and to employ about it material inſtruments, it is ſufficient to have a phyſical, and almoſt impoſſible to obtain (unleſs ſometimes by accident) a mathematical exactneſs, as they will ſcarce deny, that have, as I have done, conſidered and made trial of the difficulties that oppoſe the attainment of ſuch a preciſeneſs.

CHAP. XV.

Hydroſtatical ſtereometry applied to the materia medica.

SECT. I.

THERE is an uſe of hydroſtaticks, which though it do not directly tend to the examen of drugs, or ſimples received into the materia medica, yet may be ſerviceable both to the phyſician and the naturaliſts, in delivering their deſcriptions; and ſo it may indirectly conduce to the knowledge of them, and help, on ſome occaſions, to diſtinguiſh between genuine ſimples (eſpecially fruits) and thoſe that are not ſo; it is known, that the writers of the materia medica are wont to ſet down the bigneſs of the bodies they deſcribe by very uncertain gueſſes; and thoſe that to be more accurate, aſſign them determinate meaſures, are wont to do it, by ſaying, that ſuch a fruit, or other body, is, for example, an inch, or two inches, or half a foot long; and half an inch, or a whole inch, or two inches and an half in breadth. But it is obvious to thoſe, that are not great ſtrangers to the mathematicks, that according to this way of deſcribing bodies, there may be, by reaſon of the great variety of figures, eſpecially irregular ones, they are capable of a very great diſparity of magnitude, or bulk in bodies, to each of which the ſame length and breadth may belong or be applied.

I SHOULD here be able to preſent you an hydroſtatical way of determining the bulk of bodies, both much nearer the truth than that newly recited, and grounded as well on experiments as mathematicks; if among other papers, I had not unfortunately loſt one, that I wrote many years ago, about the meaſuring of ſolids, by the help of liquors. But though I cannot, out of my memory, recover the theoretical part of that writing, (whoſe loſs I regret, becauſe it had been examined by one of the exacteſt, as well as famouſeſt mathematicians of our age, whom I invited to be preſent at the chief experiments) yet I think I can call to mind as much of the practical applications of it, as may ſuffice for my preſent purpoſe.

THE ground of the way I am about to propoſe to you, will be eaſily underſtood by the following, though but ſhort account. I cauſed to be carefully made by ſkilful artificers ſeveral cubes, both of different ſizes and different materials, as marble and metal; whoſe ſides were each of them, as near as the artiſt could make them, either an exact inch, or preciſely more inches than one, according to our *Engliſh* meaſure, which is ſaid to differ very little from the correſpondent one of the old Romans. Theſe cubes were carefully weighed in truſty balances: firſt, in the air, and then in common water. And though I found ſome little (and but little) difference, between the products of the trials; yet that difference being no more than might reaſonably be expected from the ſcarce avoidable imperfection, even of good artiſts, and their tools; we concluded, that one might, without any conſiderable error, take a medium (as they ſpeak) between theſe products, and allow even to this medium, a latitude of ſome grains; ſince that latitude will not amount to the ſixtieth part of the weight of a cubical inch of water. Since therefore ſome of our trials inclined us to judge, that about two hundred and ſixty; and ſome others to think, that about two hundred fifty two; and others again, that about two hundred fifty ſix came neareſt to the true weight of a cubical inch of water; we thought ourſelves at liberty to make uſe of that number, that ſhould appear moſt commodious for practice, by reaſon of its diviſions and ſubdiviſions into aliquot parts, eſpecially if the body to be examined were not great; ſince in that caſe, two or three grains, more or leſs, would not be conſiderable, eſpecially in a phyſicial experiment, where geometrical exactneſs is not to be expected nor indeed required, and a far leſs accurate eſtimate will be leſs unaccurate, than can with any certainty be made by the formerly mentioned way of judging by the length, breadth, and depth (or thickneſs) of the body propoſed.

I MADE the leſs ſcruple to pitch upon the laſt of the three forementioned numbers of grains, not only becauſe it affords many aliquot parts for a number that is no greater, ſince barely by a ſucceſſive bipartition it affords ſeven ſuch parts, *viz.* 128. 64. 32. 16. 8. 4. and 2. but becauſe I was encouraged by an experiment differing from thoſe already mentioned. For having cauſed to be purpoſely made by a good artiſt, an hollow cube of braſs, whoſe cavity was fitted to contain a juſt cubical inch of matter, (either ſolid or liquid) we put it into one ſcale of a tender balance, with a juſt counterpoiſe in the other, and placed it there as horizontally as we could. Then we warily put into it, little by little, as much common water as it would contain, without either overflowing, or having its ſurface manifeſtly turgid; putting alſo from time to time in the oppoſite ſcale, ſmall weights to keep it from ſwerving too much at once from an æquilibrium. And though it is extremely difficult in practice, to diſcern with certainty, when the veſſel is ſo exactly filled, that a drop, or even two, or three drops, more or leſs, cannot be added, or taken away, without being obſervable by the eye; yet for this very reaſon, we thought our experiment agreeable enough to our ſuppoſition, when we found, that by ſo light an alteration, the weight of the water, when the ſcales were

heedfully counterpoiſed, amounted to near about two hundred fifty ſix grains, which number we ſhall therefore hereafter employ, as expreſſing the weight of a cubical inch of water.

AND now to apply the paſt diſcourſe to our preſent purpoſe.

SUPPOSE, for example, that a ſolid heavier in ſpecie than water, having been weighed firſt in the air, be found to loſe of its weight in the water ℥ß. ſixteen grains, that is, two hundred fifty ſix grains, I ſay, that the dimenſions of this ſolid, if it were of a cubical ſhape, would make it equal to a cubical inch: ſo that (to expreſs the thing yet more clearly) if the given body be ſuppoſed to be an eaſily fuſible metal, as tin, or lead; and being melted to be warily poured into the hollow cube formerly mentioned, and ſuffered to cool, it would juſt fill it and no more, and conſequently be a cube of metal, whoſe length, breadth, and depth, are equal to one another, and each of them to an inch. For as it is a fundamental theorem in hydroſtaticks, demonſtrated mathematically by *Archimedes*, and elſewhere phyſically by me; that *a ſinking ſolid weighs leſs in water than in air, by the weight of as much water as is equal to the ſolid in bulk*; and ſince we have lately ſhewn by experiments, that a cubical inch of water weighs ℥ß. 16 grains, that is, 256 grains; it will follow, that when the decrement of a body's weight in water is found to be 256 grains, the ſolid content of that body is a cubical inch: ſince an aqueous body weighing 256 grains is equal in magnitude, as well to the ſolid propounded, as to a cubick inch of water. And here it may prevent a ſcruple, to obſerve, that to make bodies equal in magnitude, it is not at all neceſſary, that they ſhould be of the ſame weight, or of the ſame matter, as is evident in bullets of copper, tin, and gold, caſt ſeparately and dextrouſly in the ſame mould. For though they be equal in bulk, yet the bullet of copper will be much heavier than that of tin; and the bullet of pure gold will be more than twice as heavy as that of copper. Whenſoever therefore you meet with a ſolid, ponderous enough to ſink in water, that being weighed in that liquor loſes 256 grains of the weight it had in the air; you may conclude, the magnitude or bulk of that body to be equal to a cubical inch, of whatever matter it conſiſts, or of what ſhape ſoever, regular or irregular it be. And in caſe the ſolid propoſed do (as it will very often happen) loſe of its weight in the water leſs than 256 grains, you may conclude its bulk to be proportionably leſs than a cubical inch. And ſuch is the conveniency of the number we have pitched upon, which abounds in aliquot parts; that every 32 grains that the ſolid loſes of its weight in the water, anſwers to an eighth (that is, half a quarter) of an inch in the bulk of the body: as if the decrement be 128 grains, the ſolid will be half a cubick inch; and if it be but 64 grains, it will be but a quarter of a cubick inch; and ſo if it be 160 grains, it will be $\frac{5}{8}$, that is, half and half a quarter of an inch cube: and on the other ſide, if the decrement of the given body exceed the ſtandard, *viz.* 256 grains, twice, thrice, *&c.* then that decrement being reduced to grains, as ſuppoſe it weigh ℥i. + grains 32 (amounting to 512 grains) or ℥i. ß. + grains 48 (amounting to 768 grains) the body will be equal to two or three (ſingle) cubical inches. And, if after the diviſion there remains a fraction, it will not be difficult to eſtimate it to him that conſiders what has been newly delivered.

SECT. II.

TO diſcover hydroſtatically the ſolid contents of a body heavier in ſpecie than water; to him that knows how to make uſe of the method newly delivered, it will not be very difficult. But to meaſure, by the help of water, the ſolidity of a body lighter in ſpecie than that liquor, is a work not ſo eaſily performed. It may ſomewhat leſſen the difficulty, to premiſe, that there are two ſorts of bodies, that will naturally not ſink in water. For ſome are of a cloſer texture, and will not be eaſily invaded by that liquor; at leaſt, in ſo ſhort a time, as they are of neceſſity to be kept in it: and others abound with pores, that diſpoſe them to imbibe the water they muſt be kept immerſed in till the experiment be diſpatched.

To begin with the firſt ſort of bodies: it is known to hydroſtaticians, that, according to a theorem of *Archimedes*, the weight of a body belonging to that kind, may be gathered from the weight of the water, that is equal in magnitude to that part of the body that is immerſed in that liquor, when the ſolid floats freely upon it; as, if a paralelipipedon, or a cylinder, of wood, twelve inches long, being placed upon water, ſhould reſt there, when a twelfth part of it lies beneath the ſurface of the liquor; in this caſe, the weight of the water, equal in bulk to that immerſed twelfth part, would be equal to the weight of the whole wooden body. But becauſe the bodies, whoſe bulk phyſicians and chemiſts may have occaſion to examine, will very ſeldom happen to have ſhapes ſo near thoſe of regular ones; it will ſcarce be worth our while to enlarge upon this way of eſtimating light bodies; which it will be ſo troubleſom to make fit for moſt mens practice, that, unleſs it be deſired, I ſhall not trouble you with it; but forthwith proceed to what will conduce far more to our preſent deſign, which being to meaſure the ſolid contents of bodies, not ſo heavy (intenſively) as water, and for the moſt part irregularly ſhaped; it will be neceſſary, that we employ a method differing from what we have hitherto made uſe of. In the firſt ſtep of this, though not in the ſecond, we may be helped by the induſtrious *Merſennus*, who probably borrowed his way of *Ghetaldus*, from whoſe *promotus Archimedes* he profeſſedly borrows many things.

BUT becauſe that, on this occaſion, *Merſennus*, affecting brevity, hath made himſelf obſcure; ſo that what he writes can ſcarce be underſtood, but by mathematical peruſers; I

ſhall, for the ſake of another ſort of readers, deliver the propounded method, though not in ſo few words, yet more clearly and orderly. Firſt then, you ſhall weigh in the air the body (lighter than water) to be examined. Secondly, you ſhall take a plate of lead capable of making this body ſink with itſelf in water, and of ſome weight, not incumbred with fractions, as juſt a dram, half an ounce, an ounce, *&c.* Thirdly, you muſt weigh this plate in water, and by ſubſtracting its weight in this liquor from what it weighed in the air, you muſt obtain a difference, which will give the weight of as much water as is equal in bulk to the immerſed lead. This, for diſtinction's ſake, may be called the ſpecifick weight of the lead in water. Fourthly, you muſt tie together (which you may beſt do by one or more horſe-hairs) the plate of lead, and the lighter body, and note the weight of the aggregate, which, as you know, is nothing but the ſum of the reſpective weights of the lighter, and of the heavier body. Fifthly, you muſt weigh this aggregate in the water, and ſubſtract its weight in that liquor, from the weight that the ſame aggregate had in the air, and the difference will be the ſpecifick weight of the ſaid aggregate in water. Sixthly, from this difference ſubſtract the formerly found ſpecifick weight of the plate alone in water, and the remains will give you the weight of the lighter body in the ſame liquor.

THUS far our author; without whoſe help we may eaſily diſpatch the reſt of our work. by the method employed already of meaſuring ſolids heavier than water. For the lately obtained weight of the light body in water, being (according to the method formerly propoſed) divided by 256 grains, will give you the ſolid content of that naturally floating body.

BUT becauſe a method, that is difficult enough to be put in practice by thoſe that are not more than ordinarily well verſed in hydroſtaticks, requires to be illuſtrated by an example, I ſhall ſubjoin an experiment, that may ſerve not only to clear up this practice, but in good meaſure to confirm it too; we took then a piece of oak conveniently ſhaped, and that weighed in air 193½ grains. To this we tied with an horſe-hair a plate of lead, weighing juſt half an ounce, *i. e.* 240 grains. But before we tied them together, the lead was weighed in water, where it loſt of its former weight 20 grains, which, being deducted out of the 240 grains lately mentioned, left a difference or reſidue of 20 grains, for the ſpecifick weight of this piece of lead (for I have ſeldom found lead quite ſo heavy) in the water. Then the aggregate of the wood and lead was weighed, firſt in the air, and found to be 433 grains and an half, and then in water, where it amounted but to 162 grains; which being ſubſtracted from the aggregate of the ſame bodies in the air, the reſidue, or difference, was found to be 271 and ½ grains: from which difference the other difference of 20 grains (which had been lately found) of the leaden plate alone in the water being deducted, there remained 251 grains and ½ for the weight of water equal in bulk to the given piece of wood. If this number had amounted to 256 grains, of which it fell ſhort but 4½ grains, we might have concluded the ſolidity of it to be a cubick inch, ſince 256 grains of water, which we formerly found equal to a bulk of water of a cubick inch, was alſo now found equal to the bulk of the given piece of wood. And indeed, intending (as I formerly intimated) to give an example, that ſhould not only illuſtrate, but confirm the propoſed practice, I cauſed the wood I employed to be formed into as exact a cube of an inch every way as I could procure from a joiner, that bragged of the pains he had taken about it: ſo that the difference of its weight in water from 256 grains, the weight of a full cubic inch of that liquor, may probably be imputed to ſome little imperfection in the figure of the wood, or ſome other light circumſtance, not conſiderable enough to be much regarded.

Of this experiment one of my notes gives the following account.

I. THE oaken cube in air weighs (ʒiii. grains xiii½.)	193½
II. THE weight of the lead in air, (ʒiv.)	240
III. THE weight of the lead in water (ʒiiiß. grains x.)	220
Which, being ſubſtracted from its weight in air, leaves for its ſpecifick weight in water	020
IV. THE aggregate of the two in air is	433½
V. THE weight of both together in water is	162
Which being ſubſtracted from its weight in air, gives the difference of both the aggregates	271½
VI. THE difference between the weight of lead alone in air and in water, or, which is all one, the ſpecific weight of the plate alone, *viz.*	20
being ſubſtracted from the difference of the weights of the aggregates in air, and in water, gives [for the weight of the cube propoſed]	251½

THE way of meaſuring bodies, that has been hitherto delivered, is appropriated to ſuch as will not at all, or, at leaſt, will not readily be diſſolved in water. But becauſe there are divers other ſolids, as lumps of ſalt, alum, vitriol, ſugar, *&c.* whoſe magnitudes it may be fit for inquiſitive men, of more profeſſions than one, to know and to compare, I ſhall, to what has been already ſaid, ſubjoin this advertiſement; that the ſame way may be applied to meaſure the magnitudes of ſolids diſſoluble in water, if, inſtead of this liquor, we ſubſtitute oil of turpentine, whoſe proportion and ſpecifick gravity to water we have found, or is otherwiſe known to us. When I firſt made this reflection I had not ſuch conveniencies, as when I found the weight of a cubick inch of water, to determine the weight of a cubick inch of oil of turpentine. But, having

having yet lying by me the hollow veſſel of braſs, whoſe cavity was an exact inch, that I employed to find out the weight of a cubick inch of water, I made uſe of it on this occaſion too; and found, that when it was carefully filled with ſuch oil of turpentine as we were wont to employ about hydroſtatical experiments, the contained liquor amounted but to 221 grains, and an eighth (part of a grain) by which number the difference of the weight of a ſolid in the air, and in that oil, being divided, the quotient will give you the ſolid contents of the examined body.

AFTER ſo circumſtantial an account as we have given of the way of hydroſtatically examining ſuch floating ſolids as, like the wood we employed, are of a texture at leaſt moderately cloſe, it may be ſeaſonable, to proceed to the mention of the ſecond ſort of floating bodies, that I formerly told you might be propoſed to be weighed in water; namely, ſuch as, by their poroſity or laxneſs of texture, are ſubject to embibe too much of that liquor, even in as little time as is neceſſary for the diſpatch of the experiment.

MERSENNUS * (more briefly than clearly) propoſes an expedient in this caſe, which is, to cover over the body to be weighed in water with wax, pitch, or ſome other gluten, as he calls it, whoſe ſpecifick weight in water muſt be firſt known. But I take bees-wax to be much preferable to the other two. For pitch is ſo apt to ſtick to one's hands or clothes, that it is troubleſome to apply it, and very difficult to get it off: and as for glues, moſt of them, eſpecially the more common, are diſſoluble in water, and therefore not ſo fit for the purpoſe as bees-wax (for that, I preſume, he means by wax) which has this conveniency in it, that its proportion to water being uſually conſtant enough, and the gravity of thoſe two bodies differing but little, one may more eaſily diſpatch a good part of the experiment; which is thus to be performed. Take the ſolid lighter than water, that you would examine hydroſtatically, and having weighed it in the air, over-lay it carefully with a thin coat of bees-wax, ſo that no part of it may remain uncovered, or acceſſible to the liquor. Then take alſo in the air the weight of the wax you have employed, and faſten to the body thus coated, a plate of lead, or tin, heavy enough to make it ſink, and obſerve the weight of the aggregate in water. This done, ſubſtract the weight of as much water as is equal in bulk to the wax, and proceed with the reſt, as is before taught. *Merſennus* declares this practice by this inſtance, if the wax that inveſts the propoſed body be of ℥xxii. in the air, the bulk of water equal to it will be ℥xxi. and therefore a quantity of water of ℥xxi. muſt be firſt taken away, or ſubſtracted, that the remaining bulk, equal to the (immerſed) body, may, by its gravity, ſhew the gravity of the body (propoſed) as has before been ſaid.

BUT becauſe the way above delivered can can help us but to the knowledge of the weight of the propoſed body in water, we muſt, to diſcover the ſolid content of it, proceed further than our *Merſennus* enables us to go; and therefore we muſt divide the weight of the ſolid in water, already found, by 256 grains, that by the help of the quotient we may obtain the ſolid contents of the propoſed body.

I HAVE ſometimes (to add that upon the by) thought of, and tried, another expedient, to hinder ſmaller ſolids, whether lighter or heavier in ſpecie than water, from imbibing the ambient liquor. In order to this, I firſt found the weight of a cubick inch of quickſilver (which is not difficult to diſcover by its proportion to water of the ſame bulk.) And then we brought the body to be meaſured into a veſſel, whoſe ſolid contents were known before: and thirdly, all that was not poſſeſſed by the firm body being filled with quickſilver, it was eaſy enough to know, by the difference in weight of that quickſilver from the weight of the quickſilver requiſite to fill the whole veſſel, to how much quickſilver the environed body was equal. And by this means, and the knowledge before gained of the weight of a cubical inch of mercury, the ſolid contents of the body propoſed was not difficult to be obtained. But I forbear to give more than this intimation of an expedient, which, beſides that it belongs properly to another eſſay, is rather mechanical than hydroſtatical. And, for the ſame reaſon, I forbear to ſet down one way of meaſuring the contents of irregular ſolids, delivered in ſome books of practical geometry; and another, but yet unpubliſhed, way, differing enough from the former, that tends to the ſame purpoſe.

CHAP. XVI.

BUT, I perceive, that it is now more than time, that I ſhould put an end to a labour, that has, I fear, tired you, becauſe I am ſure it has tired me. And yet I dare not conclude this tract without briefly anſwering a couple of queſtions, that, I foreſee, may juſtly enough be aſked me by a peruſer of the foregoing eſſay.

AND firſt, I preſume it may be demanded, 'Whether I have propoſed the beſt ways that 'can be thought of to examine bodies hydro-'ſtatically?' To which queſtion I anſwer, that, upon divers conſiderations, ſome of which have been mentioned here and there in the body of the foregoing eſſay, I did not think my ſelf obliged ſolicitouſly to invent or propound new inſtruments for the hydroſtatical examen of bodies. For though I am not ignorant, that divers more curious and artificial ways of finding out their weight in water, or their ſolid contents by it, may be deviſed by perſons more ſkilful and ſagacious than I: And though alſo I think it not unlikely, that, when the utility of ſuch practices comes to be taken notice of, artificial inſtruments will be found out to facilitate, or otherwiſe improve them; yet I thought it became me at firſt to propound only the more ſimple ways of operating, as the moſt likely to invite the gene-

* In his *Phænomena Hydraulica*, pag. 185.

rality of thoſe, for whoſe ſake this eſſay is made publick, and to require, for the main part of our experiments, only the uſe of the balance, as an inſtrument eaſily procurable, and already, for other purpoſes, in moſt mens hands, without mentioning, at this time, any more artificial inſtruments; though ſome of them are ſuch as I have long ſince not only had thoughts of, but for my own uſes practiſed; which intimation may be countenanced, if it were needful, by the mention of that little inſtrument, for diſtinguiſhing between true and counterfeit guineas, or the like pieces of coined gold, by the help of water; which was ſeveral years ago publiſhed in the philoſophical tranſactions, and has ſince (without ſtaying for my improvements of it) been made uſe of by ſome, and uſurped by others. But of ſuch things no more in this place.

HAVING anſwered the firſt queſtion, it remains that I conſider the ſecond, wherein, though I ſhall aim at brevity as much as in the former, yet I fear I ſhall not be able to diſcuſs it in as few lines as I did that. I preſume then it will be aſked, 'What credit may 'be given to the eſtimates of the weight, and 'proportions of bodies, obtained by hydro-'ſtatical trials?' Since we ſee that though mathematicians, not knowing, or not applying, our obſervation about the ſpecifick gravity of rock-cryſtal, and the nature of oil, eſpecially that of turpentine, have given us but the proportions of metals, and ſome very few other familiar bodies, as the loadſtone, wax, honey, oil and wine; yet thoſe few that have not tranſcribed from one another differ, in the tables they have left us of the comparative weight of thoſe few bodies.

THIS queſtion is ſo comprehenſive, that I think it cannot well receive a ſingle anſwer; and therefore I ſhall offer two things to be conſidered about it.

AND firſt, I freely acknowledge, that there is no exact uniformity in the obſervations delivered about the weight of metals, and the other bodies newly named, among the few authors that have written of this ſubject; and there would probably have been yet more difference in their accounts, if ſome, even of thoſe writers, had not avowedly made uſe, to their purpoſes, of as much as they thought fit of the tables of *Ghetaldus*.

NAY, I ſhall not think it very ſtrange, if I find that the experiments of the ſame man, made at diſtant times, and in other differing circumſtances, ſhould not all of them exactly agree. For I have already noted, and I think in more places than one, that there will ſcarce be found ſo great an uniformity in qualities, and particularly in ſpecifick weight, among bodies of the ſame kind or denomination, as there is generally preſumed to be. There may be alſo ſome difference, though but little, betwixt the waters men employ, eſpecially if the air be at one time (as in July) intenſely hot, and at another (as in *January*) exceeding cold. The difference alſo of degrees of goodneſs of the balances, men employ about nice experiments, is not altogether inconſiderable. But there is a thing of greater moment than this towards the hindering hydroſtatical experiments, and even ſtatical ones themſelves, from being ſo accurate as thoſe that are not verſed in ſuch matters may require. The thing I mean is the difficulty of finding an exact uniformity in weights of the ſame denomination, which, for that reaſon, are vulgarly ſuppoſed to be exactly equal; but to know how far this ſuppoſition is to be relied on, it may at preſent ſuffice to ſet down ſome paſſages of a mathematician juſtly famous for his diligence, and who has made it his particular work to examine theſe matters ſcrupulouſly. The firſt paſſage I ſhall alledge out of his writings ſhall be the ſhort account he gives of many trials he made of natural grains, whence all ſorts of weights have been deduced. * *Cum* (ſaith he) *omnia grana, vel ſemina, quæ reperiri ſolent in atriis venalibus Lutetiæ, ad ſtateram expendiſſem, vixque granum ullum inter ejuſdem ſpeciei grana grano alteri exactè reſpondiſſet, in incertis ludere nolui.* The ſame author informs us, that the Roman grains differ from the French grains, ſince, as he obſerves, 688 grains of the former ſort are equiponderant but to 576 grains of the latter ſort. And he ſubjoins, that whilſt he was writing theſe things there was found by the more exact weights of the mint, an error in the former eſtimate of at leaſt half a grain in 36 grains.

AND elſewhere he † gives notice, that, by two relations ſent him from *Rome*, about the number of grains contained in a Roman ounce, it appeared, that even that number varied, ſince one of thoſe relations reckoned 612 grains in an ounce, whereas the other allowed it but 576 grains. And yet this I do not wonder at, becauſe I have my ſelf found it ſo difficult in practice to get and keep weights (for, as little as this is wont to be ſuſpected, the very air may, in time, a little alter them) as exact as I deſired, that I left off the hopes of it. And one remark, though commonly overlooked, I think too conſiderable to be here omitted. For whereas the accurate *Ghetaldus*'s ‖ tables of the weight of metals, and ſome few other bodies, in reference to one another, are looked upon as the moſt authentick that have been publiſhed, and are accordingly made the moſt uſe of: it is certain, that the weights he employed are not divided, as ours are. For though indeed according to him, as well as with us, the ounce conſiſts of four and twenty ſcruples, yet the ſcruple, which with us is divided but into twenty grains, he divides into twenty four. But to return to *Merſennus*, a while after he had told us of the difference between his repeated trials, and thoſe of other men, in determining the weight of a certain body, he has this paſſage, which ſhews, that he was not over confident of the preciſeneſs of all his own determinations. *Cum autem* (ſaith he)

* *In præfatione ad librum de menſuris, ponderibus & nummis.*
† *Merſennus*, in the paper entituled, *Pariſienſia pondera*, Corollar. 1, and 2.
‖ In the paper called *Galic. Nummis.*

pag. 37. lib. 16. *dixi, Chelinum, undecim dici denariorum, credunt tamen alii decem duntaxat, nil aſſero.*

HAVING gone through the firſt part of my anſwer, to the ſecond query above propoſed, it remains, that I proceed to the other part, which perhaps will not need more than the following reflection.

I CONSIDER then, that though it be granted, that hydroſtatical experiments are not always either ſingly accurate, or exactly agreeable among themſelves, yet they may well be both accurate enough to be of very good uſe, eſpecially in practice, and leſs remote from being quite accurate, than any other ways that have been hitherto known to be practiſed of determining the proportions of bodies in point of weight and bulk, and of meaſuring the ſolid contents of ſtable bodies, whether heavier in ſpecie than water, or lighter.

THE firſt part of this reflection may be deduced as a corollary from, or at leaſt confirmed by the greateſt part of the foregoing eſſay. And indeed, as little ſkill as I have in hydroſtaticks, I would not be debarred from the uſe of them for a conſiderable ſum of money; it having already done me acceptable ſervice, and on far more occaſions than I myſelf at firſt expected, eſpecially in the examen of metals and mineral bodies, and of ſeveral chemical productions. And I have been able more than once or twice to undeceive artiſts and other experimenters, that *bona fide*, believed they had made, or were poſſeſſors of, *luna fixa*, (as they call it) and other valuable things: and to make a good judgment of the genuineneſs or falſity, and the degrees of worth, or ſtrength in their kind, of divers richer or poorer metalline mixtures, and other bodies, (ſome ſolid, and ſome liquid) whoſe fair appearances might otherwiſe have much puzzled, if not deceived me.

BUT of this more may be found in another paper. For I muſt haſten to the ſecond part of our deſigned reflection, by repreſenting, that our hydroſtatical methods of diſcovering the weights and bulks of bodies, though they may be not mathematically accurate, yet they are leſs remote from being ſo, than any way of menſuration of bodies, (eſpecially ſuch little ones as we uſually have need to examine on the account of the materia medica) by the geometrical inſtruments, that are hitherto known to be practiſed; or, by the way, whereby the *tabula coitionis & expanſionis materiæ per ſpatia in tangibilibus*, &c. was framed by the renowned Sir * *Francis Bacon*, whoſe judicious reflections upon the rarity and denſity of bodies, ſuch as their meaſures are delivered in that table, do ſufficiently manifeſt, as the philoſophical genius of the author, ſo the utility that may be derived from even ſuch determinations of the bulks and weights of bodies, as fall ſhort enough of being accurate.

I MIGHT here relate, that to convince ſome curious perſons, how much hydroſtaticks may be made ſerviceable to as accurate a menſuration, as ought to be expected in phyſical experiments; I deſired a virtuoſo, firſt, to put together two lumps of metal, (*viz.* of tin, and of lead) in a certain proportion, that he was to conceal from me, but to ſet down in writing to prevent miſtakes. Then I deſired him to melt the metals (whoſe reſpective ſpecifick gravities I knew before) into one maſs, and give me that maſs. And thirdly, I weighed it carefully in water, and did alſo algebraically examine it. Which being done, I told him, that the lead he had employed, amounted to ſuch a weight, and the tin to ſuch another; which being compared with the quantities he had committed to paper, the difference was found to be little more than one grain, and this itſelf probably proceeded from ſome ſcarce avoidable imperfection in the melting, pouring out, *&c.* of the given bodies. But becauſe ſpecious arithmetick was employed in this work, (to which yet it was not abſolutely neceſſary) I ſhall lay no ſtreſs upon it; becauſe, if I miſtake not, the paſt diſcourſe may ſuffice to give the hydroſtatical ways of menſuration of bodies a preference to their competitors, and may keep it from being preſumptuous, to ſay, that they may be received as the beſt for practice, till ſome other more accurate, and yet as firmly grounded, and as practicable ways of accompliſhing the ſame purpoſes, ſhall be propoſed.

HYDROSTATICAL WAY

OF

Eſtimating ORES.

Addreſſed to the Secretary of the Royal Society.

ADVERTISEMENTS.

I KNOW there is a greater number of different kinds of foſſils, than thoſe that are yet known to belong to the materia medica. And, I confeſs, that the perſons, which the following paper is chiefly deſigned to aſſiſt, are thoſe that explore minerals with an aim not at health, but at profit. But yet I was content, that the enſuing diſcourſe ſhould accompany the foregoing eſſay, as a kind of appendix to it, becauſe many of the ſubjects, about which both tracts are converſant, are the ſame; and the fundamental obſervation, (*viz.* about the ſpecifick gravity of cryſtal or marble) and the hydroſtatical way of applying it in explorations, is the ſame in both: and alſo (and indeed chiefly) becauſe I was made to believe, that it might, eſpecially at this ſeaſon, be grateful, and not unuſeful to divers ſearchers after profitable minerals.

THIS paper (as the inſcription intimates) was deſigned to be ſent to the learned ſecretary of the Royal Society, when it was expected, that he would begin again to publiſh monthly the philoſophical tranſactions, that had been long ſuſpended, and as long deſired by the curious. But ſince ſome accidents have occurred, that occaſion a further delay of their publication, it was not thought fit, this paper (after having been long already) ſhould be any longer confined to my cloſet. It is true, that this diſcourſe, containing but an application of an hydroſtatical experiment, I am far, as I ought to be, from propoſing it as a treatiſe of the docimaſtical art, whoſe grand inſtrument is, the fire ſkilfully managed. For which reaſon I have forborn to ſet down in this paper, any of the flux powders, or other ways of examining ores, or of reducing them, or other foſſils, to metals or regulus's; that either ſay-maſters are wont to employ, or I have deviſed, or tried upon minerals. But this notwithſtanding our unpractiſed way of eſtimating ores, may not be uſeleſs; and for that reaſon, will not perhaps be unwelcome to ſome that love mineralogy, much better than they underſtand it: eſpecially coming forth at a time, when many induſtrious perſons of this nation are excited to look after profitable minerals, by the repeal (that has been made ſince our appendix was written) of a diſcouraging act of parliament made in the reign of *Henry* IV. And though our hydroſtatical way of eſtimating foſſils will not determine how rich or poor they are in this or that particular metal; yet (as is intimated at the beginning in the enſuing paper) it may, on many occaſions, ſerve to keep thoſe that are venturous, and not ſkilful, from being deluded by cheats, or from deluding themſelves with ill-grounded expectations, which the promiſing appearances of divers foſſils, eſpecially marchaſites, will temptingly invite, but never anſwer.

SECT. I.

SIR,

A way propoſed for the previous examen of ores.

AT a time wherein ſo many ingenious or induſtrious men appear very ſolicitous to diſcover and to work mines, both here and in *New England*, and others of his majeſty's American colonies; it will not probably be thought unſeaſonable, nor prove unwelcome to the ſeekers of ſubterraneal treaſures, if my deſire to do them a piece of ſervice, make me borrow of a paper, I long ſince wrote about ſome things relating to the materia medica, a few paragraphs that contain a way of exploration of minerals; which though it reaches but to one of their qualities, will perhaps, by reaſon of the conſiderableneſs of this, keep on certain occaſion ſome ſearchers after mines from beginning chargeable works, or proſecuting them with too great expectations, which are uſually followed by proportionable diſappointments. And I make the leſs ſcruple to ſuffer this fragment to leave its company, and preſent itſelf to you; becauſe after

after the misfortune, I have formerly ſignified to you of the loſs and ſpoiling of ſeveral of my writings, I know not when, if ever, I may have opportunity of communicating to my friends the treatiſe that theſe paragraphs belong to.

THAT part of the forementioned treatiſe that concerns my preſent purpoſe, is founded on an experiment, whereof what you are about to read is one of the applications.

I SHALL then ſuccinctly inform you, that the obſervation, whereon my diſcourſe was grounded, is double, as will by and by appear; and that the riſe of it, which will help to underſtand the nature and influences of it, was this. I thought fit (for reaſons elſewhere given) to find out what was the ſpecifick gravity of a pure ſtone, ſuch as I ſuppoſed cryſtal or white marble, or a ſtony iſicle to be; and found it by the hydroſtatical way of trial, (doubtleſs not unknown to you) that is delivered in the eſſay called *Medicina Hydroſtatica*, whereof when you pleaſe, you may command a ſight, to have to clear common water, equal to it in bulk or magnitude, pretty near the ratio, or proportion of two and an half to one; or which is ſomewhat more obvious to conceive, as five to two; I ſaid pretty near, becauſe it is not always exact, nor need be for our preſent purpoſe, but uſually enough does ſomewhat rather exceed that proportion than fall ſhort of it; but that is ſo little, that it may, on all common occaſions, be ſafely enough neglected by a mineraliſt: though, if one pleaſes, one may make uſe of the proportion of $2\frac{1}{4}$ to 1, that is, of 11 to 4.

SECT. II.

THE uſes that may be made to our preſent purpoſe of this fundamental obſervation, are either of a more general or of a more particular nature.

As to the firſt of theſe, when my intention is only to diſcover in general, whether a foſſil propounded, or perhaps caſually lighted on, may with probability be judged to contain any ſubſtance, either metalline, or belonging to ſome foſſil of affinity to a metalline nature; and alſo, whether in caſe the firſt queſtion be reſolved in the affirmative, the propoſed boby does, indefinitely ſpeaking, contain much, or but little of the metalline or other adventitious ſubſtance: when I ſay, I would only make thoſe general inquiries, I weigh the body I would examine, firſt in air, and then in water, and obſerve the proportion in ſpecifick gravity between them; and if I find it weigh either leſs, or but little more than cryſtal or marble of the ſame bulk, I judge it unlikely to contain any metalline portion, conſiderable for its quantity. And if it weigh manifeſtly, or ſomewhat conſiderably more than marble or cryſtal, I gueſs, that in proportion to that exceſs, it abounds, more or leſs, with a metalline ingredient, or one or other of affinity to a metalline nature.

To explain myſelf a little by two or three examples; it is known, that the magnet is vulgarly reckoned amongſt ſtones, and its great hardneſs confirms men in that opinion. But having obſerved, that loadſtones, eſpecially thoſe that come from ſome places, that I elſewhere take notice of, ſeem to be apparently more ponderous than common ſtones of the like bulk; we weighed them in air and water, and found their ſpecifick gravity, eſpecially of ſome of them, ſo far to exceed that of cryſtal or marble, that it could not be difficult for us to conclude, that theſe foſſils contained a not inconſiderable proportion of metalline matter, which, by collateral experiments, delivered in another paper *, appeared to be of a martial or ferruginous nature.

EMERI is a foſſil well known to many tradeſmen, eſpecially armourers and gunſmiths, by whom it is commonly reputed a mere ſtone. But finding that its weight in water conſiderably exceeded that of cryſtal of the ſame bulk, ſince it was to that liquor very near as 4 to 1; I conjectured, that it contained a metalline ſubſtance, as afterwards by proper trials I found it to do. Upon the ſame ground (its weight in my hand) I concluded, that lapis hæmatites, that is commonly ſold in ſhops, and as its name witneſſeth, paſſes for a ſtone, did not ſparingly participate of a metalline ingredient; in proſecution of which conjecture, I quickly thought on ways whereby I diſcovered, that iron or ſteel was the metal it contained.

AND not to accumulate inſtances in this place, I ſhall advertiſe you in general, (what perhaps may hereafter be found uſeful to ſeveral enquirers) that upon the grounds hitherto mentioned, I was invited to gueſs, that divers bodies that were little ſuſpected to be of a metalline or mineral nature, did really contain a portion of ſubſtance that was ſo. And I remember in particular, that having met with granates of ſeveral ſizes, that were not Bohemian, but were found in other parts of Europe, and ſome that I diſcovered in a kind of talc, that was brought me from America; which angularly figured ſtones, I ſuſpected by their weight to be metallick, and found by hydroſtaticks, to have a ſpecifick gravity conſiderably ſurpaſſing that of cryſtal. Upon theſe grounds, I ſay, I ſuppoſed them to participate, and that not very ſparingly, of a metal, one or more; and by other ways of exploring, found that I had gueſſed aright; ſince I was able, notwithſtanding the great compactneſs of ſuch ſeemingly vitreous bodies, to diſcover there a decompoſition, and extract thence a metallick ſubſtance.

To theſe I might add other foſſils, and ſome that were not, even by men not unſkilful, ſuſpected to have any metallick ingredients. But I have not time to ſpeak of them, and therefore ſhall proceed in the lately begun diſcourſe.

* The author means a paper containing experiments and obſervations about the loadſtone, as it is a mineral.

SECT.

SECT. III.

TO illuſtrate then the general obſervation formerly laid down, and make it more diſtinct, I ſhall ſubjoin the following remarks.

FIRST, I do not pretend by this way to make any more than probable conjectures and eſtimates about the contents of the bodies, I examine by it: But though the eſtimates grounded on it be not always true, yet they may be frequently uſeful, as may be gathered from ſome of the ſubſequent obſervations.

SECONDLY, if the foſſil propoſed be lighter, eſpecially if it be much lighter than ſo much cryſtal, it is an almoſt certain token, that it is not a metalline ore. And this negative uſe, if I may ſo call it of our hydroſtaticks, may be more ſafely relied on, than the affirmative conſequences uſually can be. Thus when I find that jet, though a foſſil dug up in veins, eſpecially in the Pyrenean mountains, (as a learned man, whoſe brother has there a mine of jet, aſſured me) has far leſs of ſpecifick gravity than cryſtal, I conclude it to be no metalline body. The like inference I make on the ſame ground, as to foſſil amber or ſuccinum, ſulphur vive, and the obſervation holds in common ſulphur, (clear or ſemidiaphanous) Engliſh talc, Venetian talc, and ſome other firm concretions, whether brittle or not, that are dug out of the earth. Among theſe, I think fit to mention particularly black lead, leſt the name it bears ſhould deceive men into a belief, that it is an ore of that metal. For having found its weight, in reference to water, to be but as $1\frac{86}{100}$ to 1. And gathering from the ſmalneſs of its ſpecifick gravity, that it would prove to be very unlike our true common lead ores, I found, upon trial purpoſely made, that it was a mineral *ſui generis*, and ſeemed, upon the ſcore of more than one quality, to be of kin to a ſort of talc that I have met with.

THIRDLY, we ſhould diſtinguiſh between the ſeveral uſes that foſſils may be ſought for and examined by men of different profeſſions, or deſigns. And therefore, if a foſſil be found to be ſomewhat, and yet but very little heavier in ſpecie than cryſtal or marble, it may poſſibly have a metalline or mineral portion, which, though very ſmall in quantity, may conſiſt of ſuch efficacious parts, as may make it deſerve the eſteem of a jeweller, a phyſician, or a chemiſt. But if the ſurplus of ſpecifick gravity be inconſiderable, the foſſil it ſelf will be ſo too to a mineraliſt, that ſeeks not to gratify his curioſity, or make a good medicine, but to fill his purſe. For the charge and trouble of working a foſſil, ſo poor in metalline ſubſtance, will probably either exceed the profit, or keep it from being conſiderable; whereas if the ſpecifick gravity do much exceed that of marble or cryſtal, it may give good hopes of proving a ſubject profitable to be wrought on.

FOURTHLY, but here I muſt give notice, that though for the moſt part the great ponderoſity of a foſſil proceeds from a portion of ſome metalline ſubſtance, more ſtrictly ſo called, that is embodied with the other part of the concrete; yet this alone is indeed a certain ſign, that the foſſil is not a mere ſtone, but is not alone a ſure ſign, that the mineral portion is properly metalline; and therefore, where there is juſt cauſe of doubt, it is beſt to endeavour by ſome collateral ſigns to reſolve it. The reaſon why I thought fit to give you this admonition, is, that beſides metalline ores more properly ſo called, there are other foſſils, which ſome call ſemi-metals, others media mineralia, and others again give other appellations to; which foſſils, though of affinity to metals, are wont to be diſtinguiſhed from true metalline ores; ſuch (foſſils) as are (that I may here name the principal of them) antimony, biſmuth (uſually in our ſhops called tin-glaſs) lapis calaminaris, and pyrites, commonly called marcaſites, and vulgarly, in Engliſh, vitriol ſtones.) But there will not perhaps occur many caſes, wherein it will be neceſſary to have recourſe to collateral ſigns, to diſcern whether the mineral portion of a foſſil be, in a ſtricter ſenſe, of a metalline nature, or not: For theſe ſemi-metals that I ſpeak of are moſt commonly found either in veins, or in maſſes, or great lumps of their reſpective kinds; and eaſily diſcover, to one that conſiders them with ſo much as a moderate meaſure of attention and ſkill, what ſpecies of foſſils they belong to. I have indeed from *Devonſhire* received a lump of matter, which the owner of the mine, not knowing what to make of, deſired my opinion of, wherein I found ſome antimony mixt with lead, which was the predominant body. But ſuch mixtures occur not often enough, at leaſt here in *England*, to keep our way of eſtimating ponderous foſſils from being, on moſt occaſions, uſeful.

SECT. IV.

FIFTHLY, it will be almoſt neceſſary to give you notice in this place, that there may be a two-fold eſtimate made of the ſpecifick gravity of ores; one, when the metalline body propoſed is weighed in its natural ſtate, that is, as it is taken out of the earth, accompanied with the ſpar, or other heterogeneous matter, that firmly adheres to it, (only the looſe earth being firſt waſhed off:) and the other, after it has been beaten ſmall and ſeparated from ſtony and other heterogeneous ſubſtances, by the help of water; where being ſkilfully agitated, there is eaſily diſcovered a notable diſparity in weight between theſe and the genuine or metalline parts of the ore, which being thus ſevered from the reſt, are called, for inſtance, waſhed tin, if afforded by a vein of that metal. And ſometimes alſo it is very uſeful, if not neceſſary, to prepare the ore by roaſting it, (as they ſpeak) once, or oftner, or by keeping it ſeveral hours in a competently ſtrong fire, as is uſually enough done to prepare copper ore, eſpecially if it be ſtubborn. I have diſtinctly mentioned theſe two ſtates, wherein the weight of an ore may be eſtimated; becauſe I have

I have obſerved, that in ſeveral caſes it will much import the experimenter to diſtinguiſh them carefully. For ſeveral ores, which in their natural ſtate, have too little of ſpecifick gravity to make them judged worth the charge of being wrought, may yet, being prepared by water and fire, afford a metalline portion ſo heavy in ſpecie, that it may give fair hopes of containing in it ſome portion of ſilver, or of gold; and in that caſe a ſmall proportion of the former, and a much ſmaller of the latter, would render the ore conſiderable, and make it pretty rich, though not in reference to the quantity it yields of the predominant metal, as lead, tin, or copper; yet in a more abſolute ſenſe, as it may better recompenſe the charges of him that ſhall work it. Which brings into my mind, that ſome time ago a piece of lead ore, then brought out of *Ireland*, being offered me to judge of, found it ſo light in the lump, that I thought it not at all worthy to be wrought for lead; but afterwards upon trial it appeared to be, though very poor in that metal, yet ſo well ſtored with corpuſcles of ſilver, that I ſcrupled not to encourage the owner to beſtow pains and coſt upon it.

SECT. V.

BUT there is one kind of minerals, that I have obſerved to impoſe on men ſo often, that I think it neceſſary to take a particular notice of them in this place. For, not to mention examples, that I might draw out of the books of travellers and navigators, I have met with, I know not how many, that have built great hopes, and ſome (which is worſe that have been at charges upon thoſe illuſory expectations of great matters from marcaſites. And, I remember, I have had ſent me, or brought me, not only from places nearer home, but from hotter and colder countries of the *Indies* themſelves, foſſils, whereof I was earneſtly deſired to give my opinion, that I found to be but marcaſites: and many of theſe foſſils having two qualities, that make them very fit to delude the vulgar and the unſkilful, namely, firſt a multitude of ſhining ſtreaks, or other gliſtering parts uſually of a colour near enough to that of gold, and ſometimes to that of ſilver; and then, a ponderouſneſs uſually not inferior, at leaſt to that of true metalline ores; marcaſites, I ſay, being thus fitted to delude the unſkilful, I have had much ado to undeceive ſome, that brought or ſent me them from *America*, of the pleaſing confidence they had entertained, that theſe promiſing foſſils were lumps of rich ore of gold, or ſilver. Wherefore ſince their ponderouſneſs (which is the criterion of minerals I am now treating of) is one of the two chief things that delude ſo many, I think it expedient to ſubjoin ſome few but various inſtances of the ſpecifick gravity of marcaſites, whereby it may appear, that ſome of them are, bulk for bulk, far more ponderous than divers true metalline ores, that I have tried, have been found to be. And indeed this great ponderoſity has ſeveral times invited me, before I made any artificial trial of propounded foſſils, and ſometimes before I took them out of the bags or papers to look on them, to judge, though perhaps to the ſurprize of thoſe that brought them, that they were not true ores, but marcaſites. And, becauſe this miſtake is ſpeciouſly grounded, and has deceived many, whereof ſome have undertaken voyages betwixt *Europe* and the *Indies*, upon confidence of the value of theſe gliſtering ſtones; I ſhall decline a little the method of this paper, which confines me to the hydroſtatical way of exploring minerals, to advertiſe thoſe whom it may concern, that they may eaſily try almoſt any ſtone, that by its great weight and luſtre they ſuſpect to be a marcaſite, if they put it either within a crucible or without one, into a well kindled fire, and blow now and then upon it with a pair of bellows. For by this means the ſulphur, wherewith marcaſites are wont to abound, (ſo that I remember, that even by diſtillation in a cloſe veſſel, I had ℥iv. of good brimſtone, like the vulgar, out of ℔iij. of the ſtones) will take fire, and burn with a flame for the moſt part blue like that of common ſulphur. And, if when it ceaſes to flame and ſmoke, you take it out of the fire and let it cool, you will find it deprived of all the gaudy appearance of rich metal it had before, and turned to a brittle blackiſh ſubſtance, differing enough from that of a metalline ore, more ſtrictly ſo called. Theſe laſt words I add, becauſe in a lax ſenſe, it is eaſy to ſhew, that marcaſites, at leaſt thoſe that I have tried, may be looked upon as a kind of metalline bodies. For beſides that I have found divers of them to contain particles of copper, I found all that I purpoſely examined, to contain, and ſome of them plentifully enough, corpuſcles of iron or ſteel, as plainly appeared, when, after the newly mentioned calcination (for with crude marcaſites I found not the following trial to ſucceed) I applied to the pulveriſed remains a vigorous load-ſtone; to which great multitudes of martial corpuſcles quickly adhered. And, I remember, I found in a catalogue of the foſſils of *Miſnia*, publiſhed by the experienced *Kentmannus*, that under the head or title of pyrites, he brings in ſeveral marcaſites, whereof ſome contained copper, others ſilver, others gold, and others both the laſt named metals; which brings into my mind, that having preſented, among other Engliſh minerals, a curiouſly ſhaped and very fine marcaſite, to a virtuoſo, that is now overſeer of one of the emperor's beſt mines; he quickly examined it by a peculiar way not known to me, hoping to find in it ſome gold or ſilver; but inſtead of that, obtained a portion of running mercury, which he was pleaſed to preſent me, and which I preſume I may have yet by me.

THOUGH I thought it needful to give the foregoing caution about marcaſites, for the reaſons before expreſſed, yet my deſign is only to keep the leſs ſkilful from being deluded by their promiſing appearance. For

otherwiſe I do not deny, but that it is poſſible for a ſkilful artiſt to make (at leaſt of ſome ſorts) of them a gainful uſe, either by fixing the volatile gold or ſilver, that may be found in ſome of them; or by graduating ſilver by their means; or perhaps by ſome other ways that I can but gueſs at. But (to add that on this occaſion) that, for which I much more value marcaſites, is, that (NB) ſomewhat more than bare conjectures make me think, that being dexterouſly handled, and perhaps even without additions, they may afford very noble, as well as uncommon medicines, and particularly in continual fevers, though their operation be uſually ſcarce ſenſible, but by their good effects.

SECT. VI.

ON this occaſion I muſt not forbear to give an advertiſement, that may be of good uſe to divers examiners of ores, eſpecially ſuch as are novices in the art of reducing them. And it is this, that as to many who make trials of ores, though they much value their own flux-powders, or thoſe that are cried up by others, yet they commonly act as if they expected nothing from thoſe that they prefer, but that they ſhould more than others facilitate the fuſion of the ores; as that which being once done, the metalline part will be ſeparated by its own weight, or as it were ſpontaneouſly. But yet having purpoſely examined the matter more nicely, and compared the quantities of metal, that we obtained from two portions of equal weight of the ſame ore, we found that thoſe proportions did very conſiderably differ, though that which yielded leaſt metal was fluxed down with a fondant (as the French compendiouſly call, what our men, after the Germans, call a flux-powder) that is dear enough, and not undeſervedly eſteemed, when ſuch ores are to be handled. And I little doubt, but that from other metalline ores, a greater portion of pure metal may be obtained by ſome, but little employed or known, fondants, and perhaps cheap ones too, than by others that are much more in uſe and famous; of which I may elſewhere give ſome inſtances: now, one that firſt occurs to my memory, was afforded me, by two equally heavy portions of the ſame lead ore devoid of ſpar; whereof one, being reduced with a due weight of nitre and tartar fulminated together, afforded much leſs of malleable lead, than was obtained by means of half or a quarter of the quantity of filings of *Mars*, which, for trial's ſake, I then employed on the other; to ſhew, how much better a reductive of that kind of ore that metalline flux was, than even a ſharp and fiery fixed ſalt.

AND yet (to give you an inſtance in a much more precious mineral than lead ore) I ſhall add, that having, for curioſity's ſake, tried ſome ounces of good native cinnabar finely pulveriſed, one half with a fixed alcali of tartar, and the other with a different flux-powder, we obtained from the firſt parcel twice as much mercury as we did from the other half, diſtilled with another fixed alcali, even though it were of a mineral nature.

ECT. VII.

Some obſervations about native gold.

About the hydroſtatical examen of gold and its ore.

GOLD being by far the moſt noble and precious of metals, it may be ill taken, if I ſhould here leave the ore and mineral, that affords it, altogether unmentioned; and therefore, though I have but two or three obſervations pertinent to my preſent ſubject, to offer about it, yet I think it may not be uſeleſs to ſay ſomewhat of that ore in this place.

I KNOW there are many learned men, and even chemiſts, that think there are no ſuch things as gold mines, properly ſo called. And I confeſs, that I myſelf was long kept from being confident of the affirmative. And I was induced to this diffidence by conſidering, that though having had the honour for divers years to be a member of his majeſty's council for foreign plantations, I had the opportunity to converſe with a conſiderable number of navigators, and other great travellers, and with divers perſons that had ſettled themſelves in the *Indies*, I made it more than once my buſineſs to enquire, not whether they knew of any golden mines in the popular ſenſe of the word, for I knew that there are in *Hungary*, *Macedonia*, and ſome other countries, mines that afford gold enough to deſerve to be wrought for it: but whether there are any real mines, or veins, whereof gold is manifeſtly the predominant metal. Having, I ſay, propoſed to many this queſtion, I was anſwered, that ſome of them indeed had heard of ſuch mines, but none of them had ever ſeen any. But afterwards I ſaw ſome ore that I judged true, that was preſented to his majeſty *Charles* II. and I alſo received from an unknown virtuoſo, reſiding in the *Eaſt Indies*, together with a very civil letter (which I wiſhed had been more hiſtorical and leſs complimental) among other leſs valuable pieces of ore, one in whoſe clefts, and a little beyond them, there appear ſome lumps, wherein by their colour, and other ſigns, it is ſo apparent, that gold is the predominant metal, that I little doubt, but that, if I would ſpoil the lump by breaking the ſpar, I ſhould find theſe metalline protuberances malleable, without the help of the fire.

BUT being unwilling to deſtroy the entireneſs of it, I ſhall make only a few and ſhort remarks about this ore.

THE biggeſt piece, and that which was beſt furniſhed with metalline parts, being about an ounce and a quarter in weight, contained ſo great a proportion of ſpar, in reference to the metal, that its weight to an equal bulk of water was but as $2\frac{91}{100}$ to 1.

BUT ſomewhat to compenſate this ſmalneſs of the metalline portion, that, that was of it, ſeemed to be all gold, there being no ſign of any other metal in that lump of ore,

nor in ſome leſſer ones that I received with it.

THE ſpar (as our mine men uſe to call that ſtony matter, in which the true ore is immediately lodged) did not look like the ſpar of lead ore, or that of any other of our Engliſh metals that I have ſeen, but ſeemed at firſt view to be a kind of white marble with a daſh of yellow.

AND upon trial, I found it to differ more from the ſpar of lead ore, which, with us, is uſually white, and almoſt ſemidiaphanous than in the colour. For, whereas our ſpar of lead ore is oftentimes ſo ſoft or tender, that it may eaſily enough be cut with a knife, we found the ſparry portion of our gold ore to be a ſolid ſtone, and that ſo hard, that being ſtruck with a piece of ſteel, it would yield ſparks of fire.

WHEREAS alſo I found, that the ſpar of lead ore would be eaſily enough, and in a ſhort-time (as about a quarter of an hour) calcined to a kind of lime; our golden ſpar, though kept ſome hours red hot in a crucible, did not appear to be at all calcined. And whereas I had formerly obſerved, that I could eaſily diſſolve the ſpar of lead ore in ſome acid menſtruums, and even in diſtilled vinegar itſelf, I did not find, that our golden ſpar, though kept divers hours in ſtronger menſtruums, as ſpirit of ſalt, aqua fortis, and aqua regis, was diſſolved or manifeſtly wrought upon by any of them, as if it were of a glaſſy nature, as well as of a very hard one.

A PIECE of ſpar, that had ſcarce any gold at all that could be diſcerned, being hydroſtatically examined, was in ſpecifick gravity to water as $2\frac{65}{100}$ to 1. which ponderoſity does but very little exceed that of white marble, or that of ſome good ſpar of lead ore that was compared with it.

IF I had received a greater quantity of gold ore, I ſhould have given a leſs imperfect account of this ſubject. But theſe notes, ſuch as they are, may perchance not be unwelcome to ſome of thoſe many Engliſh and other ſearchers for mines, that have never ſeen true gold ore, or have not had liberty to make any trials upon it, and yet are in ſearch of gold mines, eſpecially in *Jamaica*, where, if I much miſremember not, the * inquiſitive gentleman that conquered it for the Engliſh, told me, at his return thence, that the Spaniſh governor of the iſland, when his priſoner, confeſſed to him, that there was mineral gold, though the Spaniards did not dig deep for it for want of workmen.

* General *Venables.*

SECT. VIII.

BUT by the mention I have made of the true ore of gold, I would not diſcourage any from ſeeking for that rich metal in the veins of ſome other metals; becauſe, in divers of theſe, I know it may ſometimes be found blended with predominant minerals. This may appear by thoſe Hungarian copper mines of *Cremnitz*, whence a conſiderable quantity of gold is yearly obtained. I have elſewhere alſo taken notice, that I have ſeen an Engliſh tin ore, part of which I preſented to the king, wherein there lay, in little cells, a good number of ſmall leaves or chips of gold, which I ſaw there with pleaſure. And though the tin-men, not being able to ſeparate them with profit, uſually melted both the metals together, and ſold the product for mere tin; yet an experienced gentleman, who was owner of the mine, aſſured me, that one of his workmen, who had many little children, employed them with good profit, to pick the gold with their ſmall fingers out of the ſkilfully broken ore. And though lead mines be looked upon as thoſe, which the matter whereof gold is made is ſeldomeſt found to be near, and does as it were avoid; yet there is a place in *Scotland*, (whoſe name I remember not) where over a lead mine, upon or near the ſurface of the ground, they oftentimes find grains or bigger pieces of native gold without ſpar; ſome of which, by the ingenious owner's favour, I was maſter of, and thought ſometimes worthy of being preſented to that curious examiner of ores, his highneſs prince *Rupert*. And ſtill I have one bit of native metal by me, which, if much I miſtake not, I had from the ſame place: which foſſil, though I found it hydroſtatically (becauſe being native I would not melt it) not to be, as the owner ſuppoſed, pure gold; yet gold is the predominant metal in it, and the piece weighs forty odd grains. Memoirs for the natural hiſtory of tin.

SINCE I wrote the laſt foregoing lines, I have, in an old collection of my notes, found three, whereof the firſt is thus ſet down, a grain of Scotch gold, ſuch as nature had made it, without any adhering ſtone or ſpar, weighed ʒiij. + 21 grains: the ſecond thus, another grain of the ſame gold, that had here and there ſome little ſtone or ſpar ſticking to it, and partly incloſed in it, weighed ʒiij. + 3 grains; ſo that the heterogeneous ſubſtance being, according to my eſtimate, abated, it weighed about ʒiij: and the third is ſubjoined in theſe terms, a grain of Scotch gold weighed in air 43 grains, in water $39\frac{1}{2}$ grains, differ. $3 + \frac{1}{2}$ propor. $12\frac{7}{8}$ to 1.

THIS lightneſs of a yellow metal (heavier than braſs or ſilver) deſerves a reflection; but I cannot ſtay to make it.

IT ſeveral times happens, that among the leſſer grains of gold, that are more properly called ſand-gold, there are found pieces, ſome of which I have ſeen, that are ſingly big enough to be tied about with an horſe-hair, and ſo weighed in water, as lumps of ore of other metals are wont to be. And to ſuch bigger fragments of gold, it is manifeſt, by what has been already delivered, that our hydroſtatical way of exploring may be uſefully applied. For ſince, according to the famous and diligent *Merſennus*, and ſome eſteemed writers, pure gold is to water of the ſame bulk, as (about) 18 to 1; and by my examen of very fine gold, I found that it equals about nineteen times the weight of as much water (I ſay about, becauſe I unhappily loſt the exacteſt

acteſt of my trials upon gold among thoſe made upon the other metals in a moſt exquiſite balance) as is equal to it in bulk; it will readily appear, whether the fragment propoſed be perfectly pure or not. For if its weight amount to near nineteen times as much water in quantity, we may conclude it to be unallayed; and as it wants leſs or more of this ponderoſity, we may conclude it to be more or leſs pure.

SECT. IX.

IT is known, that ſince we began effectually to cultivate the African trade, it frequently brings into theſe parts, beſides things of leſs value, conſiderable quantities of what, from the moſt uſual ſize of it, is by many called ſand-gold; but which, by reaſon of the very unequal bulks of the grains, may perhaps juſtly be called fragments of gold, ſince being brought from the maritime parts, where no mines of gold are yet found, they ſeem to have been broken off and waſhed away from hidden veins by the violence of waters, that having carried them as far as they were able, left them a prey to men. Now (becauſe that unleſs it be perhaps brought by, or for ſome virtuoſo) there is ſcarce any gold that comes into *Europe* in lumps, under the form of ore; but a great deal that is brought from *Guinea*, (and thoſe other parts of *Africk*, which for that reaſon are compriſed under the name of the golden coaſt) in the form chiefly of ſand or gravel, groſſer or ſmaller, and partly alſo of leſs minute pieces; it may conduce to the ſcope of theſe papers to take notice, that in making eſtimates of the genuineneſs and the degrees of purity of theſe native fragments of gold, our hydroſtatical way of exploring may be of no ſmall uſe.

FOR firſt, when we have once diſcovered the proportion between pure or exquiſitely refined gold, and water equal to it in bulk, (which proportion I have lately given exactly enough for our preſent purpoſe) it is eaſy, by our hydroſtatical method, to examine the fineneſs of any other gold propoſed; ſo at leaſt as to know, whether it be perfectly fine; and if it be not, whether it do conſiderably fall ſhort of perfect fineneſs. But ſince of this I elſewhere treat, I think it more proper to obſerve in this place, that when once a man has found the true ſpecifick gravity of a parcel of ſand-gold, (ſmaller or coarſer) whoſe degree of fineneſs he knows by collateral trials, or ſome other means, (whatever they be) he may (as was formerly noted when I ſpoke of metalline ores) take this ſpecifick gravity for a ſtandard, with relation to which he may make his eſtimates of the fineneſs of other parcels of the like native gold, that he is concerned to buy or to examine. And, by this means, he may oftentimes prevent that chief fraud of the negroes, whereof ſeveral traders to the golden coaſt are not a little apprehenſive, as being in danger to be much damnified by it. For they complain, that though the blacks be, otherwiſe, for the moſt part, but a dull ſort of people; yet they have often made a ſhift to cheat the traders, by clandeſtinely mixing with the right ſand-gold, filings of copper, or rather of braſs, whoſe colour does ſo reſemble that of gold, that the fraud is not eaſily diſcerned. And in the account of a late voyage, made by the French to the coaſt of *Africk*, to trade eſpecially for gold, it is acknowledged, that the officers were egregiouſly cheated by the blacks, who, inſtead of paying them for the wares they brought with powder of true gold, gave them powder of braſs, or gilt copper, which thoſe that were not accuſtomed to make trial of ſuch wares, are, as the relater complains, in a ſcarce evitable danger to be cheated, as theſe Frenchmen confeſs they were in one day to the worth of a thouſand crowns. But in regard that, as trial has informed me, braſs is not quite half ſo heavy as fine gold of the ſame bulk, if there be any conſiderable quantity of filings of braſs with the gold; this mixture being put into ſuch an hydroſtatical bucket, or wide mouthed glaſs, as is mentioned in the eſſay, will manifeſtly weigh leſs in water, than if it were all gold. And by comparing its ſpecifick gravity, with that formerly found to the grain gold pitched upon for a ſtandard, the greater or leſſer decrement of the ſuſpected gold will help to make an eſtimate of the quantity of braſs, mingled with the natural gold.

SECT. X.

BUT though my preſent undertaking do not oblige me to conſider ſand-gold, otherwiſe than hydroſtatically; and though it highly concerns merchants and others, that deal in ſo rich a commodity as gold, and that is by ſo many ſtudiouſly adulterated, to be furniſhed with nice and truſty balances; yet, becauſe divers perſons, eſpecially ſeamen, that trade to the gold coaſt and other parts, where ſand-gold is to be met with, do, (perhaps too often) without being furniſhed with good ſcales and ſufficient ſkill to uſe them, venture upon buying ſuch precious wares; it will not be to depart from my general and main deſign, which is to ſerve the publick, if I deviate a little from my ſubject, and add to the hydroſtatical way, lately propoſed, of examining ſand-gold, two or three chemical ways to the ſame purpoſe. Firſt then, if he that would purchaſe ſand-gold, doubts that there are filings of braſs (or of copper) mixed with it; in caſe he have aqua fortis at hand, he may quickly diſcover the cheat, if there be any. For it is known to chemiſts, that aqua fortis will not work upon gold, and therefore if there be filings of braſs mixed with it, the operation of the menſtruum upon thoſe, together with the colour betwixt blue and green, it will thereby acquire, will diſcover the deceit. But, becauſe if nature hath mingled much ſilver with the gold, the proof by aqua fortis will require ſkill, and may puzzle thoſe that want it; I ſhall add, that good ſpirit of urine may be ſubſtituted

in

in its ſtead. For I elſewhere ſhew, that it will readily work upon filings of copper or braſs in the gold, and gain from them a fine blue colour; and this being a menſtruum not corroſive, like the other, but harmleſs to moſt bodies, and a good medicine for human bodies in ſeveral diſeaſes, (as the jaundice, pleuriſies, ſome kind of fevers, coughs, and aſthma's) may be fit to be carried about in voyages, and to be preferred to aqua fortis. And to make the operation of this liquor on filings of braſs far more quick, than if the ſolution be attempted an ordinary way, I thought upon the following expedient. I took filings of braſs, (and the like may be done with thoſe of copper) amounting to the weight but of eight or ten grains, or perhaps leſs; and having with my finger ſpread them ſomewhat thin upon a ſmall piece of white paper, I moiſtned them thoroughly with good ſpirit of fermented (or putrified) urine, (which will not diſſolve gold) that by this means the air might promote the diſſolutive action of the menſtruum; which accordingly it did ſo well, that, to the ſurpriſe of the beholders, there appeared in leſs than a quarter of an hour, and ſometimes in a few minutes, a manifeſt, if not alſo a deep and pleaſant blue colour upon the paper, or on ſome of the filings, or both. Thoſe that carry with them ſpirit of hartſhorn, or ſuch other volatile alcalies for medicinal uſes, (as ſome modern ſhip-chirurgeons do) may, for a need, employ that inſtead of ſpirit of urine. Nay, one may for the ſame purpoſe make uſe of urine itſelf never diſtilled, if it be ſtale and rank enough, (as it grows to be, ſooner in hot airs than in others:) ſince having for trial's ſake moiſtened with ſuch urine ſome filings of braſs, thinly ſpread on a piece of paper, there was a manifeſt blueneſs produced in about a quarter of an hour. But I thought alſo of another way, which I preſumed would be better liked by moſt traders, as more commodious; becauſe the agent being in a dry form, cannot, like ſpirituous liquors, be ſpilt; and though it be more eaſily procured, may ſerve the turn almoſt as well. This agent is common ſal armoniack, of which, when I have occaſion to uſe it, I reduce a greater quantity to powder, than I gueſs the quantity of water, I ſhall need, will diſſolve; that the liquor may be ſatiated with the ſalt. With this brine I thoroughly wet filings of braſs, (or copper) after the forementioned manner, thinly ſpreading them with my finger on a piece of paper, or ſome other fit and flat body; and in a ſhort time (as about a quarter of an hour or leſs) there will appear a greeniſh blue colour, drawn from the braſs by the liquor: which (liquor,) I ſuppoſe, I need not tell you, will not work on the gold, wherewith the braſs is mingled.

SECT. XI.

I HAVE obſerved ſuch a variety of appearances and diſguiſes of metalline bodies, and ſome other minerals, that I would adviſe thoſe that are given to the ſearch of mines, and other foſſils, to have their eyes always open when they paſs (eſpecially by land) from one place to another, that they may be ready to take notice of any unknown or uncommon foſſil, that they chance to ſee in their way; and that having taken it up, they do not neglect to poiſe it in their hands, (which after a little practice it will not be difficult to do, though not exactly, yet not unuſefully) and if they judge it to exceed the weight of cryſtal, or marble, to examine it hydroſtatically at their firſt conveniency. For there are in *England*, as well as in divers other countries, uſeful foſſils, that are wont to be overlooked by the unſkilful; and I have found in this kingdom, even upon, or very near the highways, eagle-ſtones, and ſome other minerals that were not ſuſpected to be of Engliſh growth. And I remember, that having occaſion, in the country, to paſs by the work-houſe of an ingenious potter, that I ſometimes imployed in his profeſſion; and having viewed the ground ſomewhat attentively, among ſome other uncommon foſſils that I took notice of, I made a diſcovery of manganeſe, or magneſia, whereof I gave the potter an advertiſement, which he afterwards thankfully made uſe of, having found the mineral very proper for the glazing and colouring of his veſſels.

NOR was this the only kindneſs, that ſkill in mineralogy, as little as mine was, enabled me then to do him. For he having invited me to view very privately, a place wherein there was great ſtore of a foſſil ſubſtance, that men knew not what to make of, becauſe they had not ſeen nor heard of the like in *England*: the knowledge I had of ſome Italian mines, made me quickly gueſs what it was that was taken for an unknown metal. For it is true, that this mineral was not divided into lumps of ſuch ſhapes and bigneſſes, as make glittering foſſils paſs for ſtones among the unſkilful, ſuch as are the marchaſites, whereof they make vitriol, and are found by the ſea-ſhore in or near the *Iſle of Wight*, and (though not ſo plentifully) in other parts of *England* (where I have found them) but ran a great way (and I had not time or liberty to try how far) under ground, like a vein of metalline ore. But this notwithſtanding, I judged the mineral to be but a marchaſite, in a form unuſual indeed in *England*, but which is not without reſemblers in ſome parts of *Italy*; which conjecture I found true the ſame day, by ſome eaſy trials that manifeſted it to abound much more in vitriolate ſalt, than any marchaſite that I had examined in the form of ſtones. So that, though I had no opportunity to try, whether or no it contained any better metal than iron; yet I concluded, that, *cæteris paribus*, it might be employed to make ſtore of vitriol, in far leſs time, and with far leſs coſt, than the marchaſites made uſe of in the vitriol works at *Deptford*, or elſewhere in *England*.

I REMEMBER alſo, that a mineral of an odd, though pretty appearance, being ſent me,

whoſe ſpecies was unknown to the mine-men that dug it up, I gueſſed that it was a foſſil, that I had not found in a good printed catalogue of our Engliſh minerals, namely, the ore of Biſmuth. And in this conjecture ſome trials, purpoſely made of that mineral, ſufficiently confirmed me, and gave me cauſe to be ſorry, that the vein, that afforded it, was ſo very ſmall, as the diggers found it, of an ore, that has properties enough; and is by ſome famous chemiſts affirmed to have ſome, that are not only rare, but wonderful.

BUT the chief thing, that invites me to recommend in this place, to thoſe that travel, an heedful eye on the ore-like, or ponderous ſubſtances, that may occur to them, is, that one of the applications of our general remark about the ſpecifick gravity of foſſils may be extended to an uſe, that has not, that I know of, been made by mineraliſts, and which yet I thought fit not to overlook: becauſe I ſee no need we ſhould be confined to examine only thoſe foſſils, whereof we can obtain parcels big enough to be weighed in water in the entire body. For beſides other minerals, that may be found profitable to the phyſician, the drugſter, or the mineraliſt, the ores, or wombs of metal themſelves, may be divers times found diſguiſed in the form of earth, or of mud, eaſy to be dried: which foſſils, though (becauſe they chance not to be found in lumps) unfit to be kept immediately ſuſpended by an horſe-hair, may be conveniently enough examined by the help of a glaſs-jar, whoſe weights in air, and water, and their difference, (which gives the ſpecifick weight of the veſſel) have been taken once for all, which I uſually call an *hydroſtatical bucket*. For this veſſel being almoſt filled with the propounded foſſil, and carefully counterpoiſed in the air, and then thoroughly wetted with water, and when it is ſo, warily let down into the water, and kept ſuſpended by an horſe-hair to a tender balance; when theſe things, I ſay, are done, the difference between the weight of the mineral and veſſel, when they are under water, and their former weight being obſerved; and the ſpecifick weight already found of the veſſel itſelf in water being ſubſtracted from that difference, there will remain the weight of the foſſil only, (which we here ſuppoſe to be heavier in ſpecie than water, and not to be diſſoluble in it) or the mineral itſelf in that liquor; and conſequently the proportion between that body, and water of the ſame bulk, as is elſewhere ſufficiently declared.

SECT. XII.

TO manifeſt, that this expedient may be of uſe in divers caſes, I ſhall only here obſerve, that a late author, who hath publiſhed an account of *Swedeland*, declares, that one of the beſt ſorts of Swedſh iron (which, you know, is much eſteemed in its kind) is divers times found in the form of a red mud, at the bottom of lakes, or far leſſer ſtagnant waters; which I the more readily believe, becauſe I have found ſome Engliſh okers (that paſs but for red earth, or ſtone of that colour) to be richer in iron than I found ſome famous ores of that metal to be. And another experienced writer, who gives us an account of the gold and ſilver mines of *America*, among which he ſpent ſeveral years, takes notice, that gold itſelf is found, from time to time, diſguiſed into a reddiſh earth, or is (though unſuſpectedly) harboured in it. An Italian mineraliſt, of repute in the laſt age, doth alſo take notice, that a reddiſh ſort of earth doth ſometimes contain a portion of the richeſt metals. I have obſerved ſome European diamonds, as many call a ſort of clear and finely figured cryſtals, to grow in a red earth, whence I have taken up pretty ſtore of them. And an inquiſitive traveller, who has been in the *Indies*, preſented me with a certain earth, which he affirmed to be from the diamond mines, (I preſume in the kingdom of *Colchonda*) which I found to be alſo red, and which I made ſome trials of, that belong not to this place. Vannochio.

SECT. XIII.

BUT the profitableſt uſe, that a mineraliſt may make of our hydroſtatical bucket, is to employ it much in weighing variety of coloured ſands and gravels, particularly ſome hereafter to be mentioned.

AND to let you ſee, by an eaſy inſtance, how apt we are to overlook ſands for want of trying them by weight, I ſhall not tell you, that I have ſometimes ſeen a ſort of ſand, that was ſlighted as common or worthleſs, which being waſhed and viewed in a microſcope, though none of the beſt, looked like an aggregate of ſmall granates, and perhaps was ſo; but ſhall here content myſelf to inſtance in that black ſand, that is commonly uſed in *London* and elſewhere, only to dry up the ink of words, that have been newly written. For having obſerved, when I had ſome quantity of this in my hand, that it was manifeſtly heavier than common ſand, I thought it worth the being examined by the hydroſtatical bucket; by which trial, that which we employed appeared to be to water of the ſame bulk, near about as $4\frac{6}{10}$ to 1. And having, for reaſons, that I cannot ſtay to mention, judged this ſand to be a mineral of a martial nature, I was confirmed in my conjecture, by melting it down with two or three parts of antimony, and caſting it into an iron cone. But I was more than confirmed in the ſame conjecture, when having tried it with a vigorous loadſtone, I found it to be far richer in metal than any of the Engliſh iron ores I had made trial of, and (except perhaps one) than any of the outlandiſh: for having taken, at adventures, ſome drachms out of a much larger quantity, and weighed it, I found, that at leaſt ſeven parts of eight would eaſily be taken up by the magnet. But ſuch obſervations as theſe are not the things, that chiefly move me to recommend the examen of ſands and gravels to the mineraliſt; particularly thoſe

ſorts of them, that being ſomewhat ponderous, are reddiſh or yellow, eſpecially if they retain thoſe colours, after they have been made red hot, and quenched in cold water.

But therefore to proceed to the mention of richer ſands, it is known, that from the coaſt of *Guinea* European traders, of ſeveral nations, do yearly bring gold to a great value, which is waſhed or picked out of the ſand. And even in *Europe* there are rivers, whoſe ſand is enriched by grains of gold, for which the *Tagus*, that runs by *Liſbon*, and *Pactolus*, were famous among the ancients. I knew an induſtrious chemiſt, who owned to me, that he got gold with profit from the ſand, which he found in ſome places of the banks of the Rhine: and there is a little river in *Savoy* proceeding from the mountains there, on whoſe banks, after a land-flood, I ſaw poor people buſy themſelves in ſeeking for grains of gold. Some trial (alſo) that I cauſed purpoſely to be made, confirmed me in a conjecture, which poſſibly may hereafter prove beneficial to many, namely, that the ſands of divers places, if they be ſkilfully treated by a dextrous chemiſt, may afford much more gold than is picked or waſhed out of them in form of grains. For beſides, that there may be many atoms, or corpuſcles of gold, that are ſo very minute, and ſtick ſo cloſe to grains of ſand, that they are neither taken notice of by the eye, nor ſeparable by waſhing and picking; beſides this, I ſay there may, as I conceive, be many particles of gold incorporated with the body of the ſand, which may be a kind of womb for matter of a golden nature, that a ſkilful artiſt, by the help of proper additaments, may ſeparate with profit, eſpecially if, with litharge or minium, he firſt reduce the ſand to a glaſs, and then take care to get the volatile gold, by giving it a pure body fit to retain and fix it, ſuch as is fine ſilver: out of which, I remember, we ſeparated by quartation, (though without profit, becauſe of the charges, and of the ſmall quantity we could work with at once) from as much vitrified ſand, and two or three fluxing additaments of ſmall price, as were contained in one crucible, (that broke too before the operation was near done) ſixteen grains of pure gold, that you may yet ſee, if you deſire it.

SECT. XIV.

It need not ſtartle you, that in reciting this experiment, I made mention of volatile gold. For though I know, that divers learned men, and ſome able chemiſts themſelves, look upon it as a fictitious thing, and that ſeems to bear a kind of contradiction in its very name, in regard of the perfect fixity they preſume to be an eſſential property of gold; yet I do not ſcruple to diſſent from them, being warranted ſo to do by my own experience. For I have more than once made uſe of a way, wherein, by the help of an additament, inconſiderable as to bulk, and leſs as to weight, one may, without a naked fire, and in a glaſs retort, ſublime gold, (not prepared by previous calcination) ſometimes in the form of a yellow or golden coloured ſalt; and ſometimes, when the operation ſucceeded better, in the form of thin cryſtals prettily ſhaped, gloſſy, and as red as rubies. But this upon the by; it may perhaps be more uſeful to ſearchers of rich foſſils not found in lumps, if I take this occaſion to obſerve, that when they meet with ſands, earths, mineral fragments, *&c.* that conſiderably exceed cryſtal in ſpecifick gravity; and by the place, wherein they are found, or by other tokens, give hopes of their containing corpuſcles of a golden nature: when this, I ſay, happens, it will not be adviſable, haſtily to reject ſuch bodies, but rather carefully to try, whether they do not deſerve a better uſage. For having ſometimes had the opportunity to diſcover corpuſcles of *Mars*, as chemiſts call iron and ſteel, in a far greater variety of foſſils and of diſguiſes, than even many noted chemiſts would have imagined, or ſome of them could, upon heedful trial, diſcover; I was much confirmed in my ſuſpicion, that corpuſcles of a golden nature may be concealed in divers bodies, which are thought not to contain any metal; and that in more of thoſe minerals, that are looked upon as ores of ſome other metal, becauſe of its being manifeſtly predominant, there may be mingled pretty ſtore of particles of gold or ſilver; which (becauſe of the greater quantity of that other metal, or mineral, that doth, as it were, cover or diſguiſe them) lie unperceived, and uſually unſuſpected, by perſons not very well acquainted with ſuch matters; and yet may, by one that is very ſkilful, be ſeparated even with profit.

SECT. XV.

But the grounds of the forementioned ſuſpicion being as yet but conjectural, I ſhall decline the particular mention of them in this place; and ſhall rather adviſe, with reference to ores in general, that thoſe, that would apply the hydroſtaticks to them, do labour to procure ſamples of the ores of differing mines, eſpecially if they be found in the ſame country; and do either by trial, or ſtrict enquiry, inform themſelves, what proportion of the metal, that denominates them, they contain. For theſe proportions of ores and minerals being carefully weighed in air and water, and their ſpecifick gravities being thereby made known, they may ſerve for a kind of ſtandard, by compariſon whereto we may oftentimes make not altogether unuſeful eſtimates of the metalline portions contained in other parcels of ore, of that ſpecies, whether afforded by the ſame mine, or vein of it, or by any other of the ſame metal hydroſtatically examined.

For inſtance, our Engliſh lead ores, that are worth taking notice of, may be, for diſtinction ſake, divided into three kinds or orders, and in each of theſe there may be allowed a latitude for greater or leſſer degrees

of goodneſs. The firſt ſort is of thoſe ores, that, in the ordinary way of melting, hold ſome of them from 30 ℔. of lead in an hundred weight of ore, to 40; and others to 45 ℔. of the ſame metal, and theſe by ſeveral are ſlighted as mean, and ſcarce, if at all, worth working, eſpecially thoſe, that hold under 35 or 40. As for the ſecond ſort, that reaches from 45 to 60 ℔. in the hundred, the moſt uſual proportion I have found in many trials, hath been about half the weight of the ore in clean and malleable lead. Theſe ores are thought indifferently good, and worth working: but other ores compriſed in this ſecond ſort held about 55, and ſome near 60, and theſe were looked upon, not only as good, but pretty rich. And for the third ſort, it conſiſts of thoſe, that yield from 60 to 80 in the hundred, and theſe ores are juſtly reputed very rich, (in lead) eſpecially theſe that come any thing near 80; for I confeſs, I never met with any that reached ſo far, but was aſſured by an ingenious and ſkilful gentleman, maſter of his majeſty's royal mint, that he had found ſome ſuch upon trial. But for me, I think that I have not above twice or thrice met with any that yielded me above 75. Theſe looked exceedingly promiſing, as if they were all metal, and I obſerved, whether the thing were caſual or not, ſome lumps to be compoſed of divers great cubes like dice, ſticking very hard to one another.

THE conſiderations, that moved me to offer the advice given at the beginning of this ſection, invited me to make reſearches of the ſpecifick gravity, not only of divers Engliſh ores, as of lead, tin, *&c.* of which I had carefully made a collection, (that was loſt by a ſudden fire, broke out in the place where I kept them) but of the ores, that were preſented me from ſeveral countries, both in *Europe* and *America*; as Swediſh copper and iron ores, German ſilver and tin glaſs ores; Hungarian antimonial ores; *New England* lead, iron, and copper ores, *&c.* The effects of ſome few of which reſearches, that chanced to come to hand, whilſt I was ſeeking for ſome hydroſtatical trials of drugs, I thought it not amiſs to inſert in a table annexed to the *Medicina Hydroſtatica*; becauſe perhaps they may be of ſome uſe in making a previous conjecture, about a mine's being, or not being likely to be wrought with profit, all other things concurring that ſhould do ſo. Which laſt clauſe I deſire ſhould be taken notice of, becauſe there are divers other circumſtances, beſides the proportion of the metalline part in the foſſil, that are fit to be conſidered, [as the plenty or ſcarcity of the mineral, the eaſineſs or difficulty of coming at it, becauſe of its depth, or its being, or not being troubled with waters, *&c.* its nearneſs to plenty of fuel, and the conveniency of water to drive mills; its nearneſs to, or remotneſs from the ſea, or ſome navigable river, convenient for its tranſportation, to omit other important circumſtances] before one begins to work a mine; which, as they happen to be commodious or inconvenient, may render the attempt adviſable or imprudent.

BUT, Sir, I perceive (though late) that I have forgot I was to write, not a book of the trial of ores and other minerals, but a moderately ſized letter about an hydroſtatical way of exploring their ſpecifick gravity. And therefore, to avoid encreaſing the already too great prolixity of this paper, by making an apology for it, I ſhall lengthen it, only to beg you to pardon it, and to look upon the writer as,

SIR,

Your moſt humble

and obedient ſervant,

R. B.

ADVERTISEMENT.

TO give the curious the ſatisfaction of ſeeing at one view, and of ſo eaſily comparing together the ſpecifick gravities of a good number and variety of bodies, and to ſave them the labour of turning over many leaves of the foregoing tract, to find the particular body, whoſe ponderoſity they deſire to know; I have cauſed to be annexed a table, containing in an alphabetical order (though not a ſcrupulouſly exact one) the names of the drugs, and other bodies, whoſe gravities are delivered in the foregoing papers, without ſcrupling to add ſome others, that I chanced to light on in turning over ſome of my old and forgotten notes.

BUT I muſt to the following table premiſe this advertiſement, (warranted by ſeveral paſſages of the foregoing papers here laid together) that it is not to be expected, every one, that ſhall try the ſpecifick gravities of the bodies here mentioned, ſhall find all of them to be preciſely the ſame, that the table exhibits: ſince (not to mention, that perhaps every experimenter will not employ ſo much care, and be aſſiſted with ſo much uſe in making hydroſtatical trials, as thoſe this table conſiſts of were made with) the difference, that may ſometimes be found between his trials and mine, may very probably be imputed to that variety of texture and compactneſs, that may be found in ſeveral bodies of the ſame kind or denomination, neither nature nor art being wont to give all the productions, that bear the ſame name, a mathematical preciſeneſs, either in gravity or in other qualities.

The TABLE

	Weight In air in gr.	Weight In water in gr.	Proportion.
A			
AMBER — —	306	12	$1\frac{4}{100}$ to 1.
Agat — — —	251	156	$2\frac{64}{100}$ to 1.
A piece of alum-ſtone —	$280\frac{3}{4}$	$152\frac{1}{4}$	$2\frac{18}{100}$ to 1.
Antimony good and ſuppoſed to be Hungarian one —— —— ——	391	295	$4\frac{7}{100}$ to 1.
B			
Bezoar-ſtone — —	187	61	$1\frac{48}{100}$ to 1.
A piece of the ſame —	$56\frac{1}{2}$	22	$1\frac{64}{100}$ to 1.
A fine oriental one —	172	60	$1\frac{53}{100}$ to 1.
Another — — —	237	61	$1\frac{34}{100}$ to 1.
C			
Coral red —— —	$129\frac{1}{4}$	$80\frac{1}{4}$	$2\frac{63}{100}$ to 1.
Cryſtal — — —	256	140	$2\frac{21}{100}$ to 1.
Cornelian — — —	148	103	$3\frac{29}{100}$ to 1.
Calculus humanus — —	2570	1080	$1\frac{72}{100}$ to 1.
Coco-ſhell — — —	331	85	$1\frac{34}{100}$ to 1.
Native crabs eyes — —	$77\frac{1}{2}$	$36\frac{1}{2}$	$1\frac{89}{100}$ to 1.
Crabs eyes artificial —	$90\frac{1}{2}$	54	$2\frac{48}{100}$ to 1.
Calx of lead — — —	$138\frac{1}{2}$	123	$8\frac{94}{100}$ to 1.
Copper-ſtone — —	$65\frac{1}{2}$	$49\frac{1}{2}$	$4\frac{9}{100}$ to 1.
Common cinnabar — —	802	702	$8\frac{1}{10}$ to 1.
Cinnabar of antimony —	197	169	$7\frac{3}{100}$ to 1.
Cinnabar native — —	197	171	$7\frac{57}{100}$ to 1.
Coral white — —	336	204	$2\frac{54}{100}$ to 1.
Another piece fine —	139	85	$2\frac{57}{100}$ to 1.
Calculus humanus — —	302	97	$1\frac{47}{100}$ to 1.
Copper ore — — —	1436	1090	$4\frac{15}{100}$ to 1.
Copper ore rich — —	413	314	$4\frac{17}{100}$ to 1.
Cinnabar native, very ſparkling — — —	226	194	$7\frac{6}{100}$ to 1.
G			
Gold ore not rich, brought from the *Eaſt-Indies* —	1100	682	$2\frac{63}{100}$ to 1.
Another lump of the ſame	1151	717	$2\frac{65}{100}$ to 1.
Granati Minera — —	217	147	$3\frac{1}{10}$ to 1.
Granate Bohemian ——			$4\frac{36}{100}$ to 1.
H			
Hæmatites Engliſh —	1574	1156	$3\frac{76}{100}$ to 1.
I			
Ivory — — — —	$173\frac{1}{2}$	83	$1\frac{91}{100}$ to 1.
L			
Lapis manati — —	450	293	$2\frac{86}{100}$ to 1.
A fragment of the ſame	$218\frac{1}{2}$	123	$2\frac{29}{100}$ to 1.
Another — — —	345	197	$2\frac{33}{100}$ to 1.
Another from *Jamaica*	2011	1127	$2\frac{27}{100}$ to 1.
Lapis lazuli one piece —	385	256	$2\frac{98}{100}$ to 1.
Lead ore — — —	686	590	$7\frac{14}{100}$ to 1.
Another — — —			
Lapis calaminaris — —	477	380	$4\frac{92}{100}$ to 1.
Lapis judaicus — —	$261\frac{1}{2}$	164	$2\frac{69}{100}$ to 1.
M			
Marcaſites — — —	814	631	$4\frac{45}{100}$ to 1.
Another from *Stalbridge*	243	189	$4\frac{1}{2}$ to 1.
Another more ſhining than ordinary — —	287	227	$4\frac{78}{100}$ to 1.
Mercury revived from ore			
Manganeſe a piece — —	321	230	$3\frac{53}{100}$ to 1.
Mineral Corniſh like a ſhining marcaſite —	145	129	$9\frac{6}{100}$ to 1.
O.			
Oſteocolla — — —	195	108	$2\frac{24}{100}$ to 1.
Ore ſilver choice from *Saxony* — — —	458	366	$4\frac{97}{100}$ to 1.
Another piece — —	1120	960	7 to 1.
Ore lead from *Cumberland* rich — — — —	1872	$1586\frac{1}{2}$	$\frac{54}{100}$ to 1.
R			
Rhinoceros horn — —	8563	4260	$1\frac{99}{100}$ to 1.
Rock-cryſtal, another piece —— ——	256	140	$2\frac{20}{100}$ to 1.
S			
Sapphir — — —			
Seed pearl — — —			
Sulphur vive — —	371	185	2 to 1.
Germane very fine ——	306	152	$1\frac{98}{100}$ to 1.
Slate Iriſh — — —	779	467	$2\frac{49}{100}$ to 1.
T			
A piece of talc like lapis amianthus — —	596	334	$2\frac{28}{100}$ to 1.
Talc { Venetian — —	802	508	$2\frac{73}{100}$ to 1.
Talc { Jamaican — —	1857	1238	3 to 1.
New Engliſh tin ore, Mr. *Hubert's* — —	812	613	$4\frac{8}{100}$ to 1.
Tin ore black rich —	1293	984	$4\frac{13}{100}$ to 1.
Another piece choice —	2893	2314	5 to 1.
Tutty a piece — —	104	83	5 to 1.
Tin-glaſs — — —	468	419	$9\frac{55}{100}$ to 1.
V			
Vitrum Antimonii per ſe	$357\frac{1}{2}$	$282\frac{1}{2}$	$4\frac{76}{100}$ to 1.
Vitriol Engliſh, a very fine piece — — —	1093	512	$1\frac{88}{100}$ to 1.
Unicorns horn a piece	407	195	$1\frac{91}{100}$ to 1.

POSTSCRIPT.

WHEN I began to ſend the eſſay, called, *Medicina Hydroſtatica*, to the preſs, and drew up the foregoing preface to it, I intended it ſhould, in the ſame book or volume, be accompanied by another help or two, to explore and improve the *Materia Medica*. But when the eſſay itſelf, and the annexed epiſtle about a previous exploration of ores had been printed off, I could not but perceive, that the bulk of thoſe two tracts ſo far exceeded what I expected, that if I ſubjoined what I at firſt deſigned to add to it, it would prove a miſ-ſhapen book, and inconvenient to be opened. Wherefore it ſeemed expedient to divide the whole intended work into two volumes or tomes, whereof what had already paſt the preſs ſhould make the firſt, which, that it might be the ſooner ſerviceable, ſhould forthwith come abroad by it ſelf; and the ſecond ſhould conſiſt partly of the other papers abovementioned, as relating to the *Materia Medica*, and partly of a ſupplement to the firſt tome, containing divers hiſtorical paralipomena, that by miſtake were omitted, and are fit to be there ſupplied out of a fuller copy, than that, which by an overſight was made uſe of at the preſs.

THE

THE

CHRISTIAN VIRTUOSO:

SHEWING,

That by being addicted to experimental philoſophy, a man is rather aſſiſted than indiſpoſed to be a good Chriſtian.

The FIRST PART.

To which are ſubjoined,

I. A diſcourſe about the diſtinction, that repreſents ſome things as above reaſon, but but not contrary to reaſon.

II. The firſt chapters of a diſcourſe, entitled, Greatneſs of mind promoted by Chriſtianity.

The PREFACE.

WHEN many years ago I was induced to write ſomething about the ſubject of the following treatiſe, I did it partly to give ſome ſatisfaction to a friend, and partly to impoſe upon myſelf an obligation, to conſider the more attentively, upon what grounds it may be aſſerted, that there is no inconſiſtence between a man's being an induſtrious virtuoſo, and a good Chriſtian. How little fond I was of troubling the publick with a diſcourſe of this nature, may be gueſſed by my having thrown it aſide, among other neglected papers, for ſeveral years. And it had ſtill continued in that obſcurity, if the formerly unprevalent deſires of thoſe, that would have it appear in publick, had not been enforced by an obſervation or two, that I could not but make. For I could ſcarce avoid taking notice of the great and deplorable growth of irreligion, eſpecially among thoſe, that aſpired to paſs for wits, and ſeveral of them too for philoſophers. And on the other ſide it was obvious, that divers learned men, as well as others, partly upon the ſcore of their abhorrence of theſe infidels and libertines, and partly upon that of a well-meaning but ill-formed zeal, had brought many good men to think, that religion and philoſophy were incompatible; both parties contributing to the vulgar error, but with this difference, that the libertines thought a virtuoſo ought not to be a Chriſtian, and the others, that he could not be a true one.

IT is like it may ſeem to ſome readers, that I have too much enlarged the notion of experience, and too much inſiſted on the proofs deducible from that topick: but it is not improbable, that others may approve the reaſons, with which that ample notion of experience is, where it is propoſed, accompanied. And the ingenious perſon, I was chiefly to pleaſe, being a lover and valuer of experience, and of arguments grounded on it, the deſire of gratifying him enticed me to ſay ſo much, that when I took up the thoughts of making this treatiſe publick, I found the effects of my complaiſance ſo interwoven with the other parts of the diſcourſe, that I could not make any great alteration, (for ſome I did make) without almoſt ſpoiling the contexture of it.

I HOPE the equitable reader will not expect to find every ſubject, of which I have occaſion to diſcourſe, fully treated of: for I neither deſigned nor pretended to write a body of natural theology, nor a demonſtration of the Chriſtian religion, but thought it ſufficient for me to conſider the points I wrote of, as far forth as was neceſſary or very conducive to my purpoſe. And therefore I thought myſelf not only warranted, but obliged (in point of diſcretion) to decline the mention of ſeveral arguments and reflections, that would indeed have been very proper, if my deſign had been to ſhew, why one ſhould be a Chriſtian; but impertinent to ſhew, that a virtuoſo, while ſuch, may be a true Chriſtian. But as for this reaſon, I omitted many things, that would have enriched or adorned my diſcourſe; ſo I have endeavoured to make ſome amends, both by ſuggeſting ſome new ſubjects, and

by adding, on thoſe that have been already treated of by others, divers thoughts, into which I was led by the attentive conſideration of the ſubject itſelf; on which ſcore, they may probably not have yet occurred to the reader, and may appear to him, either to be new as to the ſubſtance, or if any of them be coincident with the more known ones, to have ſomething peculiar as to the way of propounding or of applying them. And, I confeſs, I was ſomewhat encouraged to communicate my thoughts on theſe ſubjects, by conſidering, that (though it ought not to be ſo, yet) it is notorious, that in the age we live in, there are too many perſons, that are like to be found more indiſpoſed to be impreſſed on by arguments, in favour of religion, from profeſſed divines, how worthy ſoever, than from ſuch as I, who am a layman, and have been looked upon as no undiligent cultivator of experimental philoſophy. And that the ſtile might not be unſuitable to the writer, and the deſign, I thought fit, in my arguments and illuſtrations, both to employ compariſons drawn from teleſcopes, microſcopes, *&c.* and to make frequent uſe of notions, hypotheſes, and obſervations, in requeſt among thoſe, that are called the new philoſophers. Which I the rather did, becauſe ſome experience has taught me, that ſuch a way of propoſing and elucidating things, is either as moſt clear, or, upon account of its novelty, wont to be more acceptable than any other to our modern virtuoſi; whom thus to gratify is a good ſtep towards the perſuading of them. For it is eaſy to obſerve, that ſome men are more acceſſible to truth, and will be more prevailed upon by it, when it is preſented to them in one dreſs, than when it appears in another; as we daily ſee, that ſome perſons will be more eaſily prevailed with to take a medicine, and that it will have a more kindly operation upon them, if it be exhibited in that form and conſiſtence, that is beſt liked by the patients; whereof ſome love to have the ingredients the medicine is to conſiſt of, offered them in a liquid, others in a ſoft, and others in a dry form.

THOUGH I am wont, as well as inclinable, to ſpare the preſent age; and though my cenſures of ſome reputed virtuoſi, that live in it, are written with as harmleſs and friendly deſigns, as was the ſeeming rudeneſs of the angel to St. *Peter*, when he ſtruck him on the ſide, and haſtily rouzed him, but to awake him, to take off his chains, and to free him from the danger that threatned him; yet I ſhall be more troubled and ſurpriſed, if I ſhall find the following treatiſe diſliked by divers perſons, that would paſs for virtuoſi, and by ſome that are really ſo. For ſome men, that have but ſuperficial, though conſpicuous wits, are not fitted to penetrate ſuch truths as require a laſting and attentive ſpeculation; and divers, that want not abilities, are ſo taken up by their ſecular affairs, and their ſenſual pleaſures, that they neither have diſpoſition, nor will have leiſure to diſcover thoſe truths, that require both an attentive and penetrating mind. And more than either of theſe ſorts of men there are, whom their prejudices do ſo foreſtal, or their intereſt biaſs, or their appetites blind, or their paſſions diſcompoſe, too much to allow them a clear diſcernment and right judgment of divine things. Upon which, and other accounts, I ſhall not think it ſtrange, if what I write ſhall make no great impreſſion on readers thus qualified, whom to convert, it is not enough to convince them: nor ſhall I be greatly diſcouraged, or think much the worſe of my arguments, if they do not make proſelytes of thoſe, whom ſiniſter conſiderations make ſuch reſolved adverſaries to the truth, that he alone, that can preach from heaven, is able to prevail upon them; and they muſt be converted almoſt as *Saul* the perſecutor was, by an extraordinary light from heaven, and a power able to ſtrike them to the ground. But though I am not ſo little acquainted with the preſent age, as to expect to plead for religion with the approbation of atheiſts, or of libertines; yet I ſhall not think my pains altogether miſpent, if what I have written, either ſtartle any irreligious reader ſo far, as to engage him to conſult abler aſſertors of Chriſtianity and virtue, than I pretend to be; or elſe prove ſo happy, as to confirm and ſtrengthen, by new arguments and motives, thoſe, that have heartily embraced the Chriſtian faith and morals, though perhaps not upon the firmeſt grounds. For it will be no ſmall ſatisfaction to me, if though I cannot convert the reſolvedly irreligious, I ſhall at leaſt furniſh thoſe, that are not ſo, with preſervatives againſt them, and hinder their impiety from being contagious.

BUT I fear, that thoſe, that are enemies, both to the doctrines I propoſe, and to the aims I purſue, will not be the only perſons, that will find fault with the following tract; ſince perhaps, there will not be wanting ſome ingenious men, that expected, as well as deſired, that I ſhould never write but as a naturaliſt, becauſe they themſelves eſteem nothing, ſave the laws and phœnomena of nature, to be ſubjects worthy of a philoſophical pen: as if, becauſe rational ſpirits are inviſible and immaterial beings, all diſquiſitions about them muſt be airy and uncertain ſpeculations, and, like their objects, devoid of ſolidity and uſefulneſs. But though among theſe ingenious men there are ſeveral, whoſe expectations from me I am much more diſpoſed to gratify, than appoint; yet, on ſuch an occaſion as this, I muſt take the liberty to own, that I do not think the corporeal world, nor the preſent ſtate of things, the only or the principal ſubjects, that an inquiſitive man's pen may be worthily employed about; and that there are ſome things, that are grounded neither upon mechanical nor upon chemical notices or experiments, that are yet far from deſerving to be neglected, and much leſs to be deſpiſed, or ſo much as to be left uncultivated, eſpecially by ſuch writers, as being more concerned to act as Chriſtians, than as virtuoſi, muſt alſo think, that ſometimes they may uſefully buſy themſelves about the

ſtudy

ſtudy of divine things, as well as at other times employ their thoughts about the inſpection of natural ones. There are ſome objects, whoſe nobleneſs is ſuch, that though we derive no advantage from them, but the contentment of knowing them, and that but very imperfectly too; yet our virtuoſi themſelves juſtly think much pains and time, and perhaps coſt too, well ſpent in indeavouring to acquire ſome conjectural knowledge of them: as may be inſtanced in the aſſiduous and induſtrious reſearches they have made about the remote cœleſtial part of the world, eſpecially the ſtars and comets, that our age has expoſed to their curioſity. For moſt of theſe, though they require chargeable teleſcopes, and tedious, as well as unhealthy nocturnal obſervations, are objects, of which we can know very little with any certainty; and which, for ought appears, we can make no uſeful experiments with. Since therefore we ſo much prize a little knowledge of things, that are not only corporeal, but inanimate; methinks we ſhould not undervalue the ſtudies of thoſe men, that aſpire to the knowledge of incorporeal and rational beings, which are incomparably more noble than all the ſtars in the world, which are, as far as we know, but maſſes of ſenſeleſs and ſtupid matter. Since alſo the virtuoſi deſervedly applaud and cheriſh the laborious induſtry of anatomiſts, in their enquiries into the ſtructure of dead, ghaſtly, and oftentimes unhealthfully as well as offenſively fœtid bodies; can it be an employment improper for a Chriſtian virtuoſo, or unworthy of him, to endeavour the diſcovery of the nature and faculties of the rational mind, which is that, that ennobles its manſion, and gives man the advantage he has of the beaſts that periſh?

I AM content, that merely natural philoſophy ſhould often employ my thoughts and my pen; but I cannot conſent it ſhould engroſs them, and hinder me from being converſant with theological ſubjects. And ſince, among my friends, I have ſome (and thoſe not inconſiderable for their number, and much leſs for their merit) that preſs me to treat of religious matters, as well as others, that would have me addict myſelf to cultivate phyſical ones; I, who think myſelf a debtor to both theſe ſorts, am willing to endeavour to gratify both; and having already, on many occaſions, preſented the latter ſort with large, as well as publick, effects of my complaiſance for them, I hope, they will not think it ſtrange, that I ſhould now and then have regard to the former ſort, too; eſpecially ſince I had higher motives than complaiſance ought to be, to induce me to treat ſometimes of things, that might be grateful to thoſe friends, that are much ſo to religious compoſures.

I PRESUME it will be taken notice of, that, in the following treatiſe, as well as in divers of my other writings, eſpecially about ſubjects that are purely, or partly, philoſophical, I make frequent uſe of ſimilitudes, or compariſons: and therefore I think my ſelf here obliged to acknowledge once for all, that I did it purpoſely. And my reaſons for this practice were, not only becauſe fit compariſons are wont to delight moſt readers, and to make the notions they convey better kept in memory; whence the beſt orators and preachers have made great and ſucceſsful uſe of metaphors, allegories, and other reſemblances; but I was induced to employ them chiefly for two other reaſons: 1. That though I freely confeſs, that arbitrary ſimilitudes, and likewiſe thoſe that are foreign to the ſubject treated of, ſuch as are moſt of the vulgar ones, that are uſually borrowed from the fictions of the poets, and from the uncertain and often ill-applied relations of *Pliny*, *Ælian*, and other too frequently fabulous writers, are ſcarce fit to be made uſe of but to vulgar readers, or popular auditories; yet compariſons fitly choſen, and well applied, may, on many occaſions, uſefully ſerve to illuſtrate the notions, for whoſe ſake they are brought, and, by placing them in a true light, help men to conceive them far better than otherwiſe they would do. And, 2. appoſite compariſons do not only give light, but ſtrength, to the paſſages they belong to, ſince they are not always bare pictures and reſemblances, but a kind of arguments; being oftentimes, if I may ſo call them, analogous inſtances, which do declare the nature, or way of operating, of the thing they relate to, and by that means do in a ſort prove, that, as 'tis poſſible, ſo it is not improbable, that the thing may be ſuch as it is repreſented: and therefore not only the illuſtrious *Verulam*, though not more a florid, than a judicious writer, has, much to the ſatisfaction of his readers, frequently made uſe of compariſons, in whoſe choice and application he was very happy; but that ſevere philoſopher, monſieur *Des Cartes* himſelf, ſomewhere ſays, that he ſcarce thought, that he underſtood any thing in phyſicks, but what he could declare by ſome apt ſimilitude; of which, in effect, he has many in his writings; [as where he compares the particles of freſh water to little eels; and the corpuſcles of ſalt in the ſea-water to little rigid ſtaves; and where, after the Stoicks, he compares the ſenſe of objects by the intervention of light to the ſenſe, that a blind man hath of ſtones, mud, *&c.* by the intervention of his ſtaff.] To which I ſhall add, that proper compariſons do the imagination almoſt as much ſervice, as microſcopes do the eye; for, as this inſtrument gives us a diſtinct view of divers minute things, which our naked eyes cannot well diſcern, becauſe theſe glaſſes repreſent them far more large, than by the bare eye we judge them; ſo a ſkilfully choſen and well applied compariſon much helps the imagination, by illuſtrating things ſcarce diſcernible, ſo as to repreſent them by things much more familiar and eaſy to be apprehended.

I CONFESS I might, on ſome occaſions, have ſpoken, not only more poſitively and boldly, but, as to many learned readers, more acceptably, if I would have diſcourſed altogether like a Carteſian, or as a partizan of ſome other modern ſect of philoſophizers. But,

beſides

beſides that I am not minded to give myſelf up to any ſect, I thought it convenient, that a diſcourſe, deſigned to work on perſons of differing perſuaſions about philoſophical matters, ſhould not declare itſelf dogmatically, or unreſervedly, of a party; but employ rather the dictates of reaſon, or principles either granted or little conteſted, than proceed upon the peculiar principles of a diſtinct party of philoſophizers.

If now and then I have inſiſted upon ſome particular ſubjects, more than appears abſolutely neceſſary, I did it, becauſe that, though I wrote this treatiſe chiefly for my friends, yet I did not write it for them only, but was willing to lay hold on ſome of the occaſions, that the ſeries of my diſcourſe offered me, to excite in my ſelf thoſe diſpoſitions, that I endeavoured to produce in others, and, by inſiſting upon ſome reflections, impreſs them more deeply upon my own mind; eſpecially when I was treating of ſome points, either ſo important, or ſo oppoſed, or both, that they can ſcarce be too much inculcated.

The name of the perſon, to whom the following papers were addreſſed, not being neceſſary to be made publick, ſome reaſons made it thought convenient, that it ſhould remain unmentioned.

POSTSCRIPT.

To give an account of the prolixity, that ſome might otherwiſe cenſure, of the foregoing preface, I muſt advertiſe the reader, that it is of an ancient date; and that the firſt part of the treatiſe, that it belongs to, was already written, and it was then deſigned, that the ſecond part ſhould accompany it to the preſs: on which ſcore it was preſumed, that, as the particulars, that make up the preamble, would not appear ſuperfluous, in regard of the variety of ſubjects to be treated of; ſo its length would ſcarce be found diſproportionate to the bulk of the whole deſigned book.

THE

CHRISTIAN VIRTUOSO:

SHEWING,

That by being addicted to experimental philoſophy, a man is rather aſſiſted than indiſpoſed to be a good Chriſtian.

The FIRST PART.

SIR,

I PERCEIVE by what you intimate, that your friends Dr. *W.* and Mr. *N.* think it very ſtrange, that I, whom they are pleaſed to look upon as a diligent cultivater of experimental philoſophy, ſhould be a concerned embracer of the Chriſtian religion; though divers of its articles are ſo far from being objects of ſenſe, that they are thought to be above the ſphere of reaſon. But though I preſume they may find many objects of the like wonder, among thoſe with whom I am compriſed by them, under the name of the new virtuoſi; and among theſe, they may meet with divers perſons more able than I, to eaſe them of their wonder; yet ſince they are pleaſed by ſingling me out, as it were to challenge me to do it, I ſhall endeavour to make them think it at leaſt leſs ſtrange, that a great eſteem of experience, and a high veneration for religion, ſhould be compatible in the ſame perſon. Wherefore I ſhall not deny, that I am now and then buſied in deviſing, and putting in practice, trials of ſeveral ſorts, and making reflections upon them: and I own too, that (about natural things) I have a great reverence for experience, in compariſon of authority. But withal, I declare, that to embrace Chriſtianity, I do not think I need to recede from the value and kindneſs I have for experimental philoſophy, any thing near ſo far as your friends ſeem to imagine. And I hope it will appear, that if the experimental way of philoſophiſing I am addicted to have any things in it, that indiſpoſe a man to aſſent to the truth, and live according to the laws of the Chriſtian religion; thoſe few things are more than countervailed by the peculiar advantages, that it affords a man of a well-diſpoſed mind, towards the being a good Chriſtian.

I said, a man of a well-diſpoſed mind, that is, one, that is both docile, and inclined to make pious applications of the truths he diſcovers; becauſe ſuch a qualification of mind, I hope, God, through his goodneſs, has vouchſafed me; and the occaſion given by your friends to the following diſcourſe relating peculiarly to me, a perſonal account of my opinions, and reaſons of them, ought to ſuffice. And it will be *ex abundanti*, (as they ſpeak) if my diſcourſe be found, as it often will be, to extend much further. Which reflection,

fiection I desire you would frequently have in your thoughts, to prevent mistaking the design of the following epistle.

I DOUBT not, but the popular prejudices, that I perceive your two friends, among many other more devout than well-informed persons, have entertained, will make them think, that what I have now delivered needs good proof, and perhaps better than it is capable of. And therefore I hope you will easily allow me the liberty, I am going to take, of briefly premising some things, to clear the way for the principal points designed to be discoursed of in this letter.

I KNOW you need not be told, that the philosophy, which is most in request among the modern virtuosi, and which by some is called the new, by others the corpuscularian, by others the real, by others (though not so properly) the atomical, and by others again the Cartesian, or the mechanical philosophy, is built upon two foundations, reason and experience. But it may not be impertinent to observe to you, that although the peripatetick, and some other philosophies, do also pretend to be grounded upon reason and experience; yet there is a great difference betwixt the use, that is made of these two principles, by the school-philosophers, and by the virtuosi. For those, in the framing of their system, make but little use of experience; contenting themselves for the most part to employ but few and obvious experiments, and vulgar traditions, usually uncertain, and oftentimes false; and superstructing almost their whole physicks upon abstracted reason; by which I mean the rational faculty, endowed but with its own congenit or common notions and ideas, and with popular notices; that is, such as are common among men, especially those that are any thing learned. But now, the virtuosi I speak of, and by whom, in this whole discourse, I mean those, that understand and cultivate experimental philosophy, make a much greater and better use of experience in their philosophical researches. For they consult experience both frequently and heedfully; and, not content with the phænomena, that nature spontaneously affords them, they are solicitous, when they find it needful, to enlarge their experience by trials purposely devised; and ever and anon reflecting upon it, they are careful to conform their opinions to it; or, if there be just cause, reform their opinions by it. So that our virtuosi have a peculiar right to the distinguishing title, that is often given them, of experimental philosophers.

I CAN scarce doubt, but your friends have more than once obliged you to take notice of the profane discourses and licentious lives of some virtuosi, that boast much of the principles of the new philosophy. And I deny not, but that, if the knowledge of nature falls into the hands of a resolved atheist, or a sensual libertine, he may misemploy it to oppugn the grounds, or discredit the practice of religion. But it will fare much otherwise, if a deep insight into nature be acquired by a man of probity and ingenuity, or at least free from prejudices and vices, that may indispose him to entertain and improve those truths of philosophy, that would naturally lead him to sentiments of religion. For, if a person thus qualified in his morals, and thereby disposed to make use of the knowledge of the creatures to confirm his belief, and encrease his veneration of the Creator (and such a person I here again advertise you, and desire you would not forget it, I suppose the virtuoso, this paper is concerned in, to be) shall make a great progress in real philosophy; I am persuaded, that nature will be found very loyal to her author; and instead of alienating his mind from making religious acknowledgments, will furnish him with weighty and uncommon motives, to conclude such sentiments to be highly rational and just. On which occasion I must not pretermit that judicious observation of one of the first and greatest experimental philosophers of our age, Sir *Francis Bacon*, that God never wrought a miracle to convince atheists; because in his visible works he had placed enough to do it, if they were not wanting to themselves. The reason he gives for which remark, I shall confirm, by observing, that it is intimated in a passage of St. *Paul*, asserting both "that the invisi- Rom. i. 20.
"ble things of God are clearly seen from the "creation of the world," as tokens and effects (as I remember the particle ἀπὸ in the Greek doth elsewhere signify) and that his divinity and eternal power may be so well understood by the things that are made, that the Gentiles, who had but the light of nature to lead them to the acknowledgment of the true God, were excuseless, for not being brought by that guide to that acknowledgment.

AND indeed, the experimental philosophy giving us a more clear discovery, than strangers to it have, of the divine excellencies displayed in the fabrick and conduct of the universe, and of the creatures it consists of, very much indispoſeth the mind, to ascribe such admirable effects to so incompetent and pitiful a cause as blind chance, or the tumultuous justlings of atomical portions of senseless matter; and leads it directly to the acknowledgment and adoration of a most intelligent, powerful, and benign author of things, to whom alone such excellent productions may, with the greatest congruity, be ascribed. And therefore, if any of the cultivators of real philosophy pervert it to countenance atheism, it is certainly the fault of the persons, not the doctrine; which is to be judged of by its own natural tendency, not by the ill use, that some bad men may make of it; especially if the prevaricating persons are but pretenders to the philosophy they misemploy; which character will perhaps be found to belong to most, if not all, the atheistical and profane men, the objection means. For most of these do as little understand the mysteries of nature, as believe those of Christianity; and of divers of them it may be truly said, that their sensuality, and lusts, and passions, darkened and se-

duced their intellects: their immorality was the original cause of their infidelity; nor were they led by philosophy to irreligion, but got and perverted some smattering of philosophy, to countenance the irreligious principles, they brought with them to the study of it.

BUT all this notwithstanding, I fear, if not foresee, that you will surmise, that the study of natural philosophy, how innocent soever it may be in it self, will, in this libertine city, engage me to converse with many, who, though they pass for virtuosi, are indeed atheists; whose contagious company must endanger, if not infect me.

THIS obliges me to tell you, that though I have no reason to take it at all unkindly, that you are jealous of me on the score of being solicitous for my safety; yet I hope my danger is not so great as you may apprehend it. For first, I must own to you, that I do not think there are so many speculative atheists, as men are wont to imagine. And though my conversation has been pretty free and general among naturalists, yet I have met with so few true atheists, that I am very apt to think, that mens want of due information, or their uncharitable zeal, has made them mistake or misrepresent many for deniers of God, that are thought such, chiefly because they take uncommon methods in studying his works, and have other sentiments of them, than those of vulgar philosophers. And in the next place I must tell you, that having, through the goodness of God, chosen my religion, not inconsiderately, but upon mature deliberation, I do not find those virtuosi, you call atheists, such formidable adversaries, as those that are afraid to hear them, do, by that apprehension, appear to think them. And indeed, I have observed the physical arguments of the atheists to be but very few, and those far enough from being unanswerable. And as for the very chief of them, though they are wont to puzzle such as are not versed in nice speculations, because they represent the assertion of a deity as a doctrine encumbered with inextricable difficulties; yet I do not think the objections solidly grounded, since the same difficulties, or others not inferior, may be urged against those hypotheses and principles, that the deniers of God do or must admit. And indeed, most of the perplexing difficulties the atheists lay so much stress on, do not proceed from any absurdity contained in the tenent of the theists, but from the nature of things; that is, partly from the dimness and other imperfections of our human understandings, and partly from the abstruse nature, that, to such bounded intellects, all objects must appear to have, in whose conception infinity is involved; whether that object be God, or atoms, or duration, or some other thing, that is uncausable. For, however we may flatter our selves, I fear we shall find, upon strict and impartial trial, that finite understandings are not able clearly to resolve such difficulties, as exact a clear comprehension of what is really infinite.

BUT to pursue this discourse would lead us too far. And it is more fit, after so much has been said concerning not only the design of this tract, but the new philosophy, the virtuosi, and my self, to proceed to those more particular things, that directly tend to the main scope of our epistle.

THE first advantage, that our experimental philosopher, as such, hath towards being a Christian, is, that his course of studies conduceth much to settle in his mind a firm belief of the existence, and divers of the chief attributes, of God: which belief is, in the order of things, the first principle of that natural religion, which it self is pre-required to revealed religion in general, and consequently to that in particular, which is embraced by Christians.

THAT the consideration of the vastness, beauty, and regular motions, of the heavenly bodies; the excellent structure of animals and plants; besides a multitude of other phænomena of nature, and the subserviency of most of these to man; may justly induce him, as a rational creature, to conclude, that this vast, beautiful, orderly, and (in a word) many ways admirable system of things, that we call the world, was framed by an author supremely powerful, wise, and good, can scarce be denied by an intelligent and unprejudiced considerer. And this is strongly confirmed by experience, which witnesseth, that in almost all ages and countries, the generality of philosophers, and contemplative men, were persuaded of the existence of a deity, by the consideration of the phænomena of the universe; whose fabrick and conduct they rationally concluded could not be deservedly ascribed, either to blind chance, or to any other cause than a divine being.

BUT though it be true, that "God hath "not left himself without witness," even to perfunctory considerers, by stamping upon divers of the more obvious parts of his workmanship such conspicuous impressions of his attributes, that a moderate degree of understanding, and attention, may suffice to make men acknowledge his being: yet I scruple not to think that assent very much inferior to the belief, that the same objects are fitted to produce in an heedful and intelligent contemplator of them. For the works of God are so worthy of their author, that besides the impresses of his wisdom and goodness, that are left as it were upon their surfaces, there are a great many more curious and excellent tokens and effects of divine artifice, in the hidden and innermost recesses of them; and these are not to be discovered by the perfunctory looks of oscitant or unskilful beholders; but require, as well as deserve, the most attentive and prying inspection of inquisitive and well-instructed considerers. And sometimes in one creature there may be I know not how many admirable things, that escape a vulgar eye, and yet may be clearly discerned by that of a true naturalist; who brings with him, besides a more than common curiosity and attention, a competent knowledge of anatomy, opticks, cosmography, mechanicks, and chemistry. But treating elsewhere purposely of this

this ſubject, it may here ſuffice to ſay, that God has couched ſo many things in his viſible works, that the clearer light a man has, the more he may diſcover of their unobvious exquiſiteneſs, and the more clearly and diſtinctly he may diſcern thoſe qualities, that lie more obvious. And the more wonderful things he diſcovers in the works of nature, the more auxiliary proofs he meets with to eſtabliſh and enforce the argument, drawn from the univerſe and its parts, to evince that there is a God: which is a propoſition of that vaſt weight and importance, that it ought to endear every thing to us, that is able to confirm it, and afford us new motives to acknowledge and adore the divine author of things.

IN reference to this matter, we may confidently ſay, that the experimental philoſophy has a great advantage of the ſcholaſtick. For in the peripatetick ſchools, where things are wont to be aſcribed to certain ſubſtantial forms and real qualities; (the former of which are acknowledged to be very abſtruſe and myſterious things, and the latter are many of them confeſſedly occult;) the accounts of nature's works may be eaſily given in a few words, that are general enough to be applicable to almoſt all occaſions. But theſe uninſtructive terms do neither oblige nor conduct a man to deeper ſearches into the ſtructure of things, nor the manner of being produced, and of operating upon one another. And conſequently are very inſufficient to diſcloſe the exquiſite wiſdom, which the omniſcient maker has expreſſed in the peculiar fabricks of bodies, and the ſkilfully regulated motions of them, or of their conſtituent parts: from the diſcernment of which things nevertheleſs it is, that there is, by way of reſult, produced in the mind of an intelligent contemplator a ſtrong conviction of the being of a divine opificer, and a juſt acknowledgment of his admirable wiſdom. To be told, that an eye is the organ of ſight, and that this is performed by that faculty of the mind, which from its function is called viſive, will give a man but a ſorry account of the inſtruments and manner of viſion itſelf, or of the knowledge of that opificer, who, as the Scripture ſpeaks, "formed the eye." And he that can take up with this eaſy theory of viſion, will not think it neceſſary to take the pains to diſſect the eyes of animals, nor ſtudy the books of mathematicians, to underſtand viſion; and accordingly will have but mean thoughts of the contrivance of the organ, and the ſkill of the artificer, in compariſon of the ideas, that will be ſuggeſted of both of them to him, that being profoundly ſkilled in anatomy and opticks, by their help takes aſunder the ſeveral coats, humours, and muſcles, of which that exquiſite dioptrical inſtrument conſiſts: and having ſeparately conſidered the figure, ſize, conſiſtence, texture, diaphaneity, or opacity, ſituation, and connexions of each of them, and their coaptation in the whole eye, ſhall diſcover, by the help of the laws of opticks, how admirably this little organ is fitted to receive the incident beams of light, and diſpoſe them in the beſt manner poſſible for completing the lively repreſentation of the almoſt infinitely various objects of ſight.

Pſal. xciv. 9.

IT is eaſy for men to ſay in general terms, that the word is wiſely framed; but I doubt it often happens, that men confeſs, that the creatures are wiſely made, rather becauſe upon other grounds they believe God to be a wiſe agent, than becauſe ſo ſlight an account, as the ſchool philoſophy gives of particular creatures, convinces them of any divine wiſdom in the Creator. And though I am willing to grant, that ſome impreſſions of God's wiſdom are ſo conſpicuous, that (as I lately intimated) even a ſuperficial philoſopher may thence infer, that the author of ſuch works muſt be a wiſe agent; yet how wiſe an agent he has in thoſe works expreſſed himſelf to be, none but an experimental philoſopher can well diſcern. And it is not by a ſlight ſurvey, but by a diligent and ſkilful ſcrutiny of the works of God, that a man muſt be, by a rational and affective conviction, engaged to acknowledge with the prophet, that the author of nature is "wonderful in counſel, and excellent in working," Iſa. xxviii. 29.

II. AFTER the exiſtence of the deity, the next grand principle of natural religion, is the immortality of the rational ſoul; whoſe genuine conſequence is, the belief and expectation of a future and everlaſting ſtate. For this important truth, divers arguments may be alledged, that may perſuade a ſober and well-diſpoſed man to embrace it: but to convince a learned adverſary, the ſtrongeſt argument, that the light of nature ſupplies us with, ſeems to be that, which is afforded by the real philoſophy. For this teacheth us to form true and diſtinct notions of the body, and the mind; and thereby manifeſts ſo great a difference in their eſſential attributes, that the ſame thing cannot be both. This it makes out more diſtinctly, by enumerating ſeveral faculties and functions of the rational ſoul; ſuch as to underſtand, and that ſo, as to form conceptions of abſtracted things, of univerſals, of immaterial ſpirits, and even of that infinitely perfect one, God himſelf: and alſo to conceive, and demonſtrate, that there are incommenſurable lines, and ſurd numbers; to make ratiocinations, and both cogent and concatenated inferences, about theſe things; to expreſs their intellectual notions, *pro re natâ*, by words or inſtituted ſigns to other men; to exerciſe free-will about many things; and to make reflections on its own acts, both of intellect and will. For theſe and the like prerogatives, that are peculiar to the human mind, and ſuperior to any thing, that belongs to the outward ſenſes, or to the imagination itſelf, manifeſt, that the rational ſoul is a being of an higher order than corporeal; and conſequently, that the ſeat of theſe ſpiritual faculties, and the ſource of theſe operations, is a ſubſtance, that being in its own nature diſtinct from the body, is not naturally ſubject to die or periſh with it.

AND in reference to this truth, our virtuoſo hath an advantage of a mere ſchool-philoſopher. For being acquainted with the true and real cauſes of putrefaction, and other phyſical kinds of corruption; and thereby diſcerning, that the things, that deſtroy bodies, are the avolation, or other receſs of ſome neceſſary parts, and ſuch a depraving tranſpoſition of the component portions of matter, as is altogether incongruous to the ſtructure and mechanical modification, that is eſſential to a body of that ſpecies or kind it belongs to: our naturaliſt, I ſay, knowing this, plainly perceives, that theſe cauſes of deſtruction can have no place in the rational ſoul; which being an immaterial ſpirit, and conſequently a ſubſtance not really diviſible, can have no parts expelled or tranſpoſed, and ſo being exempted from the phyſical cauſes of corruption that deſtroys bodies, ſhe ought to laſt always. And being a rational creature, endowed with internal principles of acting, as appears in free-will, ſhe ought to live for ever, unleſs it pleaſe God to annihilate her; which we have no reaſon to ſuppoſe he will do. But on the other ſide, the modern peripateticks (for I queſtion, whether *Ariſtotle* himſelf were of the ſame opinion) maintain ſubſtantial forms, by ſome of them ſtiled *ſemi ſubſtantiæ*, to which in apes, elephants, and others, that paſs for ingenious animals, they aſcribe ſome ſuch faculties and functions, as ſeem to differ but gradually from thoſe of the rational ſoul; and (how innocent ſoever I grant their intentions to be) their doctrine tends much to enervate, if not quite to diſable the chief phyſical way of probation, whence the immortality of man's mind is juſtly inferred. For ſince according to the peripateticks, ſubſtantial forms are, as they ſpeak, enduced out of the power or potentiality of the matter; and do ſo depend upon it, not only as to action, but as to being, that they cannot at all ſubſiſt without it; but when the particular body (as an herb, a ſtone, or a bird) is deſtroyed, they periſh with it, or (as ſome of them ſcarce intelligibly expreſs the ſame thing) fall back into the boſom of the matter: I think they give great advantage to atheiſts and cavillers, to impugn the mind's immortality.

FOR if to an ape, or other brute animal, there belongs a being more noble than matter, that can actuate and inform it, and make itſelf the architect of its own manſion, though ſo admirable as that of an ape, or an elephant; if this being can in the body it hath framed, perform all the functions of a vegetable ſoul; and beſides thoſe, ſee, hear, taſte, ſmell, imagine, infer, remember, love, hate, fear, hope, expect, *&c.* and yet be a mortal thing, and periſh with the body; it will not be difficult for thoſe enemies of religion, who are willing to think the ſoul mortal, becauſe their brutiſh lives make them wiſh ſhe were, to fancy, that human minds are but a ſomewhat more noble, but not for that leſs mortal kind of ſubſtantial forms, as amongſt ſenſitive ſouls themſelves, which they acknowledge to be equally mortal, there is a great diſparity in degrees, that of a monkey, for inſtance, being very far ſuperior to that of an oiſter.

III. THE third main principle of unrevealed religion, and conſequently of revealed, (which preſuppoſes natural religion, as its foundation) is a belief of the divine providence. And in this grand article, as well as in the two foregoing, a man may be much confirmed by experimental philoſophy, both as it affords him poſitive inducements to acknowledge the article, and as it ſhews the great improbability of the two main grounds, on one or other of which (for they are not well conſiſtent) is founded the denial of God's providence.

A VIRTUOSO, that by manifold and curious experiments ſearches deep into the nature of things, has great and peculiar advantages to diſcover and obſerve the excellent fabrick of the world, as it is an immenſe aggregate of the ſeveral creatures that compoſe it; and to take notice in its particular parts, eſpecially thoſe that are animated, of ſuch exquiſite contrivances, and ſuch admirable co-ordinations, and ſubordinations, in reference to each other, as lye hid from thoſe beholders, that are not both attentive and ſkilful. When our virtuoſo contemplates the vaſtneſs, ſcarce conceivable ſwiftneſs, and yet conſtant regularity of the various motions of the ſun, moon, and other celeſtial lights; when he conſiders, how the magnetiſm of the earth makes its poles conſtantly look the ſame way, notwithſtanding the motions of its fluid vortex; how by daily turning about its own center in four and twenty hours, it receives as much light, and benefit from the ſun, and all the glorious conſtellations of the firmament, as if they, with all the vaſt heavenly region they belong to, moved about it in the ſame time; how by its ſituation among them it enjoys the regular viciſſitudes of day and night, ſummer and winter, *&c.* how the ſeveral parts of the ſublunary world are mutually ſubſervient to one another, and moſt of them (one way or other) ſerviceable to man; how excellently the bodies of animals are contrived; what various and congruous proviſion is made for differing animals, that they may ſubſiſt as long as they ſhould, according to the inſtitution of nature, by furniſhing them, according to their reſpective natures, ſome with ſtrength to take their food by force, others with induſtry to procure it by ſubtilty, ſome with arms, as horns, hoofs, ſcales, tuſks, poiſons, ſtings, *&c.* to defend themſelves, and offend their enemies; ſome with wings or ſwiftneſs to fly from dangers; ſome with foreſight to prevent them; ſome with craft, and perhaps ſtrange fetches of it to elude them; how being diſtinguiſhed into two ſexes, each of theſe is furniſhed with appoſite organs for the propagation of the ſpecies, and with ſkill and kindneſs to nouriſh and train up their young ones, till they can ſhift for themſelves; how admirable, and indeed aſtoniſhing, a proceſs is gone through in the formation of the fœtus, eſpecially of a human one; how divers animals are endowed

dowed with ſtrange inſtincts, whoſe effects ſometimes ſeem much to ſurpaſs thoſe of reaſon itſelf; though they are ſuperadded to the mechanical ſtructure of the animal, and argue a reſpect to things very remote from it, either in time, place, or both, and perhaps alſo to the grand fabrick or ſyſtem of the world, and the general oeconomy of nature. When, as I was ſaying, a philoſopher duly reflects on theſe things, and many others of the like import, he will think it highly rational to infer from them theſe three concluſions.

FIRST, that a machine ſo immenſe, ſo beautiful, ſo well contrived, and, in a word, ſo admirable as the world, cannot have been the effect of mere chance, or the tumultuous juſtlings and fortuitous concourſe of atoms, but muſt have been produced by a cauſe exceedingly powerful, wiſe, and beneficent.

SECONDLY, that this moſt potent author, and (if I may ſo ſpeak) opificer of the world, hath not abandoned a maſterpiece ſo worthy of him, but does ſtill maintain and preſerve it, ſo regulating the ſtupendiouſly ſwift motions of the great globes, and other vaſt maſſes of the mundane matter, that they do not, by any notable irregularity, diſorder the grand ſyſtem of the univerſe, and reduce it to a kind of chaos, or confuſed ſtate of ſhuffled and depraved things.

THIRDLY, that as it is not above the ability of the divine author of things, though a ſingle being, to preſerve and govern all his viſible works, how great and numerous ſoever; ſo he thinks it not below his dignity and majeſty, to extend his care and beneficence to particular bodies, and even to the meaneſt creatures; providing not only for the nouriſhment, but for the propagation of ſpiders and ants themſelves. And indeed, ſince the truth of this aſſertion, that God governs the world he has made, would appear (if it did not by other proofs) by the conſtancy and regularity, and aſtoniſhing rapid motions of the vaſt celeſtial bodies, and by the long trains of as admirable as neceſſary artifices, that are employed to the propagation of various ſorts of animals, whether viviparous, or oviparous; I ſee not, why it ſhould be denied, that God's providence may reach to his particular works here below, eſpecially to the nobleſt of them, man; ſince moſt of thoſe learned men, that deny this, as derogatory to God's majeſty and happineſs, acknowledge, that at the firſt creation, or (if they diſlike that term) formation of things, the great author of them muſt not only have extended his care to the grand ſyſtem of the univerſe in general, but allowed it to deſcend ſo low, as to contrive all the minute and various parts, (and even the moſt homely ones) not only of greater and (reputedly) more perfect animals, as elephants, whales, and men; but ſuch ſmall and abject ones, as flies, ants, fleas, *&c.* which being manifeſtly propagated by eggs laid by the female, cannot reaſonably be thought the off-ſpring of putrefaction. Whence I gather, as from matter of fact, that to be concerned for the welfare, even of particular animals, as it is agreeable to God's all-pervading wiſdom, and exuberant beneficence; ſo (whatever men's vanity may make them ſurmiſe) it is not truly derogatory to his adorable greatneſs and majeſty.

AND on this occaſion, I ſhall add, that ſince man is the nobleſt of God's viſible works; ſince very many of them ſeem made for his uſe; ſince, even as an animal, he is (as the Pſalmiſt truly ſpeaks) "wonderfully made," and curiouſly or artificially wrought; and ſince God has both given him a rational mind, and endowed it with an intellect, whereby he can contemplate the works of nature, and by them acquire a conviction of the exiſtence, and divers attributes, of their ſupremely perfect author; ſince God hath planted notions and principles in the mind of man, fit to make him ſenſible, that he ought to adore God, as the moſt perfect of beings, the ſupreme lord and governor of the world, the author of his own nature, and all his enjoyments; ſince all this, I ſay, is ſo, natural reaſon dictates to him, that he ought to expreſs the ſentiments he has for this divine being, by veneration of his excellencies; by gratitude for his benefits; by humiliation, in view of his greatneſs and majeſty; by an awe of his juſtice; by reliance on his power and goodneſs, when he duly endeavours to ſerve and pleaſe him; and, in ſhort, by thoſe ſeveral acts of natural religion, that reaſon ſhews to be ſuitable, and therefore due to thoſe ſeveral divine attributes of his, which it has led us to the knowledge of. Pſalm cxxxviii. 14, 15.

AND here I ſhall take leave to add, that, from the Carteſian principles (which you know are embraced by a great part of the modern virtuoſi) I think, I may draw a double argument for divine providence.

FOR firſt, according to the Carteſians, all local motion (which is, under God, the grand principle of all actions among things corporeal) is adventitious to matter, and was at firſt produced in it, and is ſtill every moment continued and preſerved immediately by God: whence may be inferred, that he concurs to the actions of each particular agent (as they are phyſical) and conſequently, that his providence reaches to all and every one of them,

AND ſecondly, the ſame Carteſians believe the rational ſoul to be an immaterial ſubſtance, really diſtinct and ſeparable from the body. Whence I infer, that the divine providence extends to every particular man; ſince whenever an embryo, or little human body formed in the womb, is, by being duly organiſed, fitted to receive a rational mind, God is pleaſed to create one, and unite it with that body. In which tranſaction, there ſeems to me a neceſſity of a direct and particular intervention of the divine power; ſince I underſtand not, by what phyſical charm or ſpell an immaterial ſubſtance can be allured into this or that particular embryo, of many that are at the ſame time fitted to receive a human ſoul; nor by what merely mechanical tie, or band, an immaterial ſubſtance can be ſo durably (perhaps for 80 or 100 years) joined and united with a corporeal, in which it finds no parts, that it has organs to take hold of, and to which it

can furniſh no parts to be faſtened upon by them. Nor do I better conceive, how a mere body can produce pain, pleaſure, *&c.* by its own mere action, or rather endeavour to act, on an immaterial ſpirit. Nor will the force of all that has been ſaid for God's ſpecial providence, be eluded, by ſaying, with ſome deiſts, that after the firſt formation of the univerſe, all things are brought to paſs by the ſettled laws of nature. For though this be confidently, and not without colour pretended; yet, I confeſs, it does not ſatisfy me. For, beſide the inſuperable difficulty there is, to give an account of the firſt formation of things, which many (eſpecially Ariſtotelian) deiſts will not aſcribe to God; and beſides that the laws of motion, without which the preſent ſtate and courſe of things could not be maintained, did not neceſſarily ſpring from the nature of matter, but depended upon the will of the divine author of things: beſides this, I ſay, I look upon a law as a moral, not a phyſical cauſe, as being indeed but a notional thing, according to which, an intelligent and free agent is bound to regulate its actions. But inanimate bodies are utterly incapable of underſtanding what a law is, or what it enjoins, or when they act conformably or unconformably to it; and therefore the actions of inanimate bodies, which cannot incite or moderate their own actions, are produced by real power, not by laws; though the agents, if intelligent, may regulate the exertions of their power by ſettled rules.

IV. I HAVE taken notice of two other accounts, upon which the experimental knowledge of God's works may, in a well-diſpoſed mind, conduce to eſtabliſh the belief of his providence; and therefore, though I ſhall not dwell long upon them, I muſt not altogether pretermit them.

FIRST then, when our virtuoſo ſees how many, and how various, and oftentimes how ſtrange, and how admirable ſtructures, inſtincts, and other artifices, the wiſe opificer hath furniſhed even brutes and plants withal, to purchaſe and aſſimilate their food, to defend or otherwiſe ſecure themſelves from hoſtile things, and (to be ſhort) to maintain their lives, and propagate their ſpecies; it will very much conduce to perſuade him, that ſo wiſe an agent, who has at command ſo many differing and excellent methods and tools, to accompliſh what he deſigns, and does oftentimes actually employ them, for the preſervation and welfare of beaſts, and even of plants, can never want means to compaſs his moſt wiſe and juſt ends, in relation to mankind; being able, by ways that we ſhould never dream of, to execute his menaces, and fulfil his promiſes. But of theſe rare ſtructures, inſtincts, and other methods, and, if I may ſo ſtile ſome of them with reverence, ſtratagems and fetches of divine ſkill, that God is pleaſed to employ in the conduct of the viſible world, eſpecially animals, I have already elſewhere purpoſely diſcourſed; and therefore ſhall now proceed, and obſerve, in the ſecond place, that, when we duly conſider the very differing ends, to which many of God's particular works, eſpecially thoſe that are animated, ſeem deſigned, in reference both to their own welfare, and the utility of man; and with how much wiſdom, and, I had almoſt ſaid, care, the glorious Creator has been pleaſed to ſupply them with means admirably fit for the attainment of theſe reſpective ends; we cannot but think it highly probable, that ſo wiſe, and ſo benign a being has not left his nobleſt viſible creature, man, unfurniſhed with means to procure his own welfare, and obtain his true end, if he be not culpably wanting to himſelf. And ſince man is endowed with reaſon, which may convince him (of what neither a plant, nor brute animal is capable of knowing, namely) that God is both his maker, and his continual benefactor; ſince his reaſon likewiſe teacheth him, that upon both thoſe accounts, beſides others, God may juſtly expect and require worſhip and obedience from him; ſince alſo the ſame rational faculty may perſuade him, that it may well become the majeſty and wiſdom of God, as the ſovereign rector of the world, to give a law to man, who is a rational creature, capable of underſtanding and obeying it, and thereby glorifying the author of it; ſince (farthermore) finding in his own mind (if it be not depraved by vice, or luſts) a principle, that dictates to him, that he owes a veneration, and other ſuitable ſentiments, to the divinely excellent author of his being, and his continual and munificent benefactor; ſince, on theſe ſcores, his conſcience will convince him of his obligation to all the eſſential duties of natural religion; and ſince, laſtly, his reaſon may convince him, that his ſoul is immortal, and is therefore capable, as well as deſirous, to be everlaſtingly happy, after it has left the body; he muſt in reaſon be ſtrongly inclined to wiſh for a ſupernatural diſcovery of what God would have him believe and do. And therefore if, being thus prepared, he ſhall be very credibly informed, that God hath actually been pleaſed to diſcover by ſupernatural revelation (what, by reaſon, without it, he can either not at all, or but rovingly, gueſs at) what kind of worſhip and obedience will be moſt acceptable to him; and to encourage man to both theſe, by explicit promiſes of that felicity, that man, without them, can but faintly hope for; he would be ready then thankfully to acknowledge, that this way of proceeding beſeems the tranſcendent goodneſs of God, without derogating from his majeſty and wiſdom. And by theſe and the like reflections, whereof ſome were formerly intimated, a philoſopher, that takes notice of the wonderful providence, that God deſcends to exerciſe for the welfare of inferior and irrational creatures, will have an advantage above men not verſed in the works and courſe of nature, to believe, upon the hiſtorical and other proofs, that Chriſtianity offers, that God has actually vouchſafed to man, his nobleſt, and only rational viſible creature, an explicit and poſitive law, enforced by threatning ſevere penalties to the ſtubborn tranſgreſſors; and promiſing

promiſing to the ſincere obeyers rewards ſuitable to his own greatneſs and goodneſs. And thus the conſideration of God's providence, in the conduct of things corporeal, may prove, to a well diſpoſed contemplator, a bridge, whereon he may paſs from natural to revealed religion.

I HAVE been the more particular and expreſs, in what I have ſaid about divine providence, becauſe I did not find other writers had made it needleſs for me to do ſo. And I dwelt the longer upon the exiſtence of the deity, and the immortality of the ſoul, that I might let you ſee, that I did not ſpeak groundleſly, or raſhly, but, that I had conſidered what I ſaid, when I aſſerted, that the experimental philoſophy might afford a well-diſpoſed mind conſiderable helps to natural religion. I find my ſelf therefore now at liberty to proceed to farther conſiderations, and repreſent to you, that,

V. ANOTHER thing, that diſpoſes an experimentarian philoſopher to embrace religion, is, that his genius and courſe of ſtudies accuſtoms him to value and delight in abſtracted truths; by which term, I here mean ſuch truths, as do not at all, or do but very little, gratify mens ambition, ſenſuality, or other inferior paſſions and appetites. For, whereas the generality of thoſe, that are averſe from religion, are enclined to be ſo, upon this account (among others) that they have a contempt or undervaluation of all truths, that do not gratify their paſſions or intereſts; he, that is addicted to knowledge experimental, is accuſtomed both to purſue, eſteem and reliſh many truths, that do not delight his ſenſes, or gratify his paſſions, or his intereſts, but only entertain his underſtanding with that manly and ſpiritual ſatisfaction, that is naturally afforded it by the attainment of clear and noble truths, which are its genuine objects and delights. And though I grant, that the diſcoveries made by the help of phyſical or mechanical experiments are not, for the moſt part, of kin to religion; yet, beſides that ſome of them do manifeſtly conduce to eſtabliſh or illuſtrate natural theology, which is that (as, though noted already, deſerves to be inculcated) which revealed religion, and conſequently, that of Chriſtians, muſt be founded on, or muſt ſuppoſe: beſides this, I ſay, we may argue *à fortiori*, that he, that is accuſtomed to prize truths of an inferior kind, becauſe they are truths, will be much more diſpoſed to value divine truths, which are of a much higher and nobler order, and of an ineſtimable and eternal advantage.

VI. THERE is another thing, that is too pertinent to the main ſcope of this diſcourſe to be here pretermitted: and it is, that both the temper of mind, that makes a man moſt proper to be a virtuoſo, and the way of philoſophiſing he chiefly employs, conduce much to give him a ſufficient, and yet well grounded and duly limited docility, which is a great diſpoſition to the entertainment of revealed religion. In the vulgar and ſuperficial philoſophy, wherein a man is allowed to think, that he has done his part well enough, when he has aſcribed things to a ſubſtantial form, or to nature, or to ſome real quality, whether manifeſt or occult, without proving, that there are ſuch cauſes, or intelligibly declaring, how they produce the phænomena, or effects referred to them; in this philoſophy, I ſay, it is eaſy for a man to have a great opinion of his own knowledge, and be puffed up by it. But a virtuoſo, that cannot ſatisfy himſelf, nor dares pretend to ſatisfy others, till he can by hypotheſes, that may be underſtood and proved, declare intelligibly the manner of the operation of the cauſes he aſſigns, will often find it ſo difficult a taſk to do ſo, that he will eaſily diſcern, that he needs further information, and therefore ought to ſeek for it where it is the moſt likely to be had; and not only to admit, but welcome it if he finds it. Beſides, the litigious philoſophy of the ſchools ſeldom furniſhes its diſciples with better than dialectical or probable arguments, which are not proper, either fully to ſatisfy the perſon that employs them, or leave his adverſary without any anſwer, plauſible at leaſt, if not full as probable as the objection, upon which account, men, that have more wit than ſincere love of truth, will be able to diſpute ſpeciouſly enough, as long as they have a mind to do ſo. And as ſuch ſlippery arguments are not able to convince even him that employs them, if he be a man of judgment; ſo if he deals with a witty adverſary, they will leave him to elude any arguments of the like nature, with which he ſhall be preſſed. And in effect we ſee, that in the Ariſtotelian philoſophy there are divers queſtions, ſuch as, whether the elements retain their diſtinct nature in a mixed body? Whether the celeſtial orbs are moved by intelligences? To omit many others, which are as it were ſtated queſtions; and as they have been diſputed from age to age, are like to continue queſtions for many more, if that philoſophy laſt ſo long. But a virtuoſo, that is wont in his reaſonings to attend to the principles of mathematicks, and ſound philoſophy, and to the clear teſtimonies of ſenſe, or well verified experiments, acquires a habit of diſcerning the cogency of an argument, or way of probation, and eaſily diſcerns, that dialectical ſubtilties and ſchool tricks cannot ſhift off its force, but finds more ſatisfaction in embracing a demonſtrated truth, than in the vain glory of diſputing ſubtilly againſt it.

VII. ANOTHER thing, that may diſpoſe a ſtudious ſearcher of truth, (not by ſpeculations only, but) by experiments, for theology, is, that his inquiſitiveneſs, and courſe of ſtudies, makes him both willing and fit to ſearch out and diſcover deep and unobvious truths. I have with trouble obſerved, that the greater part of the libertines we have among us, being men of *Pilate*'s humour, (who, when he had ſcornfully aſked what is truth? would not ſtay for an anſwer) do with great faſtidiouſneſs decline the ſtudy of all truths, that require a ſerious and ſettled application of mind. Theſe men are, for the moſt part, a ſort

ſort of ſuperficial and deſultory wits, that go no further than the outſide of things, without penetrating into the receſſes of them; and being eaſily tired with contemplating one, paſs quickly to another; the conſideration whereof they with the ſame lightneſs forſake. And upon this account, among others, it is, that this ſort of men, though often much applauded by others, becauſe the moſt are but ſuperficial, as well as they, do almoſt as ſeldom make good philoſophers, as good Chriſtians. For though all the good arguments, that may be brought to evince the truth of natural (and revealed) religion, be not abſtruſe; yet ſome of the chief ones, eſpecially thoſe, that prove the exiſtence and ſpecial providence of God, and the ſoul's immortality, are, if not of a metaphyſical, yet at leaſt of a philoſophical nature; and will ſcarce be clearly underſtood, and duly reliſhed, but by a perſon capable of, and ſomewhat accuſtomed to attentive and laſting ſpeculations, (as in another paper has been more fully declared.) But now, a man addicted to proſecute diſcoveries of truths, not only by ſerious meditation, but by intricate and laborious experiments, will not eaſily be deterred from effectually proſecuting his end, by the troubleſomneſs or difficulties that attend the clearing of thoſe notions, and matters of fact, whereon ſolid arguments for natural or revealed religion are founded; how remote ſoever thoſe truths may be from vulgar apprehenſions. In ſhort, whereas a ſuperficial wit, ſuch as is frequently found in libertines, and often helps to make them ſuch, may be compared to an ordinary ſwimmer, who can reach but ſuch things as float upon the water; an experimental philoſopher may be compared to a ſkilful diver, that cannot only fetch thoſe things, that lie upon the ſurface of the ſea, but make his way to the very bottom of it, and thence fetch up pearls, corals, and other precious things, that in thoſe depths lie concealed from other men's ſight and reach.

About ſome cauſes of atheiſm.

WE have already ſeen, that experimental philoſophy is, in its own nature, friendly to religion in general.

WHEREFORE I ſhall now add, that the reverence I pay experience, eſpecially as it gives both grounds and hints to rational notions and concluſions, does not a little conduce to the aſſent I give to the truth of the Chriſtian religion in particular.

THIS excellent religion is recommended to well diſpoſed minds by a greater number of prerogatives, and other arguments, than it were proper for me to inſiſt on in this diſcourſe: and yet my deſign engages me to conſider a few of them ſomewhat particularly.

AND firſt, I ſhall obſerve, that whereas the three grand arguments, that jointly evince the truth of the Chriſtian religion in general, are (at leaſt in my opinion) the excellency of the doctrine, which makes it worthy to have proceeded from God; the teſtimony of the divine miracles, that were wrought to recommend it; the great effects produced in the world by it; two of theſe three arguments (for the firſt is of a more ſpeculative nature) are bottomed upon matters of fact, and conſequently are likely to be the moſt prevalent upon thoſe, that have a great veneration for experience, and are duly diſpoſed to frame ſuch pious reflections, as it warrants and leads them to make. This laſt clauſe I add, becauſe, though I have formerly more than intimated ſomething of the like import, yet it is ſo neceſſary to my deſign, that you ſhould take ſpecial notice of it, that I muſt not here omit to advertiſe you, that when, in this diſcourſe, I ſpeak of an experimental philoſopher, or virtuoſo; I do not mean, either on this hand, a libertine, though ingenious, or a ſenſualiſt, though curious; or on that hand, a mere empirick, or ſome vulgar chemiſt, that looks upon nothing as experimental, wherein chemiſtry, mechanicks, *&c.* are not employed; and who too often makes experiments, without making reflection on them, as having it more in his aim to produce effects, than to diſcover truths. But the perſon I here mean, is ſuch a one, as by attentively looking about him, gathers experience, not from his own trials alone, but from divers other matters of fact, which he heedfully obſerves, though he had no ſhare in the effecting them; and on which he is diſpoſed to make ſuch reflections, as may (unforcedly) be applied to confirm and encreaſe in him the ſentiments of natural religion, and facilitate his ſubmiſſion and adherence to the Chriſtian religion.

AN experimental philoſopher thus diſpoſed will, with the divine aſſiſtance, (which he will be careful to implore) find pregnant motives to the belief of Chriſtianity, in the two laſt of the three arguments of its truth, that I lately propoſed. That which is drawn from the effects of this religion in the world, as it is laſt named, ſo I ſhall defer the conſideration of it, till I have treated of the other, namely, the teſtimony of divine miracles, whoſe difficulty makes it requiſite for us to conſider it the more attentively, and diſtinctly declare the grounds, upon which experience may be eſteemed a good topick on the preſent occaſion. For the clearing of this matter, I ſhall repreſent to you, that the word experience may admit of divers ſenſes, whereof one is far more comprehenſive than another, and likewiſe of ſeveral diviſions and diſtributions. For beſides its more reſtrained acceptation, it is ſometimes ſet in contradiſtinction to reaſon, ſo as to comprehend, not only thoſe phænomena, that nature or art exhibits to our outward ſenſes, but thoſe things, that we perceive to paſs within ourſelves; and all thoſe ways of information, whereby we attain any knowledge that we do not owe to abſtracted reaſon. So that, without ſtretching the word to the utmoſt extent of which it is capable, and to which it has been enlarged; it may be looked upon as ſo comprehenſive a term, that I think it may be of ſome importance to my preſent deſign, and perhaps to theology itſelf, to propoſe to you a diſtribution of experience, that will not,

not, I hope, be found uſeleſs to clear the extent of that term. I ſhall then take the freedom to enlarge the ſignification of the word beyond its commoneſt limits, and divide it, for diſtinction's ſake, into immediate and vicarious experience; or rather ſomewhat leſs compendiouſly, but perhaps more commodiouſly, into perſonal, hiſtorical, and ſupernatural, (which may be alſo ſtiled theological;) referring the firſt of the three members of this diſtribution to immediate experience, and the two others to vicarious.

I CALL that perſonal experience, which a man acquires immediately by himſelf, and accrues to him by his own ſenſations, or the exerciſe of his faculties, without the intervention of any external teſtimony. It is by this experience, that we know, that the ſun is bright; fire hot; ſnow cold and white; that upon the want of aliments we feel hunger; that we hope for future goods; that we love what we judge good, and hate what we think evil; and diſcern, that there is a great difference between a triangle and a circle, and can diſtinguiſh them by it.

BY hiſtorical experience I mean that, which, though it were perſonal in ſome other man, is but by his relation or teſtimony, whether immediately or mediately, conveyed to us. It is by this, that we know, that there were ſuch men as *Julius Cæſar*, and *William the Conqueror*, and that *Joſeph* knew, that *Pharoah* had a dream, which the Egyptian wiſe men could not expound.

BY theological experience I mean that, by which we know, what, ſuppoſing there is ſome divine revelation, God is pleaſed to relate or declare concerning himſelf, his attributes, his actions, his will, or his purpoſes, whether immediately, (or without the intervention of man) as he ſometimes did to *Job* and *Moſes*, and conſtantly to Chriſt our Saviour: or by the intervention of angels, prophets, apoſtles, or inſpired perſons, as he did to the Iſraelites, and the primitive Chriſtian church; and does ſtill to us, by thoſe written teſtimonies we call the Scriptures.

BY perſonal experience we know, that there are ſtars in heaven; by hiſtorical experience we know, that there was a new ſtar ſeen by *Tycho* and other aſtronomers in *Caſſiopæa*, in the year 1572. and by theological experience we know, that the ſtars were made on the fourth day of the creation.

BY this you may ſee, that I do not in this diſcourſe take experience in the ſtricteſt ſenſe of all, but in a greater latitude, for the knowledge we have of any matter of fact, which, without owing it to ratiocination, either we acquire by the immediate teſtimony of our own ſenſes and other faculties, or accrues to us by the communicated teſtimony of others. And I make the leſs ſcruple to take this liberty, becauſe I obſerve, that even in common acceptation, the word experience is not always meant of that which is immediate, but is often taken in a latitude. As when we ſay, that experience teaches us, who perhaps were never out of *England*, that the torrid zone is habitable and inhabited; and perſuades learned men, that never had opportunity to make nice celeſtial obſervations, that ſtars may be generated and periſh, or at leaſt begin to appear, and then diſappear in the celeſtial region of the world. And on this kind of hiſtorical experience, conſiſting of the perſonal obſervations of *Hippocrates*, *Galen*, and other phyſicians, tranſmitted to us, a great part of the practice of phyſick is founded. And the moſt rational phyſicians reckon upon, as matters of fact, not only what other phyſicians have left upon record, but divers preſent things, which themſelves can know but by the relation of their patients; as that a man has a particular antipathy to ſuch a thing, which the doctor perhaps judges fit for him to uſe; or that a woman with child longs for this or that determinate thing. And phyſicians reduce theſe and the like matters of fact to experience, as to one of the two columns of phyſick diſtinguiſhed from reaſon.

SINCE then learned men, as well as common uſe, confine not the appearance of the word experience to that which is perſonal, but employ it in a far greater latitude, I ſee not, why that, which I call theological experience, may not be admitted; ſince the revelations, that God makes concerning what he has done, or purpoſes to do, are but teſtimonies of things, moſt of them matters of fact, and all of them ſuch, as ſo far forth as they are merely revelations, cannot be known by reaſoning, but by teſtimony: whoſe being divine, and relating to theological ſubjects, does not alter its nature, though it give it a peculiar and ſupereminent authority.

HAVING premiſed and cleared the propoſed diſtribution of experience, it will now be ſeaſonable to conſider, how it may be applied to the matters of fact, that recommend the credibility of the Chriſtian religion; and on this occaſion I ſhall diſtinctly offer you my thoughts in the two following propoſitions.

PROP. I. "We ought to believe divers "things upon the information of experience, "(whether immediate, or vicarious) which, "without that information, we ſhould judge "unfit to be believed, or antecedently to it "did actually judge contrary to reaſon."

THIS propoſition may be underſtood, either of perſons, or of things, and will hold true as to both.

AND firſt, as to perſons; if your own obſervation of what occurs among mankind do not ſatisfy you, that we are obliged, after ſufficient trial, frequently to alter the opinions, which upon probable reaſons we had before entertained, of the fidelity, or prudence, or juſtice, or chaſtity, *&c.* of this or that perſon; I ſhall refer you to the records of hiſtory, or appeal to the tribunals of judges. For both in the one, and at the other, you will find but too many inſtances and proofs from matters of fact, that perſons looked on, even by intelligent men, as honeſt, virtuous,

and perhaps holy too, have proved guilty of falſeneſs to their friends, perfidiouſneſs to their princes, diſloyalty to their huſbands or wives, injuſtice to their neighbours, ſacrilege, perjury, or other impieties to their God: and in the courts of juſtice, you will find a great part of the time employed to detect and puniſh, not only civil tranſgreſſions, as thefts, cheats, forgery, falſe-witneſs, adultery, and the like heinous crimes, perpetrated by thoſe, that before they were thoroughly ſifted, paſſed for honeſt; but you will find ſins againſt nature, ſuch as ſodomy, and other unnatural luſts, the murders of parents by their children, and innocent children by their parents, nay, ſelf-murder too; though this be a crime, which cannot be acted without a violation of what ſeems the moſt univerſal and radicated law of nature, (and is acknowledged ſo by wicked men) ſelf-preſervation. But it will not be neceſſary more ſolicitouſly to prove, that we ought, upon the teſtimony of experience, to change the opinions we thought we had rationally taken up of perſons; and therefore I ſhall now proceed to make good the propoſition in the ſenſe I chiefly intended, which is as it relates to things.

IF experience did not both inform and certify us, who would believe, that a light black powder ſhould be able, being duly managed, to throw down ſtone walls, and blow up whole caſtles and rock themſelves, and do thoſe other ſtupendous things, that we ſee actually performed by gun-powder, made uſe of in ordnance, and in mines? Who would think, that two or three grains of opium ſhould ſo ſtupify a whole body, as to force a ſleep, and oftentimes even without that ſuſpend the ſharpeſt torments in the cholick, gout, and other the moſt painful diſeaſes, and that in patients of quite different ages, ſexes, and conſtitutions, in whom alſo the diſeaſes are produced by differing, or even by contrary cauſes? Who would believe, that the poiſon, adhering to the tooth of a mad dog, though perhaps ſo little as to be ſcarce diſcernible by ſenſe, ſhould be able, after the ſlight hurt is quite healed, to continue in the warm and ſtill perſpirable body of the bitten perſon, not only for ſome days or months, but ſometimes for very many years? And after having lurked all that while, without giving any trouble to the patient, ſhould on a ſudden pervert the whole oeconomy of his body, and put him into a madneſs like that of the dog that bit him, diſcovering itſelf by that as admirable as fatal ſymptom of hydrophobia.

BUT, beſides a multitude of inſtances, that may be given of truths, that, were it not for experience, we ſhould refuſe to believe; becauſe the ſmall ſtrength of ſuch agents ſeems altogether diſproportionate to the effects aſcribed to them; many other inſtances might be alledged, wherein we aſſent to experience, even when its informations ſeem contrary to reaſon, and that, which, perhaps, we did actually and without ſcruple take to be true.

SINCE gravity is the principle, that determines falling bodies to move towards the center of the earth; it ſeems very rational to believe, with the generality of philoſophers, that therein follow *Ariſtotle*, that, in proportion as one body is more heavy than another, ſo it ſhall fall to the ground faſter than the other. Whence it has been, eſpecially by ſome of the peripatetick ſchool, inferred, that of two homogeneous bodies, whereof one does, for example, weigh ten pounds, and the other but one pound, the former being let fall from the ſame height, and at the ſame time, with the latter, will reach the ground ten times ſooner.

BUT notwithſtanding this plauſible ratiocination, experience ſhews us (and I have purpoſely tried it) that (at leaſt in moderate heights, ſuch as thoſe of our towers, and other elevated buildings) bodies of very unequal weight, let fall together, will reach the ground at the ſame time, or ſo near it, that it is not eaſy to perceive any difference in the velocity of their deſcent.

IT is generally taken for granted by naturaliſts, as well as others, that ſtrong and loud noiſes, as they are heard much farther off than fainter ſounds, ſo, if the ſonorous bodies be equally diſtant from the ear, the very ſtrong ſound will arrive much ſooner at it, than the other. And yet by the experiments of the moderns about the velocity of ſounds (in making divers of which, I have endeavoured to be accurate) it appears, that weaker ſounds are (at leaſt as to ſenſe) tranſmitted through the air as ſwiftly as ſtronger ones. And indeed, it is often obſerved, that when cannons and muſkets are diſcharged together, the noiſes of both arrive alſo together at the ear; which would not be, if the ſound of a cannon were any thing near as much ſwifter, as it is louder, than that of a muſket.

IT ſeems irrational to conceive, that a ſmaller and weaker loadſtone may draw away a piece of ſteel from a larger and ſtronger; and yet experience (which both others and I have made) evinces, that in ſome caſes this paradox is a truth.

IT has generally, by philoſophers as well as other men, been looked upon as manifeſt, and conſonant to reaſon, that cold condenſes water more or leſs, according as the degree of the cold is; and conſequently that ice is water reduced into a leſſer volume. But it is plain, by experiments carefully made (ſome of which I have elſewhere publiſhed) that by glaciation, water is rather expanded; or at leaſt, that ice takes up more room, than the water did before it was congealed. And of this ſort of inſtances, where we believe, upon the authotity of experience, things, that are contrary to what we ſhould otherwiſe judge to be a dictate or concluſion of reaſon; I could add many, if I thought it as needful in this place, as in ſome other papers, where I have given them already. An eſſay of improbable truths.

AND now it will be ſeaſonable to put you in mind, that in one part of the propoſition, hitherto diſcourſed of, it appears, that I deſigned to extend the force of the arguments, grounded upon experience, to that, which is not immediate, but vicarious; that is, not

perſonally our own, but communicated by others; provided it be competently atteſted, and duly conveyed to us.

THERE will need but a little reflection on what is judged reaſonable, and freely practiſed, by philoſophers themſelves, to juſtify this propoſition. For how many concluſions have the modern naturaliſts admitted, though not only abſtracted reaſon never led men to make them, but plauſible arguments, and the notions and axioms of the moſt generally received philoſophy were repugnant to them. Thus, that in heaven it ſelf there ſhould be generations and corruptions, was not only unobſerved before the time of *Ariſtotle* (who thence argues the incorruptibility of cœleſtial bodies) but is contradicted by his arguments; and yet both many others, and I, have ſeen great ſpots (perhaps bigger than *England*, or than *Europe* it ſelf) generated and diſſipated on or near the ſurface of the ſun; and ſeveral of the modern philoſophers and aſtronomers, having never had the good fortune to ſee any of theſe (which indeed of late years have but rarely appeared) muſt take theſe phænomena upon the credit of thoſe that have obſerved them. And much more muſt they do ſo, who, in ſpite of the vulgar philoſophy, which made all comets ſublunary, believe, there were cœleſtial, and perhaps firmamentary, comets. For, that they were above the concave of the moon's orb, we muſt believe upon the affirmation of thoſe that obſerved them, which very few have done themſelves. And the height of the famous comet, or diſappearing ſtar, in *Caſſiopæa*, in the year 1572. whereon ſo much ſtreſs is laid by our philoſophers and mathematicians, is admitted and urged, chiefly upon the belief they have, not only of *Tycho*'s veracity, but his ſkill in obſerving the motions and phænomena of that celeſtial light, and particularly its having no parallax.

IN ſhort, the great architect of experimental hiſtory, Sir *Francis Bacon*, when he divides it but into three parts, aſſigns the ſecond of them to what he calls præter-generations, ſuch as monſters, prodigies, and other things; which being (as to us) but caſualties, all thoſe that happened in other times and places than we have lived in (and thoſe will be confeſſed to be incomparably more than any of us has perſonally obſerved) we muſt take upon the credit of others. And yet theſe (vicarious experiments) by ſuggeſting new inſtances of nature's power, and uncommon ways of working; and by overthrowing, or limiting, received rules and traditions, afford us a conſiderable and inſtructive part of natural hiſtory, without which, it would not be either ſo ſound, or ſo compleat.

PROP. II. After what has been hitherto diſcourſed, it may be, I hope, both ſeaſonable and warrantable to advance to, and aſſert, our ſecond propoſition; *viz.* That "we ought "to have a great and particular regard to "thoſe things, that are recommended to our "belief, by what we have reduced to real, "though ſupernatural, experience."

FOR, 1. it is manifeſt, that the moſt rational men ſcruple not to believe, upon competent teſtimony, many things, whoſe truth did no way appear to them by the conſideration of the nature of the things themſelves; nay, though what is thus believed upon teſtimony be ſo ſtrange, and, ſetting aſide that teſtimony, would ſeem ſo irrational, that antecedently to that teſtimony, the things at laſt admitted as truths were actually rejected as errors, or judged altogether unfit to be believed. And I muſt here deſire you to conſider, that the points, wherein experience overrules that, which, before it ſupervened, was judged to be moſt agreeable to reaſon, concern things merely natural or civil, whereof human reaſon is held to be a proper judge: whereas many of the points recommended by ſupernatural experience concern things of a ſuperior order; many of which are not to be adequately eſtimated by the ſame rules with things merely corporeal or civil; and ſome of which, as the eſſence and manner of exiſtence, and ſome peculiar attributes, of the infinite God, involve or require ſuch a knowledge of what is infinite, as much paſſes the reach of our limited intellects.

BUT this is not all. For, 2. You may conſider in the next place, that, whereas it is as juſtly as generally granted, that the better qualified a witneſs is in the capacity of a witneſs, the ſtronger aſſent his teſtimony deſerves; we ought of all the things, that can be recommended to us by teſtimony, to receive thoſe with the higheſt degree of aſſent, that are taught us by God, by the intervention of thoſe perſons, that appear to have been commiſſioned by him to declare his mind to men. For the two grand requiſites of a witneſs, being the knowledge he has of the things he delivers, and his faithfulneſs in truly delivering what he knows; all human teſtimony muſt on theſe accounts be inferior to divine teſtimony: ſince this (latter) is warranted both by the veracity of God (which is generally acknowledged by thoſe that believe his exiſtence) and by his boundleſs knowledge; which makes it as impoſſible he ſhould be deceived himſelf, as the other does, that he ſhould deceive us. And, becauſe that, for the delivery of the divine teſtimony we are ſpeaking of, it has oftentimes pleaſed God, who is a moſt free, as well as a moſt wiſe agent, to make uſe of unpromiſing perſons as his inſtruments; I ſhall not on this occaſion altogether overlook this circumſtance, that an experimental philoſopher ſo often encreaſes his knowledge of natural things, by what he learns from the obſervations and practices, even of mean, and perhaps of illiterate, perſons (ſuch as ſhepherds, plowmen, ſmiths, fowlers, *&c.*) becauſe they are converſant with the works of nature; that he is not only willing to admit, but often curious to ſeek for informations from them; and therefore is not like to find much repugnancy in receiving the doctrines of revealed religion, ſuch as Chriſtianity, if the teachers of it were honeſt men, and had opportunity to know the truth of the things they deliver, though they

they were fiſhermen, tentmakers, or ſome other mean profeſſion.

AND indeed (to enlarge a little upon a ſubject, that, I fear, has ſcarce been conſidered) ſuch a perſon as our virtuoſo will, with both great willingneſs and no leſs advantage, exerciſe himſelf in peruſing, with great attention and much regard, the writings of the apoſtles, evangeliſts, and ancient prophets; notwithſtanding any meanneſs of their firſt condition, or of their ſecular employments. And in theſe ſacred writings, he will not only readily ſuffer himſelf to be inſtructed in theſe grand and catholick articles of religion, which, becauſe of their neceſſity or very great uſefulneſs, are to be met with in many places, and in variety of expreſſions, by honeſt and duly diſpoſed readers; but he will, inſtead of diſdaining ſuch tutors, both expect, and carefully ſtrive, to improve his knowledge of divine things in general, even by thoſe hints and incidental paſſages, that a careleſs or ordinary reader would overlook, or not expect any thing from. For, as the fecundity of the ſcriptures is not wont to be enough diſcerned, when the ſacred writers tranſiently touch upon, or glance at, a great many ſubjects, that they do not expreſly handle, and that therefore are not vulgarly taken notice of; ſo the docility we have aſcribed to our virtuoſo will make him repoſe a great deal of truſt in the teſtimony of inſpired perſons, ſuch as Chriſt and his apoſtles, about things of all ſorts, either uſually taken notice of or not, that relate to objects of a ſupernatural order; eſpecially if among theſe God himſelf, and his purpoſes, be compriſed, ſince divers of thoſe things are not knowable without revelation, and others are beſt known by it. And to be allowed to ground a belief about ſuch things on the relations and other teſtimonies of thoſe that were, in the ſcripture-phraſe, "eye witneſſes and miniſters" of the things they ſpeak of, will by our virtuoſo be juſtly reputed ſuch an advantage, in order to the knowledge of things divine, as the conſulting with navigators and travellers to *America* is to him, that is curious to learn the ſtate of that new world. For an ordinary ſeaman or traveller, that had the opportunity with *Columbus* to ſail along the ſeveral coaſts of it, and paſs up and down through the country, was able at his return to inform men of an hundred things, that they ſhould never have learned by *Ariſtotle*'s philoſophy, or *Ptolomy*'s geography; and might not only acquaint them with divers particulars, conſonant to the opinions, which their formerly received phyſicks and coſmography did ſuggeſt, but alſo rectify divers erroneous preſumptions and miſtakes, which till then they thought very agreeable to the dictates of thoſe ſciences, and ſo to reaſon. And as one, that had a candid and knowing friend intimate with *Columbus*, might better rely on his informations about many particulars of the natural hiſtory of thoſe parts, than on thoſe of an hundred ſchool-philoſophers, that knew but what they learned from *Ariſtotle*, *Pliny*, *Ælian*, and the like ancient naturaliſts; ſo, and much more, may we rely on the accounts given us of theological things, by the apoſtles, and conſtant attendants of him that lay in the "boſom of God his Father," and commiſſioned them to declare to the world "the whole "counſel of God," as far as it was neceſſary for man to know. Luke i. 2. John i. 18. Act. xx. 27.

WE know, that fuller trials are allowed among ingenious men, to rectify the informations of the more imperfect ones; and therefore I ſhall add, that though the innate notions and ſentiments, that nature gives us of the attributes and mind of God, be highly to be prized; yet the informations, that theological experience affords of thoſe abſtruſe things, is far more excellent and compleat. For methinks, thoſe great "depths of God" may be compared to the depths of the ocean. And we know, that in the ſea there are ſome abyſſes ſo deep, that the ſeaman's ſounding-lines have never been able to reach to the bottom of them; and where they are not unfathomable, all we are wont to do by our ſoundings, is, to fetch from the bottom ſome little gravel, or mud, or ſhells, or ſome ſuch thing, that ſticks to the tallowed end of the plummet, and gives us but a very imperfect account of the bottom, even of the ſhallower parts of the ſea: but if a ſkilful diver be employed, he will not only tell us, whether the bottom be muddy, gravelly, or ſandy, but will be able to give us a kind of topography of that ſubmarine land, and acquaint us with many ſurpriſing particulars, that we ſhould never otherwiſe have diſcovered, or perchance ſo much as dreamed of. And peradventure it may be no hyperbole to ſay, that the informations of a plummet, which reaches not to ſome depths, and brings but a very ſlender account of ſoils that lie in any, are not more ſhort of thoſe of a diver, than the informations philoſophy gives us of ſome divine things are of thoſe compleater ones, that may be had from the holy Scriptures. And when I remember, how many opinions about the ſubmarine parts, that I, among many other men, thought probable, I found cauſe to change, upon the converſation I had with a famous diver, that ſometimes, by the help of an engine, ſtayed ſeveral hours at the bottom of the ſea; I find the leſs reluctancy to ſuffer opinions about divine matters, that before ſeemed probable to me, to be rectified by the fuller diſcoveries made of thoſe things by the preachers of the goſpel. 1 Cor. ii. 10.

YOU may find ſome things appliable to the confirmation of what has been newly delivered in an eſſay, (which you may ſee when you pleaſe) that conſiders the bounds and uſe of experience in natural philoſophy. Wherefore remembring, that before this late excurſion I was ſpeaking of miracles, I ſhall now reſume the ſubject, and proceed to tell you, that I have the more inſiſted upon the miracles, that may be pleaded to recommend the Chriſtian religion, becauſe I thought, that an argument grounded on them is little leſs than abſolutely neceſſary, to evince, that any

religion, that men believe to be ſupernaturally revealed, and conſequently that the Chriſtian does really proceed from God.

FOR, though the excellency of the Chriſtian doctrine, and other concurrent motives, may juſtly perſuade me, that it is worthy and likely to be given by God; yet that *de facto* this doctrine comes from him by way of ſupernatural revelation, I can ſcarce be ſufficiently aſcertained, but by the miracles wrought by Chriſt and his diſciples, to evince, that the doctrine they preached, as commiſſioned by God to do ſo, was indeed his, being as ſuch owned by him. But theſe miracles having been wrought (when it was moſt fit and needful they ſhould be wrought) in the firſt ages of the church, we, that live at ſo great a diſtance from them, can have no knowledge of them by our own ſenſes, or immediate obſervation; but muſt believe them upon the account of the formerly mentioned hiſtorical or vicarious experience, which is afforded us by the duly tranſmitted teſtimony of thoſe, that were themſelves (to ſpeak once more in an evangeliſt's phraſe) "eye-witneſſes and miniſters" of the things they relate. And ſince we ſcruple not to believe ſuch ſtrange prodigies, as celeſtial comets, vaniſhing and reappearing ſtars, iſlands founded by ſubterraneal fires in the ſea, darkenings of the ſun for many months together, earthquakes reaching above a thouſand miles in length, and the like amazing anomalies of nature, upon the credit of human hiſtories; I ſee not, why that vicarious experience ſhould not more be truſted, which has divers peculiar and concurrent circumſtances to confirm it, and particularly the death, that moſt of the firſt promulgators chearfully ſuffered to atteſt the truth of it, and the ſucceſs and ſpreading of the doctrine authoriſed by thoſe miracles, and received chiefly upon their account. To which things ſome perhaps would add, that it is leſs credible, that the author of nature ſhould, for moſt weighty purpoſes, make ſtupendous alterations of the courſe of nature, than that nature herſelf, for no ſuch end, ſhould by ſuch prodigies, as are newly mentioned, as it were, throw herſelf out of her own courſe.

Luke i. 2.

MIRACLES being ſo neceſſary to the eſtabliſhment of revealed religion in general, it may be looked upon as a farther diſpoſition in our virtuoſo, to receive the Chriſtian religion, that the philoſophy, he cultivates, does much conduce to enable him to judge aright of thoſe ſtrange things, that are by many propoſed as miracles, and believed to be ſo.

FOR firſt, the knowledge he has of the various, and ſometimes very wonderful operations of ſome natural things, eſpecially when they are ſkilfully improved, and dexterouſly applied by art, particularly mathematicks, mechanicks, and chemiſtry, will qualify him to diſtinguiſh between things, that are only ſtrange and ſurpriſing, and thoſe that are only miraculous; ſo that he will not miſtake the effects of natural magick, for thoſe of a divine power. And by this well-inſtructed warineſs, he will be able to diſcover the ſubtil cheats and colluſions of impoſtors; by which, not only multitudes of all religions, eſpecially heathen, but even learned men of moſt religions, for want of an inſight into real philoſophy, have formerly been, or are at this day deluded, and drawn into idolatrous, ſuperſtitious, or otherwiſe erroneous tenents or practices.

AND on the other ſide, the knowledge our virtuoſo may have of what cannot be juſtly expected or pretended from the mechanical powers of matter, will enable him to diſcern, that divers things are not produceable by them, without the intervention of an intelligent ſuperior power; on which ſcore he will frankly acknowledge, and heartily believe, divers effects to be truly miraculous, that may be plauſibly enough aſcribed to other cauſes in the vulgar philoſophy; where men are taught and wont to attribute ſtupendous unaccountable effects to ſympathy, antipathy, *fuga vacui*, ſubſtantial forms, and eſpecially to a certain being, preſumed to be almoſt infinitely potent and wiſe, which they call nature: for this is repreſented as a kind of goddeſs, whoſe power may be little leſs than boundleſs; as I remember *Galen* himſelf compares it to that of God, and ſaith, that he could not do ſuch a thing, becauſe nature cannot; and cenſures *Moſes* for ſpeaking as if he were of another mind. The whole paſſage is ſo weighty, that I thought fit to direct you to it in the margin; though, to comply with my haſte, I forbear to tranſcribe and deſcant upon ſo prolix a one, and add to it divers other paſſages, that I have met with in famous authors; who, for want of knowing the true extent of the powers of matter and motion, left to themſelves in the ordinary courſe of things, aſcribe to natural cauſes, as they call them, ſuch effects as are beyond their reach, unleſs they be elevated by agents of a ſuperior order,

Gal. de Uſu part. Lib. 11. *Cap.* 14.

I know it may be objected, that the hitherto-mentioned diſpoſitions, that experimental knowledge may give a man to admit the hiſtories of the miracles recorded in the goſpel; and likewiſe to expect, that God will be able to perform the promiſes and menaces that are in his name delivered there, may be countervailed by this, that thoſe, who are ſo much acquainted with the myſteries of nature, and her various and ſtrange ways of working, as a virtuoſo may well be, may by that knowledge be ſtrongly tempted to think, that thoſe ſurpriſing things, that other men call miracles, are but effects of her power; the extent of which is not eaſily diſcerned by ordinary men, nor ſafely defined by philoſophers themſelves. But this objection being plauſible enough, to make me think it deſerved to be ſeriouſly conſidered, I took an occaſion, that was once offered me, to examine the validity of it in a paper by itſelf; and this being at your command, I ſhall refer you to it. And I hope, that in the mean time it may ſuffice to ſay, that to make it reaſonable to judge this or that particular performance a ſupernatural one, it is not at all neceſſary, that it ſurpaſs the whole power of nature,

that is, of phyſical agents, provided it ſurpaſs the power of that cauſe, or that complex of cauſes, from which the effect muſt in reaſon, if it be purely natural or phyſical, be ſuppoſed to have proceeded. As for inſtance, that a fiſherman or two ſhould ſpeak other languages than their own, does not at all exceed the power of nature, if they employed a competent time in learning them. But that a great number of fiſhermen, and other illiterate perſons, ſhould all on a ſudden become linguiſts, and in an hour's time be able to ſpeak intelligibly to a great number and variety of nations in their reſpective languages, as the new teſtament relates, that the apoſtles and their companions did on the day of pentecoſt: that gift of tongues, I ſay, was an ability, which in thoſe circumſtances of place, time, and perſons, wherein it was exerciſed, may juſtly be concluded to have been ſupernatural or miraculous.

See Acts ii.

I FEAR you will think I have dwelt too long upon the argument for Chriſtianity, drawn from that ſort of matter of fact we call miracles; though the uncommon way, that my deſign led me to repreſent them in, would not permit me to make it out in fewer words. Wherefore I ſhall now paſs on to another argument, in favour of the ſame religion, that is afforded by experience, being drawn from the ſtrangely ſucceſsful propagation, and the happy effects of Chriſtianity in the world. But having formerly had occaſion to diſplay this argument in a ſeparate paper, which you may command a ſight of, if I ſhall not have time to annex a tranſcript of it to the latter ſheets of this firſt part of the preſent eſſay, I will refer you for more ample proof to that writing, and content myſelf in this place briefly to touch ſome of the heads, and ſubjoin a reflection or two, that you will not meet with in that paper.

IT is a notorious matter of fact, that in leſs than half an age, the Chriſtian religion was ſpread over a great part of the then known world; inſomuch, that in a few years after it began to be preached, the apoſtle of the Gentiles could tell the Romans with joy, that their faith (*i. e.* profeſſion of the goſpel) "was ſpoken of throughout the whole world." And in the ſecond century, *Tertullian*, and other famous writers, ſhew, that the goſpel had already numerous proſelytes in a great number of different kingdoms and provinces. But I forbear to mention what he and others have magnificently ſaid of the ſucceſs of the goſpel, becauſe I had rather refer you to the plain narratives made of it by *Euſebius*, *Socrates Scholaſticus*, and other grave authors; being of opinion, that mere hiſtorians may give, to a philoſophical reader, a more advantageous idea of the efficacy of that excellent doctrine, than eloquent orators, as ſuch, can do. This wonderful quick progreſs of this religion being aſcertained to our virtuoſo, by a thing he is ſo much ſwayed by as experience; it does not a little diſpoſe him to believe the truth of ſo prevalent a religion: For if he conſiders the perſons, that firſt promulgated it, they were but half a ſcore of illiterate fiſhermen, and a few tent-makers and other tradeſmen. If he conſiders the means, that were employed to propagate this doctrine, he finds, that they had neither arms, nor external power, to compel men to receive it; nor riches, honours, or preferments, to bribe or allure them to it; nor were they men of philoſophical ſubtilty, to intrap or entangle the minds of their auditors. Nor did they make uſe of the pompous ornaments of rhetorick, and fetches of oratory, to inveigle or entice men; but treated of the moſt ſublime and abſtruſe matters, in a moſt plain and unaffected ſtile, as became lovers and teachers of truth. If he conſiders the nature of the doctrine, that in little time obtained ſo many proſelytes, he will find, that inſtead of being ſuited to the natural apprehenſions, or the received opinions of men; and inſtead of gratifying their corrupt affections, or complying with ſo much as their innoceneſt intereſts; it preſcribed ſuch mortifications, and ſuch great ſtrictneſs of life, and high degrees of virtue, as no legiſlator had ever dared to impoſe upon his ſubjects, nay, nor any philoſopher on his diſciples. And this doctrine was propoſed in ſuch a way, and was accompanied with predictions of ſuch hardſhips and perſecutions, that ſhould in thoſe times be the portion of its ſincere profeſſors, as if the law-giver had deſigned rather to fright men from his doctrine, than allure them to it; ſince they could not believe what he ſaid, and foretold, to be true, without believing, that they ſhould be made great ſufferers by that belief. If our virtuoſo conſiders the oppoſition made to the progreſs of the goſpel, he will find cauſe to wonder, that it could ever be ſurmounted. For the heathens, which made by far the greateſt part of the world, were deeply engaged in polytheiſm, idolatry, magical rites and ſuperſtitions, and almoſt all kind of crimes, and ſome of theſe were ſhameleſs debaucheries, which oftentimes made a part of their worſhip. And the Jews were by the corrupt leaven of the Phariſees, and the impious errors of the Sadducees, and the general miſtakes of the nation about the perſon, office, and kingdom of the *Meſſias*; and by their dotage upon their vain traditions, and numerous ſuperſtitions grounded upon them: the Gentiles, I ſay, and the Jews, who were thoſe, that were to be converted, were, on theſe and other accounts, highly indiſpoſed to be made proſelytes. Eſpecially when they could not own themſelves to be ſuch, without expoſing their perſons to be hated and deſpiſed, their poſſeſſions to be confiſcated, their bodies to be impriſoned and tormented, and oftentimes their lives to be in as ignominious as cruel ways deſtroyed. And whilſt the ſecular magiſtrates made them ſuffer all theſe miſchiefs, the venerated prieſts, the ſubtil philoſophers, and the eloquent orators, perſuaded the world, that they deſerved yet more than they endured, and employed all their learning and wit to make the religion odious and ridiculous, as well as the embracers of it miſerable;

Rom. i. 8.

miſerable; accuſing the martyrs, and other Chriſtians, of no leſs than atheiſm, inceſt, and the inhuman ſhedding and drinking the innocent blood of infants. Theſe and the like matters of fact when our virtuoſo reflects on, and conſiders by what unpromiſing means, (as far as they were but ſecular) ſuch ſeemingly inſurmountable difficulties were conquered; he cannot but by this hiſtorical experience be inclined to think, that effects, ſo diſproportionate to the viſible means, could not be brought to paſs without the peculiar aſſiſtance and extraordinary bleſſing of God: by whom thoſe ſucceſsful preachers averred themſelves to be commiſſionated. For, that the ſupernatural help the Chriſtian doctrine appears to have had, was divine, not diabolical, will ſeem evident to our virtuoſo, from the nature, tendency, and effects of the doctrine itſelf, which expreſsly teacheth, that there is but one God; that he alone is to be worſhipped, and not idols, nor any of the heathen dæmons or deities; that the devils are wicked, apoſtate, malicious, and miſerable creatures, that are hated of God, and do extremely hate mankind; and that thoſe vices, as well as rites of worſhip, that they have eſtabliſhed in the world, were abominable to God, and would be by degrees deſtroyed by him: as in effect they ſoon began to be in many places of the world, where the worſhippers of Chriſt caſt the devil out of his temples, out of men's veneration, and oftentimes out of their bodies too.

ONE circumſtance there is of the propagation of the goſpel, which, though it may ſeem more extrinſical than thoſe hitherto mentioned, is yet too conſiderable to be here pretermitted; ſince it is this, that the quick ſpreading and ſucceſs of the Chriſtian doctrine in the world was foretold both by the prophets of the old teſtament, and the author and promulgators of the new. For it being notorious, that there have been divers errors and ſuperſtitions, that have with too much celerity been ſpread far and wide in the world, either by mere accidents, (as they were reputed) that were very friendly to them, or by the induſtry and artifices of men: this, I ſay, being ſo, it ought to be no ſmall ſatisfaction to equitable judges, that the quick progreſs, and notable effects of the Chriſtian religion, were foretold, partly by the ancient prophets, and partly by the Meſſias and his apoſtles. For by theſe accompliſhed predictions it may appear, that the wonderful ſucceſs of the goſpel was not an effect of chance, but was long before determined by divine providence, as a work fit to be dear to God, and to be accompliſhed in a wonderful way by his peculiar aſſiſtance, (as will by and by be ſomewhat more fully declared.) That the triumphs of the goſpel were foretold by ſeveral of the old prophets, may appear by their yet extant writings; ſome of which are alledged to that purpoſe by thoſe writers of the new teſtament, that were endowed with the ſame prophetick ſpirit. And if you pleaſe to conſider the paſſages cited in the margin, you will eaſily grant, that thoſe ancient inſpired writers foreſaw, that in the days of the Meſſias, there ſhould be a great and notable converſion of the Gentiles of ſeveral nations, to the worſhip of the only true God of Iſrael: and though God did not think fit, that thoſe predictions extant in the goſpel ſhould be ſo conſpicuous and pompouſly ſet forth, that ſpeak of the converſion, that ſhould be made, not only of the heathen world, but (of a more refractory portion of mankind) a great part of the Jewiſh nation, to the Chriſtian doctrine; yet there are divers paſſages in the new teſtament, that are real, though ſome of them unheeded prophecies of the wonderful progreſs of the goſpel, and the large extent of the kingdom of the Meſſias. Thus Chriſt foretold, that his twelve apoſtles ſhould be his witneſſes, not only in *Judea* and *Samaria*, but to the uttermoſt parts of the earth. And according to the moſt probable explication of that text, in the xxivth of St. *Matthew*'s goſpel, which is uſually referred to the end of the world, but ſeems rather to reſpect the deſtruction of *Jeruſalem*; there is a prediction, that before "the end (of Mat. xxiv. "the Jewiſh polity, as well as the Moſaical 14. "oeconomy) the goſpel of the kingdom (of "the Meſſias) ſhould be preached or pro- Παρὰ τῶν "claimed in the whole world," (in that ſenſe ὅλην. Luke ii. 1. of the term world, that was then much in uſe, and was employed by the evangeliſt *Luke* to ſignify the Roman world or empire.) To which may be added, that ten or twelve fiſhermen (called the apoſtles) were ſent to convert all nations to the worſhip of a crucified perſon; which would have been a ſtrange commiſſion to be given ſuch men at that time, if their maſter, who ſent them, had not foreſeen the ſucceſs, as well as known the truth of the doctrine he ſent them to preach. The quick diffuſion of the Chriſtian faith, and the ſwift growth of the Chriſtian church from deſpicable beginnings to a greatneſs very diſproportionate to them, are more than intimated by what Chriſt ſays of the leaven hid in a great quantity of meal; and of the muſtard-ſeed, that quickly grows (in the hot and fertile country of *Judea*) to a wonderful bigneſs and height; ſince theſe paſſages, that perfunctory readers look on but as mere parables, were really prophecies, that quickly began to be manifeſtly fulfilled. And it may bring no ſmall authority to the predictions of the new teſtament, that when divers of them were made, there appeared no likelihood, that they ſhould ever be made good. When a poor virgin, that was betrothed to a carpenter, confidently pronounces, that *all ages ſhould call her bleſſed*; what probability was there, that what ſhe ſaid, ſhould come to paſs? And when another private woman, then living in a village, had it foretold her, that a cenſured action of hers Mat. xxvi. ſhould be reported through the whole world, 13. to her great praiſe; what ſober man, that were not a prophet, would venture to loſe his credit, by making ſuch a promiſe? And therefore, ſince we ſee ſuch unlikely predictions actually accompliſhed,

Gen. xlix. 11. Iſa. ii. 2. Pſal. ii. 8 Mal. i. 11

accompliſhed, it may well convince an unbiaſſed man, that the authors of them, as well as the ancient ſeers, were really endowed with a truly prophetick ſpirit; and that the events, by that foretold, were not effects of chance or policy, but of divine providence.

I THOUGHT it not improper to make the mention of theſe predictions follow ſo cloſe the diſcourſe of the miracles, becauſe true prophecies of unlikely events, fulfilled by unlikely means, are ſupernatural things; and as ſuch, (eſpecially their author and deſign conſidered) may properly enough be reckoned among miracles. And I may add, that theſe have a peculiar advantage above moſt other miracles, on the ſcore of their duration: ſince the manifeſt proofs of the prediction continue ſtill, and are as viſible as the extent of the Chriſtian religion; and ſome of them are ſtill more and more accompliſhed by the converſions made of multitudes of infidels, in ſeveral vaſt regions of *America*, (to name no other countries.) So that if we may call ſome miracles tranſient ones, ſuch as the turning water into wine at a wedding-feaſt in *Galilee*; and the darkening of the ſun, when the moon was full, at the crucifixion of Chriſt: accompliſhed predictions may be ſtiled permanent ones; and their difference may be ſet forth by the differing ſtates of the Moſaick Manna: for, though both that, which fell daily (except on the ſabbath) in the wilderneſs, and that which was laid up in a pot before the teſtimony, were ſupernatural productions; yet whereas a portion of the former outlaſted not two or three days, that kept in the pot was preſerved many ages, and continued to be (as it was foretold it ſhould) a viſible miracle.

Exod. xvi. 14, 21, 20, 33.

THERE is another reaſon, why the wonderful propagation of the goſpel ſhould be annexed to the argument drawn from miracles in favour of the Chriſtian religion. For the preachers of it both pretended and appealed to miracles, as proofs of the truth of their doctrine: and if we conſider the great diſadvantages they lay under, and the powerful oppoſition of all ſorts, that they met with and ſurmounted; it cannot reaſonably be thought, that ſuch unlikely men ſhould ſo ſucceſsfully preach ſo uninviting a doctrine, unleſs it were confirmed by conſpicuous miracles: or at leaſt, if ſo uneaſy and perſecuted a religion was propagated without miracles, that propagation itſelf (as one of the fathers well obſerves) may juſtly paſs for a miracle; and be no leſs fit than another, to confirm the religion ſo admirably propagated.

THE paſt diſcourſe has, I hope, manifeſted, that a virtuoſo has ſome helps, that other men generally ſpeaking have not, to make him judiciouſly approve the arguments for the truth of the Chriſtian religion, that are grounded on the miracles wrought in its favour, and the wonderful ſucceſs of it in the world. But becauſe a revealed religion, how true ſoever it be, can ſcarce be proved but by moral demonſtrations; and becauſe for this reaſon, it is not always ſufficient, that the arguments be good in their kind, but there are ſome qualifications required in the minds of them that are to be convinced by him; I ſhall now add, that experimental philoſophy does alſo diſpoſe the minds of its cultivators to receive due impreſſions from ſuch proofs, as miracles do, as well as other topicks, afford the Chriſtian religion.

ANOTHER thing then, that qualifies an experimentarian for the reception of a revealed religion, and ſo of Chriſtianity, is, that an accuſtomance of endeavouring to give clear explications of the phænomena of nature, and diſcover the weakneſs of thoſe ſolutions, that ſuperficial wits are wont to make and acquieſce in, does inſenſibly work in him a great and ingenuous modeſty of mind. And on the ſcore of this intellectual, as well as moral virture, not only he will be very inclinable, both to deſire and admit further information, about things which he perceives to be dark or abſtruſe; but he will be very unapt to take, for the adequate ſtandard of truth, a thing ſo imperfectly informed, and narrowly limited, as his mere or abſtracted reaſon, (as I think I have elſewhere intimated, that one may call that, which is furniſhed only with its own, either congenite, or very eaſily and very early acquired notions and ideas, and with popular notices.) And though a vulgar philoſopher, that allows himſelf to refer the obſcureſt things in nature to ſubſtantial forms, real qualities, ſympathy, antipathy, and ſome few other terms, which, to be employed by him, need not, and perhaps for their darkneſs cannot be clearly underſtood; and by which he pretends to explain all things in nature, and may indeed explicate one thing as well as another; though (I ſay) ſuch a titular philoſopher may preſume, that he underſtands every thing, and may be eaſily tempted to think, that he muſt not hope, nor deſire to learn from leſs able men than his firſt teachers; and that, that cannot be true, or be done, which agrees not with his philoſophy; yet a ſober and experienced naturaliſt, that knows what difficulties remain yet unſurmounted in the preſumedly clear conception and explications even of things corporeal, will not, by a lazy or arrogant preſumption, that his knowledge about things ſupernatural is already ſufficient, be induced to reject, or to neglect any information, that may encreaſe it.

AND this frame of mind is a very happy one for a ſtudent in revealed theology, where cautiouſneſs is not more neceſſary for the avoiding of errors, than docility is advantageous for the learning of truth: ſince the knowledge and goodneſs of the divine teacher is ſuch, that a ſcholar, to improve his intellect, needs but bring a mind fitted to receive the genuine informations, that are moſt liberally offered (in the Scripture) and will never deceive him; then employs, together with fervent prayers, a due carenot to miſtake the meaning of them.

AN aſſiduous converſation with the exquiſitely framed, and admirably managed works of God, brings a ſkilful conſiderer of them to diſcover

diſcover from time to time, ſo many things to be feaſible, or to be true, which, whilſt he argued but upon grounds of incompetently informed reaſon, he judged falſe or unpracticable; that little by little he acquires a habit of receiving ſome ſorts of opinions, and eſpecially thoſe that ſeem unfriendly to religion, but as probationers, with a diſpoſition to reform or diſcard them upon further information. And this as he is reſolved to ſubmit to, in caſe he meets with it, ſo he is diſpoſed to receive, if not to expect it, by having often found himſelf obliged, upon ſubſequent information, to mend or lay aſide his former opinions, though very agreeable to the beſt light he had to judge by, when he entertained them. As though it ſeems a viſible truth, that the diſcus of *Venus* is, in all reſpects to the ſun, totally luminous; yet when the teleſcope diſcovers her to have her full and her wane, like the moon, he will believe this further obſervation againſt the firſt made with his naked eyes.

AND indeed, I have ſometimes doubted, whether to be verſed in mathematicks, and other demonſtrative parts of philoſophy, bring a greater advantage to the mind, by accuſtoming and aſſiſting it to examine ſtrictly things propoſed for truths, and to evince ſtrongly the truths a man knows to others, than by fitting him to diſcern the force of a good argument, and ſubmit willingly to truths clearly evinced, how little ſoever he may have expected to find ſuch concluſions true. It will not be difficult to apply theſe reflections to our preſent purpoſe, ſince there are ſeveral paſſages in the Scripture, that ſufficiently declare, both that multitudes perſiſt in a criminal infidelity, out of an overweaning conceit of their own knowledge, and a readineſs to be ſwayed rather by ſtrong prejudices, than by the ſtrongeſt arguments that would remove them; and that docility is a very happy diſpoſition to the entertainment of revealed religion: in reference to which, this qualification will be the more eaſily found in our virtuoſo; becauſe, whereas the things, about which he has been accuſtomed to be ſenſible of his ignorance, or deſire further inſtruction, are within the ſphere of nature, and the juriſdiction of philoſophy; many of the things that revealed religion declares, (ſuch as are the decrees, the purpoſes, the promiſes, *&c.* of God, and his moſt peculiar manner of exiſting and operating) are things ſo ſublime and abſtruſe, that they may well be looked upon as of an higher order than merely phyſical ones, and cannot be ſatisfactorily reached by the mere light of nature. It is true, that our philoſopher, becauſe he is ſo, will examine more ſtrictly, than ordinary men are wont or able to do, the proofs brought for this or that propoſed revelation. But that is no diſadvantage to a ſupernatural religion, ſuch as the Chriſtian, if it be, as we now ſuppoſe it to be, true; and the real truth about religion itſelf does not require credulity, but only docility. And perhaps this matter may be illuſtrated, by comparing what happens to a philoſopher in the examen of opinions, and to a chemiſt in that of metals. For if a piece of coin, that men would have paſs for true gold, be offered to an ordinary man, and to a ſkilful refiner; though the latter will examine it more ſtrictly, and not acquieſce in the ſtamp, the colour, the ſound, and other obvious marks, that may ſatisfy a ſhop-keeper, or a merchant; yet when he has tried it by the ſeverer ways of examining, ſuch as the touchſtone, the cupel, aqua fortis, *&c.* and finds it to hold good in thoſe proofs, he will readily and frankly acknowledge, that it is true gold, and will be more thoroughly convinced of it, than the other perſon, whoſe want of ſkill will make him ſtill apt to retain a diſtruſt, and render him indeed more eaſy to be perſuaded, but more difficult to be fully ſatisfied. On the like account, though our virtuoſo will examine with more ſtrictneſs and ſkill, than ordinary men are able, miracles, prophecies, or other proofs, ſaid to be ſupernatural, that are alledged to evince a revealed religion; yet if the certain and genuine characters of truth appear in it, he will be more thoroughly convinced of it than a leſs ſkilful man, whoſe want of good criteria (or touchſtones) and ſound judgment will encline him to be diffident, and to be ſtill afraid of having been impoſed on.

I EXPECT in the mean time, that you ſhould here object againſt what has been ſaid in the later leaves of the paſt diſcourſe, that it hath degraded the human intellect, by aſcribing ſo much to experience, natural or ſupernatural, that it has left nothing for reaſon to do, unleſs ſervilely to obey.

BUT though this objection be plauſible, yet the anſwer to it will not be very difficult, if the matter itſelf be duly conſidered, and reaſon be brought to act, even on this occaſion, not as an intereſſed party, but an unbiaſſed judge.

FOR we have already ſhewn, that rational philoſophers ſcruple not to alter or renounce the opinions, that ſpecious reaſons had ſuggeſted to them, when once they either find thoſe opinions contradicted by experience, or meet with other opinions more conformable to experience. And *Ariſtotle* himſelf, though he be accuſed to have, perhaps the firſt of all the ancient naturaliſts, perverted phyſicks, by wreſting them to a compliance with logical and metaphyſical fancies; yet even he confeſſes, not only that in the ſcience of nature reaſon ought to comport with the phænomena, and the phænomena with reaſon; but that to adhere to plauſible ratiocinations, with the neglect of ſenſible obſervations, is a weakneſs, or diſeaſe (ἀῤῥωστία) of mind. I will not here mention what I ſay in another paper, by way of attempt to ſettle the bounds of reaſon and experience, in reference to natural philoſophy; but it may concern our preſent argument, to employ a few lines in this place, towards the further clearing the lately propoſed objection. We may obſerve then, that, whether or no it be true, which is taught by *Ariſtotle*, and commonly received

in the ſchools, that the underſtanding is like blank paper; and that it receives no knowledge, but what has been conveyed to it through the ſenſes: whether, I ſay, this be or be not admitted, it is plain, that the notions, which are either congenite with the underſtanding, or ſo eaſily and early acquired by it, that divers philoſophers think them innate, are but very few in compariſon of thoſe, that are requiſite to judge aright about any one of a multitude of things, that occur either in natural philoſophy, or theology. For in the divine nature, power, wiſdom, and other attributes, there is a fecundity, that has produced a world of contrivances, laws, and other things, that exceedingly ſurpaſs both the number and variety, that the dim and limited intellect of man could reach to, by framing and compounding ideas, without the aſſiſtance of the patterns, afforded by the works and declarations of God.

ON the account of the ſame prerogative of the divine knowledge, it muſt frequently happen, that the notions and opinions men take up of the works and mind of God, upon the mere ſuggeſtions of the abſtracted reaſon, (if I may ſo call it) newly ſpoken of, muſt not only be almoſt always very deficient, but will be oftentimes very erroneous. Of which we ſee evident proofs in many of the opinions of the old philoſophers, who, though men of ſtrong natural parts, were miſled by what they miſtook for reaſon, to maintain ſuch things about the works and the author of nature, as we, who, by the favour of experience and revelation, ſtand in a much clearer light, know to be falſe, and often juſtly think utterly extravagant.

THE importance of the ſubject lately ſpoken of, and its being too little conſidered, may make it deſerved to be inculcated; and therefore I ſhall ſubjoin on this occaſion, that that, which I have lately called abſtracted reaſon, is but a narrow thing, and reaches but to a very ſmall ſhare of the multitude of things knowable, whether human or divine, that may be obtained by the help of further experience, and ſupernatural revelation. This reaſon, furniſhed with no other notices than it can ſupply itſelf with, is ſo narrow and deceitful a thing, that he, that ſeeks for knowledge only within himſelf, ſhall be ſure to be quite ignorant of far the greateſt part of things, and will ſcarce eſcape being miſtaken about a good part of thoſe he thinks he knows.

BUT notwithſtanding what has been hitherto ſaid, I am far from intending to deny reaſon any of its juſt prerogatives. For I ſhew in another paper, that experience is but an aſſiſtant to reaſon, ſince it doth indeed ſupply informations to the underſtanding; but the underſtanding remains ſtill the judge, and has the power or right to examine and make uſe of the teſtimonies, that are preſented to it. The outward ſenſes are but the inſtruments of the ſoul, which hears by the intervention of the ear, and in reſpect of which the eye itſelf is but a more immediate optical tube; and the ſenſe does but perceive objects, not judge of them. Nor do the more wary among the philoſophers, truſt their eye to teach them the nature of the viſible object; but only to employ it to perceive the phænomena it exhibits, and the changes that happen to itſelf by the action of it. And whereas it is confeſſed, that the ſenſories may deceive us, if the requiſites of ſenſation be wanting, as when a ſquare tower appears round at a great diſtance, and a ſtrait ſtick half in the water appears crooked, becauſe of the doubled medium; it is the part of reaſon, not ſenſe, to judge, whether none of the requiſites of ſenſation be wanting; which (give me leave to add) oftentimes requires, not only reaſon, but philoſophy; and then alſo it is the part of reaſon to judge, what concluſions may, and what cannot be ſafely grounded on the informations of the ſenſes, and the teſtimony of experience. So that when it is ſaid, that experience corrects reaſon, it is ſomewhat an improper way of ſpeaking; ſince it is reaſon itſelf, that upon the information of experience, corrects the judgments ſhe had made before.

AND this (borrowed from the forementioned paper, becauſe it was never publiſhed) prompts me to illuſtrate the uſe of reaſon, by comparing her to an able judge, who comes to hear and decide cauſes in a ſtrange country. For the general notions he brings with him, and the dictates of juſtice and equity can give him but a very ſhort and imperfect knowledge of many things, that are requiſite to frame a right judgment about the caſes, that are firſt brought before him; and before he has heard the witneſſes, he may be very apt to fall into prejudicate opinions of things, (whether perſons or cauſes.) But when an authentick and ſufficient teſtimony has cleared things to him, he then pronounces, according to the light of reaſon, he is maſter of; to which the witneſſes did but give information, though that ſubſequent information may have obliged him to lay aſide ſome prejudicate opinions he had entertained before he received it. And what is ſaid of natural experience, in reference to the underſtanding, may, with due alteration, be applied to ſupernatural revelation: for here alſo the underſtanding is to examine, whether the teſtimony be indeed divine; and whether a divine teſtimony ought to be (as it will eaſily perceive it ſhould) believed, in what it clearly teaches; to omit other uſes of reaſon, (about theological matters) which belong not to this place, where it may ſuffice to have ſhewn, that reaſon is not degraded from the dignity, that belongs to her, of perceiving and judging; though ſhe be obliged by her own dictates, to take in all the aſſiſtance ſhe can from experience, whether natural, or ſupernatural; and by the fuller accounts of things ſhe receives from thoſe informations, to rectify, if need be, her former and leſs mature judgments.

IN ſhort, thoſe, that cry up abſtracted reaſon, as if it were ſelf-ſufficient, exalt it in words; but we that addreſs reaſon to phyſical and

and theological experience, and direct it how to consult them, and take its informations from them, exalt it in effect; and reason is much less usefully served by the former sort of men, than by the latter; since whilst those do but flatter it, these take the right way to improve it.

I HOPE you will not imagine, that I have in the foregoing part of this letter said all that I could say pertinently. For being mindful of the brevity becoming an epistolary discourse, I omitted several arguments, that would have challenged their places in a treatise; and have but touched upon most of those I have mentioned; though reasonings of this kind are usually like tapestry, which loses much by being looked on whilst the hangings are folded up, which should be displayed to their full dimensions.

BUT having offered you some things, which perhaps you have not met with elsewhere; and having, though but transiently, touched upon the grounds of divers other considerable arguments, I hope, that your learning and sagacity will both supply what you will discern to have been omitted, and enforce what has been but intimated; and then I shall not despair, that what I have said may suffice to persuade you, that experimental philosophy may greatly assist a well-disposed mind, to yield an hearty and operative assent to the principles of religion. I am,

SIR,

Your most, *&c.*

The end of the FIRST PART.

REFLECTIONS

UPON A

Theological Distinction.

According to which it is said,

That some ARTICLES of FAITH are above Reason, but not against Reason.

In a LETTER to a Friend.

ADVERTISEMENT.

AFTER the author had begun the second part of his *Christian Virtuoso*, and made some progress in it, which he designed to continue till he had compleated it; he was obliged to leave the country, where he enjoyed some leisure, and to remove to London; where sickness, and business, and a multitude of visits he could not avoid receiving, did so distract him, that these remora's, added to the fertility of the subjects, that remained to be treated of, which he found much greater than he was at first aware of, made him lay aside the materials he had prepared for the second part, to a fitter opportunity, and comply with the occasions he had to publish some tracts, that required more. And it is for the like reasons, that having at present some other essays of a quite differing nature in the press, he is obliged to postpone his resuming and finishing the second part of the *Christian Virtuoso* (which will require more sheets than the former) for some longer time; though yet, to comply with the solicitations of the printer, he consents, both to let the first part come abroad, and (to make the book of a more decent size) add to it, by way of substitution, a discourse, that is of affinity enough to the other, upon the account of some of the points it handles, and more upon that of its scope; and that will not be ill received, if it have the good fortune to find the publick as kind to it, as private perusers have been.

For

For my learned Friend Mr. *H. O.*

SIR,

I. I CAN neither admire nor blame the curioſity you expreſſed, to receive ſome ſatisfaction about the important diſtinction, that is made uſe of in defence of ſome myſteries of the Chriſtian religion; namely, that *they are indeed above reaſon, but not againſt reaſon.* For though divers learned men have, eſpecially of late, employed it, yet I perceive you and your friends *N. N.* think, that they have not done it ſo clearly, as both to prevent the exceptions of infidels, or render them more groundleſs; and at leaſt, to obviate the ſurmiſes of thoſe others, who have been perſuaded to look upon this diſtinction but as a fine evaſion, whereby to elude ſome objections, that cannot otherwiſe be anſwered. And indeed, as far as I can diſcern by the authors, wherein I have met with it, (for I pretend not to judge of any others) there are divers that employ this diſtinction, few that have attempted to explain it, (and that I fear not ſufficiently,) and none that has taken care to juſtify it.

II. In order to the removal of the difficulties, that you take notice of, I ſhall endeavour to do theſe two things: 1. To declare in what ſenſe I think our diſtinction is to be underſtood. And 2. To prove, that it is not an arbitrary or illuſory diſtinction, but grounded upon the nature of things.

Though I do not deſire to impoſe my ſentiments on any man, much leſs on you; yet becauſe I, as well as others, have had ſome occaſions to make uſe of the diſtinction we are conſidering, I think myſelf obliged, before I go any further, to acquaint you in what ſenſe I underſtand it.

III. By ſuch things then in theology, as may be ſaid to be above reaſon, I conceive ſuch notions and propoſitions, as mere reaſon, that is, reaſon unaſſiſted by ſupernatural revelation, would never have diſcovered to us; whether thoſe things be to our finite capacities clearly comprehenſible or not. And by things contrary to reaſon, I underſtand ſuch conceptions and propoſitions, as are not only undiſcoverable by mere reaſon, but alſo, when we underſtand them, do evidently and truly appear to be repugnant to ſome principle, or to ſome concluſion of right reaſon.

IV. To illuſtrate this matter a little, I ſhall propound to you a compariſon drawn from that ſenſe, which is allowed to have the greateſt cognation with the underſtanding, which I preſume you will readily gueſs to be the ſight. Suppoſe then, that on a deep ſea, a diver ſhould bid you tell him, what you can ſee there; that, which you would anſwer, would be, that you can ſee into a ſea-green liquor, to the depth of ſome yards, and no further: ſo that if he ſhould further aſk you, whether you ſee what lies at the bottom of the ſea, you would return him a negative anſwer. If afterwards the diver letting himſelf down to the bottom, ſhould thence bring up and ſhew you oiſters, or muſcles with pearls in them; you would eaſily acknowledge, both that they lay beyond the reach of your ſight, and conſequently argued an imperfection in it; though but ſuch an imperfection, as is not perſonal, but common to you with other men, and that the pearls have the genuine colour and luſtre, that naturally belong to ſuch gems. But if this diver ſhould pretend, that each of theſe pearls he ſhews you, is as large as a tennis-ball, or ſome of them bigger than the ſhells they were encloſed in, and that they are not round but cubical, and their colour not white or orient, but black or ſcarlet; you would doubtleſs judge what he aſſerts to be not only (or not ſo properly) undiſcernible by your eyes, but contrary to the informations of them, and therefore would deny what he affirms. Becauſe, that to admit it would not only argue your ſight to be imperfect, but falſe and deluſory; though the organ be rightly qualified, and duly applied to its proper objects.

V. This illuſtration may give you ſome ſuperficial notion of the difference betwixt a thing's being above reaſon, and its being contrary to it. But this may better appear, if we conſider the matter more diſtinctly. And to offer ſomething in order to this, I ſhall beg leave to ſay, that in my opinion, the things, that may be ſaid to be above reaſon, are not all of one ſort, but may be diſtinguiſhed into two kinds, differing enough from each other.

VI. For it ſeems to me, that there are ſome things, that reaſon by its own light cannot diſcover; and others, that, when propoſed, it cannot comprehend.

VII. And firſt, there are divers truths in the Chriſtian religion, that reaſon, left to itſelf, would never have been able to find out, nor perhaps to have ſo much as dreamed of; ſuch as are moſt of thoſe, that depend upon the free will and ordination of God; as, that the world was made in ſix days, that Chriſt ſhould be born of a virgin, and that in his perſon there ſhould be united two ſuch infinitely diſtant natures as the divine and human; and that the bodies of good men ſhall be raiſed from death, and ſo advantageouſly changed, that the glorified perſons ſhall be like, or equal to the angels.

VIII. Of this kind of theological truths, you will eaſily believe, that it were not difficult for me to offer divers other inſtances; and indeed there are many truths, and more I think than we are wont to imagine, that we want mediums or inſtruments to diſcover, though, if they were duly propoſed, they would be intelligible to us: As for my part, when by looking on the ſtarry heaven, firſt with my naked eyes, and then with teleſcopes of differing lengths, I do not only deſcry more

and more ſtars, according to the goodneſs of the inſtruments I employed, but diſcovered great inducements to think, that there are in thoſe ineſtimably remote regions many celeſtial lights, that only the want of more reaching teleſcopes conceal from our ſight.

IX. And thus much I preſume you will cloſe with the more eaſily, becauſe it diſagrees not with the ſentiments of ſome few (for I dare ſay not many) orthodox divines. But I muſt take leave to add, that beſides theſe myſterious truths, that are too remote and hidden to be detected by human reaſon; there is another ſort of things, that may be ſaid to be above reaſon.

X. For there are divers truths delivered by revelation, (contained in the holy Scriptures,) that not only would never have been found out by mere natural reaſon; but are ſo abſtruſe, that when they are propoſed, as clearly as proper and unambiguous expreſſions can propoſe them in, they do nevertheleſs ſurpaſs our dim and bounded reaſon, on one or other of thoſe three accounts, that are mentioned in a Dialogue about things tranſcending reaſon; namely, either as not clearly conceivable by our underſtanding, ſuch as the infiniteneſs and perfections of the divine nature; or inexplicable by us, ſuch as the manner, how God can create a rational ſoul, or how this being an immaterial ſubſtance, it can act upon a human body, and be acted on by it; (which inſtance I rather choſe, than the creation of matter, becauſe it may be more eaſily proved;) or elſe aſymmetrical, or unſociable, that is, ſuch as we ſee not how to reconcile with other things, which alſo manifeſtly are, or are by us acknowledged to be true; ſuch as are the divine preſcience of future contingents, and the liberty, that belongs to man's will, at leaſt in divers caſes.

XI. It will not perhaps be improper to obſerve, on this occaſion, that as of things, that are ſaid to be above reaſon, there are more kinds than one; ſo there may be a difference in the degrees, or at leaſt the diſcernibleneſs of their abſtruſeneſs.

XII. For ſome things appear to ſurpaſs or diſtreſs our underſtandings, almoſt as ſoon as they are propoſed, at leaſt before they are attentively looked into; as what is ſaid to be infinite, either in extent or number. But there are other things, the notions whereof, as they firſt ariſe from the things conſidered in groſs, and as it were indefinitely, are ſuch, as do not choke or perplex our underſtandings; and are ſo far intelligible, that they may be uſefully employed in ordinary diſcourſe. But when we come to make a deep inſpection into theſe, and proſecute to the uttermoſt the ſucceſſive inferences that may be drawn from them, we reaſon ourſelves into inextricable difficulties, if not flat repugnancies too. And to ſhew you, that I do not ſay this gratis, be pleaſed to conſider with me, that we uſually diſcourſe of place, of time, and of motion, and have certain general indeterminate conceptions of each of theſe, by the help of which we underſtand one another, when we ſpeak of them; though, if we will look thoroughly into them, and attentively conſider all the difficulties, that may be diſcovered by ſuch an inſpection, we ſhall find our reaſon oppreſſed by the number and greatneſs of the difficulties, into which we ſhall argue ourſelves, or at leaſt may be argued by others; though theſe men, who do make ſuch ſhrewd objections againſt the hypotheſis we embrace, will hardly be able themſelves to pitch on any, that will not allow us to repay them in the ſame coin.

XIII. What has been newly ſaid may, I hope, aſſiſt us to clear a difficulty, or ſcruple, (about the diſtinction we treat of,) which, ſince it ſprung up in my own mind, may very probably occur alſo to your thoughts; namely, that if any theological propoſition be granted to ſurpaſs our reaſon, we cannot pretend to believe it, without diſcovering, that we do not ſufficiently conſider what we ſay; ſince we pretend to exerciſe an act of the underſtanding, in embracing ſomewhat, that we do not underſtand, nor have a notion of.

XIV. But on this occaſion we may juſtly have recourſe to a diſtinction, like that I have lately intimated. For in divers caſes, the notions men have of ſome things may be different enough, ſince the one is more obvious and ſuperficial, and the other more philoſophical or accurate. And of theſe two differing kinds of conceptions I have already offered ſome inſtances in the very differing notions men have of place and time; which, though familiar objects, I elſewhere ſhew to be each of them of ſo abſtruſe a nature, that I do not wonder to find *Ariſtole* himſelf complaining of the difficulty, that there is to give a clear and unexceptionable notion of place; nor to find ſo acute a wit as St. *Auſtin* ingenuouſly confeſſing his diſability to explicate the nature of time.

XV. And what is ſaid of the great intricacies, that incumber a deep ſcrutiny into theſe familiar objects of diſcourſe, will hold as to the diviſibility of quantity, as to local motion, and as to ſome other primary things, whoſe abſtruſeneſs is not inferior in degree, though differing as to the kinds of things, wherein it conſiſts.

XVI. By ſuch inſtances as theſe, it may appear, that without talking as parrots, (as your friends would intimate, that thoſe that uſe our diſtinction muſt do,) or as irrational men, we may ſpeak of ſome things, that we acknowledge to be on ſome account or other above our reaſon; ſince the notions we may have of thoſe things, however dim and imperfect, may yet be of uſe, and may be in ſome meaſure intelligible, though the things they relate to may, in another reſpect, be ſaid to tranſcend our underſtanding; becauſe an attentive conſiderer may perceive, that ſomething belongs to them, that is not clearly comprehenſible, or does otherwiſe ſurpaſs our reaſon (at leaſt in our preſent ſtate.)

XVII. Having diſpatched the objection, that required this digreſſion; I ſhall now ſtep again into the way, and proceed in it by telling

ing you, that any one appoſite inſtance may ſuffice to clear the former part of the expreſſion, that is employed, when it is ſaid, that a myſtery, or other article of faith, is above reaſon, but not contrary to it: for if there be ſo much as one truth, which is acknowledged to be ſuch, and yet not to be clearly and diſtinctly comprehenſible, it cannot juſtly be pretended, that to make uſe of the diſtinction we are treating of is to ſay ſomething, that is not intelligible, or is abſurd. And it will further juſtify the expreſſion quarrelled at, if we can make it appear, that it is neither impertinent or arbitrary, but grounded on the nature of things. And this I ſhall endeavour to do, by ſhewing, that though I admit two ſorts of things, which may be ſaid to be above reaſon, yet there is no neceſſity, that either of them muſt (always) be contrary to reaſon.

XVIII. As for the firſt ſort of things ſaid to ſurpaſs reaſon, I ſee not, but that men may be unable, without the aſſiſtance of a more knowing inſtructor, to diſcover ſome truths; and yet be able, when theſe are revealed or diſcovered to them by that inſtructor, both to underſtand the diſcloſed propoſitions by their own rational faculty, and approve them for true, and fit to be embraced. The intellect of man being ſuch a bounded faculty as it is, and naturally furniſhed with no greater a ſtock or ſhare of knowledge, than it is able by its own endeavours to give itſelf, or acquire; it would be a great unhappineſs to mankind, if we were obliged to reject, as repugnant to reaſon, whatever we cannot diſcover by our own natural light; and conſequently, to deny ourſelves the great benefits we may receive from the communications of any higher and more diſcerning intellect. An inſtance to my preſent purpoſe may be found among rational ſouls themſelves, though univerſally granted to be all of the ſame nature. For though a perſon but ſuperficially acquainted (for example) with geometry would never have diſcovered by his own light, that the diameter of a ſquare is incommenſurable to the ſide; yet when a ſkilful mathematician dextrouſly declares, and by a ſeries of demonſtrations proves that noble theorem, the diſciple, by his now inſtructed reaſon, will be able both to underſtand it, and to aſſent to it; inſomuch that *Plato* ſaid, that *he was rather a beaſt than a man, that would deny it.*

XIX. OTHER inſtances may be alledged to exemplify the truth newly mentioned. And indeed, there is not ſo much as a ſtrong preſumption, that a propoſition or notion is therefore repugnant to reaſon, becauſe it is not diſcoverable by it; ſince it is altogether extrinſical and accidental to the truth or falſity of a propoſition, that we never heard of it before; or that we could never have found it out by our own endeavours; but muſt have had the knowledge of it imparted to us by another. But then this diſability to find out a thing by our own ſearch doth not hinder us from being able by our own reaſon both to underſtand it when duly propoſed, and to diſcern it to be agreeable to the dictates of right reaſon. To induce you to aſſent to the latter part of this obſervation, I ſhall add, that theſe intellectual aſſiſtances may oftentimes not only enlighten, but gratify the mind, by giving it ſuch informations, as both agree with its former maimed or imperfect notices, and compleat them. When, for example, an antique medal, half conſumed with ruſt, is ſhewed to an unſkilful perſon, though a ſcholar, he will not by his own endeavours be able to read the whole inſcription, whereof we ſuppoſe ſome parts to be obliterated by time or ruſt, or to diſcover the meaning of it. But when a knowing medaliſt becomes his inſtructor, he may then know ſome (much defaced) letters, that were illegible to him before; and both underſtand the ſenſe of the inſcription, and approve it as genuine and ſuitable to the things, whereto it ought to be congruous. And becauſe divers philoſophical wits are apt, as well as you, to be ſtartled at the name of myſtery, and ſuſpect, that becauſe it implies ſomething abſtruſe, there lies hid ſome illuſion under that obſcure term; I ſhall venture to add, that agreeably to our doctrine we may obſerve, that divers things, that relate to the old teſtament, are in the new called myſteries, becauſe they were ſo under the Moſaick diſpenſation; though they ceaſe to be ſo, now that the apoſtles have explained them to the world. As the calling of the Gentiles into the church of God is by their apoſtle called a myſtery; becauſe, to uſe his phraſe, it "had been hid from "ages and generations;" though he adds, "but now it is made manifeſt to his ſaints." And the ſame writer tells the *Corinthians*, that he "ſhows them a myſtery," which he immediately explains, by foretelling, that all pious believers ſhall not die, becauſe that "thoſe, "that ſhall be found alive at the coming of "Chriſt, ſhall not ſleep, but be changed;" as the other "dead ſhall be raiſed incorruptible." Which ſurpriſing doctrine, though, becauſe it could not be diſcovered by the light of nature, nor of the writings of the old teſtament, he calls a myſtery, yet it is no more ſo to us, now that he hath ſo expreſsly foretold it, and therefore declared it.

Coloſſ. i. 26. Epheſ. iii. 3, 5, 6. 1 Corinth. xv. 51, 52.

XX. OTHER inſtances I content myſelf to point at in the margin, that I may paſs on to confirm the obſervation I formerly intimated; that divers things, which the ſcripture teaches beyond what was known, or (in probability) are diſcoverable by natural light, are ſo far from being againſt reaſon, by being (in the ſenſe declared) above it, that theſe diſcoveries ought much to recommend the ſcripture to a rational mind; becauſe they do not only agree with the doubtful or imperfect notions we already had of things, but improve them; if not compleat them. Nay, I ſhall venture to add, that theſe intellectual aids may not ſeldom help us to diſcern, that ſome things, which not only are above reaſon, but at firſt ſight ſeem to be againſt it, are really reconcileable to reaſon, improved by

See Mat. xiii. 11. Epheſ. v. 31.

by the new helps afforded it by revelation. To illuſtrate this by a philoſophical inſtance; when *Galileo* firſt made his diſcoveries with the teleſcope, and ſaid, that there were planets that moved about *Jupiter*; he ſaid ſomething, that other aſtronomers could not diſcern to be true, but nothing that they could prove to be falſe. And even when ſome revelations are thought not only to tranſcend reaſon, but to claſh with it; it is to be conſidered, whether ſuch doctrines are really repugnant to any abſolute catholick rule of reaſon, or only to ſomething, which ſo far depends upon the meaſure of acquired information we then enjoy, that, though we judge it to be irrational, yet we are not ſure, that the thing, this judgment is grounded on, is clearly and fully enough known to us. As to reſume the former example, when *Galileo*, or ſome of his diſciples, affirmed *Venus* to be ſometimes horned like the moon; though this aſſertion were repugnant to the unanimous doctrine of aſtronomers, who thought their opinion very well grounded on no leſs a teſtimony than that of their own eyes; yet in effect the proof was incompetent, becauſe their unaſſiſted eyes could not afford them ſufficient information about this caſe. And ſo when *Galileo* ſpoke of hills and valleys, and ſhadows in the moon, they were not ſtrait to reject what he taught, but to have, if not a kind of implicit faith, yet a great diſpoſition to believe what he delivered, as upon his own knowledge, about the figure and number of the planets. For they knew, that he had, and had already ſucceſsfully made uſe of a way of diſcovering celeſtial objects, that they were not maſters of, nor therefore competent judges of all the things, though they might well be of many, that he affirmed to be diſcoverable by it. And though they could not ſee in the moon what he obſerved, (vallies, mountains, and the ſhadows of theſe) yet they might juſtly ſuſpect, that the difference of the idea that they framed of that planet, and that which he propoſed, might well proceed from the imperfection of their unaided ſight; eſpecially conſidering, that what he ſaid of the differing conſtitution of what is there analogous to ſea and land, did rather correct and improve, than abſolutely overthrow their former notices. For he allowed the ſpots they ſaw to be darker parts of the moon, and gave cauſes of that darkneſs, which their bare eyes could not have led them to any ſuch knowledge of. And the non-appearance of the mountainous parts of the moon in that form to the naked eye might well be imputed to the great diſtance betwixt them and us, ſince at a far leſs diſtance ſquare towers appear round, *&c.*

XXI. It now remains, that I ſay ſomething, that may both make ſome application of the form of ſpeech hitherto diſcourſed of, and afford a confirmation of the grounds, whereon I think it may be juſtified. This I am the rather induced to do, becauſe I expect it will be objected, that he that acknowledges, that the thing he would have us believe, tranſcends our reaſon, has a mind to deceive us, and procures for himſelf a fair opportunity to delude us, by employing an arbitrary diſtinction, which he may apply as he pleaſes.

XXII. But to ſpeak firſt a word or two to this laſt clauſe, I acknowledge, that ſuch a diſtinction is capable enough of being miſapplied; and I am apt to think, that by ſome ſchool-divines, and others, it has been ſo. But ſince there are other diſtinctions, that are generally and juſtly received by learned men, and even by philoſophers themſelves, without having any immunity from being capable to be perverted; I know not, why the diſtinction we are conſidering ſhould not be treated as favourably as they. And however, the queſtion at preſent is not, whether our diſtinction may poſſibly be miſapplied by raſh or impoſing men, but whether it be grounded on the nature of things. To come then to the thing itſelf; I conſider, that for an opinion to be above reaſon, in the ſenſe formerly aſſigned, is ſomewhat, that (as was noted in reference to the firſt ſort of things that ſurpaſs it) is extrinſical and accidental to its being true or falſe. For to be above our reaſon is not an abſolute thing, but a reſpective one, importing a relation to the meaſure of knowledge, that belongs to the human underſtanding, ſuch as it is ſaid to tranſcend: and therefore it may not be above reaſon, in reference to a more enlightened intellect, ſuch as in probability may be found in rational beings of an higher order, ſuch as are the angels, and without peradventure, is to be found in God, whom when we conceive to be a being infinitely perfect, we muſt aſcribe to him a perfect underſtanding and boundleſs knowledge. This being ſuppoſed, it ought not to be denied, that a ſuperior intellect may both comprehend ſeveral things, that we cannot, and diſcern ſuch of them to be congruous to the fixed and eternal ideas of truth, and conſequently agreeable to one another, as dim-ſighted mortals are apt to ſuſpect, or to think to be ſeparately falſe, or, when collated, inconſiſtent with one another. But to launch into this ſpeculation would lead me farther than I have time to go. And therefore I ſhall content myſelf to offer you one argument, to prove, that of things, that may be ſaid to be above reaſon, in the ſenſe formerly explained, it is no way impoſſible, that even ſuch an one ſhould be true, as is obnoxious to objections not directly anſwerable. For I conſider, that of things above reaſon, there may be ſome, which are really contradictory to one another, and yet each of them is maintainable by ſuch arguments, as very learned and ſubtile men do both acquieſce in and enforce, by loading the embracers of the oppoſite opinion with objections they cannot directly anſwer.

XXIII. This I take to be manifeſt in the caſe of the controverſy about the endleſs diviſibility of quantity, as ſuppoſe of a ſtrait line. For many eminent mathematicians, and a greater number of naturaliſts, and in particular almoſt all the Epicureans, and other atomiſts, ſtiffly maintain the negative. The affirmative

affirmative is nevertheleſs aſſerted, and thought to be mathematically demonſtrated by *Ariſtotle* in a peculiar tract; and both by his ſchool, and by ſeveral excellent geometricians beſides. And yet in reality the aſſertions of theſe two contending parties are truly contradictory; ſince of neceſſity a ſtrait line propoſed muſt be, at leaſt mentally, diviſible, into parts, that are themſelves ſtill further diviſible; or it muſt not be ſo, and the ſubdiviſions muſt at length come to a ſtop. And therefore one of the oppoſite opinions muſt be true. And it is plain to thoſe, that have, with competent ſkill and attention, impartially examined this controverſy, that the ſide, that is pitched upon, which ſoever it be, is liable to be expoſed to ſuch difficulties, and other objections, as are not clearly anſwerable, but confound and oppreſs the reaſon of thoſe, that ſtrive to defend it.

XXIV. I HAVE, Sir, the more largely diſcourſed of the foregoing diſtinction, not only becauſe I did not find myſelf to have been prevented by others, but becauſe I look upon the explaining and juſtifying of it to be of importance, not alone to the defence of ſome myſteries of the Chriſtian religion, but (what perhaps may have eſcaped your obſervation) of ſome important articles of natural theology itſelf. For though natural religion taught divers heathen philoſophers, ſuch truths as theſe, *viz.* the production of the rational ſoul or mind, which is an immaterial ſubſtance; the formation of the world out of the univerſal matter, though this action required, that an incorporeal ſubſtance gave motion to a body; that God knows men's thoughts and intentions, how carefully ſoever they ſtrive to hide them; and that God foreknows the events of the free actions of ſuch men, as are not to be born theſe many ages: though, I ſay, theſe and ſome other ſublime truths were by divers men embraced before the goſpel began to be preached; yet when I attentively conſider, how hard it is to conceive the modus of theſe things, and explain how ſome of them can be performed; and alſo, how ſome of the divine attributes, as eternity, immenſity, omnipreſence, and ſome others, belong to God; and how ſome actions, as the moving of bodies, and the creation of human minds, with all their noble faculties, are exerciſed by him: when I conſider ſuch things, I ſay, I acknowledge, that, to my apprehenſion, there are ſome doctrines allowed to have been diſcovered by the mere light of nature, that are liable to ſuch objections from phyſical principles, and the ſettled order of things corporeal, as, if they be urged home, will bring thoſe, that are ingenuous, to acknowledge, that their intellects are but dim and imperfect, and indeed diſproportionate to the ſublimeſt and moſt myſterious truths; and that they cannot perfectly comprehend them, and anſwer all the difficulties that incumber them, though they find themſelves obliged to admit them, becauſe of the weighty poſitive reaſons, that recommend thoſe heteroclite truths to their aſſent.

XXV. IF you ſhould now tell me, that after all I have ſaid, it is plain, that the queſtioned diſtinction, if it were granted, might be of very bad conſequence, as affording ſhelter to any unintelligible ſtuff, that ſome bold enthuſiaſt, or conceited philoſophizer, may obtrude under the venerable title of a myſtery, above the juriſdiction of reaſon; and that, though the diſtinction were admitted, it would not be a good proof of any diſputed article of the Chriſtian religion: if, I ſay, this ſhall be objected, I ſhall anſwer, (what in part is intimated already) that I do not deny, but that our diſtinction is liable to be ill employed; but that this is no other blemiſh than what is common with it to divers other diſtinctions, that are without ſcruple admitted, becauſe they are uſeful, and not rejected, becauſe they have not the privilege, that they can never be miſapplied. And therefore, both in reference to thoſe diſtinctions, and to that we have been treating of, it becomes men to ſtand upon their guard, and ſtrictly examine, how far the notion, or doctrine, propoſed as a myſtery, does require, and is entitled to the benefit of this diſtinction. I ſhall alſo readily grant the greateſt part of the ſecond member of your objection. For I think it were great weakneſs in a Chriſtian, to urge our diſtinction as a poſitive proof; ſince, though it be extrinſical to an abſtruſe notion, to be, or not to be, above reaſon, (as was juſt now noted to another purpoſe;) yet generally ſpeaking, that abſtruſeneſs is leſs fit to bring credit to a conception, or a doctrine, than it is to make it to be diſtruſted. Nor are Chriſtians ſuch fond diſcourſers, as to pretend, that ſuch an article of religion ought to be believed, becauſe it is above reaſon, as if that were a proof of its truth; but only, that if it be otherwiſe well proved, it ought to be believed, notwithſtanding its being above reaſon.

XXVI. AND this I ſhall repreſent in favour of thoſe, that believe theſe abſtruſe articles, that are clearly revealed in the ſcripture, upon the authority of the divine revealer, (who never deceives others, nor can be himſelf deceived,) that ſince, as we have lately ſhewn by the contradictory opinions about the diviſibility of quantity, ſome doctrines muſt be true, whoſe difficulties do not appear to be ſurmountable by our dim reaſon; and ſince the perfectneſs of God's knowledge permits us not to doubt, but that he certainly knows which of the two contending opinions is the true, and can declare ſo much to men; it would not be a ſure ground of rejecting a revealed article, to alledge, that it is encumbered with confounding difficulties, and liable to many and weighty objections.

XXVII. AND, (to add ſomewhat, that may help to defend ſome truths of natural, and others of revealed religion) that a thing may be rationally aſſented to upon clear poſitive evidence, though we cannot directly anſwer the objections, that a ſpeculative and ſubtil wit may deviſe againſt it, is a truth, which, as important as it is to religion in general, and the Chriſtian religion in particular, I think one

one may ſufficiently manifeſt by this one inſtance, that becauſe we can walk up and down, and ſo remove our bodies from place to place; by this one argument, I ſay, we are juſtly ſatisfied, that there is a local motion in the world, notwithſtanding all the ſpecious and ſubtil arguments, that *Zeno* and his followers have employed to impugn that truth: againſt which they have alledged ſuch difficulties, as have not only puzzled and perplexed, but (for aught yet appears) nonplus'd the ancient philoſophers, and, I doubt, thoſe moderns too, that have attempted to give clear ſolutions of them.

XXXVIII. If now, Sir, we look upon what hath hitherto been diſcourſed, I hope you will allow me to gather thence the concluſion I aim at, which is, that there is no neceſſity, that every notion or propoſition, that may be found delivered in the holy ſcriptures, that ſurpaſſes our reaſon, muſt therefore be contradictory to it: and that in caſe the Chriſtian religion be true, and its myſteries or other articles divinely revealed, it is not enough for the confution of any of them, to reject the expreſſion, that it is above reaſon, but not contrary to it; as if it involved an unintelligible or groundleſs diſtinction: for though this will not evince the truth of a myſtery, ſince that muſt be eſtabliſhed upon its proper grounds and arguments; yet it will keep it from being therefore abſurd or falſe, becauſe it tranſcends our reaſon: ſince to do ſo may belong almoſt indifferently to a chimerical notion, and a myſterious truth. And if the expreſſion be employed to juſtify any thing, that, though ſtiled a myſtery, is but a pretended one, the error will lye, not in the groundleſſneſs of the diſtinction, but the erroneouſneſs of the application. I am,

SIR,

Your moſt, *&c.*

GREATNESS of MIND

PROMOTED BY

CHRISTIANITY.

In a LETTER to a Friend.

The FIRST PART.

To my honoured Friend Sir *R. M.*

SIR,

I DO not wonder, that a great ſoul, like yours, ſhould enquire, what aſpect religion, and particularly that of Chriſtians, has upon *greatneſs of mind:* but I confeſs, I ſomewhat marvel, that you ſhould be put upon the enquiry by the ſuggeſtions of ſuch a libertine as Mr. *N. N.*'s confidently pretending, that his atheiſtical and ſenſual principles are much more friendly, than the doctrines of Chriſtianity, to a noble frame of mind. Wherefore I dare not permit the ſenſe I have of my own weakneſs, how great and juſt ſoever, to keep me from preſenting you with my thoughts; and the rather, becauſe I preſume you are not indiſpoſed to receive a ſatisfaction in this point, ſince you ſeem to expect it from a pen, that is no better than mine; which, you well know, muſt not be on this occaſion aſſiſted by the arguments and ornaments, that the fine ſentences of the fathers, and other divines and humaniſts, might afford to a perſon, that were at leiſure, and furniſhed with a library. Yet I ſhall not much either excuſe or deplore my being ſo ill accommodated for the taſk you impoſe upon me; becauſe as you ſeem to deſire but my own thoughts, ſo I know not, whether common place-books would afford me any great aſſiſtance on ſo uncommon a theme; and, I confeſs, that when the matter will bear it, I, as well as you, do leſs care for authorities, eſpecially taken from diſcourſes, deſigned rather to perſuade than prove, in compariſon of thoſe arguments, that are ſuggeſted by a due conſideration of the nature of the thing. But yet, I preſume, you will readily give me leave to do that frequently enough, which your friend perhaps will call preaching. For beſides that your deſires, and my haſte, confine me to the bible and

my own thoughts; the frequent citation of texts of holy ſcripture is exacted by the nature of the queſtion I am to handle: it being neceſſary for the evincing of the doctrines of Chriſtianity, not to be inconſiſtent with greatneſs of mind, that we as well conſider, what thoſe doctrines are, which ſure will be beſt declared by the ſcriptural texts that contain them, as what are the attributes of greatneſs of mind.

CHAP. I.

TO proceed then with ſome method, as well as much brevity, I conceive it will be no unfit way to come to a reſolution in our enquiry, if I firſt ſet down and enumerate the chiefeſt things, that in the eſtimation of intelligent men do, as if they were ſo many ingredients, make up what we call magnanimity or greatneſs of mind, that not being a ſingle ſtar, but a conſtellation of elevated and radiant qualities; and then ſhew, that religion, eſpecially that of the Chriſtians, is at leaſt conſiſtent with each of theſe, if it do not alſo promote it. But in this enumeration, though I ſhall, *ex abundanti*, take in ſome qualities, that are not eſſential to greatneſs of mind, but rather acceſſions to it; yet I ſhall not ſcrupulouſly diſtinguiſh thoſe things, that are neceſſary to compleat it, and thoſe that are partly ſome of them ſigns, and ſome of them effects of it; hoping from your equity, that theſe additional things will be thought to make full amends, if through haſte or miſtake I ſhould chance to have omitted any property, that you may judge to belong to the true notion of generoſity.

I SHALL, in the following diſcourſe, take it for granted (and I hope I need not tell you, that I do ſo) that as we think not maſons, but jewellers, fit to judge of the genuineneſs and value of precious ſtones; ſo you will allow me to take the notion and meaſures of greatneſs of mind, not from the opinions of the injudicious vulgar, but the judicious eſtimates of reaſon, improved by philoſophy, and enlightened by natural theology.

I KNOW, the undiſcerning multitude, whoſe judgment ſeems rather lodged in the eye than in the brain, when they hear men name greatneſs of mind, are apt to fancy ſomething, that, like the coronation of a king, is attended with pomp and ſplendor, and a numerous train of gazers, and the loud acclamations of the people. And, at leaſt, when mention is made of an heroick ſoul, they imagine, that it cannot be but in a great commander, like a Roman emperor, or a Tartarian general, that leads and defeats armies, and deſolates whole countries, and leaves them peopled only with carcaſſes. But reaſon and religion, that look on human things with eyes untroubled by thoſe pompous outſides, that dazzle the vulgar, can eaſily ſee a vaſt difference betwixt greatneſs of fortune and greatneſs of mind. And not only Chriſtianity teaches, that 'God, who is no 'Προσωπολήπτης, reſpecter of perſons,' *Acts* x. 34. 2 *Sam.* xiv. 14. 'ſees not perſons as man ſees 'them;' and that 'a thing, that is ſublime 'amongſt men, may be an abomination to him.' But philoſophers themſelves can eaſily diſtinguiſh betwixt that real greatneſs, that truly belongs to the man, and that theatrical one, that fortune may have annexed to his condition. And, though they pay a peculiar honour and reſpect to great virtue in ſovereigns, rather than in ſubjects, becauſe in the former it is more diffuſively beneficial, and cannot laſt without reſiſting ſtronger temptations; yet, they do not think, that a great empire always either finds, or makes, a great ſoul. And if dignities, how high ſoever, be attained by mean ſubmiſſions, or weak actions, they think this extrinſecal greatneſs can no more make a mean ſoul great, than high ſtilts can make a dwarf a proper man. Perhaps they look upon many, who, for making a great buſtle and noiſe in the world, are, by themſelves, and the ſhallow vulgar, thought great ſpirits, but as gnats, that are in themſelves ſmall and worthleſs creatures, and are really conſiderable for nothing, ſave the noiſe and the ſtings wherewith they are able to diſturb mens reſt. That lucky monarch, that overcame ſo great a part of the then known world, and conquered countries, faſter than one would have thought he could have travelled over them, has this character given of his ſtupendous exploits by the Roman hiſtorian, that all he had done was, 'that he durſt well 'deſpiſe deſpicable things.' And in a poet of the ſame nation this is his elogy,

Fœlix terrarum prædo, non utile mundo
Editus exemplum.

AND if ſuch perſons as they had ſo little reſpect for ſo great a monarch, that was a lawful ſovereign; what liberty, think you, do philoſophers allow themſelves, who ſo little value the favourites of fortune for their being ſo, that even ſuch as thoſe proſperous uſurpers, *Phocas*, *&c.* that her fondneſs, and the applauſe of a multitude (as blind, perhaps, as ſhe is painted) have ſeated in the throne? Philoſophers, in their thoughts, do as well doom to a ſcaffold, as religion does to hell. And certainly, true greatneſs of mind muſt be ſomething, that both reſides in the ſoul, and is perfective of it; neither of which properties belong to any thing, that fortune can beſtow: and all that outward greatneſs can do is not to make a ſoul great, but to afford one, that is, the opportunity of ſhewing itſelf to be ſo. And all theſe ſubmiſſions and reſpects, that cuſtom, or fear, or intereſt make men pay to thoſe, whom only their titles, or their places, or their power, makes great ones, do as little argue or increaſe the real worth of thoſe envied perſons, as the ſtanding for more than formerly in an account turns a braſs counter into ſilver or gold. And as no leſs ſkill in arithmetick is required, to multiply, *&c.* a thouſand farthings than a thouſand guineas; though one of the latter be worth almoſt a thouſand of the former; ſo the ordering or diſpoſing of all things according to

the beſt rules, and after the beſt manner they are capable of, may argue no leſs greatneſs of mind in a private man, than is exerciſed by a great monarch, in thoſe actions, that attract the eyes, and buſy the tongues, of nations. And as it uſually ſpeaks a man a better artiſt to make a pocket-watch, than a great town-clock, all the advantage the latter has of the former conſiſting in the greatneſs of the matter that is wrought, and not that of the ſkill, that is diſplayed; ſo it ſometimes happens, that thoſe productions of virtue argue a greater ſoul, that make by far a leſſer ſhew and noiſe. And you may remember, not only that *Socrates*, notwithſtanding his private, and even neceſſitous, condition, was by the oracle preferred to all the Grecians, when *Greece* was the theatre of generous minds; but, that a far truer oracle than that of *Delphos* pronounced the poor widow's mind, and circumſtances, to have made her mite a greater liberality, than all that the rich man had beſtowed upon the Corban. And it is the ſentence of no worſe a judge than *Solomon*.

Mark xii. 43. Prov. xvi. 32.

LET us not then, from the mean notions of the vulgar, and the fond opinions of common ſouls, take our eſtimates of ſo ſublime and extraordinary a quality, as greatneſs of mind. For many things, to which they give not only their approbation but their applauſe, are, and ought to be, as little eſteemed, if they be condemned by the wiſe, as a piece of braſs money, that has long paſſed current among the people, ought to be thought good gold, when refiners and ſay-maſters have declared it counterfeit. And if you aſk me, what notion then of greatneſs of mind I am willing to allow, I ſhall freely tell you, that, in my apprehenſion, the man, that has a great mind, is he, that uſes his utmoſt moral diligence to find out what are the beſt things he can do, and then, without being deterred by dangers, or diſcouraged by difficulties, does reſolutely and ſteadily purſue them, as far as his ability and opportunities will ſerve; and this out of an internal principle of love to God and man, and with a ſincere aim to glorify the one, and benefit the other.

CHAP. II.

BUT, before I deſcend to particulars, it will not be amiſs to take notice of one conſideration, that may, in general, make it probable, that the Chriſtian Religion is rather favourable, than oppoſite, to true magnanimity. That this argument may make ſomewhat the more impreſſion, I ſhall, though very briefly, obſerve, that the aſpects, both of the author, the rules, the aims, or ſcopes, and the rewards of virtue, as it is recommended by Chriſtianity, have a great and direct tendency to elevate it, and make it heroick.

AND firſt, the prime author of the doctrine of the goſpel being God himſelf, who both knows man perfectly, and is mentioned in ſcripture as a φιλάνθρωπος, or lover of mankind; it is but reaſonable to ſuppoſe, that the doctrines and laws he cauſed to be ſolemnly delivered to mankind, and confirmed by miracles, and whoſe ſyſtem is, in the Apocalypſe, honoured with the title of the ever-laſting goſpel, (*i. e.*) not to be ſucceeded by a more perfect inſtitution, as the Moſaick law was by that; ſhould be fitted to beget and advance ſolid and ſublime virtue, and be, more than any other inſtitution, perfective of human nature.

Tit. iii. 4.

Revel. xiv. 6.

NEXT, the rules, and (if there be any ſuch) the counſels of the Chriſtian religion require, and tend to, extraordinary degrees of virtue. The divine legiſlator, being able to look into the hearts of men, makes his laws reach thoſe, and thoſe principally too. The "loving God with all our hearts, with "all our minds, *&c.* and our neighbour as "our ſelves," as comprehenſive as thoſe two grand principles of virtue are, is by our Saviour made the ſummary of the moral law, and adopted into the goſpel; the "cleanſing our "ſelves from all filthineſs, both of fleſh and "ſpirit;" and the "abſtaining from all kind, "or appearance, of evil," are the negative parts of the Chriſtian's duty; and for the poſitive parts, we are plainly told, that, "unleſs "our righteouſneſs exceed that" boaſted one "of the ſcribes and phariſees, we ſhall not "enter into the kingdom of heaven." We are urged to "grow in grace, to add to our "faith, virtue," and to that, a whole train of excellent qualities. And, for fear any ſuch thing ſhould be thought to be purpoſely omitted, becauſe left unmentioned, this general exhortation is given us; "finally, my bre-"thren, whatſoever things are true, *&c.*". But there is yet a more aſpiring path of virtue traced us out in the goſpel, where it propoſes to us the example of Chriſt, as one, whoſe ſteps we are to tread in: for not only that divine perſon never committed any ſin, neither was guile found in his mouth; but the ſupreme and omniſcient judge, God himſelf, declared, by a voice from heaven, his full approbation, both of his perſon, and his doctrine, when he ſaid, "this is my beloved "ſon, in whom I am well pleaſed, hear ye "him." And his ſinleſs life, which was a living law, did not only ſurpaſs the examples, but even the precepts and the idea's too, of the heathen moraliſts and philoſophers, as may be elſewhere ſhewn. And the becoming a ſerious diſciple of ſo perfect and divine a teacher does itſelf ſo engage a man to renounce his former vices, that when St. *Paul* had diſſuaded his Romans from divers other vices, inſtead of exhorting them to the contrary virtues in particular, he only deſires them, in general, "to put on the Lord Jeſus "Chriſt," as a comprehenſive duty, which contained in it all tho virtues, he declined to enumerate.

Mat. xvii. 5.

Rom. xiii. 14.

THIRDLY, but though he calls us to high degrees of virtue, yet he does not to unattainable ones: for, though philoſophy wiſely forbore, though not always to commend, yet to enjoin things diſproportionate to human infirmities; yet he may well be allowed to engage us to more than human virtues, that by his

his divine aſſiſtances, if they be duly ſought, is always ready to enable us to acquire and practiſe them. Of his "fulneſs," ſays St.
John i. 16. *John*, "we have all received, and grace for "grace;" (*i. e.*) either graces anſwerable to his, as the faculties of a child's mind are to thoſe of a perfect man; or, grace upon grace, (*i. e.*) an accumulation of graces heaped upon one another; which may keep you from wondring, that St. *Paul* ſhould dare to ſay,
Phil. iv. 13. "that he could do all things through Chriſt, "that ſtrengthened him." And where his invitations meet with an honeſt and a willing mind, his commands do not only chalk out the way, but give ſtrength to walk in it; and he uſually does, by his ſpirit, ſuch a kind of work, as he ſometimes did miraculouſly by his power, when he at once bid, and enabled
Matt. 9. 6. a paralytick perſon, that wanted ſtrength to ſtir from his bed, to riſe and walk; and
Matt. xiv. 29. when, having commanded St. *Peter* to walk to him upon the ſea, he enabled him ſecurely to tread upon the waves; thereby approving and rewarding the excellent notion that diſciple had, that the command of Chriſt was a ſufficient cauſe to put him upon action, though a miracle were requiſite to carry him through with it.

FOURTHLY, the rewards propoſed to virtue and piety by the Chriſtian religion do exceedingly tend to animate and heighten them, whether we conſider the recompences the goſpel propounds in this life, or thoſe that it promiſes in the next. The great preſent rewards of virtue are, you know, the approbation of good men, and the applauſe of a man's own conſcience. The firſt of theſe is as well attainable by Chriſtian heroes, as by any other; for virtue loſes neither its worth, nor amiableneſs by being baptized; and though in ſome times and places leſſer degrees of it may be diſregarded, or traduced, yet, generally ſpeaking, the greater degrees of it will either invite or extort mens eſteem. Among the Roman perſecutors, the exemplary lives and conſtancy of the primitive Chriſtians brought it to be proverbially ſaid, *that ſuch a man was a good man, ſaving that he was a Chriſtian*; and, *Soli Chriſtiani mortis contemptores* was uſually in heathens mouths. There are divers qualities, and thoſe more preſſed by the Chriſtian, than any other inſtitution, that have in them ſo much of native lovelineſs, that St. *Paul* might juſtly ſay of
Rom. xiv. 18. them, "that he that exerciſes himſelf in "them," is generally ſpeaking, "both accept-"able to God, and approved by men." Nor did thoſe virtues, that recommended the great *Conſtantine*, whilſt he was a Gentile, loſe their luſtre, or the veneration they procured him, when he turned Chriſtian, and practiſed them with higher aims, than that of ſatisfying himſelf, and pleaſing his people.

AND as for the reward of a good conſcience, which was able to make *Hercules* undergo all his labours, and made all the other heroes of the Gentile world; I think, it will not be doubted, but that this inward recompence is received, not only without any defalcations, but with great improvements, by him, whoſe virtues flow from religion. For to him the applauſes of conſcience may well be more acceptable than all the various ſorts of muſick, that ſolemnized the dedication of *Nebuchadnezzar*'s golden image, ſince in him
Dan. iii. 7. conſcience does not, as in mere natural men, act only the part of a domeſtick judge, but that of a delegate from God himſelf; and its abſolutions are leſs welcome, as they are approbations of reaſon, than as they are the pledges of God's acceptance, and of that higher reward, that will be conſequent to it in the life to come.

FOR theſe joys, that are placed on the other ſide of the grave, are much the nobleſt part of the recompence of virtue, and proportionable incitements to the practice of it; and yet on the account of future rewards, the Chriſtian has much greater motives to heroick virtue, than the heathen moraliſt or philoſopher. For the poſthume ſtate of man is ſo dim and uncertain, that we find even the greateſt men among the heathens ſpeak very doubtfully, and not without ifs and ands of a future ſtate, and much more of a future happineſs, as may be inſtanced in *Socrates*, *Cyrus*, *Seneca*, and many others; ſo that they rather ſeemed to have wiſhed, or hoped, than believed their future felicity: and, I fear, that many of them, finding that happy ſtate deſcribed chiefly by the poets, reckoned it among poetick fictions. And thoſe, that did, though but waveringly, expect recompences in the life to come, had but poor and mean ideas ſuggeſted to them of it; the hopes they were entertained with being of fortunate iſlands and the Elyſian fields, which are not ſo tranſcendent, as to make a diffident man very forward to quit the gardens of *Epicurus*, that he has here in poſſeſſion, upon the doubtful hopes of other gardens in *Elyſium*. Whereas to excite the Chriſtian to an heroick degree of virtue, he is not allowed to hope, but commanded to be entirely confident of paſſing out of this world into a place, to which the poets Elyſium is much more inferior, than the poſſeſſion of a garden is to that of an empire. To attempt the deſcription of that celeſtial happineſs, would be, contrary to my inclination, to launch out into a common place; and were a work, that if my haſte did not, my diſability would diſſuade me from: and therefore, though it be a ſtate made up of the confluence of all ſorts of things rationally deſirable, yet having only ſaid in general of all the other goods, that it comprizes, that the ſcripture tells us, "that
"eye has not ſeen, nor ear heard, nor the
1 Cor. ii. 9. "heart of man conceived, what God has laid "up for them that fear him;" I ſhall particularly take notice only of thoſe parts of this ineſtimable reward, that may peculiarly concern my preſent purpoſe, by being the chief things, that heroick ſouls are wont to aſpire to, a good name, honour, and dignity.

To have a good name for good actions, cannot but be a very deſirable thing, the applauſe of wiſe and good men being a loud

eccho

eccho from without, that by repeating it confirms the approbation given by the conſcience within. But though to do virtuous and worthy actions be the beſt and likelieſt way of acquiring a good name, yet it is not a certain one: for ſuch is the ignorance, the malice, or the enmity of a great many, that no man is ſure to eſcape being miſrepreſented or traduced, as we ſee, that the ſublimity, the brightneſs, and the regular courſes of the ſtars themſelves, could not hinder wanton poets, or fanciful aſtronomers, from giving thoſe luminous conſtellations the names not only of the nobler beaſts, as the lion, the eagle, and the whale; but even of animals, that lye under an ill name, as the dog, the goat, and ſcorpion. And though it be true, that oftentimes innocency long clouded does, like lightning, break out at laſt; yet oftentimes too that happens not, till malice and envy are dead, becauſe the maligned perſon is ſo; by which means he does not live to know he is juſtified, and many, if not all of thoſe miſinformed men are dead and gone, for whoſe good opinion he was chiefly concerned. But though the Chriſtian may, as well as any other, be traduced by calumny, which often ſerves good men, (as the heathen perſecutors did the martyrs, when they expoſed them to the people's view, clothed in the ſkins of beaſts, to make them hideous and hateful;) yet he is juſtly cheered by the aſſurance he has, that there will come a time, when oppreſſed and disfigured innocency ſhall ſhine forth and triumph, and his good name, as well as his body, ſhall have a glorious reſurrection, even in the ſight of his accuſers and enemies, and of all thoſe, whom their ſlanders did either prevail with, or ſtartle. For at that great and general aſſize, to which there ſhall be a far greater confluence, than the Aſſyrian monarch drew to the plains of *Babylon*, the heroick diſciples of the apoſtles will be able to ſay, upon happier terms than the apoſtles themſelves did here below, that they are made a "ſpectacle "to God, to angels, and to men." And in that illuſtrious aſſembly of the "firſt born, "whoſe names are written in heaven," being preſent, the men, not only of all nations, but of all ages, the vizards ſhall be as well taken off as the maſques; and the formerly traduced ſaints being welcomed with the title of "good "and faithful ſervants," ſhall ſolemnly be acquitted by the ſentence, not of a fallible or partial judge, but of an infinite and ſupreme one, "that ſearches the hearts and "reins, and cannot be deceived or bribed; and to be ſure, that the injured ſaint ſhall come off with honour enough, he ſhall then be abſolved by being crowned.

Dan. iii. 1 Cor. iv. 9. Heb. xii. 23. Matt. xxv. 21. Jer. xvii. 10.

THIS celeſtial crown comprehending, in the ſcripture dialect, both the remaining parts of the Chriſtians reward, honour, and dignity, or glory, and preferment; it will be pertinent to mention ſome advantages, that give it an high preference above the crowns of monarchs here below.

AND firſt, earthly crowns may ſometimes be the fruits and recompences of worth and virtue, but are not at all the proofs of them. They are uſually the gifts of nature, and not unfrequently of fortune; and hiſtory gives us cauſe to wiſh, they were more ſeldom the acquiſts of crimes. But the celeſtial crowns proclaim, though not the merit, the worth of them that receive them, being never adjudged but to ſuch, whom previous graces and virtues have fitted and qualified for "the "inheritance of the ſaints in light." Col. i. 12.

BESIDES, as an earthly crown may be acquired without merit, ſo it may be poſſeſſed without happineſs. And if crimes be made ſteps to a throne, they prove ſo many thorns to him that ſits on it, who is there a more illuſtrious, not a leſs tormented malefactor; the ſublimity of a throne, as little as the height of a ſcaffold, keeping a criminal perſon from feeling the puniſhments inflicted on him there. As may appear by the inſtance of *Herod Agrippa*, whoſe throne, and gliſtering habit, which *Joſephus* takes notice of, though they procured him not only the acclamations, but adorations of the dazzled multitude, could not protect him from the incenſed juſtice of an higher king than he; ſo that whilſt others treated him as a god, he found himſelf one of the moſt miſerable of men, and was fain to haſten from a ſeat, which occaſioned, but could not protect his impiety. But a celeſtial crown, as it is graciouſly beſtowed for the ſupreme recompence of virtue, and on that account may be called a crown of righteouſneſs; ſo it always proves a bleſſing, as inſeparable from happineſs, as a thing is from itſelf. The crowns of this world, by the very advantage of being hereditary, ſhew, that they cannot preſerve the poſſeſſors from death. But the crown I ſpeak of, is by the divine beſtower of it, called "a crown "of life;" and of it, in reſpect of other crowns, may be truly ſaid, what *Solomon* ſaid of wiſdom, in reference to other goods, that "the excellency of it is, that it gives life to "the owner thereof." And though earthly crowns be ſuch tranſitory things, that we may obſerve, that even the four great monarchies of the world were by God repreſented to *Nebuchadnezzar*, but as parts of a dream, whereas the kingdom promiſed to Chriſtians, is called in the ſcripture "a kingdom that "cannot be moved," as the believers crown is, in oppoſition to thoſe fading crowns of laurel, that adorn the heads of the Roman conquerors, called an "unwithering crown of glory:" as if the laurel placed on the Chriſtian's head, could grow and flouriſh in the wreath, better than it did on the tree. Acts xii. 21. Rev. ii. 10. Eccl. vii. 12. Dan. ii. Heb. xii. 28. 1 Pet. v. 4.

BUT all that I have yet ſaid is inferior to this laſt prerogative of the celeſtial crown, that it does not only confer a relative dignity or pre-eminence, but an eſſential worth and excellency; as if the diamonds, which adorned that crown, ſhould impart their own ſparklingneſs, tranſparency, and incorruptibility, to the perſon that wears it. The higheſt preferments here below do raiſe a man above others, without raiſing him above himſelf. By being at the top of a ladder, a man comes

to an higher ſtation, but is not really taller than he was; and a vane, by being placed on the top of the higheſt ſteeple, is not from iron turned into gold or ſilver, but remains ſtill of the ſame baſe metal it was, and is but a weather-cock, and ſo the ſport of the winds. But a celeſtial crown is always attended with a perſonal improvement, befitting ſo high a dignity. The heavenly coronation has a virtue like that of the unction of *Saul*, who, upon his being made king, was enabled to propheſy, and was turned into another man. And the reſemblance holds in this too, that Chriſt is ſaid to have made his redeemed ones, not only "kings, but prieſts to God "and his Father," as if the kingly dignity were not enough, unleſs the ſacred character of a prieſtly office were added. Congruouſly to which, St. *Peter* calls Chriſtians, in general, a "royal prieſthood;" the underſtanding, the will, the affections, are all refined and elevated; and the very body itſelf is transformed into a ſpiritual body. As if the glorified ſoul did ſhine, with an undiminiſhed ſplendor, through its happily changed manſion. And we may well ſuppoſe, that this will be a bright and noble ſtructure, if we remember, that the angels, who, in their appariti-ons to good men, were wont to be very careful not to frighten them, did yet appear with a majeſtick ſplendor; and that angel, that the apoſtles ſaw in our Saviour's ſepulchre, is repreſented, as a young man clothed "in a long "white and ſhining garment." And we are told by St. *Paul*, that, in the future ſtate, "our vile bodies ſhall be transformed into "the likeneſs of his glorious body;" and how glorious it is in heaven, we may gueſs, by what it was at his transfiguration here on earth, during which, the ſcripture relates, "that his face did ſhine as the ſun, and his "raiment was white as the light." And of *Moſes* and *Elias*, though they came to ſpeak to him of his death, it is added by St. *Luke*, "that they alſo appeared in glory." And ſince our Saviour has aſſured us, that "thoſe "that ſhall be accounted worthy of that ſtate," ſhall be like, or equal to the angels; and that then the "righteous ſhall ſhine like the ſun "in the kingdom of their Father," who knows but, that the transfigured ſoul and body of ſome happy ſaint may be as glorious a ſight, as that which appeared to St. *John* in the Apocalypſe, when he ſaw an angel "ſtanding in "the ſun?" If it be ſaid, that theſe are very bold hyperboles, I hope the texts, I have mentioned, will keep them from ſeeming altogether groundleſs conceits. And when, among other excellent prerogatives, that our Saviour promiſes the perſevering believers, one is, "that he will give them power over "the nations, and to rule them with a rod of "iron;" and the other, which may well be the laſt, is expreſſed in theſe words. "To "him that overcometh, will I grant to ſit "with me in my throne, even as I overcame, "and am ſet down with my Father in his "throne." And though I readily yield, that theſe expreſſions are not to be ſtrictly and literally taken; yet, when I conſider the infinite power, and goodneſs of God; and that, for ought we know, he may have numberleſs dominions, and ſets of governable creatures, that we are yet ſtrangers to; I think, God's attributes, and Chriſt's expreſſions, may warrant us to expect amazing things from him, that is able, and has declared himſelf willing, to do for us "above what we can aſk, or," in our preſent ſtate, ſo much as "think." And, at leaſt, that will be allowed me, which I drive at in this celebration of our future happineſs, that the Chriſtian religion, by propoſing ſuch ineſtimable rewards, preſents believers with far higher motives to heroick virtue, than morality, or philoſophy, can afford other men.

ADVERTISEMENT.

THE author being deſired to add yet ſomething to the foregoing diſcourſes, to give the book they make parts of, a thickneſs more proportionate to its largeneſs; he did, among other papers of his, that he turned over, in compliance with that requeſt, light upon an epiſtolary diſcourſe, which by its very being unfiniſhed ſeemed (by reaſon of its ſhortneſs) the more fit to ſerve the preſent turn. For this tract having been drawn up in a country, whence the author was obliged to remove, before he had made any conſiderable progreſs in his work; he was eaſily induced to put it up in a bundle of other writings, which, like this, were laid aſide, till he ſhould be at much leiſure to complete them. But, upon the newly mentioned occaſion, finding, that among divers looſe and leſſer memoirs, that had been thrown together in order to the deſigned treatiſe, there were fifteen or twenty pages at the beginning that were coherent enough; he was content they ſhould attend the Chriſtian virtuoſo, becauſe of the affinity of the things deſigned in both the papers; which being to recommend the Chriſtian religion to worthy ſouls, it was congruous enough, that a diſcourſe, which ſhews, that the Chriſtian religion may very well conſiſt with a philoſophick genius, ſhould be accompanied by another, that tends to manifeſt, that greatneſs of mind, which compriſes uncommon degrees of virtue, is not only conſiſtent with Chriſtianity, but may be highly promoted by it. Thoſe, that reflect on this aim, will not (it is hoped) think it ſtrange, that the ſtile is a little raiſed; ſince though the ſubject be theological, yet the writer (who was then many years younger than he now is) being a perſon of honour, and writing for a noble gentleman, who, like himſelf, was a layman; it was thought not only allowable, but fit, that the ſtile ſhould not be altogether unſuitable to the ſubject and to the aim; which was to make impreſſions on an illuſtrious perſon, not by dry precepts, or languid diſcourſes, but by exciting him to heroick virtue, by the nobleſt patterns and ideas, and the moſt moving incentives, he could propoſe.

AND

And though the diſcouragements lately mentioned, and ſince encreaſed by the author's not being able to find ſome of the principal materials he had, in looſe ſheets, provided for the following diſcourſe, oblige him to lay aſide the thoughts of compleating it; yet becauſe it is very poſſible, that ſome elevated ſoul may have a mind to proſecute the deſign, or cultivate ſo noble a ſubject; he thought it not amiſs (as little ſamples of his method or way of treating it) to ſubjoin to the greater fragment, beſides the index of the heads of diſcourſe, intended for the firſt part, five or ſix leſſer fragments, that he lighted on, whilſt he was ſeeking for ſome papers belonging to the ſame tract, that ſhould have been, but were not found in their company.

CHAP. III.

First fragment.

To have high aims and noble deſigns, is ſo genuine a mark, and effect of greatneſs of mind, that there is not any more generally acknowledged; inſomuch that ambition, though it be but a depravation or a counterfeit of this heroick frame of mind, does yet ſo dazzle the eyes of the greater part of men, as to paſs for magnanimity; and noble attempts do oftentimes, even when they fail of ſucceſs, not miſs of eſteem.

——*Magnis tamen excidit auſis,*

was meant for an encomium by him, that ſaid it. And I remember, that one of the ancients reckons it among the glories of that great captain *Hannibal*, who long ſucceſsfully diſputed with the Romans the empire of the world, that he reſolved to beſiege *Rome*, though he never proved able to lead his army within the ſight of her walls.

Now as to have elevated aims is one of the chief ſigns, and indeed parts of an heroick temper of mind; ſo there are no men, that ſeem to me to have nobler and ſublimer aims, than thoſe, to which a true Chriſtian is encouraged; ſince he aſpires to no leſs things than to pleaſe and glorify God, to promote the good of mankind, to improve, as far as poſſible, his perſonal excellencies in this life, and to ſecure to himſelf for ever a glorious and happy condition in the next.

CHAP. IV.

Second fragment.

One of the grand difficulties, that he, who would be highly virtuous, muſt expect to ſurmount and conquer, eſpecially in ſuch a degenerate age as ours, is the temptation, that is afforded by the univerſality of vicious cuſtoms and examples. I wiſh it were needleſs ſolicitouſly to prove, either how great an influence examples, eſpecially bad ones, have on the generality of men; or how general bad examples have been in moſt ages, and in particular in that we live in. The ſcandal given by bad examples, though it be one of the moſt obvious temptations, is none of the leaſt dangerous. For intereſt, baſhfulneſs, and that very complaiſance and civility, that is ſo uſually found in well-bred or good-natured perſons, makes them very unwilling to offend or diſoblige the company they live with, and whom they have ſeveral inducements rather to pleaſe and gratify by imitation and compliance, than tacitly to reproach by non-conformity to their ſentiments, and practices. And in effect we find, that many, that could not be perverted by the frowns and threats of the vicious, have been debauched by their company and example. Againſt this powerful temptation religion ſtrongly arms its hero, both by precepts and precedents. "Thou ſhalt not follow a multi-"tude to do evil," was the expreſs command of the Moſaic law. "Say not thou a confe-"deracy to all to whom this people ſhall ſay "a confederacy," was the command of God to his prophet. Our Saviour makes it an argument to diſſuade his diſciples from an anxious ſolicitude about meat and drink, and clothing, that after all theſe things the Gentiles (which are by far the moſt numerous part of mankind) do ſeek. And upon the ſame ground, he endeavours in the ſame divine ſermon upon the mount, to keep them from vain repetitions in prayer. And whereas it may ſeem an immodeſty to dare to diſſent from others, that vaſtly ſurpaſs us in number; the heroick conqueror of *Canaan* ſpeaks thus to the whole body of the victorious Jewiſh nation, that they may chooſe to ſerve whom they thought fit, and worſhip either the gods, whom their fathers ſerved, or thoſe worſhipped by the neighbouring nations; but as "for me and my houſe, we will ſerve the "Lord." "Be you not conformed to this "world," ſays St. *Paul*. And another apoſtle, ſpeaking of himſelf and the true Chriſtians of his time, ſcruples not to affirm it paſſionately and roundly, "we know, that we "are of God, and the whole world lies in "wickedneſs." 1 John, v. 9.

Nor does religion furniſh us with precepts only to diſobey cuſtom and example, but with precedents too, of which there are three ſo illuſtrious, that I know not how to paſs them by. The firſt is afforded by *Lot*, who lived in a place, that was grown ſo proverbial for the height of wickedneſs, that to aggravate their ſins by the moſt hyperbolical compariſon, we muſt liken them to themſelves; and they were grown ſo wicked, that in a place, where an admirable plenty, and an unbounded libertiniſm could not but make them very populous, there could not be found half a ſcore of good men, the generality of that curſed people being fallen ſo much, not only from virtue, but from common honeſty, that they did not reſtrain themſelves ſo much as to human vices. And yet, even the ſins of *Sodom*, which cried ſo loud as to reach heaven, and bring down fire and brimſtone from thence, diſturbed *Lot*'s quiet, without deſtroying his innocence; and an apoſtle aſſures us, that that "juſt man was but vexed with "the filthy converſation of the wicked," not prevailed with in the leaſt to imitate it.

The

THE next inſtance of a religious courage, inflexible to bad examples, is afforded us by the three friends of *Daniel*, who, at the great ſolemnity of the dedication of *Nebuchadnezzar*'s golden image; when they had, beſides that great and ſtern monarch's command, the example, not only of many men, but many nations, and a more numerous aſſembly of perſons, conſiderable for quality and dignity, than the world ever ſaw before or ſince, ſingly oppoſed their naked conſtancy to the haughty tyrant's menaces, and the proſtrate world's example. And yet theſe men were courtiers, bred among that ſupple ſort of fine creatures, that were as accuſtomed to bow their conſciences, as their knees to their proud maſter. They had not only lives to loſe, but the chief dignities of the province of *Babylon*, then the queen of nations. And they could not upon their refuſal quit the ſtatelieſt palace in the world, without immediately changing it for a burning fiery furnace.

THE laſt inſtance I ſhall name, and the moſt illuſtrious that can be named, is that I am ſupplied with by *Noah*: he lived in an age, in which there were as many heinous ſinners almoſt as there were men: though vice has generally had a *Benjamin*'s portion in the diſtribution of mankind betwixt it and virtue, yet *Methuſala* excepted, the inequality was grown ſuch, as gave vice rather a monopoly than a ſhare of men; or if a diſtribution were to be admitted, it was ſuch a one as that made of *Saul* and his army, when all the people were on one ſide, and only he and *Jonathan* on the other. It is ſtrange, that when the world was ſo recent, that many that were then alive might remember and converſe with one, that for two hundred years lived contemporary with *Adam*, (for ſo we may gather *Methuſala* to have done) men ſhould ſo ſoon forget all ſentiments of piety. But yet in *Noah*'s time the world could not be compared to its preſent ſtate, where though it be night in one place, it is day in another; but to the ſtate of *Tohu va Bohu*, or the firſt chaos, where darkneſs was over the face of the univerſal deep. For the ſcripture tells us, Gen. vi. 12. "that all fleſh had corrupted his way upon "the earth, that every imagination of the "thoughts of man's heart was only evil con"tinually." And though *Noah*'s family were ſaved with him in the ark, yet it may be doubted, whether that were a certain token of their being untouched by the general contagion. For that wonderful veſſel contained beaſts clean and unclean, harmleſs and rapacious, and in it were ſaved wolves as well as lambs, and vultures as well as doves. And where God gives the reaſon, why he vouchſafed to receive *Noah* and his houſe into the ark, he expreſſes it thus; "for thee have I "ſeen righteous before me in this generation," without making mention of any of his family. Nor was the wickedneſs of the antediluvian world more univerſal than it was great; that mungrel breed were guilty of ſins as gigantick as themſelves. The text ſays, "that the earth was filled with violence" through them; and thoſe impious rebels againſt their maker broke the laws of nature with an inſolence, that provoked him to break off the courſe of nature to puniſh them, ſince nothing leſs than an univerſal deluge of water could place limits to ſuch an impetuous and overflowing impiety. But all theſe ſinful examples, how general ſoever, could not prevail on *Noah* ſo much as to keep him from giving one of a quite contray nature: the ſcripture calls him an herald or "preacher "of righteouſneſs;" and though it appears 2 Peter ii. 5. not, that he made any converts, he perſevered in his rejected admonitions for ſix ſcore years, a time long enough to have tired his patience, eſpecially ſince he did not any of his hearers obſtinacy. And his conſtancy raiſed him as much above the reach of their temptations, as the waters that puniſhed their ſin raiſed his ark above their drowned manſions. And now go and compare with any conſtancy of the following times, where virtue has always had ſome party, though not a numerous one, this unequalled ſingularity of *Noah*, which God himſelf ſeems to have taken ſpecial notice of, not only by that patriarch's wonderful preſervation, but by ſaying emphatically, "thee have I ſeen righteous be- Gen. 7. i. "fore me in this generation," which was ſo brutiſh and depraved, that I know not, whether he were not obliged to live among worſe brutes before he finiſhed the ark than afterwards, when in it he was ſhut up with lions, foxes, and tygers.

ANOTHER virtue, that belongs to a great mind, is conſtancy, or perſevering patience in afflictions. This quality hath ſo noble an appearance, that when it is exerciſed even by malefactors, it obtains our eſteem; and whilſt we cannot ſo much as excuſe their actions, we cannot but commend the manner of their ſuffering for them: calmneſs of mind, in the midſt of outward ſtorms, being ſomething, that looks ſo handſomly, that crimes and gibbets cannot keep it from doing ſo; nor hinder thoſe, in whom it is found, from being both pitied and applauded. Third fragment.

THAT this part of greatneſs of mind is befriended by the Chriſtian religion, more than by any other inſtitution, will appear; if we conſider, what it contributes to conſtancy and patience, under outward preſſures and calamities, by precept, by examples, and by arguments.

CHAP. V.

HUmility is a virtue, that, at the firſt bluſh, ſeems ſo diſtant from greatneſs of mind, that ſome would think it improper to refer the former to the latter, under any other notion, than that of an oppoſite. But, whatever may be thought of humility, ſolitarily conſidered, yet, when we find it in conjunction with thoſe other qualities, that contribute to make up greatneſs of mind, it adds to their number; and though it does not perhaps ſhine as bright as ſome of them, is as amiable as any; and imparts ſomewhat of its Fourth fragment.

own lovelineſs to all the reſt. And you will not much wonder, that I place this virtue among thoſe that conſtellate, if I may ſo ſpeak, an heroick mind, if you conſider, whence humility may in ſuch a ſoul proceed, and what difficulties it may ſurmount. For if wealth, honour, and other outward bleſſings exalt our hero's condition; to be humble, in the midſt of ſuch advantages, argues a mind elevated above the preſents of fortune, and ſpeaks a ſoul great enough to undervalue thoſe things, that ordinary ſouls admire; and which even men, that paſs for great, make the objects of their ambition, and, when attained, of their pride. And if our hero be ennobled with great virtues, or famous for great actions; his humility argues, that he has ſo raiſed an idea of virtue, and dares aſpire to ſuch a pitch of it, that he cannot reſt ſatisfied with greater attainments, than perſons, but ordinarily virtuous, aim at; and looks upon himſelf as obliged and born to an unwearied purſuit of heroick and ſtill increaſing degrees of excellency. And if a laudable practice, by being extremely difficult, is a mark of a great ſoul, humility muſt not be denied that character; for this is a virtue more difficult to excellent, than to ordinary, ſouls. In other caſes, a hero is to contend but with his vices, or his paſſions, or his open enemies; but to be humble, he muſt overcome his virtues too; and that, when they act unitedly as one body: ſince, though other virtues naturally aſſiſt one another, they all conſpire to ruin humility; which, having pride to contend with, is to deal with ſo ſubtle an adverſary, that ſometimes even by being foiled he overcomes. And as the torpedo poiſons his arm, that wounds it; ſo ſometimes in the beſt arguments we employ againſt pride, the very ſtrength and ſeeming ſucceſs of them tempts the maker of them to be proud; and I will not ſwear, that, at this very time, I exalt our hero's humility, without any diminution of my own.

To the attainment of an eminent degree of this lovely both virtue and grace the goſpel conduces, by furniſhing its embracers with expreſs injunctions, clear directions, high rewards, and other weighty motives, and the nobleſt patterns and perfecteſt examples, that ever were or can be given.

The Heads of the Diſcourſe, entituled, *Greatneſs of Mind, befriended by Chriſtianity.*

The INTRODUCTION.

1. OF the true notion of greatneſs of mind. Fifth fragment.

2. OF the Tendency, that the Chriſtian religion has to promote greatneſs of mind in general.

3. THAT Chriſtianity gives men noble aims, ſuch as the glory of God, the pleaſing of him, the general good of men, perſonal excellencies in this world, and eternal happineſs in the next.

THE virtues or qualifications, which, as ſo many conſtituent parts, make up greatneſs of mind, and are peculiarly befriended by Chriſtianity, are chiefly theſe,

4. COURAGE or valour.
5. CONSTANCY and patience in afflictions.
6. BOUNTY or liberality.
7. FORWARDNESS to oblige.
8. READINESS to forgive.
9. A JUST and impartial eſtimate of riches, and other things, that ordinary men covet and admire.
10. HUMILITY.
11. A CONTEMPT of all that is baſe.

The end of the FIRST PART.

GREATNESS of MIND

PROMOTED BY

CHRISTIANITY.

The SECOND PART.

Sixth fragment.

THE former diſcourſe has, I hope, ſufficiently manifeſted, that, of the ſeveral virtues and noble qualities, that make up true greatneſs of mind, there is not any, that is not at leaſt conſiſtent with Chriſtianity, and that moſt of them are eminently promoted by it. But I expect your φιλήδονος will pretend, that there are ſome qualities required by our religion, that directly and powerfully tend to debaſe the mind they poſſeſs; and hinder it from attaining, or even aſpiring, to ſuch great things, as it would reach to, if it were not detained or depreſſed by religion. Let us now therefore examine, whether, notwithſtanding the wings, which we have ſhewn that religion adds to the mind, the clogs, that it faſtens to her, be heavy enough to diſable her to raiſe herſelf above the pitch of vulgar ſouls; and force her, inſtead of ſoaring aloft, to flutter about the earth.

THE chief things, that, as far as I can learn, are alledged, either by *Philédonus*, or more conſidering adverſaries than he, to ſhew religion to be either quite inconſiſtent with, or very unfriendly to, greatneſs of mind, are theſe. —

[But, in regard, that I find not the anſwers, that were drawn up to the objections; and it is not ſo convenient to let the latter appear unaccompanied by the former, it is thought the ſafeſt way to leave them both at preſent unmentioned; and only take notice, that to the laſt of the ſix objections, which, to deal candidly, were named and conſidered, theſe words were found ſubjoined.]

AND now, if it appear, that neither any nor all of theſe have ſuch an unfriendly aſpect on greatneſs of mind, as is pretended; and that at leaſt the impediments, they can bring, are much more than countervailed by the aſſiſtances, that religion affords heroick virtue; I hope it will appear, that greatneſs of mind is not incompatible with Chriſtianity, but rather promoted by it.

Experimenta

Experimenta & obſervationes Phyſicæ:

Wherein are briefly treated of

SEVERAL SUBJECTS

RELATING TO

NATURAL PHILOSOPHY

IN AN

EXPERIMENTAL WAY.

To which is added,

A ſmall Collection of ſtrange REPORTS.

A LETTER that may ſerve for a Preamble.

To my learned Friend Mr. *H. Oldenburg*, Secretary to the Royal Society.

SIR,

BEING at length come to a reſolution, I have already done ſomething more than barely entred upon that way of writing, that you and I have more than once diſcourſed of together; and wherein you particularly (though not you only) among my learned friends have wiſhed to ſee me engaged.

IT is not, that I am inſenſible of the prejudice, which the things I deliver are like to ſuſtain, by the diſadvantageous dreſs, wherein they muſt appear, in the way of writing I have pitched upon; which being for the moſt part plainly hiſtorical, and ſet down in the order wherein they chanced to come to hand, denies moſt of them, not only the uſual ornaments of other books, but the allowable advantages, that method, elaborate diſcourſes, neat hypotheſes, and ſubtile diſputes, are permitted to bring even to philoſophical writings.

BUT theſe conſiderations were overſwayed by a ſad one, founded upon the (yet continuing) condition I was in, when I was debating this matter in my thoughts. For it having pleaſed God (to whoſe always moſt juſt diſpenſations men ought entirely to ſubmit) to afflict me with the ſtone and the palſy; as on one ſide, theſe added to a ſufficient number of *avocations ſcarce permit me any great expectation of finiſhing in a ſhort time the tracts I had made a leſſer or greater progreſs in, according to my firſt deſign; ſo on the other ſide, my friends judging it unfit, that the materials provided for theſe more than begun treatiſes ſhould be quite loſt, or kept too long uſeleſs, it ſeemed expedient, that as opportunity ſhould from time to time ſerve, I ſhould look over my memorials, and other ſcattered papers, to take notice, what experiments and obſervations were to be found in them.

UPON theſe and the like inducements, having picked up ſeveral of my diſperſed papers, ſome of them written many years ago, and ſome of a leſs ancient date, I began to refer the moſt part of what I found hiſtorical in them, together with ſome few things, that did ſeem neceſſary not to be ſevered from them, to certain heads or titles, which I called chapters; and made them the more numerous, that they might ſingly be the leſs prolix: and about theſe I muſt deſire your leave to repreſent ſome things by way of preface.

AND firſt, ſeveral of the enſuing particulars, that I met with among my papers, being parts of eſſays, or other diſcourſes, and being for haſte tranſcribed for the moſt part verbatim, as they were couched there; I dare hope for your excuſe, if among ſuch tranſcripts you now and then meet with things, which, how pertinent ſoever to the tracts they

firſt belonged to, might have been ſpared as needleſs, if not ſometimes foreign alſo, in the new form the diſcourſes are now put into; ſince I could not leave out ſuch unneceſſary clauſes (whereof yet I hope you will not find many) without too much mutilating the coherence, or obſcuring the ſenſe of what is delivered; and I could not alter them, and adapt others to ſupply their places, without ſpending more time, and taking more pains, than in the condition I am now in, I ſuppoſe you would be willing to condemn me to.

NEXT I deſpair not, but you will allow me the liberty I have taken, to vary the bulk and method of particular chapters, as my occaſions would permit, or the plenty or paucity of materials ſuggeſted, or the nature of the thing I treated of, and the ſcope I propoſed to myſelf in writing of it, ſeemed to require. But ſometimes my want of health and leiſure, and my deſire to haſten to other ſubjects, that either pleaſed me better, or ſeemed more conſiderable, made ſome of the following chapters, compared with others, but ſhort; eſpecially if I were ſupplied but with a number of things pertinent to that ſubject, by the papers I had then in hand, how much ſoever I may have written of it in other papers, which I hope hereafter to be maſter of.

AND this advertiſement may render you a reaſon, why to the title of ſome of the chapters I have ſubjoined the firſt ſection, though it be not at preſent followed with a ſecond.

AND as for my having employed very differing methods in ſome of the enſuing tracts, I did it with deſign, as judging ſuch a variety of methods more conducive to my purpoſe, than uniformity in it would have been. For beſides that ſome of the treatiſes, whence theſe chapters were taken, did by the ways, wherein they were already written, oblige me to accommodate myſelf to their method; I thought, that if you ſhould ſhew theſe papers to any, that are very unacquainted (which I have heard you complain, that too many are) with the way of accommodating, in ſome tolerable manner, his enquiries and his writings to the ſeveral ſubjects he applies himſelf to, he may be ſomewhat helped by the differing examples he may here meet with, to make variations ſomewhat ſuitable to the differing natures of the ſubjects he deals with.

BUT here I muſt beg you to take notice, that though in compliance with this deſign, as well as for ſome other reaſons, I have in ſeveral of the following chapters given intimations and hints of things, which I do not there proſecute; and now and then propoſe ſome conjectures and opinions, whoſe proof I do not inſiſt on; yet I am not willing you ſhould think, that however ſome of thoſe paſſages may be but occaſional things, mentioned principally to excite, and give hints to the inquiſitive and ſagacious; yet all, or moſt of them, are of the ſame kind; and that I thought not on them, but as ſlightly and tranſiently as I mentioned them; and have no better and other reaſons to alledge for my ſuſpicions or intimations, or even for my conjectures or my opinions, than thoſe you will meet with in papers haſtily drawn up; eſpecially ſince, I think, I can ſhew you divers of the things delivered in thoſe paſſages, enlarged and rendered at leaſt probable or practicable in other diſcourſes, that for certain reaſons do not accompany theſe I now ſend you.

I EXPECT, that you ſhould think it ſomewhat ſtrange, to find many of the following experiments ſet down much leſs circumſtantially, than thoſe that are mentioned in the phyſico-mechanical experiments touching the air; in the Continuation of them; in the hiſtory of cold, and in ſome other books of mine, that you have been pleaſed to peruſe. But on this occaſion give me leave to repreſent to you, that the nature of divers of the former experiments, eſpecially chemical ones, and my aims in mentioning them, being conſidered, it ſeemed not requiſite they ſhould be more fully treated of: and as for others, though the brevity and diſpatch, which divers reaſons made me propoſe to myſelf, had not forbidden me to amplify; yet I daily feel my leiſure, not to ſay my life too, ſo torn piece-meal from me by ſickneſs, viſits, buſineſs, and inevitable avocations, that I am frequently admoniſhed to haſten the ſecuring of as much as conveniently I can, by diſpatching particular ſubjects, and am quite hindred from dwelling ſo long upon them, as if I had more health and leiſure, I ſhould willingly do. To theſe things perhaps ſo favourable a perſon as Mr. *Oldenburg* will add, that the characters, which learned writers, Engliſh and foreign, though divers of them perſonally unknown to me, have been pleaſed to give of the diligence and ſincerity employed in ſetting down the *phyſico-mechanical experiments*, and thoſe of ſome other writings of mine, may permit me to hope, that it will be thought, that after having been divers years verſed in making trials and experiments, I have made them with ſome care and warineſs, and mentioned them faithfully, where I have not done it amply, upon hopes it may be taken in good part from a perſon in my preſent condition, that was never a profeſſor of philoſophy, nor ſo much as a gown-man; to have made ſhift to make the experiments and obſervations he communicates, and ſet them down truly and candidly, without fraudulently concealing any part of them, for fear they ſhould make againſt him. And though perhaps you will eaſily believe, that in divers of the experiments which I have but briefly mentioned, I have been as diligent an obſerver of circumſtances, as I was wont to be when I made thoſe, which have had the luck to be taken notice of for being fully related; and though it may be alſo, that ſome ſcruples or objections, which my brevity may in part occaſion, were not unforeſeen by me, and might have been avoided by a more copious and diffuſed way writing; yet I purpoſely decline ſuch a way of delivering things, not only for the reaſons

above mentioned; and becauſe I ſuppoſe them, that may peruſe theſe papers, to be acquainted with my formerly publiſhed writings, and to have either from them, or otherwiſe, underſtood the way of making ſuch experiments as mine; but alſo, becauſe, though I wanted time and health much leſs than I do, I ſhould not think it fit too much to prevent the induſtry of others about the trials I mention; and reap the field ſo clean, as not to leave them, not only ſtore of ears to glean, but ſome corners of ſtanding corn; I have therefore here and there purpoſely omitted both, ſome not abſolutely neceſſary practical directions about making of trials, that might prevent ſuch ſcruples or objections, as have the grounds of anſwering them clearly delivered in my printed books; and ſeveral, not only leſſer circumſtances, but conſiderable phænomena, and obvious applications, that may probably occur to others, as they did to me in making the trials, and reflecting on them.

Advertiſements about the diſpoſition of the following treatiſe.

YOU will quickly diſcern, that the following chapters could not be intended for compleat tracts about the ſubjects handled in them. And indeed they were intended but for ſuch memoirs about the various particular ſubjects they treat of, as may be ſerviceable to the ſolid natural hiſtory, that has been nobly deſigned, and is ſtill proſecuted by the Royal Society. Wherefore ſince (at leaſt in our age) no writer, that I know of, has ſo early and ſo well, both urged the neceſſity of natural hiſtory, and promoted divers parts of it by precepts and ſpecimens, as the illuſtrious lord *Verulam*; I ſhall not ſcruple in the way or manner of writing theſe ſhort collections of mine, to make uſe ſomewhat frequently of his authority and examples, but without confining myſelf to either.

I. AGREEABLY to this advertiſement you will find, that ſome of the particulars, that the following treatiſe conſiſts of, are ſingle, and as it were, independent ones; upon which account they reſemble thoſe, which in the *Verulamian Sylva*, or Natural Hiſtory, are called experiments ſolitary: and have for that reaſon induced me to give that title to each of the ſeveral chapters, that are made up of them.

II. ANOTHER ſort of chapters there is, wherein divers experiments and obſervations, all of them relating to the ſame ſubject or purpoſe, are ſet down together. Theſe, if they were ranged and ſorted in order to diſtinct theories, I ſhall call, in imitation of the mentioned author, experiments in conſort. But my backwardneſs to frame theories has made me chuſe to forbear as yet to methodize them; and therefore has made me think fit to call them only various experiments and obſervations about this or that ſubject, which they belong to.

III. MY haſte, though not that only, induced me to make one ſort of chapters more, that partly agrees with, and partly differs from each of the two that I come from mentioning: for in every one of theſe chapters, there are two or three, if not more, ſingle or ſolitary experiments; and there are alſo others, that have ſome kind of connexion among themſelves, as being referrable to the ſame ſubject or purpoſe. On that ſcore the title, that is given to each of the chapters of this third ſort, is that of miſcellaneous experiments, and ſometimes (but ſeldomer) of promiſcuous ones. And all the particulars, that I refer to the three forementioned heads, are caſt into chapters, wherein the ſeveral kinds are diſtinguiſhed only by their titles, or not.

IV. THERE is one advertiſement, that regards all the ſorts of particulars, that are referred to the forementioned chapters; which is, that I have uſually comprehended obſervations, as well as trials, under the title of experiments; which I have done, not only upon the authority, and in following the example of our judicious chancellor, (as is every where obvious in his *Sylva Sylvarum*) but for other reaſons to. For both the ſorts of particulars may paſs for matters of fact, and ſo are hiſtorical, taking the word in a lax ſenſe; and the employing it in that ſenſe makes the articles or paſſages, whereof the chapters and other parts of our collection conſiſt, much more commodious for references and citations.

V. BESIDES the three forementioned kinds of chapters, you will meet, in the enſuing treatiſe, with another ſort of writings, whereof ſome are almoſt entire, and others fragments of larger diſcourſes. In neither of theſe did I confine myſelf ſo much to matters of fact, as in thoſe chapters, that conſiſt of experiments and obſervations; but took the liberty, as occaſion required, to enlarge in diſcourſes, and ſometimes to cite ſuch paſſages out of other mens writings, as I judged I could make ſome pertinent application or uſe of, perhaps unthought of by the author. And theſe papers being moſt, if not all of them written in a more free and diſcurſive way, I thought fit to ſeparate them from the ſets of collections, that are almoſt merely hiſtorical, and accordingly I have not ſtiled them chapters, but titles; and have forborn to aſſign them, as I did the others, ordinal numbers; which I deſire likewiſe you would not prefix to any of them, becauſe I am not yet reſolved how I ſhall diſpoſe of them, either by ſupplying what is wanting to finiſh any one or more of them, or by taking to pieces, and employing thoſe pieces as materials for other tracts.

VI. PERHAPS I ſhall not be thought to need pardon, if to comply with their curioſity, who affect moſt thoſe experiments, that are either uncommon, or teach them to do or perform ſomething uſeful or pretty; I ſometimes prefix a title, declaring what it treats of, to a particular experiment (or obſervation) which for its importance, novelty, or uſefulneſs (theorical or practical) may deſerve to be diſtinguiſhed; ſince by this means ſuch particulars may be better impreſſed on the me-

mory, to gratify thoſe, whoſe nicety or want of leiſure may make them well pleaſed by a tranſient view of the titles we ſpeak of, to find ſuch paſſages, as they chiefly looked for, with leſs trouble than that of peruſing an index.

VII. AMONG the experiments our collection conſiſts of, there is here and there one, to which it was thought fit to add ſomething, either by way of explication, or of illuſtration, or of confirmation, or of anſwer to objections, or of theorical reflection, or of practical application, *&c.* And theſe ſupplements or additions it was thought fit to call ſometimes annotations, but oftner ſcholiums, becauſe that term is freely uſed in a very comprehenſive ſenſe by mathematical writers. But though I readily acknowledge, that this term has been chiefly employed by mathematicians; yet the uſe of it has not been ſo confined to them, but that good authors in other parts of learning have not ſcrupled to employ it, as may appear by the ſcholiums, that ſome learned phyſicians have written upon *Hollerius*, an eminent perſon of their profeſſion; as alſo by the example of the famous and experienced *Foreſtus*, who has not ſeldom ſubjoined ſcholiums, even to his own medicinal obſervations.

VIII. THE mention of theſe ſcholia prompts me to tell you, I had almoſt forgotten, but yet muſt not leave unmentioned, that I thought fit now and then to premiſe to ſets of experiments, and ſometimes (though more ſeldom) to a ſingle obſervation, a ſhort preamble by way of introduction, which may often excuſe the need of ſubjoining a ſcholium, and may be warranted by the example of the lord *Verulam* in his centuries, wherein he often inſerts ſuch ſhort preambles, as things fitted to give light to the experiments they belong to, and to give ſome advertiſement, both of the nature and importance of the ſubject, and of the ſcope of the writer, or of other uſeful circumſtances.

IX. IF among my own experiments, namely, thoſe that I have made or ſeen, I have ſometimes inſerted experiments or obſervations that are not ſo; I have not done it without reaſon, and am authoriſed in that practice by frequent examples afforded me by the firſt, if not only author that I know of, that gave us a ſet of precepts of well writing natural hiſtory, our often cited *Verulam*, whoſe centuries do in great part conſiſt of borrowed experiments and obſervations; without which he was ſenſible, that his *Sylva* muſt be of too narrow a compaſs, or too thinly ſtocked with plants, eſpecially with trees. And indeed it is not to be expected, that as the ſilk-worm draws her whole manſion altogether out of her own bowels, ſo a ſingle man ſhould be able to write a natural hiſtory out of his own experiments and thoughts. And he, that will ſtrictly confine himſelf to thoſe, will be often reduced to omit things very pertinent, if not neceſſary to his ſubject, which is of practice ſtudiouſly declined by me, who prefer the reader's utility to the ambitioned glory of being thought to borrow nothing from any body. And I can add in my defence, at leaſt my excuſe, that I have made uſe but of a ſmall part of the liberty allowed me by the example of ſo great a guide in the way of writing natural religion. For I have very much ſeldomer than he employed the trials of others, and have yet ſeldomer mentioned unverified reports or vulgar traditions, being careful, that the bulk of the matters of fact I deliver ſhould conſiſt of things, whereof I was myſelf an actor, or an eye-witneſs; and that the comparatively few borrowed experiments, that I added, (that I might not deprive my reader of ſome things very pertinent and uſeful to my ſubject) were received from perſons of very good credit; beſides that I do not only frequently give ſufficient intimation in the experiment or obſervation its ſelf, but oftentimes by placing the letter C in the margin, do give notice; nay, and ſometimes to a whole ſet prefix the title of communicated experiments or obſervations.

X. I HAVE nothing more to give you notice of here, ſave that, whereas you will find, that I write but on one ſide of the leaves, whereof this book * conſiſts; I did ſo for two reaſons. The firſt, that in caſe I ſhould have occaſion to employ any of theſe experiments in other treatiſes, for which I am more concerned than for this rhapſody, I might have room to ſubſtitute, if it ſhould be thought fit, one or more of my later experiments in its place. And ſecondly, that I might have room, if I can get leiſure, to write annotations, or make reflections, or illuſtrations, or corrections, or, in a word, ſuch additions and alterations of particular experiments and paſſages, as they ſhall be thought fit to deſerve or need.

I AM ſenſible, that this preamble, increaſed by the advertiſements, that it was thought neceſſary to annex to it, is of a length, that may ſeem diſproportionate to the book or tract it is prefixed to. But I may in excuſe of this repreſent to you, that the bundle of writings you now receive is but a part of the book; to which, if God vouchſafe me health and leiſure, this preface enlarged by its appendix, is deſigned for an introduction. And in that caſe it is hoped, that theſe preliminaries, as many as they are, will not be thought impertinent, or needleſsly prolix.

* This refers to the manuſcript that was ſent to Mr. O. and is left to ſhew the intention of the author.

Experimenta

Experimenta & Obſervationes Phyſicæ.

TOME I.

CHAP I.

CONTAINING

Chemico-Magnetical Experiments and Obſervations.

THE loadſtone, *Pyrophilus*, is ſo admirable a body, and its uſefulneſs to mankind is already ſo great, without denying us hopes of farther improvements, that I think we muſt want curioſity or gratitude, if we neglect either to take notice of any experienced phænomena, that directly relate to ſo abſtruſe a ſubject, or by conſigning them to paper, to preſerve them from oblivion. It is chiefly by this conſideration, *Pyrophilus*, that I am induced to mention to you the following experiments and obſervations, made moſt of them by the help of the fire. For though ſome of them may ſeem but ſlight, yet they may not prove unuſeful towards diſcovering the nature of a body ſo ſtrange and ſingular, that, for ought is yet manifeſt, any true magnetical phænomena may ſomewhat conduce to the knowledge of it. And I was the rather induced to make trials and obſervations of this kind, becauſe moſt of them are ſuch, as I have not met with in authors. And the few, that remain, I have not found ſufficiently taken notice of there; philoſophers and mathematicians aiming chiefly, in their magnetical writings, to proſecute and apply the attractive and directive, and perhaps the inclinatory faculty of the loadſtone. Whereas, throwing into another paper what I obſerved of that kind, I did in the preſent enquiry mainly intend to make the loadſtone rather the object than the inſtrument of my trials; and handling chiefly the very ſubſtance of the ſtone, endeavour not ſo much to advance or apply its faculties, as to weaken and deſtroy them, though in order to the better knowing of them. Having therefore procured a conſiderable number of, for the moſt part, naked (or uncapped) loadſtones, moſt of them coarſe, but of differing ſizes, ſhapes, colours, and countries; I made upon them ſeveral trials, ſome of which I ſhould immediately proceed to give you a brief account of, but that it will be proper to premiſe this ſhort advertiſement; that I would not have the title of theſe experiments make you expect, that the fire ſhould be a main agent in every one of them; ſince to preſerve ſome few of them, I refer them hither, though an actual fire was not employed to make them; ſince the common rule, that *a potiori parte ſit denominatio*, will ſuffice to warrant, or at leaſt excuſe my giving to this ſmall collection the title of *chemico-magnetical experiments*; becauſe the greateſt part were performed by the help of the fire, or bodies chemically prepared by the application of it. And becauſe it is uſual with the beſt writers about magnetiſm, to reckon ſteel and iron among magnetical bodies; I ſhall not ſcruple to deliver in this paper ſome experiments made by the help of the fire upon thoſe ſubjects, with reference nevertheleſs to magnetiſm.

EXPERIMENT I.

HAVING ignited ſeveral loadſtones, and removed them from the fire till they grew cold again, I found a great diſparity in the viſible ſubſtance whereof they conſiſted, and the manifeſt ſtructure of the groſs parts that made them up. For ſome ſtones upon refrigeration, either fell aſunder of themſelves, or grew very brittle, when as others ſtill continued in their entireneſs: ſome of them being broken, looked not unlike iron-ore, or ſtones which I have gathered near iron-mines in *Kent*; others being broken after refrigeration appeared to conſiſt of plates or flakes of ſeveral colours, and lying parallel to one another; and others again, which as I remember were Engliſh ones, did neither appear to be compoſed of any ſuch flakes, nor had their dark colours much, if at all, changed by the operation of the fire, nor did ceaſe to be ſolid bodies.

EXPERIMENT. II.

WE could not upon the burning of ſeveral ſmall loadſtones one after another, diſcern any ſuch blue ſulphureous flame as *Porta* in his natural magick relates himſelf to have ſeen, and judges to have been, as it were, the ſoul of the loadſtone, upon whoſe receſs, he ſays, it loſt its magnetick faculty, which is moſt commonly true as to any conſiderable degree of the coitive or attractive power, but not of the directive faculty or virtue. But it may be, that *Porta* miſtook the ſmall flame, which is often emitted even by well-kindled and glowing charcoals, (on which ſort his loadſtone was placed) eſpecially when a little blown upon for the exhaling ſoul of the loadſtone; or elſe to be civil to him, we may

ſuppoſe, that his ſtone was more rich in unctuous moiſture than others are wont to be; and if we had had by us a very exact pair of ſcales, we ſhould have endeavoured to have by them diſcovered, whether the fire do deprive loadſtones of any ponderous parts.

See Exper. 10.

EXPERIMENT. III.

THE ſolidity of ſome Engliſh loadſtones made me think it fit, though I looked upon them as a kind of iron-ore, to try whether they could not be brought to ſtrike fire. And accordingly having made divers colliſions betwixt a rough piece and the ſteel of a tinder box, I found, that with much ado it was poſſible to obtain ſome ſparks, (though they ſeemed but ſmall ones:) but having taken a large piece of ſmooth loadſtone, I found, that by ſtriking it ſomewhat briſkly with the edge of a ſteeled hammer, we were able to produce good ſtore of ſparks, and ſome of them of a ſurpriſing bigneſs, for they were judged to exceed the ſize of thoſe, that are uſually afforded by common flints.

EXPERIMENT IV.

FOR certain reaſons I thought fit to make a further trial, being deſirous to ſatisfy myſelf, whether it were not poſſible to make loadſtones afford fire without the help of iron or ſteel. And being willing to comply with this curioſity, I made choice of two ſolid pieces of loadſtone, that were cut almoſt into the form of cubes; and found, that many colliſions being made between them, eſpecially at the edges, there were produced from time to time, (though not frequently) ſome ſparks of fire, though neither ſo numerous, nor ſo great or vivid, as thoſe of the foregoing experiment, wherein the ſteel was employed.

EXPERIMENT V.

I HAVE (elſewhere) formerly related, that if an oblong loadſtone made glowing hot, be refrigerated perpendicularly, the lower extreme will thereby become its northern pole. And I ſhall now add, that yet if ſuch a loadſtone be refrigerated perpendicularly, not upon an ordinary terreſtrial body, but upon the northern extreme of a much ſtronger loadſtone; in ſuch caſe, this debilitated ſtone will receive its impreſſions, as if it were an iron, and its lower extreme will not be as before, by the magnetick effluvia of the earth made its northern pole; but it will be contrariwiſe animated by the pole of the loadſtone, on which it is cooled; and, according to the laws magnetical, the lower extreme of it will not be its northern, but its ſouthern pole, nimbly attracting the north end of an excited and æquilibrated needle.

EXPERIMENT VI.

BY the forementioned way of refrigeration I alſo found, that a diſanimated loadſtone (if I may ſo ſpeak) may be reſtored to ſome degree of its attractive virtue; for I tried, that a ſmall loadſtone, which after its being made red hot in the fire, and cooled perpendicularly upon the ground, was not able to take up a fragment of a needle, being again heated, and not only cooled upon the pole of a ſtrong loadſtone, but ſuffered to reſt on it a while after, was ſoon grown vigorous enough to take up what formerly it could not move.

EXPERIMENT VII.

I FURTHER obſerved, that though a loadſtone, that had paſſed the fire, had not, by being immediately before made red hot, had its body opened, and fitted to take in plentifully the magnetical ſtreams; yet it would, like a wire of iron, acquire a new verticity from the vigorous loadſtone, but not be in many hours ſo vigorouſly impregnated with magnetick virtue, if it were applied cold to the pole of the animating loadſtone, as it would in a very ſhort time, if being glowing hot, it were refrigerated thereupon.

N. B. IT has been obſerved, that if a loadſtone be made red hot in the fire, it will ſcarce retain any ſenſible attractive virtue, ſave that it will be able, by being endowed with a magnetiſm from the earth, to drive away that pole of a needle well poiſed, which agrees in denomination with that pole of the loadſtone, which is applied to it. But I deſire, that it may be remembred, that I intimated, that this is not ſtrictly and univerſally true; for in ſome of our Engliſh loadſtones it has been obſerved, that ignition does not only leave them capable of a directive virtue, but leaves them alſo a conſiderable attractive power, ſo that they will ſuſtain a good weight of ſteel, as will appear hereafter.

EXPERIMENT VIII.

WE took three Engliſh loadſtones, that appeared to be of a very compact ſubſtance; two of them very ſmall, as not being of near half an inch in length; the other much greater, being about an inch long, and of a conſiderable breadth, but yet of ſmall thickneſs: theſe we made red hot in a fire of well-kindled charcoal, and being thoroughly ignited, removed them one after another, and haſtily ſet each of them upon a plate of ſilver, (for neither wood nor iron would have been convenient) and applying the loadſtone (capped) to each of them, whilſt it was yet red hot; it ſeemed manifeſt enough, not only, that whilſt it was in that ſtate, the ſtone had not ſo ſtrong an operation on it, as if it were not red hot: but, which is remarkable, when it ceaſed to appear ignited, but yet was intenſely hot, (ſo that it was readily able to burn his fingers, that ſhould offer to take it up between them) the armed loadſtone had a more powerful operation on it, by way of what they call attraction and ſuſtentation, not only, as I ſaid, than it had, whilſt the ignited ſtone conſpicuouſly retained

retained the colour of fire, but) than it had after the ſame ſtone was grown cold.

EXPERIMENT IX.

THIS experiment was reiterated with the two ſmaller magnets, and the greater with the like ſucceſs: and when the magnets were grown cold, they did, notwithſtanding their having been twice ignited, diſcover ſome little magnetiſm, if applied to the end of a well-excited magnetick needle, nicely poiſed upon the point of an ordinary needle [or braſs pin] (on which its centre of gravity leaned.) And I found, that the bigger of the three forementioned loadſtones, after the firſt, if not alſo after the ſecond ignition, did not only move the magnetick needle more briſkly than one would have expected, but, (which may ſeem ſtrange) being thruſt into filings of Mars, and then taken out, it carried up with it, and ſuſtained a conſiderable number of them. Whence we may conclude, that in ſome loadſtones of a very ſolid conſtitution, ſuch as this was, the magnetical virtue is more radicated (if I may ſo ſpeak) or permanent, than in the generality of other magneticks; this ſtone being the firſt, wherein I obſerved, after I had thoroughly ignited it, any attractive virtue able to take up filings of iron.

EXPERIMENT X.

ON occaſion of theſe trials I made another, which though to ſome it may ſeem but ſlight, I thought the more worthy to be made, becauſe I remember not to have read or heard of it before: we took then the ſame loadſtone, that we employed about the laſt experiment, and having again made it red hot in the fire, ſuffered it not to cool leiſurely in the air as before, but quenched it in a baſon of cold water, intending thereby to make a double variation of the experiment, firſt, by cooling it haſtily, and as it were abruptly; and next by cooling it, not in the air, but in a fluid ſome hundreds of times more denſe or ponderous than the air. The event of the trial was, that upon the immerſion of the red hot ſtone, there fell off ſome flaky matter, as if it had been ſcales of Mars; and the ſtone, when cold, would not take up any filings of iron, as before it did many; ſo that it appeared to have loſt much of the virtue it ſo lately had, though it retained the power to move a well-poiſed needle, if it were held near to either ſide of the point of it.

EXPERIMENT XI.

A BLACK oblong loadſtone, of a homogeneous ſubſtance, and weighing near three drachms, having been in a fire of well-kindled charcoals ignited, and continued ſo for ſome minutes of an hour; being weighed again as ſoon as it was cooled, was found to have loſt about $\frac{1}{8}$ of a grain of its firſt weight, and much of the blackneſs of its colour.

THOUGH the affinity between the loadſtone and iron might make one expect, that the fire might have a like operation upon this ſtone, and that out of which iron is commonly melted, both being indeed iron-ores; yet for ſome reaſons, that I cannot now ſtay to mention, I was induced to think, that the effect of ignition upon thoſe two bodies might be very differing, as I conceive their internal and unſeen texture to be. And therefore I made the following experiment.

A LUMP of iron-ore, which looked almoſt like a white ſtone, rather than a common ore, and was about the bigneſs of two eggs, being applied in ſeveral of its parts, to an excited needle, did not appear to move it manifeſtly. But being afterwards made glowing hot, and kept ſo for a while, and then refrigerated, it did in thoſe parts, which ſeemed by their newly acquired colour to abound with metalline corpuſcles; it did, I ſay, manifeſtly attract the north end of the needle. And this was tried, both with a needle of our own touching, and by the mariner's needle of a ſun-dial, whoſe flower-de-luce the burnt ore did manifeſtly draw.

EXPERIMENT XII.

To confirm the former obſervation, and alſo what I elſewhere gave notice of, that divers bodies are of a magnetical nature, or have in them ſome parts that are ſo, which yet are not vulgarly believed to be referable to that ſort of bodies, I ſhall ſubjoin the following experiment.

A BRICK, that had not been uſed, was ſawed long-ways into two equal pieces, and each of theſe (one at one time, and another at another) was heated red hot in the fire for a pretty while, and afterwards ſuffered to cool north and ſouth: and, as I expected, it thereby acquired a magnetical verticity; and with that end, that in cooling reſpected the ſouth, did a little, though but faintly, draw the flower-de-luce (which pointed out the north) of the mariner's needle; and with the other end, did ſomewhat more vigorouſly drive the flower-de-luce away, and a little attract the other extreme of the needle.

EXPERIMENT XIII.

WE took a [black] loadſtone, and having by degrees beaten it ſmall, without ſuffering it to touch any iron or ſteel veſſel, or inſtrument, [which becauſe of the hardneſs of the ſtone, was very troubleſom to do;] we ſet aſide the groſſer grains for other uſes, and upon ſome of the finer powder we poured the ſpirit of common ſalt, which had at firſt a ſenſible operation upon it, by producing fœtid fumes, and making a kind of ebullition, as that menſtruum is wont to do upon filings of iron or ſteel. But nevertheleſs, being kept a night or two in digeſtion, it drew a high tincture; and though this was not at all like the ſolutions of Mars in ſpirit of ſalt, green, but of a yellowiſh brown, not very remote

from redneſs; yet a little of it being dropped into a freſh and ſufficiently coloured infuſion of galls, turned it preſently into an inky ſubſtance, which in ſome poſitions appeared blueiſh, as a tincture or light ſolution of Mars would have done. I ſhall only add about the ſolution of loadſtone, that having carefully made it with a good aqua regia, I obtained a ſolution, ſome of which you may yet command a ſight of, that by ſome virtuoſi, to whom I ſhewed it, was thought either a fine ſolution of gold, or little, if at all, inferior to it in kind or richneſs of colour. I choſe to employ the ſpirit of ſalt, rather than that of nitre or aqua fortis in this experiment; becauſe I found the firſt named liquor to diſſolve iron very well, if not better, though leſs furiouſly than aqua fortis itſelf; and alſo, becauſe I could by this means better judge of the tincture of its colour, having formerly found by trial, that ſpirit of ſalt makes a green ſolution of Mars, but aqua fortis or ſpirit of nitre a reddiſh one. And it was to judge of the tincture of the loadſtone, as well as for another purpoſe, that I was ſo careful to keep the ſtone from touching iron, when it was pulveriſing, leſt by the hardneſs of it, and the ſharpneſs of its angles, it ſhould grate off ſome parts of the metal, and ſo alter the ſolution; for want of which caution, I have known ſome experiments about artificial gems to miſcarry; the braſs mortar, wherein the hard ingredients were beaten, having communicated ſome particles to them, that altered the colour, which the maſs after vitrification would otherwiſe have been of.

EXPERIMENT XIV.

SOME parts of the foregoing experiment may be confirmed by that which follows.

I CAUSED a weak loadſtone to be heated red hot, to make it the more eaſy to be powdered; and having cauſed it to be beaten very fine, I digeſted good ſpirit of ſalt upon it. (I afterwards found, that ordinary ſpirit would ſerve the turn.) This in a few hours acquired a tincture not greeniſh, but almoſt like that of a troubled ſolution of gold. It ſtrongly reliſhed of iron, and a little of it being dropped into infuſion of galls, it turned it immediately into an inky liquor: part of this ſolution being gently evaporated, grew thick like an extract, but did not ſeem diſpoſed to ſhoot into cryſtals; yet another part of it did precipitate with ſalt of tartar, much like a ſolution of vitriol; and another with ſpirit of fermented urine gave a plentiful but yelloviſh red precipitate.

EXPERIMENT XV.

MEETING among my looſe notes, with one, that may ſerve both for a variation and confirmation of what has been above delivered in the experiments; it ſeemed not improper to annex a tranſcript of it.

A RED mineral, whoſe conſiſtence was between ſtony and earthy, was by me judged to be a kind of iron-ore, though having powdered ſome of it, I could not find, that a good loadſtone would attract any part of it: therefore, to ſatisfy myſelf, and to confirm D. *B.*'s obſervation about the virtue of linſeed oil, I cauſed this red powder, wetted with that liquor, to be kept about two hours ignited in a crucible, by which means it was turned blackiſh. This dark coloured powder was taken out, and ſuffered to cool, and then would readily adhere to the ſame loadſtone, almoſt as if they had been a heap of filings of iron. But the operation of the fire perhaps contributed, as much (or more) as the linſeed oil to this change. For a parcel of the red powder being kept ignited in a crucible, though without the liquor, did afterwards appear magnetical.

AFTER having ſaid thus much of the moſt uſeful of uncommon ſtones, the magnet; it will not, I preſume, be thought incongruous to ſubjoin ſome remarks about the moſt precious of them, that are known among us, *viz.* diamonds, which will be done in the next chapter.

CHAP. II.

Containing various obſervations about Diamonds.

DIAMONDS being generally eſteemed the moſt noble and precious of gems, and even of inanimate bodies here below, (for of carbuncles the very exiſtence is diſputed;) the opportunity I had of being one of the committee or directors of the Engliſh *Eaſt-India* company, (whereto the deſire of knowledge, not profit, drew me) allowed me in ſome meaſure to gratify my curioſity about them, by adding to ſome obſervations of my own the anſwers I had to the queſtions I propounded to ſome *Eaſt-India* merchants and jewellers, that had opportunity to deal much with thoſe gems. Part of what I had learned about them I committed from time to time to ſome papers, which were the main things that ſupplied me with the following particulars.

THESE gems (to add that upon the by) may the rather deſerve our curioſity, becauſe the commerce they help to maintain between the weſtern and eaſtern parts of the world is very conſiderable. For as ſmall as their bulk is, their properties and mens opinion do ſo much recommend them, that I remember one of the moſt famous and intelligent merchants of this nation, (who has been governor of more than one trading company in it) being enquired of by me about the value of the diamond trade; he anſwered me, that year, according to his well-grounded eſtimate, there came from the *Eaſt-Indies* into *Europe*, one with another, to the value of about 350000 ſterl. of which about 100000 *l.* came into *England*, which at preſent, becauſe of the prudent indulgence of the government, and of the *Eaſt-India* company, is become the mart of diamonds.

I. To

I. To prove the great hardneſs of diamonds, even in compariſon of other bodies, that are thought wonderfully hard, a famous artiſt for cutting of diamonds, in return to ſome queſtions I put him, affirmed to me, that he could not either cut or poliſh diamonds with any thing but with diamonds. And he further anſwered me, that if he ſhould employ ſo rough a way, and ſuch forcible engines to cut rubies or any other ſtones, as he does to cut diamonds, it would preſently break them in pieces: which the inſpection of his engine made very probable to me.

II. A VERY ſkilful cutter and poliſher of diamonds (Mr. *L.*) being demanded by me, whether he found, that all ſorts of diamonds were of equal hardneſs, told me, that having dealt in diamonds near twenty years in *Amſterdam*, and divers years in *England*, he perceived, that there are of later years, brought over worſe and worſe ſorts of diamonds; ſo that he judges thoſe of the old rock (as he calls them) either to be quite ſpent in the *Indies* themſelves, or at leaſt to be ſeldom or never brought over to us. And he finds ſeveral of recent diamonds ſo ſoft and brittle, in compariſon of thoſe of the old rock, that he is oftentimes afraid, or unwilling to meddle with them, leſt he ſhould ſpoil them in the cutting or poliſhing.

III. NOTWITHSTANDING the (lately mentioned) wonderful hardneſs of diamonds, there is no truth in the tradition, as generally as it is received, that repreſents diamonds as uncapable of being broken by any external force, unleſs they be ſoftened by being ſteeped in the blood of a goat. For this odd aſſertion I find to be contradicted by frequent practice of diamond cutters: and particularly having enquired of one of them, to whom abundance of thoſe gems are brought to be fitted for the jeweller and goldſmith, he aſſured me, that he makes much of his powder to poliſh diamonds with, only by beating broad diamonds (as they call them) in a ſteel or iron mortar, and that he has that way made with eaſe ſome hundreds of carrats of diamond duſt.

IV. IT is an opinion received among many, that deal in gems, that as diamonds are the hardeſt of bodies, ſo the ſame compactneſs, and their great ſolidity, gives them alſo a proportionable gravity, and makes them extremely weighty, in reference to their bulk: and I ſaw in the hands of a virtuoſo a book (that I could not procure) not long ſince put out by a French jeweller, who, as he affirms, has dealt very much in diamonds; wherein the author aſſerts the great ponderoſity of theſe ſtones, in compariſon of other bodies. But this opinion agrees very little with the following experiment, that I find, among others, that I tried about gems, regiſtered to this purpoſe.

A ROUGH diamond, ſomewhat dark within, did, in a pair of ſcales that would turn either way with the 32d part of a grain, weigh 8 grains, and eight ſixteenths. This ſtone being with care weighed in water, according to the rules of the hydroſtaticks, its weight appeared to be to that of an equal bulk of that liquor, as $2\frac{15}{16}$ to 1. So that, as far as can be judged by this trial, even a diamond weighs not full thrice as much as water.

V. A FAMOUS and experienced cutter of diamonds being aſked by me, whether he did not find ſome rough diamonds heavier than others of the ſame bigneſs, told me, that he did, eſpecially if ſome of them were cloudy or foul: inſomuch that ſhewing me a diamond, that ſeemed to be about the bigneſs of two ordinary peaſe, or leſs, he affirmed, that he ſometimes found in diamonds of that bigneſs, compared together, about a carrat (or four grains) difference in point of weight.

VI. THE ſhape or figure of diamonds is not ſo eaſy to be ſecurely determined. For thoſe, that are ſeen in rings and other jewels, having been by way of preparation cut and poliſhed, have changed their natural figures for that, which the artificer thought fit to give them. And rough diamonds themſelves (which are not obviouſly met with) do oftentimes come to our hands broken, though unwillingly, by the diggers: and thereby unfit to acquaint us with their genuine ſhape, which we may alſo miſs of being able to diſcover, on account of the accidents, that the matter they conſiſted of was ſubject to, at their formation in the mine. For to omit other proofs, having had a parcel of between 100 and 150 (if I miſremember not the number) put into my hands at one time in the Eaſt-India houſe, to gratify my curioſity, I found very few of them compleatly ſhaped; but moſt of them broken, and of very irregular figures, like thoſe of ſo much gravel taken up at adventures upon the ſea-ſhore. But ſome few I ſaw, that were pretty regularly figured, which probably were not much hindered from ſhooting freely in the wombs or cavities, wherein they were coagulated or concreted. And theſe ſeemed to conſiſt, in my opinion, of ſeveral triangular ſurfaces, that were terminated in, or compoſed divers ſolid angles. And one rough diamond I had of my own, wherein this ſhape was more conſpicuous than I remember to have ſeen in any other. Beſides having enquired of a very experienced artificer, who dealt much in fitting theſe gems for the goldſmiths uſe, whether he found rough diamonds to be of any conſtant figure, and if he did, what that figure was? he anſwered me, that he always found thoſe, that had any conſtant (or, as he meant, regular) figure, to be, in his own expreſſion, ſix cornered.

VII. DIAMONDS have in them a grain (or a determinate tendency of their fibres, or rather of the thin plates they are made up of) as well as wood, and may with eaſe enough be ſplit along the grain, though not againſt it; as I have ſeen a very large diamond, that was cut according to the grain into three pieces, whereof the middlemoſt, though large, and about the thickneſs of a ſhilling, was of an even thickneſs, and exactly flat on both ſides. I have myſelf a diamond ring, whoſe ſtone I would not have poliſhed, but cauſed it to be ſet rough as nature produced it, be-

cauſe

cauſe in that ſtate the grain is manifeſt to the naked eye, and much more to a glaſs moderately magnifying the ſeveral plates it conſiſts of, having their edges diſtinguiſhable, like thoſe of a book a little opened. A cutter of theſe gems, that has had ſtore of them to practiſe his ſkill on, anſwered me, that one good blow may ſplit even great diamonds, if it be given, as they ſpeak, with the grain; but againſt the grain, he affirmed to me, as dexterous and expert an artificer as he is, that he is not able ſo much as to cut or poliſh them.

VIII. The common colour of diamonds being generally enough known by ſight, it is not needful, as it would not be poſſible to deſcribe it by words; but the moſt uſual colour of theſe gems is not the only, of which they may ſometimes be found. A great traveller into the eaſtern parts of the world aſſured me, that he had ſeen ſome of them, that were of a pale blueiſh colour. That famous French jeweller as well as traveller, Monſieur *Tavernier*, gives an account of a fair diamond that he had of a very red colour; and that great ornament of our Engliſh court, the D. of *R.* told me, that ſhe was miſtreſs of a fair one, which, though not of a ruby, was of a red colour, but not having it at hand, ſhe could not then ſhew it me. A relation of mine, in the ſame court, uſed to wear a diamond ring; which though the ſtone was not great, he valued at a hundred pound, becauſe its colour was of ſo fine a golden yellow, that I ſhould have taken it for an excellent topaz, but that he had ſatisfied me it was a diamond, to which agreed its great hardneſs, which gave an uncommon luſtre. And I remember, that ſurveying attentively a parcel of rough diamonds newly brought from the *Eaſt-Indies*, I perceived among them, beſides ſeveral lighter variations of colour, one ſtone, that was all green, and that to ſuch a degree, that I doubted not, that if it were poliſhed and ſet, it might paſs for an excellent emerald; and I ſhould have ſuſpected this gem to have been really of that kind, but that I found it among diamonds, that belonged to merchants too ſkilful in thoſe gems to be impoſed upon; and, which was more, the ſtone being yet rough and uncut, I found it plainly to have the proper ſhape of a diamond.

IX. At the late return of the ſhips from *India*, being preſent at the delivery of the diamonds to the owners, I obſerved one belonging to a Dutch merchant, whoſe father was a cutter of diamonds, and bred him to the ſame trade. The diamond came from the king of *Cholconda*; it was ſhaped (like mine) with ſix triangular ſides, which yet were neither regularly figured nor truly flat, ſome of them being a little convex, and one of them having a manifeſt and oddly-figured [illegible] in it. But the diamond being fair and [illegible] tnick, that the merchant told [illegible] too deep for one ring, and [illegible] meant to ſplit it into two; I [illegible], and found it to amount to [illegible] grains.) I could eaſily perceive the grain of this diamond, which the merchant alſo acknowledged; who anſwered me, that he had never ſeen in diamonds any heterogeneous mixture encloſed. He further informed me, that there was brought him a large diamond from *Borneo*, that was much darker than one I ſhewed him, inſomuch that he compared it to ſoot; but when he had cut and poliſhed it, he and others were much ſurpriſed to find it a fair and clear ſtone, of very great value.

X. The conjecture I have elſewhere propoſed, that divers of the real virtues of gems may be probably derived from the metalline or mineral tinctures, or other corpuſcles, that were embodied with the matter of the gem, whilſt it was yet fluid or ſoft, and afterwards concoagulated therewith: this conjecture, I ſay, may be much countenanced by the following relation, which deſerves a place in this chapter, by reaſon of its pertinency to the ſubject of it.

I have long ſuſpected, that the matter, whereof diamonds mainly conſiſt was, whilſt it was yet *in ſolutis principiis*, impregnated with metalline, and more particularly with martial ones: but by reaſon of the dearneſs of thoſe gems, and ſome other impediments, though I have been maſter of differing ſizes, cut, and uncut, yet I could never make a trial capable of ſatisfying my curioſity, till having lately met with, among other curioſities that lay long neglected by me, ſome number of ſmall diamonds, that I had bought for experiments; I conſidered, that their being yet rough, and ſo in their natural ſtate, might make them more fit for my purpoſe, and ſo it might, that they were not ſo clear as thoſe, that we value in rings, which probably argued their having more of martial tincture in them than I ſhould expect in the more diaphanous: upon this account, I ſay, I took a moderately vigorous loadſtone, (for it was none of the ſtrongeſt I have had) and applied it ſucceſſively to five or ſix of theſe ſmall ſtones, without perceiving it had any operation on them. But when I came to apply it to one more, which looked ſomewhat duller than almoſt any of the reſt, I found, that it had in it particles enough of an iron nature to make it a magnetical body; and obſerved without ſurpriſe, that not only it would ſuffer itſelf to be taken up by the ſtrongeſt pole of the loadſtone, but when that pole was offered within a convenient diſtance, it would readily leap through the air to faſten itſelf to it.

I have elſewhere mentioned ſome other qualities of diamonds, as beſides their electrical virtue, this, that it is poſſible, that ſome of them may without fire or intenſe heat be brought to ſhine; though among all that I have tried, I found but two, that I could ſo make luminous. One of theſe belongs to the king, and is deſcribed at the latter end of our *Hiſtory of Colours*; and the other is a very ſmall one of my own; which either was quickly loſt among other ſtones of the ſame ſize, or quickly loſt its faculty of ſhining.

But

But to avoid repetitions, I ſhall here only add, that ſome few other obſervations, of a more particular ſort than thoſe delivered in the two foregoing pentades, may be found in other writings of ours, to which they ſeem more properly to belong.

CHAP. III.

Many changes of colour produced by one ſimple ingredient.

I KNOW not any way more likely to convince the generality of men, (who are wont to be much more impreſſed on by ſenſible phænomena, than theories, though ſolidly founded) how great an intereſt the variable texture of bodies may have in making them appear of differing colours, than by ſhewing, how the addition of a ſingle ingredient, that either is colourleſs, or at leaſt is not of any of the colours to be produced, is capable (and that for the moſt part in a trice) by introducing a ſecret change of the texture to make the body, it is put to, appear ſometimes of another, according as the parts of the body wrought upon are diſpoſed to receive ſuch a change, as modifies the incident beams of light after the manner requiſite to make them exhibit a blue, a green, a red, or ſome other particular colour.

Upon this conſideration I thought of ſeveral liquors, ſuch as aqua fortis, oil (as they call it) of vitriol, or inſtead of it ſulphur, aqua regia, beſides other ſaline liquors, that I ſhall not now ſtay to name, becauſe it may here ſuffice to tell you, that amongſt them all I made choice of the ſpirit (not that, which chemiſts call the oil) of ſalt, as that which is very ſimple, and which, if it be not too much dephlegmed, may be had clear and colourleſs enough. With this ſpirit I proceeded to make the following experiments upon ſeveral bodies, whoſe differing textures made me ſuppoſe, they would be fit for my purpoſe. And though I could not, without much diſadvantaging my deſign, forbear to mention ſome trials, that may be found elſewhere ſcattered among my writings on other occaſions; yet the greateſt part, by odds of thoſe laid together in this chapter, will, I preſume, be found new.

I. Some drops of well coloured ſyrup of violets being let fall together upon a piece of white paper, if a third or fourth part ſo much ſpirit of ſalt be with the tip of one's finger mixed with them, the ſyrup will preſently become of a red colour, uſually ſomewhat inclining to purple.

II. But if the liquor to be acted on be otherwiſe diſpoſed, it is poſſible with ſpirit of ſalt to turn it from a blue colour, not to a red, but to a green, as I have ſometimes done by letting fall into a deep ſolution of filings of copper made with an urinous ſpirit, as that of ſal armoniac, juſt as many drops of ſpirit of ſalt, as were requiſite and ſufficient to produce the change intended. I ſay juſt ſo many drops, becauſe a very ſmall error, either in exceſs or defect, may leave the mixture ſtill blue, or bring it to be all colourleſs.

III. Upon a quantity, not exceeding many drops of good ſyrup of violets, let fall two or three drops of good ſpirit of urine, harts-horn, or the like, or of oil of tartar *per deliquium*; and by mixing them well, the ſyrup has acquired a fine green colour, then by putting to it a little of the ſpirit of ſalt, and ſtirring it with the tip of your finger, you may turn the green ſyrup (as in the firſt experiment you did the blue) into a red.

IV. If you put a quantity of red roſe leaves well dried into a glaſs vial almoſt full of fair water, and ſoon after put to them as much ſpirit of ſalt, as will make the water pretty ſharp, you will quickly ſee, both that liquor and the contained leaves brought to a fine and lovely red, which ſcarlet colour it will retain for a great while. The like effect ſpirit of ſalt will have on ſome other vegetables of a ſtiptick or of an aſtringent nature.

V. But if by infuſing braſil in fair water, you make a tincture of it, which you may much deepen by dropping into it a little ſpirit of harts-horn, or of urine; if you then put to it a little ſpirit of ſalt, it will preſently change it from a deeply reddiſh colour, oftentimes like that of muſkadine, to a colour far more pale, or rather yellow, like that of the more dilute ſack; ſo that the ſame ſpirit acting upon two vegetable tinctures differingly diſpoſed, draws out and heightens redneſs in one, and deſtroys it in the other.

VI. If you make an infuſion of true lignum nephriticum in ſpring water, it will appear of a deep colour, like that of oranges, when you place the vial between the window and your eye; and of a fine deep blue, when you look on it with your eye placed between it and the window. But if you ſhake into this liquor a few drops of ſpirit of ſalt, the ceruleous colour will preſently vaniſh and appear no more, in what light ſoever you look upon the vial, though the liquor will ſtill retain the orange colour.

VII. We took common writing ink, and having let fall ſeveral drops of it upon a piece of white paper, ſo that when it grew dry in the air, ſome parts of the ink lay thick and ſome thinner upon the paper, whereon it did ſpread itſelf, we put a few drops of ſtrong ſpirit of ſalt, ſome on one part of the blacked paper, and ſome (or perhaps a ſmall drop) on another, and obſerved, as we expected, that in theſe places, where the ſpirit had been put, or to which it reached, the blackneſs was quite deſtroyed, and ſucceeded by an unpleaſant kind of colour, that ſeemed for the moſt part to participate of yellow and blue, neither of them good in its kind.

VIII. If in ſpirit of ſalt you diſſolve filings of ſteel, and ſlowly evaporate the filtrated ſolution, it will ſhoot into a kind of vitriolum martis, that will be green, as well as that which chemiſts vulgarly make with oil of vitriol. And to add, that on this occaſion, if you take theſe cryſtals made with ſpirit of ſalt, and when they are dry, keep them in a

crucible, you will find, that even a moderate fire if duly applied, will make them in a ſhort time exchange their green colour for a red, like that of the finer ſort of crocus martis, as indeed this operation makes them referable to that ſort of medicines.

IX. We took ſome mercury precipitated, *per ſe*, (that is, by the ſole action of the fire, without any ſaline additaments) and though crude mercury is not, as far as I have tried, ſoluble in our Engliſh ſpirit of ſalt; yet this red precipitate (which is ſuppoſed to be meer mercury) with its own ſulphur extraverted, did readily enough diſſolve in that liquor, and, if I very much miſremember not, did not at all impart its own colour to it: and I alſo found, that red-lead or minium being boiled a while in good ſpirit of ſalt, the redneſs did totally diſappear. So that the ſame agent, that produces redneſs in divers bodies, did in thoſe two, I have been mentioning, more than change it, ſince it quite aboliſhed it. Of which alſo I can give you an eaſier inſtance, by obſerving, that the reddeſt coral being diſſolved in our menſtruum, the redneſs vaniſhes, and the ſolution appears colourleſs.

X. Take filings of copper (the ſmalleſt are the fitteſt for this experiment), and having poured on them good ſpirit of ſalt till it ſwim, about two fingers breadth over them; keep the vial in a pretty ſtrong heat (in a ſand furnace) till you perceive the menſtruum has diſſolved a competent part of the metal: then warily take out the vial, and holding it between your eye and the light, you will perceive the ſolution of copper to be not like that of ſteel formerly mentioned, of a green colour, but of a dark and troubled one, oftentimes inclining to a deep, but muddy red.

XI. But if you pour this ſolution into a wide-mouthed glaſs, and let it ſtand for a competent time (which ſometimes amounts but to a few hours, and ſometimes to very many) the expoſed liquor will appear of a green, much finer than that of the cryſtals of Mars.

XII. Take filtrated and limpid ſolution of ſilver, or of mercury made in aqua fortis, and drop upon it ſome ſpirit of ſalt, by which you ſhall find the clear liquor turned white as milk, which after a while will let fall a precipitate of the ſame colour.

XIII. And if, inſtead of a ſolution of ſilver, or quickſilver, you take a red ſolution, or tincture of Benjamin, or of the reſinous part of jallap root, or you will alſo have, upon the affuſion of ſpirit of ſalt, a white liquor and a precipitate of the ſame colour.

XIV. Being deſirous to produce two differing colours at once by the ſame affuſion of ſpirit of ſalt, I infuſed ſome dried red roſe-leaves in fair water, till it had acquired a deep colour from them. To this infuſion, poured off warily, that it might be clear, I added a conſiderable proportion of the ſweet liquor, made by digeſting ſpirit of vinegar upon red-lead, by which I knew it would be turned of a blueiſh green. Upon this almoſt opacous liquor I poured ſpirit of ſalt, which, as I expected, precipitated the lead, that had been diſſolved in the ſweet liquor, into a very white powder, and gave the remaining liquor, well impregnated with particles of the roſe leaves, a very fine and durable ſcarlet colour. To which experiment I ſhall add on this occaſion, that, if it had been well made, you may barely by ſhaking very well together and confounding the white powder with the red liquor, make a carnation colour, which (when it is made as it ſhould be) appeared very fine and lovely whilſt it laſted, for in no long time the two ſubſtances, that compoſed it, would by degrees ſeparate, and re-appear each of them in its former place and colour.

XV. We took ſome ſpirit of ſalt, that having lain long upon filings of copper, had loſt the muddy tincture it had firſt acquired by being almoſt boil'd upon them. This liquor, I ſay, that looked like common water, we poured into a ſmall, but wide-mouthed cryſtal-glaſs, about half an hour after 8 in the morning, and leaving it in a window, it appeared after 40 minutes to have there acquired a colour, much like that of a German amethiſt, and ſeemed to have no tendency to greenneſs. But being detained by the viſit of a virtuoſo till eleven a clock, I could not ſee what happened in the mean time: but then, as he was going away, I invited him to ſee the liquor, which he (not knowing what it was) told me it looked of a graſs-green colour; wherein, though I were not altogether of his mind, yet in a ſhort time after, it did to me alſo appear of a lovely green; in its paſſage to which it had in all been expoſed about three hours and a half.

XVI. Precipitate a ſtrong ſolution of ſublimate (made in fair water) with a ſufficient quantity (and no more) of oil of tartar *per deliquium*. Put the liquor and powder into a filter of cap-paper, and when the water is run thorough, there will remain in the filter the precipitate, which is to be ſlowly and well dried. Then take it out of the filter, in the form of a groſs powder, and having put it into a clear glaſs, let fall on it warily ſome drops of pretty ſtrong ſpirit of ſalt, and (if the experiment ſucceeds with you as it did with me) during the conflict that will be made, the little lumps of the precipitate will loſe all their former brick-duſt colour, and turn white, though afterwards they will appear diſſolved into a tranſparent liquor, wherein the orange colour is quite aboliſhed.

XVII. Having calcined copper without any additament, ſave fire and water (by the way we elſewhere mention) we took an arbitrary quantity of it, and having poured on it about 3 or 4 times the quantity of good ſpirit of ſalt, we obtained (what we looked for) both a muddy, but manifeſtly reddiſh liquor, and (ſomewhat to the ſurprize of the perſons I had a mind to ſatisfy) a white powder, whoſe quantity bore a conſiderable proportion to the part, that was diſſolved (but whoſe qualities belong not to this place.) In which part its ſelf (to add that upon the by) by the affuſion of common water, and the action of the air, we afterwards produced more than one change of colour.

XVIII. We

XVIII. We ſometimes for curioſity ſake took a quantity, not exceeding a ſpoonful, of the dark brown or ſomewhat reddiſh ſolution of ♀, mentioned in the foregoing experiment; and having put it into a cylindrical vial, that the change of colour may appear the better, we poured on it 2 or 3 ſpoonfuls of totally ardent vinous ſpirit; and giving the glaſs a ſhake to mingle them, we preſently had (as ſoon as the mixture became clear) a lovely green liquor, which, when it was well ſettled, was very fair, and looked almoſt as if it were a liquid emerald.

XIX. We took ſome green taffatee ribband, and having moiſtened one part of it, that was not great, twice or thrice with good ſpirit of ſalt, we ſuffered it to dry of its ſelf; which it did in a ſhort time, and then we found, as we expected, that the wetted part was no longer of a green, but changed to a blue colour. But the ſame ſpirit (to add that upon the by) preſently turned that part of a piece of black ribband, upon which we put 2 or 3 drops of it to a colour not unlike that, which they call *fueille morte*, or, a fading leaf.

XX. It is uſual in paper-ſhops, and in divers other places, to meet with pamphlets and other thin books, that are covered with papers, that look ſometimes of a greeniſh blue colour, bordering upon purple, and ſometimes upon that of violets. Some of the deeper coloured papers of this ſort I have ſeveral times, to gratify ſome curious perſons, eſpecially of the ſex, held in my left hand, and with the other lightly and nimbly touched them here and there with the end of a feather (cut off from the reſt of the quill) dipt in ſpirit of ſalt, which almoſt in the twinkling of an eye, died the touched parts of the paper with a lovely red, that would ſometimes continue very vivid for for a good while, and be manifeſt at the end of divers weeks, if not months. And if inſtead of the forementioned quil, I took into my right hand (a bruſh, or) ſomewhat that was fit to ſprinkle with, and having dipt it in the ſaline ſpirit, made many drops at once fall upon the paper, it was pleaſant enough to behold, how ſuddenly and prettily it would be ſpeckled.

XXI. We took antimony well powdered, and poured on it three or four times its weight of good ſpirit of ſalt: we cauſed it to be boiled in this liquor (and that in a glaſs veſſel) wherein a part of it was diſſolved, and taken up into the menſtruum; where the antimony quite loſt its blackneſs. And this thus impregnated ſpirit of ſalt being dropped into fair water, the black mineral ſubſided immediately in the form of a very white powder or precipitate.

To theſe I might add other changes of colours, that I have made by the help of ſpirit of ſalt. But theſe being not of ſo quick and eaſy trial, (eſpecially becauſe ſome of them require ſkill in chemiſty) I thought it not fit to annex them, ſuppoſing, that thoſe already delivered, amounting to above four pentades, may ſuffice for the purpoſe declared at the beginning of this paper. And alſo to afford us this reflection, that it may not be amiſs, if phyſicians, chemiſts, and others, that are wont to compound drugs or other ingredients, would be leſs forward, than they uſually are, to mingle, not to ſay to jumble ſeveral of them together, either unneceſſary, or without due regard to the friendly and incongruous qualities, (in reference to one another) that the ſeparate ingredients may have. For moſt of us are but too liable to be miſtaken, when we preſume before-hand, what changes the coalition, or other aſſociations, of differing bodies may produce, eſpecially if they be either ſaline, or plentifully partakers of a ſaline nature; ſince experience frequently ſhews, that by the action and re-action, that are conſequent upon untried ways of compoſition, there emerge in the mixture new conſiſtencies and other qualities or accidents, that were not looked for, when the ingredients it is compounded of were put together. And though it may ſometimes happen luckily enough, that theſe emergent qualities, whether of drugs, or other comparatively ſimple bodies, may prove advantageous; yet this may well be looked upon but as a lucky chance, and hinders not, but that one may juſtly fear, that ordinarily the newly produced quality of a medicine may prove to be either worſe than was expected, or at leaſt other than was deſigned, and conſequently leſs fit for the phyſician's or the artiſt's determinate purpoſe.

CHAP. IV.

An advertiſement touching thoſe paſſages, that in this book relate to the art of medicine.

THE favourable reception the publick was pleaſed to give two editions ſet forth in one year of *The Uſefulneſs of experimental Philoſophy*, having encouraged the ſtationer to ſolicit me for a new impreſſion, I was on the ſame ground invited to think of making additions to divers parts of that treatiſe. But afterwards obſerving, that notwithſtanding the thanks and acknowledgments I had the good fortune to receive from ſeveral phyſicians, ſome of them of great reputation, (and perhaps by that only known to me) yet others were not well pleaſed, that a perſon not of their profeſſion ſhould offer to meddle with it, though with a deſign of advancing it; I, whoſe condition exempted me from taking upon me their calling, and who conſequently muſt want many opportunities, that others enjoyed, of making obſervations about the phænomena of diſeaſes and of medicines, ſuffered myſelf without much violence to be diverted to other ſtudies more ſuitable to my inclinations, as well as to my condition; and accordingly I laid aſide the papers I had written in reference to the phyſician's art; nor were it eaſy, or perhaps poſſible for me to retrieve them, after they have lain ſo many years diſperſed and neglected, by which means perchance divers of them have been loſt.

But all this could not hinder me from being preſſed to retrieve and communicate theſe

ſcattered

ſcattered and duſty papers by the ſecretary of the Royal Society, Mr. *H. Oldenburg*: for as this gentleman has been almoſt every where wonderfully ſolicitous to preſerve every thing from being loſt, that may any way contribute to encreaſe the ſtock of uſeful knowledge; ſo having got notice of theſe papers, and a ſight of ſome of them, his partiality for me made him much over-value them, and perſuaded him, that a collection of them, as incoherent and unfiniſhed as they were, might be of ſome uſe to the phyſician's art. And this ſeemed the more hopeful, becauſe natural philoſophy being a ſcience of far greater extent than phyſick, and ſupplying it with many of its principles and theories, it is very poſſible, that naturaliſts, though not profeſſed phyſicians, may propoſe ſome ſuch comprehenſive notions and methods, as may awaken and enlarge the minds of them that are ſo, and at leaſt afford ſome uſeful hints to conſidering and ingenious men. And in effect divers phyſicians, as well as many patients, have been pleaſed to declare (ſome in print, and ſome other ways) that ſometimes they found not uſeleſs aſſiſtances from ſome of thoſe papers, wherein I occaſionally touched on medicinal things. Such motives as theſe made Mr. *Oldenburg* ſo earneſt to procure the ſcattered fragments, that I might have yet remaining, about medicinal affairs; that though for the reaſons mentioned above, I could not think it fit to make a collection of papers ſo unlike in their ſubjects, ſo diſproportionate in their bulk, and ſo unfiniſhed and imperfect on divers ſcores; yet thus far I was content to comply with his deſires, that when theſe trifles came to hand, I would now and then inſert them among my *Experimenta & Obſervationes Phyſicæ*, (medicine being a part, or an application of natural philoſophy;) eſpecially if there were any great affinity between the paper I lighted on, and the ſubject I was then treating of; knowing well, that Mr. *Oldenburg*, and perhaps ſome others too, had rather I ſhould impart them at all adventures, than ſuppreſs what they judged might be uſeful; and that it was better to run the hazard of having them ſlighted, than loſt.

THIS advertiſement I thought fit to give in this place, once for all, that when hereafter there ſhall occur any thing among theſe *Experimenta & Obſervationes phyſicæ*, that directly relates to the phyſician's art, you may not think it ſtrange, remembring upon what account I ventured to meddle with things of that nature, and alſo that you may readily underſtand what I mean, when you meet with any particulars delivered, as thoughts, or deſiderata, or wiſhes, tending to, or aiming at the improvement of medicine; which how ſlight or ſuperfluous ſoever they may be to experienced maſters, to whom I did not preſume to recommend them, I thought might probably be ſerviceable to a very ingenious, but yet young cultivator of that noble art, (whoſe name I concealed, after the way of the curious of *Germany*, under that of *Trallianus*) for whoſe uſe they were intended.

The firſt PENTADE.

EXPERIMENT I.

A VERY tall and well ſet gentleman, aged about twenty four years, by a fall from his horſe, had his ſkull broken in ſeveral places; and being a perſon of good eſtate, had ſeveral chirurgeons to attend him in the courſe of his ſickneſs; during which he was divers times trepaned, and had ſeveral pieces of his ſkull taken off, which left great chaſms (that I have ſeen and felt) between the remaining parts. Within about three days after his fall, this knight (for ſo he now is) was taken with a dead palſey on his right ſide, which did not equally affect his arm and his leg; the uſe of the latter being ſometimes ſuddenly reſtored to him in ſome meaſure, and (though ſeldom) after a while almoſt as ſuddenly loſt: but his arm and head were conſtantly paralytical, being wholly deprived of motion; and having ſo little ſenſe, that it would ſometimes lie under his body without his feeling it. But if his hand were pricked with a pin, he could take notice of it. This palſey continued during almoſt the whole time of the cure, which laſted twenty three or twenty four weeks. And when the chirurgeons were going to cloſe up his head, as having no more to do; one of them, who was an ingenious man, and tenant to this gentleman, oppoſed all the reſt, alledging, that, if they did no more, the gentleman would lead an uſeleſs and very melancholy life; and that he was confident, the palſey was ſome way or other occaſioned by the fall, which had left ſomething in the head, that they had not yet diſcovered. And the knight himſelf, agreeing to this man's motion, his head was further laid open; and at length, under a piece of proud fleſh, they found, with much ado, a ſplinter, or rather flake, of a bone, that bore hard upon the *dura mater*, and was not pulled out without a great hemorrhage, and ſuch a ſtretch of the parts, as made the patient think his brain it ſelf was tearing out. But this miſchief was ſoon remedied, and his hurts ſecurely healed up; and he is now a ſtrong, healthy man, and finds no inconvenience by having ſo broad and various a callus inſtead of the ſkull, ſave that he is a little obnoxious to take cold in his head. But the memorable circumſtances, for whoſe ſake I mention this narrative, were theſe: when I aſked him, how big the bone was, that was laſt taken out? he told me, that it was leſs than half the nail of one of his fingers (not his thumb) and that it was almoſt as thin, being in ſize and ſhape like the ſcale of a fiſh; but that it did not in his head lie flat, but bore hard upon the *dura mater*. When I aſked him, how long after it was taken out, he began to feel ſome relief, as to his paralytic diſtemper? he replied, that in leſs than five hours he found himſelf, to his great joy, able to move his little finger; and (though this happened in the evening) he was the next morning able to move all his fingers, and within two or

three days after to lift up his arm: by which it ſeemed manifeſt, that ſo little a body, as the ſplinter lately mentioned, produced in ſo robuſt a perſon a palſey of the whole ſide it lay on. For when I particularly aſked him, whether, after the taking away of the proud fleſh, that encompaſſed the little bone, he did not find, if he found none before, ſome relief as to his palſey? he anſwered, that he found none at all, till the bone had been pulled out, which was not till a good while after the chirurgeon had been by degrees eating off the proud fleſh, that grew about it. But there was in this caſe another phænomenon, that I thought little leſs conſiderable than the former. For, remembring the important controverſy, that is agitated among modern phyſicians and anatomiſts, about nutrition by the nerves; and having thereupon aſked this knight, whether he did not find an atrophy in the limbs of his body, that were affected? he told me, that when he began to be paralytic on that ſide, it by degrees much waſted, and the paralytic leg was very much extenuated; but the arm and hand much more, ſeeming nothing but a ſyſtem of bones, with the ſkin paſted on them. And when I further aſked, if upon the removal of the bony ſplinter abovementioned, the atrophy of the parts did not alſo begin to leſſen; he anſwered affirmatively, and told me, that in no very long time his leg and arm recovered their wonted dimenſions; and in effect I (ſome days ſince) ſaw the reſtored arm well plumped up with muſculous fleſh, though the weather were exceeding cold. And he further told me, that he found no difference between the limbs that had been paralytic, and the others, except that they would grow ſooner and more ſenſibly cold in ſharp or froſty weather.

This gentleman anſwered me, (to add that upon the by,) that, during the courſe of his cure, he was very frequently (almoſt every ſecond day) let blood; that he wanted not appetite to his meat; that for the moſt part he ſlept indifferent well; and, which was more remarkable, upon ſo great a hurt of the head he did not vomit, nor had afterwards any convulſions.

II. Among other inſtances I have met with, that ſhew the great power, which ſudden paſſions of the mind may have upon the body, I remember, that a woman of middle age, complained ſadly to me of the miſchief, a fright had done her; for ſhe related to me, that, having taken along with her to a meadow by a river-ſide, a little boy, that ſhe was dotingly fond of, whilſt ſhe was buſy about the work ſhe came thither for, the child ſtole away from her, and went along the bank, to delight himſelf with the view of the ſtream; but being heedleſs, it ſeems, by circumſtances, that he ſet his foot upon ſome piece of ground, that the water had made hollow; upon which account, the earth failing under the weight of the boy's body preſſing it, that and he fell together into the river: in the mean time, the poor mother caſually miſſing her child, haſtily caſt her eyes towards the brink of the river, and not being able to ſee him there, ſhe preſently concluded him to be drowned, and was ſtruck with ſo much horror upon the ſudden accident, that tore from her a favourite ſon, that, among other miſchiefs, ſhe fell into a dead palſy of her right arm and hand, which continued with her, in ſpite of what ſhe had done to remove it, till the time ſhe complained of it to me, who had not opportunity to know what became of her afterwards.

III. On the other ſide, to ſhew, that violent paſſions, and even frights, may ſometimes, though very ſeldom, do good, as well as harm; I ſhall here add a relation, that was circumſtantially made me by the learned perſon himſelf, to whom the accident happened. I familiarly knew a gentleman, that lived to be an eminent virtuoſo, and to oblige many by his uſeful writings, who, when he was a youth, fell into a violent and obſtinate ſciatica, which continued with him ſo long, that it left him little hope of recovery; but the devotion of this young man's friends invited them to make him be carried, ſince he could not go, to church upon ſundays; and there it happened, that the town being a frontier garriſon, the guards were ſo negligent, that there was occaſion given to a very hot alarum, that the enemy was got into the town, and was advancing towards the church to maſſacre all that were in it. This ſo amazed and terrified the people, that in very great and diſorderly haſte, they all ran out of the church, and left my relator in his pew upon a ſeat, that they placed him, and whence he could not remove without help: but he being no leſs frighted than the reſt, as they forgot him, he forgot his diſeaſe, and made a ſhift to hamper off the pew, and follow thoſe that fled: but it quickly appearing, that the alarum had been a falſe one, his friends began to think in what a condition they had left him, and haſtened back to help him out of the pew, which, whilſt they were going to do, they, to their great ſurpriſe found him in the way upon his feet, and walking as freely as other men. And when he told me this ſtory, he was above forty years elder than when he was thus ſtrangely reſcued, and in all that time never had one fit of the ſciatica.

ADVERTISEMENT.

It is eaſy to be obſerved, that of the two kinds, into which chemiſts may be conveniently enough ſorted, the number is greater of thoſe, that are not profeſſed phyſicians, than of thoſe that are: and yet ſeveral of the former ſort are led by their more free curioſity, or their particular deſigns, to allow a large ſcope to their trials; and ſo in their experiments upon various bodies, to operate upon ſome of thoſe that may be reduced (either directly, or by fit applications) to the materia medica, and afford uncommon preparations: which, though deſigned for other purpoſes, may, by a ſkilful phyſician, with a light variation, and perhaps without any, be made to

afford good medicines: and therefore I think it may be no inconſiderable ſervice to the publick, if, by the leave and aſſiſtance of the authors, divers chemical experiments, that are not directly uſeful to their immediate purpoſe, were not (as is uſual) thrown away, but put into the hands of ſome ſagacious phyſician.

Upon theſe grounds, I thought my ſelf little leſs than obliged, to ſet apart now and then an experiment, that contained ſome uncommon preparation, which ſeemed applicable to medicine; and to try whether, though, being in the country, or in ſome other inconvenient circumſtances, I had not opportunity to prove it myſelf, the notice given of it might not happen to be of uſe to a ſkilful phyſician.

I shall therefore partly in this chapter, and partly (if God permit) in ſome following chapters and other writings, tender to ſuch a one ſome few of the experiments of this ſort, that I lately lighted on among my adverſaria, and that ſeemed not uncapable to be made of ſome ſervice to the phyſician's art.

Of the good and bad effects of theſe I ſhall be glad to be informed, that they may be either uſed more freely and improved, or corrected and quite laid aſide; and I deſire that this ſhort preamble may ſerve for a general one to all the other deſigned chemical medicines, that I ſhall venture to propoſe hereafter.

A deſigned chemical medicine.

IV. I know how much men are prejudiced in ſome whole countries againſt vomitive medicines; and I remember we have had here in *London* a phyſician of great fame and practice, that would turn over a patient to another doctor, if the caſe were ſuch, that the patient would needs make uſe of emeticks. And I readily acknowledge, that they are edged tools, that require a ſkilful hand, to employ them without danger of doing more harm than good. But ſince experience ſhews, that where the patient can bear them, and the diſeaſe requires them, they act more ſpeedily and effectually than other evacuating medicines; and ſince the generality of our phyſicians, not excepting ſome, that are juſtly reputed very cautious, do not ſcruple frequently to make uſe of the infuſion of crocus metallorum, though it do not ſeldom prove a remedy harſh enough; I ſhall venture, in compliance with ſome ingenious phyſicians, and others, that have often made uſe of a medicine, that goes under the name of my emetick drops, to communicate the preparation of them; without preſſing the uſe any otherwiſe, than by confeſſing, that divers practitioners of phyſick, of differing ſentiments, agree in aſſuring me, that they have not yet found any emetick to work ſo effectually, nor with more eaſe and ſafety, than this liquor; which ſome of them prefer by much to other antimonial vomits; and eſpecially to the infuſion of crocus metallorum.

In preparing my vomitive liquor, I have not always employed the ſame proportion of the ingredients it is made of, nor did I find it neceſſary to be nice in that matter. But the proportion I ſomewhat prefer, is to take two parts of well choſen and finely powdered antimony, and on theſe to pour three parts of the menſtruum, *viz.* ſp. ; which ought to be rather moderately ſtrong, than too much rectified. Theſe are to be diſtilled together in a glaſs retort, fitted with a receiver not very ſmall, till there come over a great part of the menſtruum, which will uſually, towards the cloſe, be accompanied with red flores (ſometimes copious enough) which being ſeparated by filtration through cap-paper, the clear tranſmitted liquor is to be put into a glaſs, not newly waſhed, but dry on the inſide, and to be kept cloſe ſtopt from all intercourſe with the air.

The doſe is uſually to a man or woman, eſpecially at the firſt time, from four or five, to ſeven or eight drops: but I know an ingenious phyſician, that gives to ten or twelve, or a few more drops, if the caſe be urgent; and by that means, he told me, that with a ſmall button-bottle, that I chanced to give him a little before, he did, in two or three hours, reſcue three gentlemen, that, by a very bad ſurfeit with very bad circumſtances, were ſuddenly brought into great danger of ſpeedy death, and carried to a neighbouring tavern, as being too ill to be carried home.

The vehicle may be a ſpoonful or two of wine, or black-cherry water, or (which divers perſons chuſe rather) of ſpring-water, drinking up the liquor immediately after, becauſe there will ſome precipitation be made; and then taking two or three ſpoonfuls of the ſame vehicle to waſh it down. It uſually begins to work early, and does it without cauſing near ſo much ſtraining as vulgar emeticks; and yet makes copious evacuations, and ſometimes ſo eradicative of the morbifick matter, that the phyſician lately mentioned, who cured the three gentlemen, having a poor patient, who had conflicted for above three years with an ague in ſeveral types, but moſt commonly quartanary, perfectly cured him with two doſes of theſe drops, and a julap made chiefly of the diſtilled water of a common vitriolick mineral. And this cure ſeemed therefore to me, when the phyſician gave me an account of the drops he had from me, the more conſiderable, becauſe the patient had made uſe of great variety of remedies; and particularly he devoured great ſtore of the Jeſuits bark, or cortex peruvianus (perhaps becauſe it was not well conditioned, or ſkilfully adminiſtered,) which ſometimes altered the type of his ague, turning it to a ſingle or a double tertian, and ſometimes kept off the fits for a while, when it was a quartan, but never cured him quite; and left him in a deplorable eſtate, wherein the emetick drops found him.

Though I ſent this medicine to ſeveral patients, in whom, thanks be to God, it ſucceeded more than ordinarily well; yet I durſt not venture to give it to children, or to very young perſons; but having gratified an inge-

nious

nious ſurgeon, of good practice, with a ſtock of it, the trials he made upon divers perſons, with great ſucceſs on other patients, imboldened him to give it to boys and girls, and afterwards even to ſeveral children; whereof he gave me good account, only he diſcreetly took care to proportion his doſes to the age and ſtrength of his patients, and not to give the whole doſe at once, but divide it into two or three parts, that if the firſt ſhould work within half an hour, or leſs, the ſecond ſhould not be given, or leſſened in quantity. And if neither the ſecond did work within about an hour, he added the third. And by this cautious method, he aſſured me, that he had ſuddenly relieved ſeveral children in bad caſes, and found not any miſchief or danger enſue upon the adminiſtration of it. But children being tender creatures, this is to be further and cautiouſly tried.

POSTSCRIPT.

HAVING had occaſion to keep by me ſome vials furniſhed with the emetick drops, longer than I thought I ſhould need to do ſo; I obſerved, that, in tract of time, there began to ſubſide a white powder, wherein a good part of the emetick faculty of the medicine may be ſuppoſed to reſide: therefore it will be beſt either to employ the liquor in no long time after it is made, or if one has not leiſure or conveniency to do ſo, to ſhake the vial well (that the powder may be raiſed and well diſperſed through it) juſt before it be adminiſtered.

A deſigned chemical medicine.

THERE are many, that having a high eſteem for chalybeat waters, ſuch as thoſe of the *Spa* and *Tunbridge*, which yet in many places are not to be had at all, and in few to be had well conditioned, are very ſolicitous to find ſuccedaneums to them. To gratify ſome ingenious perſons of this ſort, (and improve a caſual hint taken from a book of a ſomewhat like preparation propounded for another purpoſe,) I remember I employed a way of emulating ſuch waters, that anſwered the outward phænomena of colour and taſte, and ſeem by the paucity and harmleſſneſs of their ingredients like to be innocent medicines. I had no opportunity to make trial of them in phyſick, but finding, that ſome inquiſitive cultivators of that art valued them more than I did, I committed the experiment to paper, and now ſuffer it to come abroad, that it may be tried by phyſicians, and either rejected or made uſe of as ſucceſs ſhall direct. The experiment as I made it was this.

WE took one part of very good filings of ♂, and ten parts of good diſtilled vinegar. Theſe we put into a bolt-head, and ſtopped it well; and then in a mild heat of ſand we digeſted them for about two days, and afterwards augmented the heat till the liquor appeared of a deep orange colour, but yet tranſparent. Part of this tincture we poured off, and kept well ſtopped by its ſelf, becauſe though by a longer digeſtion, and a greater heat, we obtained a very red tincture, yet we did not ſo much value it, becauſe when the menſtruum is over impregnated, the metal uſually precipitates, and the fine colour is deſtroyed. Of the firſt reſerved tincture, we let fall four drops into ℥viiiß. (8 ℥ß.) of clear common water, whoſe colour was not thereby ſenſibly altered; and the vial containing this mixture being well ſhaken, that the tincture might diffuſe itſelf the more thoroughly, we kept it carefully ſtopped for uſe, as being our fictitious or counterfeit *Spa*. A ſpoonful or ſomewhat more of this, with about a quarter of a grain, or leſs, of good freſh powder of galls, would preſently afford a purpliſh tincture, like that of natural ſprings impregnated with Mars, ſuch as the water of the *German Spa*, or of *Tunbridge* in *Kent*: if one's mouth were waſhed with it, it was found to have, like thoſe natural chalybeat waters, a manifeſtly ferruginous taſte. *N. B.* Theſe artificial acidulæ are to be adminiſtred in no long time after they are made; for experience has informed me, that (at leaſt ſometimes) when I kept them too long, within not many days after they were made, they would loſe much, if not moſt of their briſkneſs and force. And I ſometimes perceive, that there would ſubſide to the bottom a certain red or reddiſh ſubſtance, as it were oker, which was a token of the degeneracy of the liquor; and ſome ſuch thing I have obſerved in ſome natural chalybeat waters too long or negligently kept. But our acidulæ may be ſo ſoon and ſo cheaply made freſhly, that the above mentioned inconveniency will ſcarce to the ſkilful ſeem conſiderable.

The ſecond PENTADE.

EXPERIMENT. II.

BECAUSE it may be on ſome occaſions of uſe to a phyſician, to have ways of diſcovering the adulterateneſs of bezoar ſtone, which for its dearneſs is often conterfeited, and not eaſily diſcerned to be ſo by the common ways of exploring, which uſe to be uncertain enough; it may not be amiſs to communicate a new way of trial, which it is unlike, that impoſtors have dreamed of, or, if they ſhould know it, can eaſily elude. And this I am the rather willing to do, becauſe the propoſed way may afford an uſeful hint to the ſagacious enquirers into the nature, and ſome of the preparations, that may be made of the bezoar ſtone; which though it be a drug too much magnified by ſome phyſicians, eſpecially thoſe that depend on it againſt the true plague; yet a phyſician of great experience, and rather a ſevere than any ways a partial judge of it, allows it to be an excellent remedy even in malignant and ill-conditioned fevers, at leaſt if they be not truly peſtilential. One of the ways I employed in treating the bezoar ſtone may be eaſily gathered from the enſuing tranſcript of one of my regiſtered experiments.

We took forty or fifty grains of choice oriental bezoar ſtone reduced to powder, and in a bolt-glaſs poured on it ʒvi. of good ſpirit of nitre, as well to try, whether this liquor would prove a fit menſtruum for this ſtone, as we found it to be for the calculus humanus, as for other purpoſes. And though this affuſion being purpoſely made in the cold, the liquor did not ſeem at firſt to work on the ſtone; yet ſoon after it fell violently upon it, and diſſolved the greater part of it, not without noiſe and a notable effervescence. The ſolution was almoſt red, and the glaſs being put in a digeſtive furnace, the whole powder was not only diſſolved, but being left a night or two in a north-window, it afforded divers ſaline concretions, much larger than could well have been expected from ſo ſmall a quantity of matter; and theſe cryſtals, whilſt they were yet in the glaſs, might eaſily be taken for cryſtals of ſalt-petre, ſo great was their reſemblance,

To manifeſt, how much the faculties of looſening and binding are relative things, and depend upon the diſpoſition of the body to be wrought upon, and ſo upon the congruity betwixt the agent and the patient, I know an ingenious gentlewoman, on whom cinnamon, which generally is a conſiderable aſtringent and ſtomachick medicine, has a quite contrary operation, and that in a ſtrange degree; inſomuch, that having found by two or three accidental trials, that a very little cinnamon ſeemed to diſorder her ſtomach, and prove laxative, ſhe reſolved once to ſatisfy herſelf, whether thoſe diſcompoſures came by chance, or no; and having ſtrewed ſome powdered cinnamon upon a toaſt, ſhe was going to put into her ale, upon eating the toaſt ſhe was copiouſly purged for two days together, and that with ſuch violence, that it put her into convulſion fits, and a kind of ſpaſmus cynicus, which ſhe could never be perfectly freed from being troubled with from time to time for three years, as was the other day averred to me, and divers others that know her by her huſband, who is himſelf a learned man and a profeſſed phyſician.

A prosperous phyſician, to whom I had recommended ſome things relating to his profeſſion, whilſt he practiſed it with ſucceſs in the capital city of *Ireland*, where at that time there raged a new and violent fever, whereof multitudes died, very few patients recovering of it, happily lighted on a method, that proved, through God's bleſſing, very proſperous. This doctor returning into *Ireland* ſome time before having been deſired by me to ſend me an account of ſome things relating to natural philoſophy and phyſick, that I named to him, wrote to me, in anſwer to ſome of my enquiries, a letter, out of which I thought fit to make this extract, becauſe I know not, but that it may give good hints towards the cure of ſome other ill-conditioned fevers.

Dublin, Feb. 27, 1682.

I HAVE employed ens veneris for the removal of a ſubſultus tendinum, in a perſon dangerouſly ſick of a febris petechialis, (a diſeaſe fatal to very man here for theſe twelve or fourteen months;) and found, that it anſwered my hopes in three or four hours after I gave it in conſerve of borrage flowers.

I have, ſince I came from *England*, thought of a method of curing the aforeſaid fever, which has not once failed me, though I made of it for ſixteen or eighteen ſeveral perſons, many of which would certainly die, if treated after the uſual manner in this caſe. If I ſhould tell you, from what obſervations and reaſonings I came to alter the method of cure, I ſhould be very tedious. I ſhall therefore at preſent wave that, and proceed to tell you, that when firſt I come to any ſick of this diſeaſe, if I find coſtive, (as generally they are) I preſcribe a gliſter, and after that an epiſpaſtick plaiſter ſix or ſeven inches broad, and eight or nine inches long, to be applied between the ſhoulders: the bliſter being well raiſed I order to be dreſſed carefully, ſtripping off the cuticula. This continues running till the fever is gone off, which is moſt commonly in ten or twelve days, if they have not kept up too long with it, and then we cannot certainly foretel the time of the fever's declination: for the whole time till the going off of the fever, I preſcribe emulſions of *aq. aronis, card. bened. citrij totius & ſyr. granatorum cum aceto.* I allow of orange and butter-milk poſſets, of roaſted apples, flummery, or any other light and cooling thing they call for.

By this method I keep the genus nervoſum and brain from being affected, and conſequently ſecure my patients; for as many as I have ever known of them die, that were troubled with this diſeaſe, died of a diſorder of thoſe parts. I do not defer the bliſtering plaiſters, as others do, till I find my patients delirious, lethargick, convulſive, or otherwiſe affected in their heads and nerves, finding by the experience of others, that then they moſt commonly prove ineffectual, becauſe of ſome morbifick matter's being too deeply lodged in theſe parts. I do not preſcribe, except upon ſome extraordinary occaſions, any volatile ſalts or ſpirits, or any thing too apt to quicken the already over-briſk circulation of the blood, having experimentally learned, that by theſe often uſed the brain and nerves become ſooner than ordinary affected, for as much as they deeply inſinuate themſelves, and drive with them ſome morbifick matter into the brain and nerves. I find bleeding bad, being generally fatal. If I doubt of the recovery of any of my patients ſick of this diſeaſe, it is only when I find, that they have been let blood, or lain for eight or nine days before I come to them; though I have brought through it even perſons in thoſe circumſtances.

A deſigned chemical medicine.

I shall not, becauſe I need not, diſcourſe of the medicinal virtues of ſteel, in a city, where many learned phyſicians do ſo much eſteem and employ chalybeat medicines as they do in *London*; and therefore I ſhall content myſelf at this time to offer you a

couple of preparations of ſteel, that poſſibly you have not met with or thought of.

1. CONSIDERING, that moſt of the ways made uſe of by chemiſts to prepare ſteel tend, by dividing it into very minute parts, to make it more liable to be wrought on by the liquors of the ſtomach, and ſome other parts of the body; and that the generality of theſe chalybeat preparations are wont to be made, only with acids, whether manifeſt, as oil of vitriol, ſpirit of vinegar, *&c.* or occult, as brimſtone, which though inſipid in its natural ſtate, when it comes to be melted diſcloſes its hidden ſalt, and works on ♂ by a ſharp acidity: conſidering this, I ſay, and that men have confined themſelves to acids in working on ſteel, becauſe they ſuppoſed inſtruments of that kind were neceſſary to diſſolve that metal, I thought it might do you, and ſome ingenious men of your profeſſion, ſome little ſervice, if I propoſed to you a way of opening the body of ſteel, that, though I gave a hint of it divers years ago, is, for ought I know, yet unpractiſed.

WE took then ſeveral ounces of highly rectified ſpirit of fermented (or putrified) urine *per ſe*, and conſequently without quick-lime, and poured it upon as much filings of ſteel freſhly made, to be ſure not to have any ruſty ones, as we gueſt, would at leaſt ſuffice to ſatiate it fully. Theſe we put in a moderately warm place, where the menſtruum wrought on the metal for divers hours together, and diſſolved a conſiderable part of it. This ſolution we ſet to filter, and found it of a taſte conſiderably ſtrong, but very different from any of the chalybeat preparations, we remembered, that were ſeen made with acids. The liquor being kept in a ſtopt viol for ſome days near a window, did in the cold let fall by degrees a conſiderable quantity of powder of a deep green colour, which ſurprized ſome virtuoſi, to whom I ſhewed it, eſpecially becauſe the liquor it ſelf was not of that colour; though at leaſt the ſuperficial part of what remained (in plenty) in the filter did alſo in the air acquire a green colour. But though our ſolution poured off from the ſubſided powder was warily and ſlowly evaporated, yet we did not find it would well cryſtallize. What uſe may be made in phyſick of preparations of this kind, I leave to you, whoſe profeſſion as well as curioſity will engage you to conſider. I do not preſume to tell you, but in general it ſeems, that ſteel prepared with volatile ſpirits of the animal kingdom, that are wont to be friendly to nature, and are very contrary to acids, may have new qualities very differing from thoſe of ſteel prepared with acids, and may be more ſafe in ſome caſes and to ſome patients. With what other volatile menſtruums I have diſſolved Mars, and what phænomena ſome trials I made with that metal opened by ſuch ſalts, you may command an account of, if you think it worth deſiring.

A deſigned chemical medicine.

ANOTHER experiment, that I made on ſteel, was deſigned to make as much of it volatile, as I could with a menſtruum, not ſo corroſive or dangerous to the body as oil of vitriol, or ſpirit of nitre, which, eſpecially the former, are employed by divers chemiſts to make chalybeat preparations, that yet are not volatile. The medicinal ſcope I had in my eye (for I had alſo a chemical one, that belongs not to this place) was to try, if I could by it obtain any ſulphur of Mars, which the commendations, that ſome, even of thoſe chemiſts, whether adepti or not, whoſe authority I moſt regard, repreſent as an excellent medicine, eſpecially in caſes that require anodynes, and which the others or the ſame ſpeak of as a graduatory ſubſtance (as to ſome metals) or both. If you ſhould aſk me, why I did not make uſe of the common vitriolum martis, which is eaſy to be had in the ſhops of chemiſts? I anſwer, that my deſign being to try whether or no I could obtain a ſulphur, that might properly enough (though not in the utmoſt rigour) be called ſulphur of Mars, that which is made the common way would not anſwer my end, ſince though I ſhould be able from this vitriol to obtain a real ſulphur; yet I ſhould not think it ſafe thence to conclude, that it came from the metal, and not from the menſtruum; becauſe I have ſeveral times from oil of vitriol itſelf obtained no contemptible proportion of yellow and combuſtible ſulphur. To which I add, that the acquiſition of a metalline ſulphur, though it was not the only thing that I aimed at in this preparation, for I preſumed, that at leaſt I ſhould make a very great comminution of the parts of ſteel, which is one of the main things aimed at by the more rational phyſicians in the preparations of that metal.

UPON theſe and the like grounds, I pitched upon good ſpirit of ſea-ſalt, as a menſtruum, much fitter for my purpoſe than either oil of vitriol, or the acid part of ſulphur; and accordingly in a good many ounces of this menſtruum, we diſſolved as much as we eaſily could of choice filings of fine ſteel; and having filtered the green ſolution, we very ſlowly evaporated it in a glaſs veſſel, and took ſuch care not to ſpoil the matter, that we had ſtore of fine green cryſtals, that were not very ſmall, and looked prettily: moſt of theſe we put into a ſtrong, but ſmall retort, and by degrees of fire, and a ſtrong one, for the laſt hours, we obtained divers ounces of a liquor, that came over in white fumes, like miſts driven by the wind, and afforded a ſulphureous ſmell: this liquor we rectified, and had a yellow ponderous ſpirit, that ſeemed to be much more of kin to the ſpirit of ſea-ſalt, than to the common oil of vitriol; eſpecially ſince being mixed with aqua-fortis, it would, like ſpirit of ſalt, make it a menſtruum, that would even in the cold diſſolve gold in thin leaves. Which laſt words I add, becauſe having put into a little of it already made yellow, by having diſſolved leaf-gold a very thin plate, but a pretty deal thicker than a leaf of hammered gold, the menſtruum made it look all over white, almoſt like ſilver, which ſeemed to argue, that this vitriolate menſtruum dif-

fered from common ſpirit of ſalt. And however, it may be worth taking notice of by the by, that not only vitriols blue, as is well known to chemiſts, but that vitriols of one of thoſe colours, and whereof the ſame metal is the baſeſt, may differ much from one another on the ſcore of the various, and to us, perhaps, unknown menſtruum, that diſſolves the metal, ſince our green vitriol yields liquors very different from common Engliſh vitriol of Mars made with oil of vitriol, though all the three be green. Which may give us ſome reaſon of the uncertainty, whereof vitriol is mainly employed; and it is perhaps worth remarking, that though we did not find the vitriol of Mars made the common way, nor even Roman vitriol to diſſolve in a vinous ſpirit totally inflammable; yet it would eaſily enough diſſolve our ſaline vitriol (if I may ſo call it) which ſolution (to hint that in *tranſitu*,) you may perhaps ſee cauſe to employ as a medicine in ſeveral caſes, and particularly as a ſtyptic in wounds, ſince its taſte is very aſtringent, its parts very ſubtil, and made fit by the vinous ſpirits to prevent corruption; eſpecially in thoſe climates, where chirurgeons complain, that they can ſcarce prevent the breeding of worms in wounds, unleſs they do betimes dreſs them with ſpirit of wine or brandy.

But that which we chiefly aimed at in this operation was the dry part, of what was elevated by the force of the fire. This we found to be diſtinguiſhable, partly by its ſituation, and partly by more durable accidents, into three kinds of ſubſtance; whereof one was almoſt like a powder, which after the contact of air, did in a while come over to be of a yellow colour, almoſt like ſulphur, but it was not indeed truly combuſtible ſulphur. The other ſubſtance conſiſted of larger parts, and was of a deep colour, between red and brown. But the third, which ſeemed the moſt copious of all, was made up of fine parts, larger than the former, of a deep reddiſh colour, and adorned with a fine gloſs, like that of ſcales of fiſhes, that looked very prettily.

The caput mortuum was found to be of a texture, that would have ſurprized moſt men; for a great part of it appeared to be turned into a talky ſubſtance, conſiſting of pretty broad and very thin plates, ſmooth and gloſſy, that lay upon, and againſt one another, like thoſe that make up Muſcovia-glaſs, when the pieces are more thick than large.

CHAP. V.

Containing experiments and obſervations ſolitary; in two pentades.

The firſt PENTADE.

EXPERIMENT I.

A notable comminution of gold into powder, that will ſink in water.

To manifeſt into how great a multitude of corpuſcles, groſs and heavy enough to ſink to the bottom even of a ſaline liquor in the form of precipitate or powder, I thought of this expedient. We took a grain of refined gold, and having diſſolved it without heat in a competent quantity of good aqua regia, we put to it by gueſs about two ſpoonfuls of water; and then by a thread we hung in the mixture a little bit of clean metalline body, and kept it ſuſpended in the liquor for many hours (or ſome few days.) By this means we obtained, as we expected, a precipitate of a fine and deep colour, ſo copious and ſo light, that it was a long time before it would all ſettle at the bottom. Then looking upon the remaining part of the ſuſpended metalline body, we found it ſo very little leſs than when the whole was firſt put in, that the diminution of it was not judged to amount to near a grain. By which experiment it appeared, that one grain of gold, not ſwimming in parts ſeparately inviſible, as it is in ſolutions, but reduced to a manifeſt powder, ſeemed to make a conſiderable quantity of precipitate at the bottom of the cylindrical vial, whoſe diameter was about an inch, that we kept it in. And this glaſs being a little ſhaken, the precipitate would riſe like a mud, and be ſo thoroughly diſperſed in the form of a powder through the whole body of the liquor, and a greater quantity of water added to it, that at firſt it would ſeem opacous, and after ſome time it would appear like a high and lovely purple ſolution. So that one grain of gold (for the colour argued, that there was ſome of that metal, in every corpuſcle of the precipitate) was reduced into as many grains of powder, as ſufficed to lodge themſelves in all the particles of ſpace great enough to be viſible, that were contained in a maſs of ſixteen drachms (i. e. two ounces) of water.

EXPERIMENT II.

A proof of the metalline nature of granates.

I have elſewhere endeavoured to ſhew, that divers, if not moſt, of the real vertues of ſome gems (for there are too many fabulous ones aſcribed to them) may in probability proceed from the particles of mineral juices, that were admitted whilſt the matter was yet in *ſolutis principiis*, or at leaſt ſoft, and afterwards coagulated with the lapideſcent part of the ſtone. In confirmation of this conjecture, I ſhall now obſerve, that having, upon ſome grounds not neceſſary to be here mentioned, ſuſpected, that granates contain (ſome of them) beſides ſome other metalline ſubſtances, divers corpuſcles of a martial nature; I made choice of ſome ſmall ones, which by their deep and almoſt dark colour (to name no other ſigns) I gueſſed to contain ſomewhat of iron or ſteel; and applied to them a pretty vigorous loadſtone, which, as I expected, readily took them up, and to which they conſtantly ſtuck afterward, till I forcibly ſeparated them from it. But though I tried this upon more parcels of granates than one or two, yet I found, that there was not many in one heap, that would eaſily adhere to the magnet.

EXPE-

EXPERIMENT III.

A GENTLEMAN eminent for his travels into eaſtern parts, and for his ſkill in jewels, told me, in confirmation of my opinion about the origin of gems from fluid materials, that he had ſeen a white ſapphir, that was a table-ſtone, as they ſpeak, *i. e.* flat and not cut in facets, about the middle of which there was a cavity about the bigneſs of a large pin's-head, or ſmall fitch, that contained in it a drop of liquor, that it ſeems could not be coagulated into ſtone with the reſt of the matter: which liquor, he ſaid, was very eaſily diſcernible by its ſhifting places in the cavity, when the ſtone was put into differing poſtures. And when I aſked, whether there was no flaw or commiſſure in the ſtone, at which the liquor may be ſuſpected to have got in; he aſſured me, that there was none, but that the cavity was every way encompaſſed by the ſolid ſtone, and was about the thickneſs of three barley corns beneath the upper ſuperficies of it.

SCHOLIUM.

IT may be here fit to give notice once for all, about the experiments, that are in the following collections ſtiled ſolitary, that though moſt of them are delivered nakedly as matters of fact, without any ſuch introduction or ſubſequent reflection, as may be met with ſometimes expreſsly, and oftner by intimation in divers others; yet that it ſhould not be thence inferred, either thoſe, that are ſimply recited, were lighted on by chance, or made at all adventures; or that they are of no uſe, becauſe for the moſt part there is not any expreſly aſcribed to them. For as they were not written without a particular occaſion and ſcope too, ſo that many of them may be applied to good purpoſes, will, perchance, be found here and there in our other writings. And to make it probable in general, that moſt of them may not be uſeleſs, it may perhaps ſuffice, that we refer to what we have elſewhere purpoſely diſcourſed about the uſes of experiments (even) to ſpeculative philoſophy.

THIS may paſs for a general ſcholium applicable to moſt of thoſe experiments, that are not attended with any particular ſcholium, nor any thing in the experiment or obſervation itſelf, that may eaſily, by an attentive reader, be made to ſupply the place of a ſcholium. Which laſt clauſe I add to intimate, that beſides my haſte, another reaſon, why ſo many ſcholiums, as may be expected in the following collection, will not be found in it, was, becauſe the proœmial part did, on ſeveral occaſions, make it needleſs to ſubjoin annotations.

EXPERIMENT IV.

AN ingenious and credible perſon (Mr. *W.*) aſſured me, that in one of the fine gardens near *Genoa*, that he delighted to viſit, there was a pond, which being made on the ſide of a hill, the wall next the bottom of the hill was ſo high, that men could not look over it into the pond, nor be at all ſeen over it by the fiſhes in the pond; and yet he has ſeveral times obſerved theſe fiſhes to be called together by the gardiner as he pleaſed, with a certain noiſe, that the gardiner made to aſſemble them, though neither he nor any man elſe could be diſcovered by the fiſhes, that readily obeyed their ſummons.

THIS relation may be of uſe in the controverſy, whether fiſhes hear under water.

EXPERIMENT V.

UPON occaſion of what is elſewhere ſaid of the production of vivid apparent colours by the breaking of the beams of light, on corpuſcles extraordinary minute, though ſolid; I took a globe of rock cryſtal, which being for a certain uſe ſawn in two by a cutter of gems, and having looked upon the flat ſurfaces, obſerved to the ſun beams, the little particles, that (notwithſtanding their ſeeming ſmoothneſs in the ſhade) aſperated their ſurfaces, did ſo retract and reflect the light, as to make them exceed the vivid colours of the rain-bow, (but in a ſomewhat interrupted manner) ſometimes on one part of the ſurface, ſometimes on another, as the ſurface happened to be ſituated in reference to the ſun.

AND having cauſed a choice and fine grained touchſtone to be likewiſe ſawn aſunder by the ſame artificer to make two of it, I obſerved upon the new ſurfaces made by this action, that to the touch ſmooth and poliſhed, ſuch vivid colours, as I lately mentioned to be when theſe ſurfaces were put into various poſition in reference to the ſun and eye; ſo that notwithſtanding the great tranſparency of the cryſtal, and great opacity of the touchſtone, their ſuperficial corpuſcles were found fit to exhibit (in due poſitions) the vivid colours we admire in the rain-bow.

The ſecond PENTADE.

EXPERIMENT I.

HAVING for leſs than two hours borrowed an *oculus mundi*, whoſe colour was white, whoſe figure was round and plain convex, and whoſe diameter I judged to be about a third part of an inch (rather leſs than more) I put it into a very ſhallow glaſs veſſel almoſt filled with fair water, and obſerved within one minute, or thereabout, with the minute-watch, that one part of the edge began to appear ſomewhat diaphanous, and the whole ſtone did by degrees loſe its whiteneſs, appearing of a dark browniſh colour: when this change had reached the whole ſurface, I looked upon my watch, and found, that the ſtone had lain nine minutes in the water; out of which having taken it, I perceived the body was grown ſemi-diaphanous, and the parts near the edge being leſs thick, appeared to have

10 Cent. 12.

have loſt much more of their former opacity, than the innermoſt part had. Then putting the ſtone preſently into the water again, I let it lie there ſo long till the time effluxed, ſince the beginning of the experiment, amounted juſt to half an hour. Then taking it out, and wiping it, I found it was grown much more clear, ſince being held againſt the light, it looked almoſt like yellow amber, but not quite ſo diaphanous. Then I expoſed it to the contact of the air, in the ſcales of a very good balance, (where it weighed four grains and about a quarter) and left it for a quarter, or near half an hour in that balance, to try if by the receſs of any imbibed aqueous moiſture it would become lighter; but want of time hindered me from compleating the experiment, but did not deter me from making another obſervation, which was, that within about a ſingle minute of an hour, a portion of the ſtone, near one part of the edge, was manifeſtly grown opacous and whitiſh, and within not many minutes after the whole ſtone began to appear in a changing condition, but did not change in every part at once, nor did the alteration make an uniform progreſſion; but here one might ſucceſſively diſcover divers white arches, or as it were zones, that were parallel enough to one another; and being quite opacous, intercepted between them other little zones, which being yet ſemi-opacous, appeared of a brown colour, and concurred to make the ſtone look like a very pretty agate, wherein the whiteneſs made a continued progreſs as long as the time permitted me to obſerve it: and the poſſeſſor aſſured me, that within an hour or two it would be all of a cream white (as he expreſſed himſelf) which I thought the more credible, becauſe I ſaw one part of it that was pretty broad, to have obtained already a whiteneſs, little, if at all inferior to that of ivory.

EXPERIMENT II.

Remarkable obſervations about hurricanes.

THE late governor of the *Bermudas* iſlands, (very much ſubject to hurricanes) in anſwer to my queſtions about the preſages of thoſe hideous tempeſts, informed me, that theſe were of the principal forerunners. Firſt, that the ſea would manifeſtly ſwell at ſome diſtance from the ſhores, inſomuch that the fiſhermen would divers times make to land, and warn the inhabitants, upon confidence of that preſage, to provide againſt that diſmal ſtorm, though the ſea were then ſmooth enough. Secondly, that the ſea would beat with great noiſe againſt the ſhore, eſpecially the rocks, though there appeared no manifeſt cauſe, as upon the account of the wind or tide, why it ſhould do ſo. And this ſign would ſometimes not appear till many hours, or perhaps a full day after that forementioned. And ſometimes it was obſerved, that the ſea would now and then ſuddenly invade the ſhore, and gain further upon it than could be accounted for by the wind or tide, and then quickly ebb away beyond the uſual low water-mark, and after return again with more fury, and fall back further than before. Thirdly, that ſometimes there would be perceived an ungrateful ſmell in the air, before the hurricane began to blow. And fourthly and laſtly my relator affirmed to me, both he and others had ſeen many bundles, as it were of long ſtreaks of differing colours, ſome whitiſh, ſome reddiſh, and ſome bluiſh, or greeniſh, which by reaſon of their figure are uſually called in thoſe parts horſe-tails: and theſe were ſeen in parts of the ſky, where the air was troubled indeed, but yet no formed clouds did appear to the eye.

EXPERIMENT III.

A monſtrous pearl.

YESTERDAY a curious perſon came to ſhew me a monſtrous pearl, if I may ſo call it, becauſe it was very irregularly ſhaped, and of an enormous bigneſs. For though it were ſo artificially ſet in gold, that by the help of a little of that metal fitly placed here and there, the whole jewel repreſented a lion; yet I made ſhift to meaſure it exactly enough with a pair of calapar compaſſes, (as they call thoſe, whoſe legs are made archwiſe) and found the length to be juſt an inch and an half, and the greateſt breadth (where yet it was of a proportionate thickneſs) to be $\frac{8}{10}$ or $\frac{4}{5}$ of an inch. The colour was orient enough, all but one dark ſpot, which by its ſize, figure, and ſituation, I gueſſed to be the remains of that part (whether like an umbilical cord or no) whereby it was faſtened to the naker or ſhell of the fiſh that produced it.

EXPERIMENT IV.

An odd obſervation about the influence of the moon.

I KNOW an intelligent perſon, that having, by a very dangerous fall, ſo broken his head, that divers large pieces of his ſkull were taken out, as I could eaſily perceive by the wide ſcars, that ſtill remain; anſwered me, that for divers months, that he lay under the chirurgeons hands, he conſtantly obſerved, that about full moon, there would be extraordinary prickings and ſhootings in the wounded parts of his head, as if the meninges were ſtretched or preſſed againſt the rugged parts of the broken ſkull; and this with ſo much pain, as would for two or three nights hinder his ſleep, of which at all other times of the moon he uſed to enjoy a competency. And this gentleman added, that the chirurgeons, (for he had three or four at once) obſerved from month to month, as well as he, the operation of the full moon upon his head, informing him, that they then manifeſtly perceived an expanſion or intumeſcence of his brain, which appeared not at all at the new moon, (for that I particularly aſked) nor was he then obnoxious to the forementioned pricking pains.

EXPERIMENT V.

An uncommon experiment about heat and cold.

Novem. 9. 89. To confirm what we have elſewhere delivered about the mechanical origin of heat and cold, we deviſed the following experiment; we took a ſmall and hermetically ſealed thermoſcope, whoſe ſtem was divided into parts, equal enough as to ſenſe, by little ſpecks of amel, that ſharp liquors might not eat off or ſpoil the marks. The ball of this inſtrument we put into a ſlender cylindrical veſſel, (called in the ſhops a muſtard glaſs) and more than covered it with ſtrong oil of ☉, and left it there a while to be reduced to the temper of the ſurrounding liquor. Then we caſt upon it by degrees, groſly powdered, ✻ which preſently was wrought on furiouſly by the menſtruum; and by this conflict, was produced a ſeeming effervescence, with great noiſe and ſtore of froth, which more than once was ready to run out of the veſſel. But for all this ſeeming ebullition, the mixture inſtead of growing hot, did really grow colder and colder, as appeared not only when the veſſel was touched by the fingers on the outſide, but by a ſurer mark, which was the deſcent of the coloured ſpirit of wine. How much further it would have deſcended, (for the liquor was not near ſatiated with the ☉) we were hindered from diſcovering, by an unlucky accident, that broke the thermometer, and put an end to that firſt part of our experiment. But this was no hindrance to the ſecond part, which for its novelty we mainly deſigned. For when we poured this actually and conſiderably cold mixture into three or four times its weight (by gueſs) of as much common water, that was likewiſe actually cold; this ſecond mixture did, as I expected, immediately grow ſo hot, that I did not like to keep my finger for a minute or two upon the outſide of the glaſs.

An advertiſement about the nature and ſcope of the chemical experiments contained in the following pentades.

CHAP. V.

Containing two pentades of chemical experiments.

BEFORE you enter upon the peruſal of the following pentades, I think myſelf obliged to give you notice, that you will be deceived, if you expect to find them conſiſt, either ſolely or mainly, of ſpagirical ſecrets, or difficult and elaborate proceſſes. I do not indeed deny, that I am not altogether unfurniſhed with ſuch, as in probability moſt readers would refer to experiments of that nature; and you may find divers of them ſcattered upon fit occaſions in ſeveral of my writings: but in the preſent tract, though I have not forborn to mention here and there as many particulars of that ſort, as I thought neceſſary to excite and maintain the curioſity, and ſuſtain the attention of a reader, that reliſhes nothing, that is not ſeaſoned with ſomewhat that is not common; yet in this treatiſe, wherein I aimed not to appear a chemiſt, ſo much as to make my reader a naturaliſt, it was more ſuitable to my deſign, though not more conducive to my credit, that the following pentades (which, God permitting, may, in tract of time, much encreaſe in number) ſhould mainly conſiſt of experiments, rather uſeful than ſpecious; my deſign being to contribute ſome ſound materials towards the erection of a ſolid and uſeful natural philoſophy. In making choice of which materials, I uſually prefer thoſe experiments, that afford the more light, to thoſe that appear with the moſt luſtre; and thoſe that are proper to encreaſe the reader's ſkill, to thoſe that make an oſtentation of the writers. On which ground it is, that whatever I may do, where I purpoſely recommend chemiſtry, I make this ſmall collection conſiſt mainly of ſimple and not intricate, or elaborate experiments; thoſe that are ſimple being not only more eaſy to be tried, and if need be, reiterated without much trouble, or danger of erring; but (which I more regard) more eaſy to be judged of as to their cauſes, phænomena and effects, and conſequently more fit to ground notions and reaſonings upon: divers of which may probably in the applications, that ſagacious perſons may make of them, prove to be of practical as well as theorical uſe. Thus though a wedge of gold and a diamond be, one more rich and finely coloured, and the other more precious and ſparkling, than a piece of ſteel and a flint; yet on many occaſions the two latter are far more ſerviceable to mankind than the former: ſince not thoſe, that are more prized for themſelves, but thoſe, that in compariſon ſeem deſpicable, afford ſparks, which do not only give light, but are fit to kindle fires, which both afford incomparably more light, and in the application are of excellent and neceſſary uſe in the kitchens of families, the forges of ſmiths of all ſorts, the furnaces of mine-men, and the laboratories of chemiſts.

The firſt PENTADE.

EXPERIMENT I.

To diſſolve crude gold with dry bodies.

BECAUSE the generality of chemiſts make ſo great a matter of *aurum potabile*, though they cannot deny, but that by their preparations it is not made irreducible; and becauſe alſo I am willing to grant, that even ſome preparations, that leave the metal reducible, may yet be of conſiderable uſe in phyſick, (the grounds of which opinion I elſewhere declare, and ſhall not here repeat) I will in this place ſet down a proceſs, which though I do not overmuch value, ſerved me well enough on ſome occaſions, to vie with thoſe, that much vaunted their particular ways (as they

they thought them) of making *aurum potabile.* I then told them, I could make one in an hour or two's time without a furnace, and that without any other diſtilled liquor whatſoever than common ſpirit of wine well dephlegmed.

This I did ſeveral times after the following manner. I prepared a ſaline mixture, conſiſting of one part of ſal armoniac, two parts of roch alum, and four parts of pure nitre. This being well pulveriſed and mingled, I rubbed diligently in a glaſs or marble mortar, with 15 or 16 parts in weight of the whole mixture of leaves of gold, ſuch as apothecaries and book-binders uſe. Then I put this into a ſmall new crucible, and putting a few, and but a few kindled coals round about it, and at a little diſtance from it to neal the veſſel; I ſoon after approached them, till the heat made the matter melt, and ſo with that gentle fire I kept it in fuſion, till it viſibly emitted no more fumes, but grew dry again.

This ſign appearing, I preſently took it off from the fire, and while it was yet warm, dug it out, as clean as I could; and having ſeaſonably pulveriſed it, that it might not attract the moiſture of the air, I put upon it ſome highly rectified ſpirit of wine, which within an hour or leſs time was ennobled with a rich golden colour. And accordingly I found it to be a real ſolution of gold, by divers trials, that I purpoſely made to evince it to be ſo.

Of this and ſome other leſs common preparations of ☉ more may be met with hereafter.

EXPERIMENT II.

Luna cornea by diſtillation.

There was taken ℥iii. of well refined ſilver, thinly laminated, and ſix of common ſublimate. This was put firſt into a retort, and the ſilver cut into ſmall pieces was put in after, that the matter lying uppermoſt might be penetrated by the aſcending fumes: but the fire having not been made ſtrong enough, the ſublimate was elevated to the uppermoſt part of the retort, and left the ſilver ſcarce at all changed in the bottom of the glaſs. Wherefore we put the ſame ſublimate and metal into another retort, and adminiſtring a ſtronger fire, that the ſublimate might be thoroughly melted before it could flee away, we obtained no running mercury at all, but the greateſt part of the ſublimate was elevated in its uſual form, leaving behind it the ſilver in a lump, which ſtuck hard to the bottom of the glaſs, and appeared much altered. For beſides, that there was acquired ℥i. in weight, many of the pieces of metal ſtuck together, and ſeemed at leaſt half melted, and were of a kind of horny and ſemidiaphanous ſubſtance, which would readily enough melt almoſt like ſealing-wax, when I held it to the flame of a candle, at which yet I could not perceive it manifeſtly to take fire.

SCHOLIUM.

It is here to be noted once for all, that in this and divers other chemical experiments, there is ſometimes much more delivered, than is neceſſary to make good the title, or the thing mainly intended. But it was thought fit, not to diſmember or mutilate the entire memoir as it was regiſtered, becauſe that of the other particulars ſome may be, though indirectly, referred to the principal part; and others may be looked on as phænomena, which may be of uſe at leaſt to me, by keeping me from forgetting them, and probably tend to the main deſign of all theſe experiments, *viz.* to contribute to a natural hiſtory, which may reſpect practice, as well as theory.

EXPERIMENT III.

Mercury grown warm with ſilver.

We took ℥ii. of animated (or antimonial) quickſilver, and put it into the palm of one's hand: we put to it by degrees a drachm and an half of powder of fine ſilver, made by precipitation with copper the ordinary way (but with more than ordinary care.) Whilſt this mixture was making with one's finger, he, that held it in his hand, confeſſed he found it grow ſenſibly warm; and I, whoſe finger was conſiderably warm, could not with it perceive any coldneſs in the amalgame. This in a very ſhort time became of a ſoft, and (as to ſenſe) uniform conſiſtence, and ſo ſoft, that it was like almoſt melted butter, inſomuch that we added half a drachm more of the calx of ſilver, without rendering the amalgame at all too ſtiff; and perhaps we might have added the other half drachm, without overcharging that penetrant mercury; in which caſe it had ſwallowed up full its own weight of ſilver, ſo different it was from common mercury; and when we left off, it had reduced into a very yielding form three quarters of its own weight of ſolid metal. This $\overline{aaa}$ we put into a ſmall vial, and ſtopped the glaſs with a cork, to obſerve, whether the amalgame would harden without intercourſe with the free air. Next morning it appeared to be concreted in the glaſs; and the next morning after that, we broke the glaſs to take out the matter, which we found conſiderably hard, but brittle enough.

EXPERIMENT IV.

The durableneſs of the faculty of a certain prepared mercury to grow hot with gold.

To convince thoſe, that treat the incaleſcence of prepared mercury and of gold, as a chemical chimera; I ſent, in a concealed way, to the Royal Society ſome mercury laboriouſly prepared in my furnaces, whereof ℥i. being put upon a due proportion of a calx of gold made by the common way, (quartation) they grew preſently, and very ſenſibly

hot in the palm of one's hand. I ſhall now add, that to try, whether this ſurpriſing faculty of growing hot immediately upon gold, will continue any long time in the mercury; I lately took ſome, that I had (for a certain purpoſe) kept hermetically ſealed in a glaſs egg for divers years, (if I miſtake not, ten or twelve at leaſt) and having reiterated the forementioned trial with it, firſt alone, and then in the preſence of a cultivator of chemiſtry; it preſently grew hot with the ☉ in the palm of the hand. And having diſtilled off the mercury, and tried it again, as well as ſome that was undiſtilled, if I much miſremember not, it did again heat with the gold.

EXPERIMENT V.

An uncommon way of operating upon ♁.

When chemiſts expoſe antimony, for inſtance, and divers other conſiſtent, but not fixed bodies, to the action of the fire, they are wont to do it in veſſels, either open, as when they make calx, or glaſs of antimony; or at leaſt in veſſels, that are not ſo cloſe, but that there is air included with the matter, as when they ſublime it in glaſſes, or in earthen ſubliming pots: and though they regard not this included air, becauſe uſually there is not much of it in the veſſel, yet it may have a not inconſiderable influence on the effects of the fire's operation, not only as it contributes to the aſcenſion and ſuſtentation of diſſipated parts of the mineral, but as it affords theſe corpuſcles room to fly to and fro in it, and thereby make aſſociations, or coalitions, and concretions, that otherwiſe would not be produced. Upon this account I gueſſed, that it may be, on divers occaſions, a thing of uſe for diſcoveries, and perhaps too for practice, to employ a method, that the body expoſed to the action of the fire may be kept from the contact of the air, at leaſt as to any ſenſible portions of it, and being as it were included in bodies almoſt equivalent to ſolids; and one may ſuppreſs the free emiſſion and aſcent of exhalations, and ſo to make an operation, not only in clauſo, but as it were in ſolido, and reduce the parts of the body expoſed, and perhaps the igneous corpuſcles, to act reciprocally upon one another, without any notable diſſipation, or avolation of parts.

To apply now what hath been ſaid to antimony, I ſhall briefly ſet down an uncommon way, that came into my mind of operating upon it. We took well powdered ♁, and well dried (white) chalk reduced likewiſe to powder: with theſe in a large earthen pot or crucible, we made SSS. having a care to make the lowermoſt and uppermoſt bed of chalk, and the laſt thicker than any of the reſt, as alſo that none of the antimonial layers were but of a moderate thickneſs, that the heat might penetrate them the better: then the veſſel being covered, was put among the kindled coals of a good digeſtive furnace, (not becauſe ſuch a one was neceſſary, but becauſe it was at hand) where it was kept for a competent time; which according to the bigneſs of the pot, and the ſtrength of the fire, may be ſometimes twenty or twenty four hours, ſometimes a day and a half, and ſometimes two days or better.

The ſecond PENTADE.

EXPERIMENT I.

A very uncommon way of making a calx of gold.

It is known, that moſt chemiſts, and many phyſicians, have a ſuperlative eſteem for the medicinal virtues of gold, and the preparations of it. And upon this ground, divers of them have long been, and ſtill are ſolicitous to make calces of gold by differing ways, moſt of them laborious, and ſome of them ſcarce to be ſafely wrought and uſed in phyſick. Wherefore I ſhall, I preſume, be eaſily pardoned, if I here ſet down a way, that came into my mind, and that I have ſometimes uſed to make a preparation, wherein gold is reduced to very minute parts, without the help of mercury, or of any precipitation made by ſharp ſalts, whether acid or lixivial.

We took then refined gold, and diſſolved it in clean and ſpirituous aqua regia; and inſtead of precipitating the clear ſolution with oil of tartar *per deliquium*, as is uſually done, or with ſpirit of ſal armoniac, or other volatile urinous ſpirits, we firſt with a very modeſt heat drew off the ſuperfluous liquor; whereby the gold, with the remaining part of the menſtruum, was left in the appearance of a thick and oleous liquor. This done, we poured upon it a treble weight of vinous ſpirit totally inflammable, and in a ſhort time we had, as we expected, a very ſubtil powder, or high coloured calx of gold, that ſubſided at the bottom; the menſtruum being ſtrangely dulcified as to taſte, and become fragrant in point of ſmell. When a very few days were paſt, we decanted the liquor, and put on it freſh ardent ſpirit, and leaving them a while together, there ſubſided the like well coloured calx more plentifully than the firſt time.

I know not, (to add that upon the by,) whether it may or may not be worth while to try to diſcover, whether this dulcified A. R. ſpirituoſa being drawn off from the ſubſiding gold, may have acquired any virtue from the opened metal; ſome trials ſeeming to argue, that the openneſs of this calx made it fit to be eaſily wrought upon by a menſtruum, that would not touch water-gold, as they call the common calx made by quartation, nor yet leaf-gold, ſuch as the apothecaries employ; but however the menſtruum has acquired ſuch qualities, as make it ſeem likely to prove an uſeful medicine, which yet I refer to trial.

By the way we pitched upon to make this powder of gold, it ſeemed probable, that it would not (at leaſt) be leſs ſubtil, and yet would be more mild than common preparations; and nevertheleſs we thought it might, perhaps, make it yet more ſecure, if we ſhould, as we did, put upon it a totally ardent

dent vinous ſpirit, and burn it off once, twice, or thrice, to carry off with it any little corroſive or ſaline particles, that may have ſtill adhered to the metalline ones.

N. B. The ſpirituous aqua regia, mentioned in the proceſs, is ſo called by me, partly to diſtinguiſh it from the common aqua regia, and partly becauſe it is indeed of a more ſpirituous nature than the common, being compoſed without any groſs ſalt, ſuch as ✱, but only of ſpirits. This menſtruum I made for ſome particular uſes: and though it works more ſlowly than the common chryſulca, yet I often prefer it to this, as that which I can employ to ſome uncommon purpoſes; and as it may probably be a more innocent menſtruum in making preparations of Sol, deſigned for medicinal uſes. I make it very eaſily, by mixing one part of good ſpirit of ſalt with two parts of ſtrong ſpirit of nitre, or (when it is not to be uſed for medicines) of common, but clean aqua fortis.

SCHOLIUM.

The above recited trial was made as it is delivered; but ſome circumſtances, that I took notice of, and particularly ſome grains of powder, that, though mingled with the reſt, were ſhining, as if they had been extremely minute, and bright filings of gold: theſe circumſtances, I ſay, made me ſuſpect, that the ſucceſs might much depend upon particular and nice circumſtances, that may need more exact trial, than I had then occaſion to make; and therefore it may be fit, that the experiment be heedfully repeated. It may alſo be tried, whether the employing common A. R. inſtead of ſpirituous, will much vary the experiment.

EXPERIMENT II.

To try how much volatile ſalt an aſſigned quantity of water would diſſolve, we took ℥iii. of diſtilled water, and put into it by degrees ſome dry ſalt of ſal armoniac, (that was very white, and compact enough) keeping the liquor in digeſtion for a pretty while, that it might have time to diſſolve as much as it could. When we found it would diſſolve no more in a moderate heat, we took it off, and found, that after ſtanding ſome hours in the cold, there fell to the lower part of the glaſs, and ſettled there a pretty quantity of ſalt, which we gueſſed to be about ʒii. which being deducted from ℥ii. that had been in all put in, there remained ℥i. and ʒvi. in the liquor, which by this account had diſſolved at leaſt half its weight of ſalt.

SCHOLIUM.

I desire it may not be thought ſtrange, if, among our chemical experiments, ſome few ſhall be here and there met with, that are much leſs elaborate or promiſing than others, that I could eaſily have inſerted in their rooms; for I did it on ſet purpoſe, partly becauſe oftentimes (as was intimated at the beginning of the chapter) ſome more ſimple or ſeemingly leſs valuable experiments may be fitter materials, than more curious ones, for the natural hiſtory we would promote; and partly to give an example, if mine can ſignify any thing, of not diſdaining to regiſter ſome things, that ſeem mean, if by the light they afford, or the uſes they may be applied to, they compenſate the want of luſtre, and of immediate utility. And the ſubſtance of this ſcholium I deſire may be mentally transferred, as occaſion ſhall require, to thoſe following chapters, that treat of chemical experiments.

EXPERIMENT III.

Perhaps ſome chemiſts will think, that the following memoir may give hints, that may be of uſe on ſeveral occaſions, both for other purpoſes, and for theirs, that would draw tinctures from ſeveral bodies, that will not afford them in ſimple ſpirit of wine though well rectified.

The ſimple ſpirit of good French verdegreas, being once or twice abſtracted from as much ſalt of tartar as it would diſſolve in the cold, left the ſalt eaſily fuſible, and diſſoluble in highly rectified ſpirit of wine.

EXPERIMENT IV.

I have not been unacquainted with ſome curious and elaborate preparations of that noble flower the roſe; and experience hath convinced me, that it is poſſible, whatever moſt chemiſts think of it, to obtain from roſes a true eſſential oil, that mixes not with water, and is exceeding fragrant: but there are ſeveral, that are ſo far from believing, that an eſſential oil may be obtained from roſes, without being in the form of a butter, but in a liquid one like oil of cloves, or wormwood, that they doubt, whether a true ſpiritus ardens can be obtained from them, without addition of wine, or ſome ſuch inflammable liquor. I ſhall here tranſcribe the following note, as containing a more ſimple and eaſy preparation (than any of thoſe before mentioned) of the ardent ſpirit of thoſe flowers, and therefore more ſuitable to the deſign of the whole chapter.

To make an inflammable ſpirit of roſes.

Two buſhels of damaſk roſes (together with a good number of red roſe-buds) being beaten, and put into a veſſel with water, amounting to about four gallons, were mingled with about a quart of ale-yeaſt, and kept in fermentation for about five or ſix days (the weather being cold for the ſeaſon) and then being diſtilled *per veſicam*, afforded us a ſpiritus ardens.

EXPERIMENT V.

An experiment about the chemical analyſis of pearls.

We took ℥ii. of ſeed pearl, that were carefully bought for oriental, and without breaking them, put them into a retort, and diſtilled

them in a ſand-furnace by degrees of fire, giving a ſtrong one at the laſt. By this means we had a little black oil ſwimming upon the ſpirit, which was alſo dark and muddy, as if incorporated with ſome more oil. The weight of both theſe liquors was twenty three grains, beſides which there ſtuck to almoſt all the upper part of the retort a thin film of oil, which together with a ſtreak of the like reaching to the bottom of the receiver, we eſtimated at three grains more, and ſo reckoned twenty ſix grains for the weight of the whole aſcended matter. The caput mortuum amounted to full the remaining weight of two ounces. The empyreumatical liquors, that came over, ſmelled much like thoſe of harts-horn, and the ſpirit was found to belong, as we expected, to the tribe of urinous ones, or, as many now call them, volatile alcalies. For it readily hiſſed and produced bubbles, with good ſpirit of ſalt, turned ſyrup of violets green, and being dropped into ſolution of ſublimate, turned that white; to omit another way or two, by which I examined it. The oil, that ſtuck to the retort, and which was fœtid, like that of harts-horn, did eaſily diſſolve in dephlegmed ſpirit of wine, and afforded a reddiſh brown ſolution. The caput mortuum was very black, and ſome grains of it were found readily enough diſſoluble in ſpirit of vinegar. Being calcined in a well covered crucible, with a ſtrong fire, (for a moderate one will not do it, unleſs it be long) we reduced them to be purely white, and to a weight leſs by ſome grains than an ounce and ʒiii. and we found, as we expected, that being pulveriſed, this calx taſted hot and biteriſh upon the tongue, like good calx vive, and was not only of an alcaliſate, but a lixivial nature: for beſides that it preſently turned ſyrup of violets green, it quickly afforded an orange coloured precipitate, with ſolution of ſublimate.

STRANGE REPORTS,

In TWO PARTS.

Addreſſed to a Virtuoſo, Friend to the AUTHOR.

ADVERTISEMENT.

I PRESUME, Sir, you may yet remember, what I wrote about the nature and ſcope of my collection of *Strange Reports*, in an eſſay, which takes its title from them; and which I was encouraged to make by the example of *Ariſtotle* *. And therefore I ſhall deſire, that to ſave your trouble and my own, that paper may ſerve for a preface to that which follows. About which, ſuppoſing this requeſt to be granted, I ſhall need to give you at preſent but this ſhort advertiſement; that for diſtinction's ſake, I thought fit to divide the enſuing particulars into two parts, becauſe they are indeed of two ſorts; one relating to things purely natural, and the other conſiſting of phænomena, that are, or ſeem to be, of a ſupernatural kind or order.

THE firſt ſet of particulars belonging to each of the two forementioned parts has prefixed to it the title of the firſt ſection, though it be not at this time attended by a ſecond; becauſe it is deſigned, that, God permitting, it ſhall be ſo hereafter, when I ſhall get time to pick up out of my *Adverſaria*, and other memoirs, particulars fit to have placed in the liſt of *Strange Reports*.

I MUST likewiſe give you notice, that you are not to expect the ſecond part at this time; diſcretion forbidding me to let that appear, till I ſee what entertainment will be given to the firſt part, that conſiſts but of relations far leſs ſtrange than thoſe that make up the other part.

* This famous philoſopher in his little tract, whoſe title ſome render *De Mirandis Auditionibus*, ſcrupled not to compriſe without method divers reports, uncertain or fabulous, nor to inſert ſeveral, that were not ſo cautiouſly admitted, as thoſe recited in the following collection.

53323

STRANGE REPORTS.

PART I.

SECTION I.

RELATING to a judicious virtuoso, that a physician of *Brussels* a while since affirmed to me, that he himself had prepared three or four resuscitable plants, one of which he had presented to the marquis of *Castel Rodrigo*, now governor of the Spanish Netherlands, where this virtuoso had not long since been: relating this, I say, to this gentleman, and enquiring of him, whether he had seen this resuscitable plant; he answered me, that he had never seen nor heard of it; but told me on this occasion, that coming to *Deal* with an apothecary of *Namier*, if I misremember not the name, much esteemed for his extraordinary skill in chemistry about some choice preparations, wherewith this man's shop was furnished, the apothecary told the virtuoso, that he had really prepared resuscitable plants, a different way from that which others pretended to, and that he could prepare a great variety of them. And when having enquired of the virtuoso, whether he himself had seen any of these prepared plants, he assured me, that he had seen not only some, but many. I then upon farther enquiry, how they appeared, learned, that the chemist had divers of them in distinct glass bottles; that the apparitions, that were exhibited, shewed not the peculiar colours, but only the shape of the plant; but this so genuinely, that he could perfectly distinguish, and easily know it to be such or such a plant, instancing particularly in carduus benedictus, and camomile.

And the difference betwixt this way of exhibiting plants, and that which is mentioned by *Quercetan*, and pretended to by others, I found by this gentleman's answers, to consist chiefly in these two things: the first, that the apothecary's plants did not, as the others, seem to grow up into the air included in a sealed vial, but were seen as growing in a clear liquor, wherewith the bottle that contained it was almost filled; and the next, that whereas to make the apparition, mentioned by *Quercetan*, and others, the application of an actual heat (as that of a lamp, or the sun-beams, or the like) is affirmed to be requisite, upon the absence of which the phantastical plant relapses into its ashes; in the formation of the apothecary's vegetables, he doth not employ any actual heat, but (which may seem more strange) only the shaking of the bottle; upon that agitation, the prepared ashes or powder being raised from the bottom, and dispersed quite through the liquor, when the glass is set by in a quiet place, the scattered particles by degrees so convene, as to compose a model of the plant they once belonged to. And heat not being requisite to their formation, these plants do not quickly, as the Polonian physician's fantastick vegetable, recorded by *Quercetan*, fall back into a powder; but, if let alone, continued a great while, until the preparer think fit by a gentle agitation of the bottle, to dissolve the loose contexture of it.

RELATION II.

I met the other day with a very intelligent person, well versed in chemistry, not credulous, and in a word very well worthy of credit, who assured me, that he had himself seen a few years ago at *Mentz*, in the hands of one monsieur *P——r*, a gentleman of *Switzerland*, and a virtuoso, a piece of glass about the bigness of a shilling, or somewhat bigger, which was red and pretty transparent like glass of antimony made *per se*, and which this monsieur *P.* affirmed to the relator, that he hammered before the present elector of *Heidelburg*, (to whom, I told him, I had the honour to be known, and) by whom the relator was about that time employed. And this monsieur *P.* being his intimate acquaintance, and perceiving, that he was (as he well might be) indisposed to believe so strange a thing, after he had confessed the glass to have been given him by an excellent chemist in his country (*Switzerland*); this gentleman, I say, at the relator's earnest request, gave him leave, for his satisfaction, to lay the piece of glass upon an anvil, and to strike seven or eight strokes with a hammer upon it; by which means he found, that though it was not malleable (at least in the state it then was) like nealed silver, since it began to crack at the edges like silver, that is over-hammered; yet it did really stretch under the hammer, growing more thin on the beaten part, and having visible marks or impressions made on it by the edge of the hammer.

RELATION III.

A pious and learned schoolmaster, that ventured to stay in *London* in the great plague 1665, and was much employed, as some friends of mine, that knew him, and commended him, assured me, to visit the sick, and distribute alms and relief to them, went indiscriminately to all sorts of infected, and even dying persons, to the number, as he told me, of nine hundred, or a thousand; and being asked by me about the infection of other things than walls, he told me, that being once called to administer some ghostly comfort to a poor woman, that had buried some children of the plague, he found the

room

room ſo little, that it ſcarce held any more than the bed whereon ſhe lay ſick, and an open coffin, wherein he ſaw her huſband lie dead of the ſame diſeaſe, whom the wife ſoon after followed. In this little cloſe room they affirmed to him, that the contagious ſteams had produced ſpots on the very wall; and when I aſked, whether he himſelf had ſeen them, he anſwered, that he had not; but yet was inclined to believe the thing to be true, not only upon the ſcore of the relators, but becauſe he had obſerved the like in his own ſtudy; which being divided only by a wall from ſome rooms of a houſe, which the owner had turned into a kind of a peſt-houſe, and in which numbers had died in a ſhort time, he took notice, that the white wall of his ſtudy was (ſince the ſickneſs raged, without any other cauſe that he could imagine) blemiſhed in divers places with ſpots, like thoſe of infected perſons. When (to add that upon the by) I enquired what antidote he uſed, he replied, that next the protection of God, which ſo many ſad objects made him the more fervently implore, and a conſtant fearleſſneſs, the only preſervative he uſed, beſides good diet, were half a ſpoonful or a ſpoonful of brandy five or ſix times a-day, eſpecially when he went into infected places, and the bigneſs of a ſmall nut, or leſs, of a root of Spaniſh angelica, of which he held in his mouth the quantity of a pepper-corn, or ſomewhat leſs, as often as he thought there was need.

RELATION IV.

January 25. AN ingenious perſon, and very worthy of credit, informed me the other day, in anſwer to ſome queſtions that I propoſed to him, that he was employed ſome years ago by a German phyſician (whoſe name he told me) to diſtil a certain mineral not unknown to me, which he performed in a naked fire, with ſo good ſucceſs, that he had from about half a pound of the mineral, near ʒiii. of the liquor: this he included in a glaſs with a bubble, and a ſlender neck like one of my weather-glaſſes; but though the liquor at firſt reached not above the bubble, but only filled it to the bottom of the pipe; yet as the moon increaſed, this liquor, as the doctor expected, by degrees expanded itſelf in the glaſs; ſo that about the full-moon, it reached about an inch into the pipe, and upon the decreaſe of the moon, it ſubſided by degrees to the bottom of the pipe. And when I aſked, whether the veſſel were carefully ſtopped; he anſwered, that it was not only ſo, but hermetically ſealed like one of my thermometers with ſpirit of wine, which he had ſeen. This the relator averred to me upon his own obſervation; and being deſired, he readily gave me a deſcription of the mineral, and a direction where to procure it, (which I am now endeavouring to do) adding, that the ſame doctor made the like trial with another mineral akin to this, with which my having heard, that ſuch an experiment had been done, gave me occaſion to propoſe him the queſtion.

RELATION V.

AN inquiſitive traveller, that not long ſince waited on a German prince addicted to chemiſtry, and was employed by him in his private laboratory, being aſked by me ſome queſtions about ore of biſmute or tin-glaſs, whereof there is ſaid to be a mine in that prince's territories, and in particular, whether he had obſerved any thing of the varying bulk of a ſtrange liquor obtainable from it; he anſwered me to this effect, that he had had occaſion to make many trials upon this mineral, and that particularly, by his prince's command, he had diſtilled a conſiderable quantity of a certain ſort of it, (becauſe it yields but very little ſpirit) and that he thereby obtained a liquor, which being by rectification freed from its ſuperfluous phlegm, amounted to about half a pint. This liquor was put into a vial, which it almoſt half filled. This vial being exactly ſtopped, was ſet aſide in a quiet place, where, (as the prince expected) as the light of the moon increaſed, from the new moon towards the full, ſo this liquor gradually ſwelled, and that not in a hardly perceptible degree, but very manifeſtly and conſiderably; ſo that when the moon was full, the liquor reached almoſt to the top of the glaſs, and during her wane, as the light decreaſed, ſo did the bulk of the liquor, which was always leaſt at the new moon. I aſked him, if any trial had been made, whether the weight of this ſpirit varied with the bulk, and he frankly confeſſed to me, that it had not come into his mind; but for what is above related of the increment and decrement as to quantity he affirmed to me, that himſelf, as well as his prince, had ſeveral times obſerved it; and he alſo readily told me the way he uſed in making the diſtillation, which, he ſaid, exacted an intenſe degree of fire.

RELATION VI.

AN inquiſitive perſon, that having gone through his ſtudies in the univerſity, travelled through divers countries, to make himſelf the more fit for the profeſſion of phyſick, anſwered me, that having reſided for ſome time in *Pruſſia*, he had more than once or twice (and that in differing places) obſerved, as others in his company alſo did, that the fiſhermen in breaking the ice of long frozen places, and taking out thence conſiderable maſſes of ice, did ſeveral times find in them ſwallows, ſometimes numerous enough, that were ſo incloſed in the ice, that unleſs by breaking, or thawing it, they could not be gotten out of it. And he further anſwered me, that when theſe lumps or maſſes of ice came to be thawed in their German ſtoves, the ſwallows, that lay as dead before, would revive, and perhaps fly about the room, but did not long ſurvive their recovery out of their inſenſible ſtate, ſome dying again in few hours,

hours, others the next day, or perhaps the third; but few or none, that he obſerved, living beyond the fourth or the fifth; which immature death my relator judged to be cauſed by their having no appetite to eat, which inappetency made them die ſtarved. But as the conjecture may be true as to thoſe, that lived for ſome days, ſo it ſeems not like, that thoſe that periſhed in few hours, died merely of hunger; and as for them, that were ſtarved to death, I ſhould ſuſpect, that they were ſtarved, not ſo much for want of appetite, as for want of ſuch animals as they uſed to feed on, eſpecially flies, which they could not get in winter.

RELATION VII.

AN inquiſitive gentleman lately returned from *Jamaica*, where he was employed by the governor to make diſcoveries of natural things, anſwered me this morning, that he had ſeen in that iſland great number of trees, that bear the ſilken cotton; that he found many of them to ſurpaſs in bigneſs and height the larger ſort of our Engliſh oaks; and that on a mountain, that many went to viſit, out of curioſity, to view a ſtupendous ſilk-cotton tree, he ſaw its bulk, and many affirmed to him, and it was the general tradition of the country, which he ſaw no cauſe to diſbelieve, that this prodigious tree was in the body no leſs than twenty one yards about, that is, more than ſixty foot in compaſs.

THE ſame curious traveller told me, he ſaw a canoo made of the hollowed trunk of one of theſe ſilk-cotton trees, which, after all that had been taken off, to give it the ſhape of a veſſel fit for ſervice, was thirty foot about, and of at leaſt a proportionable length.

RELATION VIII.

A MERCHANT, rich and judicious, and more addicted to letters than is uſual to men of his calling, being returned into *England* from ſome of the remoter parts of the *Eaſt-Indies*, to ſatisfy my curioſity about a ſtrange tradition of ſeveral navigators about a more than one way extraordinary in-draught of the ſea on the coaſt of a great iſland of the ſouthern ocean, ſent me the enſuing relation, which, though it contains ſomething manifeſtly fabulous, but eaſily diſtinguiſhable from the reſt, I give you in the relator's own words, being unwilling to alter any thing, till I can ſee him again, and propoſe my ſcruples to him.

AT *Campar* and *Racan*, on the eaſt coaſt of *Sumatra*, is in the river's mouth (to a certain diſtance) at each new and full moon, a violent in-draught of the ſea (called Bunna) which approacheth with an hideous noiſe, and mountain high, ſo that whatſoever oppoſeth it, periſheth. Its approach is in three parts; the firſt high, but not ſo terrible; the ſecond is high, black and horrid; the third is low, and of gentle motion: before its approach, it giveth ſo fair warning, that the people may eat, and bathe themſelves, before they weigh anchor; but when they weigh, they muſt row hard againſt it, and when its fury is paſt, follow with it, till they return to their anchor place. The true reaſon whereof the inhabitants cannot diſcover: but (as if *Greece* only were not the mother of fabulous traditions) theſe poor natives fabulize, that at *Campar* (where is the greateſt Bunna) in former ages, there was a princeſs, who, to ſhun the rape of an inſolent *Caffree* ſlave, ran into the ſea's mouth; but the ſlave ſtill purſuing her, and after him the princeſs's little dog, all periſhed; and thus (by a new metamorphoſis) theſe three waves perpetuate their commemoration. That afterwards a bold fellow, hoping to divert this Bunna from *Campar* (by advice of ſome wizards) rowed up againſt that firſt part of the torrent, and filling a bottle of its water, which he immediately ſtoped up cloſe, he betook himſelf to *Rakan* (not far diſtant) and poured it out into that river's mouth, which brought the Bunna thither alſo, though it left not *Campar*; but that fellow ſuddenly after dying, none durſt ſince attempt the like, elſe the natives fancy it may ſtill be done.

MY humble opinion is (adds my relator) that the mouths of thoſe rivers being choaked up with their ſand-banks, and ſo rendered very ſhallow; when the great ſpring-tides come roaring over thoſe ſhoals (at the new and full-moons) out of the *Mallacca* ſtreights, the firſt influx is irreſiſtible by ſuch ſmall veſſels as uſe that port (eſpecially if attended with dark weather, or ſtormy guſts) ſo that they are forced to weigh and bear up againſt it, for fear of being ſtranded and ſplit. In which ſentiment I reſt, till I can attain a more prevalent reaſon.

RELATION IX.

A GENTLEMAN, that had travelled far, and obſerved much, related to me, that being off the coaſt of *Moſambique*, between the 20th and laſt days of September, the captain of the great Portugal ſhip they were in, walking to and fro upon the deck, ſpied, a great way off, a very little dark cloud, or blackiſh ſpot, in the ſky: whereupon, though the weather were fair, he made all the haſte he poſſibly could to provide for a great ſtorm, by taking in the ſails, *&c.* And though for a while the ſky continued clear, and they had no ſigns of an imminent change; but that, when the cloud approached, the wind, that had till then filled their ſails, ceaſed, and the ſea became calmer than before: but preſently after they had a furious hurricane, which turned their ſhip quite round many times one after another, as if it were an aerial whirl-pool, which laſted for above two hours, and then left them, ſeeming to have a progreſſive motion, as whirlpools in rivers often have.

RELATION X.

AN ingenious practitioner of phyſick, accompanied by one of the ſame profeſſion, aſ-

ſured

ſured me with great aſſeveration, that ſome while ſince, being at a place in the country near *Amſterdam*, where there lived a kind of a farmer, who (though illiterate enough) was reputed very curious; this perſon ſhewed him, among other things, a conſiderable quantity of quickſilver, that was altogether of the colour of gold. And, to anſwer my ſcruple, this relator added, that the colour did not belong only to the ſurface of the whole maſs; but having purpoſely (with water) divided it into many globules, each of them retained the ſame rich colour. And he further told me, that the poſſeſſor of this yellow mercury having put ſome of it over a fire in a convenient veſſel, it quickly loſt its fluidity, and was precipitated into a red powder; about which he hoped to learn ſome notable things at his next viſit to the author: but that having been too long delayed, when he came to the place again, he found, to his great grief, that the maſter was dead, and his relations were, or pretended to be, ignorant of his ſecrets.

A VERY learned and experienced phyſician made me a viſit to give me notice, that a few days before he had received one in the night from a couple of ſtrangers, one of whom, by ſome things that he ſaw him do, he judged to be (what they call) an adeptus, who, beſides a thing far more rare and valuable, ſhewed him, as a curioſity, a running mercury of a lovely green. And when I aſked my judicious relator, whether he had broken the fluid maſs into drops, to obſerve, whether the colour were that only of the ſurface, or of the whole maſs? he anſwered, that he purpoſely laid it upon a rough body, as a carpet, and found the globules, whereinto it was by this means divided, to be of the ſame fine green, that had beautified the whole maſs.

THESE relations, though they had come to me from leſs credible perſons than thoſe I received them from, I ſhould not haſtily have rejected, becauſe of ſome odd and fine colorations of running mercury, that I have myſelf obſerved, but here forbear to mention, becauſe they belong to another paper.

THE

GENERAL HISTORY of the AIR

DESIGNED and BEGUN.

Advertiſement of the Publiſher to the READER.

THE deſign of the following papers the author's own preface will acquaint thee with. And though, as thou wilt there ſee, his expectation of aſſiſtance (in a work too great for one ſingle man's undertaking) from others failed him, yet I doubt not but his own experiments and collections would have made this treatiſe much larger, before it had been publiſhed, had his health allowed him opportunity: but that permitting him not ſo much as to review theſe papers, or range them into that order, which would be moſt advantageous, thou art not to wonder, if thou findeſt ſome defects, ſome diſlocations, and other faults in this publication, which the author's laſt hand would have prevented. The negligence of tranſcribers has let ſlip the characters of relators, and names and places of authors, from whom ſeveral of the particulars in the following papers were taken: nor could it be hoped that the author's own memory (were he in a ſtate of health fit to be troubled with it) ſhould, after ſo long a time as this collection has been making, and in that variety of men and books he has had to do with, be able to retrieve them. But this will be no great loſs to the learned world, which is ſufficiently acquainted with his great caution, and will make no difficulty confidently to rely upon his unaffected candor and ſincerity. I know not how much ſome other parts of his noble, and always buſy deſigns for the advancement of knowledge, and the benefit of mankind, may ſuffer by that tenderneſs of his conſtitution, which the importunity of his friends can hardly prevail upon him to withdraw from philoſophical cares. But this he has ordered ſo, that imperfect as it is, one cannot call it deficient; ſince the foundation being here laid, and the draught made, every one may, if he pleaſe, add towards the compleating of the building, I will not ſay with materials equal to what his ſagacity and laboratory uſed to afford; for we muſt not expect to find in every age a man able and ready to lay out ſo much coſt, pains and ſkill, frankly, for the improvement of natural philoſophy, and the information of the world, as he has done. The ſcheme of titles, under which theſe materials for the hiſtory of the air are ranged, is ſomewhat different from that printed by him ſeveral years ſince, and diſtributed amongſt his friends. But this is without any prejudice to the main deſign,

ſince whatſoever any one hath collected under thoſe heads, will be eaſily reducible to theſe, which in a more natural order are more comprehenſive. In that firſt draught he followed my lord *Bacon*'s advice, not to be over-curious or nice in making the firſt ſet of heads, but to take them as they occur. But now that thus much comes to be publiſhed, which perhaps may ſerve to ſome men as a common place for the hiſtory of the air, the titles have been a little more increaſed, or methodized, to which any one may add as he finds occaſion: only in theſe the reader is deſired to obſerve,

I. THAT under the title of mineral ſubſtances are comprehended earth, and all other foſſils, to avoid multiplying of articles.

II. THAT when any mixed body is ranked under animal, vegetable, or mineral ſubſtances, it is put under that of the three, which either it partakes moſt of, or to which moſt is owing in the preſent experiment, or which in its own nature it moſt reſembles.

III. THAT it is not by an over-ſight, that lightning is put under two different titles; for in one it is conſidered only in reference to the ſight; in the other it is conſidered as the product of ſulphureous or inflammable effluviums taking fire, with the ſtrange effects it produces; which may be an example of putting the ſame thing with different views, under different heads.

WHAT is above ſaid, was written whilſt the author was living, to which it is neceſſary now to add, that the titles, as here printed, and the order of the papers, as now ranged under them, were ſhewn to the author, and approved by him, as fitter for the general hiſtory of the air, than thoſe he had formerly printed. So that, reader, thou haſt theſe papers as they were prepared and ordered to be publiſhed in his life-time; and they had then gone to the preſs to be printed, juſt as thou now receiveſt them, had not the publiſher the laſt winter been haſtily called out of town.

The PREFACE.

THE continual uſe of the air is ſo abſolutely neceſſary to our life; the good or bad temperature of it is ſo important to our health; and the ſcarce evitable preſence and powerful preſſure of it, has ſo great an intereſt in many of the phænomena we meet with here below, and even in divers, where its agency is not ſuſpected; that among mere bodies there are perhaps few ſubjects, that more deſerve our curioſity, whether as we are animals, or as we are naturaliſts. Upon which account I can ſcarce think, that any thing, that conduces to the fuller knowledge of a body ſo diffuſed, ſo neceſſary, and ſo powerful, is fit to be deſpiſed, or is unworthy to be preſerved in writing.

AND therefore, though I have formerly had occaſion to treat, in diſtinct tracts, of ſome of the qualities or affections of the air, as its gravity, ſpringineſs, *&c.* yet I found myſelf inclined to contribute further to the knowledge of that vaſt and uſeful ſubject, by ſetting down ſome memorials, partly out of my own obſervations and trials, and partly out of thoſe I had from perſons of good credit, concerning ſome cauſes and effects of the changes of the air, and conſequently concerning ſeveral of its qualities, that were requiſite to be taken into conſideration in a work of that nature. And not content with this, though my own ſtudies and affairs would not permit me to proſecute myſelf the deſign I am going to mention, yet thinking it might be a very uſeful thing, in reference both to philoſophy and phyſick, that a natural hiſtory of the air (though at firſt it ſhould prove but a very imperfect one) were faithfully compiled, I propounded the deſign to ſome virtuoſi, that ſeemed to reliſh it, and undertook to be aſſiſtant in it.

AND to facilitate their work, I drew up a ſet of heads and inquiries of that ſort, which in another paper I call titles of the firſt claſſis or order; which, though purpoſely ſet down without any anxious method, were comprehenſive enough to have a good number and variety of particulars conveniently referred to them. But afterwards finding the perſons, to whom I had committed theſe ſchemes, to have been for many years very unmindful of their promiſes; I did on this diſcouragement lay aſide, not only the hopes of a general hiſtory of the air, but what I had already written about the changes of that body.

AND upon the ſame accounts, thoſe ſcattered notes lay many years in looſe neglected papers, till at length the curioſity and deſires of ſome virtuoſi, that knew I had gathered ſome remarks, though few and incoherent, touching ſome qualities of the air, obliged me to draw together thoſe, that without a troubleſom ſearch I could retrieve, offering themſelves to promote the deſign, that others had abandoned. The deſire to gratify theſe inquiſitive men, and the conviction I am brought under, by ſuch reaſons as are mentioned at the beginning of this paper, that ſcarce any truth, whether hiſtorical or doctrinal, that relates to ſo important a ſubject as the air, is unfit to be preſerved, prevailed with me, rather to chuſe a very diſadvantageous way of ſetting down what I have to deliver about it, than ſuffer the looſe obſervations I had occaſion to make about ſome phænomena and qualities, and eſpecially the changes of the air, to be loſt. And therefore, though I have not the leiſure to methodize

my incoherent notes, and much leſs to weave them into continued diſcourſes; yet rather than let them periſh, and diſappoint thoſe, that will have them ſuch as they are, I am content to refer to ſome of the titles prefixed to this treatiſe, as to a kind of common places, what my memory, or ſome old notes about divers things relating to the air, and eſpecially to the cauſes and effects of its changes, ſupply me with in reference to that body.

And upon the like account, I have not ſtrictly confined myſelf to the mention of my looſe obſervations, and thoſe that I have been furniſhed with by anſwers to the queſtions I put to divers travellers and navigators; but I have alſo caſt in ſeveral pertinent paſſages, that chanced to occur to me in the reading of ſome voyages, and other books, eſpecially ſuch as either are out of print, or are but in few hands, or elſe are not extant in thoſe that are called the learned languages. And that thoſe virtuoſi, that are willing to contribute their induſtry to carry on the deſign, that was at firſt propoſed, might have ſome heads whereunto to refer what ſhall occur to them; I thought fit to premiſe to my papers the abovementioned ſcheme, or rough draught of the general hiſtory, (which, after many years I chanced to recover.) I have alſo thought fit, that under three or four titles, my collections of particulars ſhould be ſomewhat large and methodical, to afford the ſame perſons ſome ſpecimens of what I ſhould have thought requiſite to do upon particular ſubjects, if I would have ventured upon ſuch a taſk, as to write a natural hiſtory of the air.

I am not ignorant, that I expoſe myſelf to cenſure, for ſuffering to paſs out of my hands memoirs ſo maimed and imperfect, that ſeveral of the ſubjects mentioned in the ſcheme of titles are left altogether untouched; and thoſe, that are particularly mentioned, are for the moſt part touched upon but lightly. But the chief, though not perhaps the only reaſons, that kept me from being ſilenced by theſe conſiderations, though I confeſs them to be weighty, were theſe: firſt, that not pretending to write the hiſtory of the air, but only ſome memoirs of it; I might, without incongruity or indecency, contribute what had occurred to me in reference to ſome of the titles, though I left the others to thoſe, that had made experiments or obſervations about them. Next, that having, through the fraud or negligence of ſome perſons, loſt ſundry looſe papers, that I had provided for the hiſtory of the air, my unwillingneſs, that the reſt ſhould undergo the ſame fate, invited me to impart them to many, as the beſt expedient to ſecure them. To which I, thirdly, add an inducement, which, though laſt named, was the firſt in efficacy, as that which made the other two ſignificant; namely, that I had more than once obſerved, that when a work of this nature has been once begun and taken notice of, in ſuch an inquiſitive and active age as this of ours, it ſeldom fails to excite the curioſity and induſtry of others, whom, if the deſign be any thing well laid, the utility, that it promiſes, will invite to carry it on.

THE

GENERAL HISTORY of the AIR

DESIGNED and BEGUN.

TITLE I.

What we underſtand by the air.

By the air I commonly underſtand, that thin, fluid, diaphanous, compreſſible and dilatable body, in which we breathe, and wherein we move, which envelops the earth on all ſides to a great height above the higheſt mountains; but yet is ſo different from the æther [or vacuum] in the intermundane or interplanetary ſpaces, that it refracts the rays of the moon and other remoter luminaries.

TITLE II.

Of the conſtant and permanent ingredients of the air.

A ſhort anſwer to a queſtion about the nature of the air, given by Mr. Boyle *to Mr.* H. Oldenburg.

As to your queſtion, what I think the air to be? I ſhall in the firſt place take it for granted, that by the air you mean not, either the pure element of air, which ſome, nor that etherial or celeſtial ſubſtance, that others (upon what grounds I muſt not here examine) aſſert; but that, which I am wont

to

to call the atmoſpherical air, which is that common air we breathe and move in.

But though I know you too well to ſuſpect, that you deſign any ambiguity in your queſtion; yet I ſhall not adventure to anſwer it, till I have premiſed a diſtinction that is not uſual: for, according to my thoughts, the air may be taken either for that, which is temporary, (if I may ſo call it,) or in a tranſient ſtate; or that which is laſting, and in a permanent ſtate. This diſtinction, which perhaps you looked not for, I ſhall illuſtrate by this example, that if you ſufficiently heat an æolipile furniſhed with water, and ſtay a pretty while to afford time for the expulſion of the aerial particles by the aqueous vapours, you may afterwards obſerve, that theſe laſt named will be driven out in multitudes, and with a noiſe, and will emulate a wind or ſtream of air, by blowing coals held at a convenient diſtance, like a pair of bellows, and by producing a ſharp and whiſtling ſound againſt the edge of a knife, held in a convenient poſture almoſt upon the orifice of the pipe, whence they iſſue out. But this vapid ſtream, though in theſe and ſome other things it imitates true air, whilſt the vehement agitation laſts, which the vapours it conſiſts of received from the fire; yet in a very ſhort time, eſpecially if the weather, or the veſſels it enters into, be cold, loſes the temporary form it ſeemed to have of air, and returns to water, as it was at firſt.

This premiſed, I come to ſpeak directly, but dare not do it confidently to your queſtion: for though poſſibly I may have made as many trials as another about the nature of the air; yet I freely confeſs to you, that I much ſuſpect there lies yet ſomething concealed in it, that needs a further diſcovery, which may perhaps be made by further trials. But in the mean time, (not wholly to baffle your curioſity, ſince it is ſo modeſt, as to deſire to know of me, not what the true nature of the air is, but what I gueſs concerning its chiefeſt property or attribute) I will acquaint you with ſome of the thoughts I long ago had, and which I yet took upon myſelf, and deſire to have them looked upon by you but as conjectures, entertained only till farther diſcoveries confirm them, or ſuggeſt better in their room.

It ſeems then not improbable to me, that our atmoſpherical air may conſiſt of three differing kinds of corpuſcles. The firſt is made of that numberleſs multitude and great variety of particles, which, under the form of vapours or dry exhalations, aſcend from the earth, water, minerals, vegetables, and animals, *&c.* and in a word, of whatever ſubſtances are elevated by the celeſtial or ſubterraneal heats, and made to diffuſe themſelves into the atmoſphere. The ſecond ſort of particles, that make the air, may be yet more ſubtile than the former, and conſiſt of ſuch exceeding minute parts, as make up the magnetical ſteams of our terreſtrial globe, and the innumerable particles, that the ſun and other ſtars, that ſeem to ſhine of themſelves, do either emit out of their own bodies, or by their preſſure thruſt againſt our eyes, and thereby produce what we call light; which, whether we explicate it by the Epicurean or Carteſian hypotheſis, argues a great plenty of a celeſtial, or ſome other very ſubtile matter, to be diſperſed through, or harboured in the intervals of the ſtabler or groſſer corpuſcles of the atmoſphere.

But becauſe you expect from me a diſtinguiſhing, and as it were, characteriſtick quality, which may put a difference between the parts already named of the atmoſphere, and thoſe, to which moſt of the phænomena of our engine, and many other pneumatical experiments ſeem to be due, I ſhall add a third ſort of atmoſpherical particles, compared with which, I have not yet found any, whereto the name of air does ſo deſervedly belong. And this ſort of particles are thoſe, which are not only for a while, by manifeſt outward agents, made elaſtical, but are permanently ſo, and on that account may be ſtiled perennial air.

Of the ſtructure of the elaſtical particles of the air, divers conceptions may be framed, according to the ſeveral contrivances men may deviſe to anſwer the phænomena: for one may think them to be like the ſprings of watches, coiled up, and ſtill endeavouring to fly abroad. One may alſo fancy a portion of air to be like a lock or parcel of curled hairs of wool; which being compreſſed by an external force, or their own weight, may have a continual endeavour to ſtretch themſelves out, and thruſt away the neighbouring particles, and whatever other bodies would hinder them to recover their former ſtate, or attain their full liberty. One may alſo fancy them like extremely ſlender wires, ſuch as thoſe of gold and ſilver, that tradeſmen unwind from ſome cylindrical bodies of differing ſizes, on which they were rolled; which pieces of ſpiral or curled wire may be, as of differing ſubſtances and conſiſtencies, ſo of very differing lengths and thickneſſes, and have their curls greater or leſſer, nearer each other, or more diſtant, and be otherwiſe diverſified, and yet all have ſpringineſs in them, and (notwithſtanding) be, by reaſon of their ſhape, readily expanſible on the ſcore of their native ſtructure, as alſo by heat, girations, and other motions, and compreſſible by an external force into a very little room. I remember too, that I have among other compariſons of this kind, repreſented the ſpringy particles of the air, like the very thin ſhavings of wood (that carpenters and joiners are wont to take off with their plainers; for beſides, that theſe may be made of differing woods, as oak, aſh, fir, *&c.* and thereby be diverſified as to their ſubſtance, they are uſually of very various breadths, and lengths, and thickneſſes. And perhaps you may the rather prefer this compariſon, becauſe it may ſeem ſomewhat to illuſtrate the production of the ſpringy particles of the air: for to make theſe ſhavings, there is no art nor curious inſtruments required; and their curls are no ways uniform, but many ways differing, and ſeemingly caſual; and, which is chiefly conſiderable,

ſiderable, theſe ſhavings are producible out of bodies, that did not appear, nor were ſuſpected to be elaſtical in their bulk, as beams and blocks, almoſt any of which may afford ſpringy ſhavings, barely by having ſome of its parts ſo taken off, as to be thin and flexible enough, and commodiouſly ſhaped; which may perhaps illuſtrate what I tried, that divers ſolid, and even mineral bodies, not ſuſpected of elaſticity, being put into corroſive menſtruums, devoid of that quality, there will, upon the convenient comminution of parts enſuing the action and re-action, that paſſes between them in the diſſolution, reſult or emerge a pretty quantity of permanently elaſtical fire. But poſſibly you will think, that theſe are but extravagant conjectures; and therefore without adding any thing in favour of them, I ſhall proceed, and willingly grant, that one may fancy ſeveral other ſhapes, (and perhaps fitter than theſe we have mentioned) for theſe ſpringy corpuſcles, about whoſe ſtructure I ſhall not now particularly diſcourſe, becauſe of the variety of probable conjectures, that I think may be propoſed concerning it. Only I ſhall here intimate, that though the elaſtical air ſeem to continue ſuch, rather upon the ſcore of its ſtructure, than any external agitation; yet heat, that is a kind of motion, may make the agitated particles ſtrive to recede further and further from the centres of their motions, and to beat off thoſe, that would hinder the freedom of their gyrations, and ſo very much add to the endeavour of ſuch air to expand itſelf. And I will allow you to ſuſpect, that there may be ſometimes mingled with the particles, that are ſpringy, upon the newly mentioned account, ſome others, that owe their elaſticity, not ſo much to their ſtructure, as their motion, which variouſly brandiſhing them and whirling them about, may make them beat off the neighbouring particles, and thereby promote an expanſive endeavour in the air, whereof they are parts. And though ſome of theſe may, in very cold climates and ſeaſons, prove to be of thoſe, which I not long ſince referred to temporary air; yet others of them may be ſo minute and agile, and ſo advantageouſly ſhaped, that, at leaſt in our climate, the air will ſcarce be ſo cold, but that the cauſes, which entertain the agitation, and keep it fluid, may alſo give a competent motion to particles ſo well diſpoſed to be kept in it.

And now, Sir, it will be time to endeavour to proceed to ſome particulars, that may countenance the conjectures I have hitherto been propoſing.

Having not now the leiſure to proſecute this diſcourſe uninterruptedly, till it be completely finiſhed, I thought it not unfit, not only to ſet down, in this paper, ſome of thoſe occurring thoughts and obſervations of my own, upon this ſubject, that were the likelieſt, unleſs this way preſerved, to vaniſh out of my memory, and which may ſerve to recal divers others into it; but alſo to annex ſome paſſages referable to the ſame purpoſes, borrowed from ſuch books, as probably I may not have at hand, when I ſhall reſume this treatiſe. Theſe two ſorts of paſſages make up the following notes, and are therefore to be looked upon but as materially here laid together to be preſerved, not ſo much for themſelves (though ſome of them perhaps deſerve not to periſh) as in order to the finiſhing of the deſigned ſtructure. And though, for that reaſon, they may often appear very confuſedly placed, yet they may ſeem more incoherent than they are, there being certain tranſitions, and other things, by which ſome of them may be ſo connected, as to be fit to make diſcourſive parts and paragraphs of the treatiſe they belong to; upon which account it is, that they are put at divers diſtances one from another, that if hereafter I have leiſure, there may be room for the tranſitions, *&c.* by which they are deſigned to be connected into coherent diſcourſes.

What is above ſaid, in reference to this tract in general, is applicable to thoſe particular parts of it, whether chapters or ſections, or other diviſions, that follow a line of aſtericks, ſuch as the enſuing * * * * * * * * * * * * * * * * * * * employed to ſeparate the unfiniſhed part of the diviſion it belongs to, from the foregoing.

TITLE III.

Of the æther in the atmoſphere.

TITLE IV.

Of the ſpringy particles of the air, and the ſpring of the air.

Aerem validè comprimere, aut dilatare.

Follibus luſoriis aerem pyulco ingerentes majorem ſubinde atque majorem difficultatem percipiunt; quo enim magis aer concluſus à naturali raritate recedere cogitur, etiam majore niſu reſiſtit, neque ſolùm magis denſari renuit, ſed & ſe latiùs explicare molitur. Hinc didicimus & pneumaticos fontes conſtruere, qui ſpiritu interno urgente aquam in altum evibrant, & plumbeas glandes fiſtulis ejaculari, non pulvere nitrato ignem concipiente, ſed aere per vim denſato ad antiquas dimenſiones recuperandas erumpente. Quoniam verò ingeſta jam in conceptaculum non exigua aeris copia difficiliùs comprimitur novâ aeris acceſſione, quàm ut manus valeat truſillum rectâ impellere; idcirco truſilli haſtulam deformatam in helicem, & ſuæ matrici inſertam, adhibere operæ pretium erit: dum enim manubrio agitante contorquetur cochlea, ſenſim deprimitur embolus, aeremque ingerit. Ne autem morâ longiore opus ſit perpetuâ verſatione manubrii, ita cochleæ matrix externam vaſis faciem contingat, ut illi adnecti, atque ab eo disjungi valeat: initio enim, quando adhuc levis Caſati Mechanicorum, lib. VIII. c. 5. p. 792, 793, &c.

eſt aeris modicè compreſſi reſiſtentia, lamella illa ſuo foramine interiùs claviculatim ſtriato cohærens haſtulæ emboli, ſi à vaſe disjuncta fuerit, unà cum haſtulâ movebitur: deinde vero, quando jam truſillis ægrè impellitur, lamella illa cum vaſe connectatur, & non niſi verſato manubrio adduci atque reduci embolus poterit, id quod ſatis lentè perficietur. Rem claritatis gratia in fonte pneumatico explicemus.

Quin & pneumatica hujuſmodi tormenta citrà conceptaculum aeris compreſſi conſtruere non inutile accidat, ſi, quemadmodum noſtrates pueri ſurculos ſambuceos fungosâ medullâ exhauriunt, & utraque tubuli extremitate papyraceis globulis obſtructâ, alterum globulum congruo cylindro propellunt, atque incluſum aerem denſant, quoad aeris vim elaſticam & impellentis manus conatum non ferens extremus alter globulus edito ſcloppo expellatur; ita ferream fiſtulam longiorem paraveris, cujus alteri extremitati immittatur plumbea glans obducta papyro, aut ſimili materiâ, ut exquiſitè tubi oſculum implens demum univerſam aeris vim excipiat, alteram extremitatem aliquot ſpiris ambiat cava cochlea, quam impleat cylindrus ferreus in congruentem cochleam deformatus; ſi enim hujuſmodi cylindrus vix brevior fuerit, quàm fiſtula, & apto manubrio convolutus in fiſtulam ſenſim immittatur, totum aerem, quo fiſtula replebatur, ad exiguas ſpatii anguſtias adiget, ex quibus magnâ vi demum, quâ data porta, erumpens ejaculabitur plumbeum globulum.

TITLE V.

Of the magnetical particles in the air.

TITLE VI.

Of the deſtruction, generation, abſorption and extrication of the air.

New experiments about producing of air, and examining the bodies produced.

THAT the air has a great intereſt in the production of many phænomena of nature, either not formerly known, or not formerly aſcribed unto it, as the chief agent, if as any at all, has been, I ſuppoſe, ſufficiently manifeſted by our own experiments, as well as by thoſe publiſhed by abler writers.

THAT alſo the air is neceſſary not only to the well-being, but to the very being and motions of the generality of animals, will be eaſily deduced from thoſe trials, whereby we have made it appear, that animals, whoſe blood is hot, may be killed in our engine by the withdrawing of the air in about one mi-

nute of an hour; and that even thoſe minute creatures, whoſe blood or analogous juice is cold, will, for the moſt part, without excepting cheeſe-mites themſelves, preſently loſe all their viſible motions, upon the receſs of the air, may appear from our experiments about reſpiration.

WHEREFORE the air being a body ſo important in our ſpeculations of nature, and ſo neceſſary to the continuance of our lives, I could not but think it deſerved, that we ſhould ſolicitouſly enquire, whether it may or may not be produced by art: for if it can be ſo by any, not very uneaſily practicable ways, the diſcovery may not only help us to explicate ſome difficult phænomena of nature, but may afford us, among ſeveral other uſes, that of enabling us to ſupply divers, if not alſo ſubmarine navigators with freſh air produced under water, and thereby lengthen their ſtaying in places, where the continuance of it may be of great uſe, both ſpeculative and practical.

UPON theſe and the like motives, I reſolved, notwithſtanding the difficulties I foreſaw my curioſity would meet with in ſo new an attempt, to try what I could do. But before I relate the ſucceſs of this attempt, I muſt premiſe a couple of neceſſary advertiſements.

AND firſt, when I here ſpeak of production of air, I deſire to be underſtood in a familiar ſenſe, meaning, by that expreſſion, the obtaining a ſenſible quantity of air from bodies, wherein it did not appear, before they were handled after our way, that ſo much air, if any at all, was pre-exiſtent. This I ſay, becauſe I would not in this place needleſly ingage in the controverſy about the ingenerability (as they ſpeak) or the mutual tranſmutation of the bodies, that are called elementary: for though I am not ſure, but that ſome of our experiments may argue a new and real production of air, or a generation of it in the ſtricter ſenſe, yet I ſhall now employ the words generation and production, in the large and popular acceptation, and would ſignify by them, as I lately intimated, the obtaining of a ſenſible quantity of aerial ſubſtances from bodies, that did not appear to have it; whether this obtained ſubſtance were due to an extrication and union of aerial particles latent in the pores of the bodies, that afford it, or to a real production or generation of air, no where exiſtent antecedently to our experiments. And this is the firſt of my two advertiſements.

THE ſecond is this, that among the difficulties I foreſaw, in making experiments ſuited to my deſign, I looked upon it as one of the greateſt, though the leaſt obvious, that to ſatisfy ſuch a diſpoſition as mine, that is naturally prone enough to queſtion things, it would be requiſite for me to conſider, and, if I could, to determine, by appropriated trials, whether the fluid ſubſtances my experiments might afford me, deſerved the name of air or not. Wherefore I ſaw myſelf obliged to increaſe my taſk, and ſo direct my enquiries, that in the firſt place they may afford me ſenſible portions of ſuch a ſubſtance, as in a popular ſenſe may be ſtiled air, whether theſe obtained ſubſtances ought to be looked upon as true air or no. So that my intended diſquiſition would naturally conſiſt of two parts, whereof the former was to contain the ways of producing that, which ſeems air; and the other to propound thoſe of examining, how far the produced ſubſtance is endowed with the qualities, that are judged to belong to air as ſuch.

BUT in regard, that I thought it moſt convenient ſo to contrive my experiments, as to make ſuch of them as I could to ſerve me, both to produce air, and to examine it, I ſhall be more than once obliged to mingle the two parts of my diſquiſition, and reſerve for the latter of them only thoſe few trials, that concern purely the examen of the produced air.

AND upon this ſcore it will be ſeaſonable to take notice in this place, that foraſmuch as there are divers qualities aſcribed to air, which to me ſeem but accidental, and not univerſally to belong to air as ſuch; I have not obſerved any one attribute, that I think to be ſo much the property of air, and ſo fit to diſtinguiſh its true particles from aqueous vapours, earthy exhalations, and the effluvia of other bodies, as a durable elaſticity or ſpringineſs. And therefore I ſhall henceforth employ that as the chief criterion, whereby to conſtitute a portion of matter aerial, and diſcriminate it from other flying and fluid ſubſtances, and conſequently to allow or deny it the title of air.

NOW among the ſeveral ways I thought of, whereby to produce air, thoſe I judged fitteſt to put in practice were theſe. 1. By fermentation. 2. By corroſions and diſſolutions of bodies. 3. By boiling of water and other liquors. 4. By the mutual actions of ſome, eſpecially ſaline bodies, upon one another. 5. By the analyſes and reſolutions of certain ſubſtances.

EXPERIMENT I.

ON *January* 17 we conveyed into a long and large tube ſome filings of ſteel, and as much water as was thought convenient to dilute the oil of vitriol, which we alſo conveyed in a peculiarly ſhaped glaſs, ſealed at both ends, but with a hole opened near one of them; the external tube, and the water in them being exhauſted, and the mercury in the gage, which we had alſo included, being ſo far impelled up into the open leg, that there was ſcarce any at all left in the ſealed leg: this, I ſay, being done, the external tube was by our way exactly cloſed; and then the oil of vitriol being by little and little, and at good intervals of time, poured out of the internal tube, to actuate the water, there were produced exceeding large bubbles by the action of the ſolvent upon the metal, which alſo produced a ſenſible heat, though not a great one. When this conflict had laſted a while, we obſerved, in compliance with the chief ſcope of this experiment, whether

ther there would be any ſpringy air produced by all thoſe bubbles; and we perceived, that there ſeemed to be ſo much of it generated, that at length the mercury in the gage was impelled to the very bottom of the open leg, and the air included in the other ſeemed to be more compreſſed than it had been, when it was put in by the weight of the atmoſphere. But to try, whether this ſpring (wherein the warmth formerly mentioned might be ſuſpected to have for that time ſome intereſt) would continue, I removed the tube into another room, where was no chimney; and coming to look on it the next day, did not take notice of any ſenſible alteration in the gage; and with the like ſucceſs I viſited it for three or four days. But then coming one day to look upon it, I found the mercury in the gage to have aſcended about an inch and an half, and about that quantity of water to have got into the ſealed leg; which inclined me ſo much the more to ſuſpect, that this change in the gage might have been accidental, a boy having unknown to me removed the tube from its wonted ſtation, to place ſomewhat elſe there, without doing it heedfully enough. And this conjecture ſeems the more likely, becauſe I have not ſeen any notable change to have happened in the gage from that to this, (which is the 25th of *January* at night) the mercury in the open leg being about one inch and an half.

EXPERIMENT II.

MARCH 8. A glaſs vial holding about a pint (by gueſs) was filled with wheat flower, and as much water as was ſufficient to drench it well. Afterwards the orifice was exactly and ſtrongly cloſed with a cork, and an excellent cement: the glaſs was ſet in a warm place of the laboratory, becauſe of the coldneſs of the ſeaſon; and having ſtood there a fortnight bating one day, it this morning broke by the mere dilatation of the included matter, whoſe viſible part was laſt night obſerved to leave a conſiderable part unfilled beneath the cork. Notice was taken by the laborant of the event of this trial by a noiſe, which was no louder than one made upon the burſting of the glaſs into ſeveral pieces. To my taſte the included matter was but a little ſouriſh, but another afterwards judged it to be manifeſtly acid.

EXPERIMENT III.

MARCH 9. Having on the 23d of *February* put into a pretty large bolt-head a convenient quantity of bruiſed raiſins, with as much water as I thought neceſſary to make them ferment; and having cauſed the air to be carefully pumped out, and taken ſufficient order to keep any from forcing or ſtealing into the glaſs, I ſet it in the laboratory, that the warmth of the air might facilitate the fermentation. At the end of four or five days, it did not appear by a mercurial gage, (which had been purpoſely incloſed together with the raiſins) that there was generated any ſpringy ſubſtance. But being hindred by ſeveral occaſions from looking after this glaſs from time to time, it ſeems the contained liquor fermented more violently than the time of the year would have made one expect: for about four of the clock in the afternoon, no body being in the laboratory, the glaſs flew in pieces with a loud noiſe like the report of a piſtol; which alarming a domeſtick of mine, that was in a chamber not far off, made him haſten to the laboratory, where he found the raiſins thrown all about, and the middle part of the bolt-head (for the bottom and the pipe were intire enough) ſcattered into ſuch little pieces, that they ſeemed almoſt to be vaniſhed.

EXPERIMENT IV.

ON the 22d of *February* I filled a glaſs, that had a ſomewhat wide mouth, and might hold by eſtimation three pints (or pounds) of water; to which that liquor, and a convenient quantity of bruiſed raiſins upon the orifice of the glaſs, were tied to the neck of a pretty large bladder, out of which the air having been diligently expreſſed, it was ſtrongly faſtned to our glaſs with one of our cloſe cements; ſo that by ſqueezing the bladder, we could not perceive, that any air could get in or out. Then, this done, we left the glaſs in a convenient place in the laboratory, till the 8th or 9th of *March*; and then finding the bladder to be pumped up, we would have tied up the contained air, but could not do it by reaſon of an imperceived hole, perchance made with the point of a pin, by ſome one of them that handled it. Wherefore taking off this bladder, we cauſed another, that was very limber, to be put on after the manner newly deſcribed; and yeſterday morning we found it, though by eſtimation it might hold about two pounds of water, to be ſo full of air, that we could not without difficulty, and loſing a pretty deal of the contained air, tie the bladder very cloſe near the neck of it.

AND to try, whether this ſame mixture would continue to produce air, (whether fermented or not, I muſt not here diſpute) I cauſed another bladder to be faſtned to the ſame glaſs as before, and found it this morning, *March* 11, as full as if it were diſtended with a pair of bellows.

EXPERIMENT V.

APRIL 28. Into the bottom of a wide-mouthed vial we put ſome good ſpirit of ſalt, and filings of ſteel, and whelmed over it a R^r. fitted with an eel-ſkin and a wire, to the latter end of which was tied a thin glaſs-veſſel, hermetically ſealed at the bottom, though it was but ſlender, and furniſhed with a competent quantity of filings of copper: then we exhauſted the R^r. well with our engine, and afterwards thruſting the glaſs, that held the filings, againſt the bottom of the vial, we broke

broke it off, upon which the filings fell into the menſtruum, which acting upon them, there enſued good ſtore of bubbles, that made a froth much deeper than was the liquor, and the ſucceſſive generation of theſe bubbles continued a good while, and appeared ſome of them large enough, though in the free air they would ſcarce have been viſible, or at leaſt would not have been taken notice of, the vial having been kept in our vacuum for a quarter of an hour longer, and no greenneſs to be ſeen in the liquor, the R^r. was taken off, and the vial left open to the air.

EXPERIMENT VI.

A BUBBLE of air, whoſe diameter was near in length to that of a middle ſized pea, was left at the top of a round vial with a long narrow neck, whoſe cavity was filled with fine oil of turpentine, and then being inverted into a vial filled with the ſame liquor, was ſet aſide in a quiet place, and left there for a competent time. Another vial ſhaped like the former, but a pretty deal leſs, was filled neck and all with alcohol of wine, ſave a bubble of air about the ſame bigneſs with the former: this vial being inverted into another furniſhed with the ſame liquor, was ſet aſide in the ſame window with it, and at the ſame time: the event was, that about the end of the 6th day, the bubble diſappeared in the glaſs, that contained the oil of turpentine. And the like abſorption, if I may ſo call it, I obſerved to have been made of the air by the contiguous ſpirit of wine the next day after.

EXPERIMENT VII.

MAY the 23d. We opened another exhauſted receiver, wherein was an unſtopped vial more than half full of an opacous and blackiſh liquor, which we gueſſed (for we found no inſcription belonging to it) to have been frog's ſpawn, and were ſure to have been included at leaſt three years: by the mercurial gage, that was put up with it, it appeared to have afforded ſome air, but not very much. Its ſmell was ſtinking, much like that of the pump of a ſhip, but yet it had produced no inſects, nor had any appearance of mouldineſs.

EXPERIMENT VIII.

A GENTLEMAN of my acquaintance, an induſtrious digger for mines, and owner of a good one, informs me, that when the miners meet with running water under ground, they are thereby ſupplied with air enough for free reſpiration: and when I aſked, whether he thought, that air was produced or extricated by the motion of the water, or elſe were only concomitant to the ſtream? he anſwered, that it ſeemed to him more like to proceed from the water itſelf: and further anſwered me, that ſtanding waters did not afford air to the diggers; and that running waters did it even at conſiderable depths, amounting to many fathoms.

Experiments about the production of air, and the examining thereof propoſed.

SECTION I.

TO produce air by fermentation in exactly cloſed receivers.

To produce air by fermentation in ſealed glaſſes.

To ſeparate air from liquors by boiling.

To ſeparate air from liquors by the engine.

To produce air by corroſion, eſpecially with ſp. aceti.

To ſeparate air by animal and ſulphureous ſolvents.

To obtain air in the exhauſted receiver by burning glaſſes, and red hot irons.

To produce air out of gun-powder, and other nitrous bodies.

SECTION II.

EXAMINE the produced aerial ſubſtance by its preſerving or reviving, 1ſt, Animals. 2dly, Flame. 3dly, Fire. 4thly, The light of rotton wood, fiſh.

To examine it by its elaſticity, and the duration thereof.

As alſo by its weight.

AND by its lifting up the ſmoke of liquors.

TITLE VII.

Of the accidental or leſs conſtant ingredients of air.

TITLE VIII.

Of aqueous particles in the air, and of the moiſture and drineſs of the air.

I SHALL not here determine, whether in all the inſtances, that are referred to this title, the phænomena be produced by the mere moiſture of the air as ſuch, or by ſome other agents, whoſe corpuſcles are accompanied and aſſiſted by the moiſt air as a vehicle and a concurrent cauſe. But without nicely diſtinguiſhing the grounds of particular operations, we ſhall refer the phænomena in general to the moiſture of the air, (or moiſt air) that quality being the moſt obvious to be obſerved in theſe phænomena; in the production of ſome of which it ſeems either the only, or the main cauſe, in others an aſſiſtant cauſe, and in all a not uſeleſs concomitant.

THE account, upon which a body is dry, being uſually but this, that the pores inter-

cepted between its more ſtable parts are not filled with any viſible liquor, it is not to be expected, that a quality, ſo near of kin to a privation, ſhould furniſh much to our preſent hiſtorical notes: but yet drineſs may ſometimes have a not inconſiderable intereſt in the changes of a body, and that upon differing ſcores, whereof I take theſe two to be the chief. Firſt, as the body by exſiccation is deprived of thoſe liquid and exhalable parts, that were before harboured in its pores, and were perhaps the principle of divers operations aſcribed to it. And ſecondly, as theſe evaporable parts by their receſs may occaſion a change of texture in the body, eſpecially in regard of the pores, whoſe bigneſs, figure, and perhaps poſition being altered, the body by this change of texture acquires a diſpoſition to act, and be acted on in ſeveral caſes, otherwiſe than formerly.

A tranſcript of an obſervation made at *Stanton*.

SOMETIMES when the weather began to be overcaſt, the hygroſcope did not ſenſibly appear to grow heavier; and ſometimes it would preponderate, when I took notice of no vapours to make it do ſo: and though theſe things happened but ſeldom in reſpect of the ordinary changes of the hygroſcope according to thoſe of the weather; yet they made me ſuſpect, that ſometimes the clouds may conſiſt of other ſteams than aqueous, or that there may be ſome exhalations, that may have a peculiar congruity with the pores of the hygroſcope, and whoſe nature may be ſuch as to the power of drying the hygroſcope, that upon theſe or ſome other yet unheeded accounts, the ſteams, that are ſometimes diffuſed in the air, may controul the uſual and regular cauſes of increaſing or leſſening the gravity of the hygroſcope. And this ſuſpicion was the ſtronger, becauſe having made hygroſcopes with powder and ſalt, and alſo with the ſaw-duſt of wainſcot, hung at nice ſcales in very thin open glaſſes, purpoſely blown for lightneſs ſake at the flame of a lamp, though they uſually acquired and loſt weight, as the weather grew moiſter or drier, yet ſometimes they did not.

EXPERIMENT I.

AT half an hour after nine o'clock at night, I looked upon the half hundred weight, that hung at the bottom of the rope, the weather being then fair; and a mark being put at that part of the erected board, where the bottom of the weight touched, I perceived the ſky a while after to grow cloudy and overcaſt, but without rain: wherefore going to viſit the weight again, I found it to be riſen $\frac{1}{4}$ of an inch or more; and looking on my watch, perceived there had paſſed an hour and a quarter ſince the mark was made.

THIS morning I came again to look upon the weight between eight and nine of the clock, and found it raiſed above the newly mentioned mark, made laſt night, about one inch (for it was about $\frac{9}{10}$ths of an inch.) This day, the weather being fair and windy, the weight was fallen by ten at night about ſix inches beneath its ſtation, at which I found it when I looked on it in the morning.

BEING not well yeſter-night, the weight was obſerved at bed-time by two of my ſervants, and it then reſted at the 11th of the erected bound. This morning, about eight of the clock, I viſited it my ſelf, and found it to be riſen about $\frac{1}{8}$ of an inch above the eighth inch, the morning being cloudy, though the morning very dry and duſty. The weather growing more overcaſt, within ſomewhat leſs than an hour after, I viſited the weight again, ſome ſcattered drops of rain then beginning to fall, and found it to be riſen about half an inch above the newly mentioned eighth mark.

I LOOKED, when I was ready to go to bed, upon the ſuſpended weight of 56 pound, and marked how low it reached upon the divided board; and a great part of the night having been rainy; I looked again, when I was dreſſed in the morning, which was about half an hour after eight a clock, and I found the cord ſo ſhrunk, that the weight was raiſed above five inches higher than I left it the night before; but the day recovering dry and windy, and ſometimes warm, the rope was ſo ſtretched, that at night the weight ſunk a good way beneath all the marks. *N. B.* The rope near the weight was in diameter $\frac{3}{16}$ of an inch, and four decimal parts of a tenth.

EXPERIMENT II.

We took a rope of near three foot and an half in length from the point of appenſion, and ſomewhat leſs than $\frac{3}{16}$ (inch) in diameter: this we ſuffered to be ſtretched for ſome days by a weight of lead with an iron ring or anſula, weighing a quarter of an hundred, according to the great hundred, which is five ſcore and twelve: and then placing a flat board under it, ſo that the weight juſt reſted upon it, we had the rope well wetted over them with a ſponge dipped in water, and ſo often applied to it, that the liquor might be thoroughly ſoaked into the pores of the rope, which at firſt ſeemed thereby a little ſtretched, rather than ſhortened; but after an hour or two it began to ſhrink, ſo that we could make the weight ſwing like a pendulum over the piece of board it leaned upon before. But afterwards the ſame day the weight ſtretched out the rope again as much as formerly.

IT is obſervable, that though *Morocco* be an inland-town, and the ſoil of thoſe parts be uſually dry, if not parched; yet doctor *D.* who was lately there, informed me, that about *Morocco*, notwithſtanding the violent heats he felt in the day-time, he obſerved the nocturnal air to be very damp, ſo as to make the clothes he put off at night exceeding moiſt, and unfit to be worn, without airing the next morning. He added, that though the air was very piercing, and manifeſted itſelf to be ſo by many other ſigns, yet it would not make his knife ruſt in his pocket, or his ſword in the ſcabbard, though it would quickly produce a ruſt in inſtruments of that metal expoſed naked to it.

Air too moiſt cannot be wholeſom. The air in our parts, *viz.* about *Oakly* in *Buckinghamſhire*, though a high country, is, as I ſaid before, between *Michaelmas* and *Alhallontide* very moiſt, eſpecially in rainy weather, and upon a thaw, inſomuch that wainſcots, ſtair-caſes and pictures will ſtand all of a water, and after run down in great drops; and at *Brill*, upon that high hill, it is in divers houſes worſe than in the valley, inſomuch that the ſtair-caſes, eſpecially if laid in oil, will run down with water: the north and north-eaſt ſide of our houſes are obſerved to be moiſter, inſomuch that the furniture will rot, if fires be not made ſometimes in the rooms, and the things aired: this is obſerved to be the moſt aguiſh ſeaſon of the year. Mr. *J. T.*

As in another experiment we tried, whether or no the removal of the air out of the receiver would much alter the temperature of the included medium or ſpace, as to heat and cold; ſo we endeavoured to diſcover, whether the alteration would be notable, as to drineſs and moiſture. To this purpoſe we did indeed wiſh for ſuch a hygroſcope (or inſtrument wherewith to meaſure the moiſture and drineſs of the air) as we uſed, many years ago, and ſince found well deſcribed by the induſtrious *Kircher*, in a place of his *ars magnetica*, to which I therefore refer your lordſhip. But in regard that to this inſtrument there is requiſite the bread of a wild oat ſeaſonably gathered, which we could not then procure; we recalled to mind another hygroſcope, which, though it diſcover not ſuch ſmall mutations as the former, we thought might be uſefully enough ſubſtituted inſtead of it.

Of this hygroſcrope, having particularly deſcribed it in another paper, we ſhall now only ſay in a word, that it is made by faſtning to the upper end of a piece of gut-ſtring, or great luteſtring, a very light index, and ſtrongly faſtning the lower end of the ſame ſtring to the bottom of a box, or other convenient frame, the circumference of whoſe upper part may be at pleaſure divided into degrees or other partitions, upon which the index may move to and fro. For the inſtrument being thus made, when the air grows moiſter, the vapours inſinuating themſelves into the pores of the filaments, that compoſe the ſtring, do ſomewhat ſhorten it; and thereby thoſe filaments being altered in point of contortion, the index that is faſtened to them turns one way; and, upon the receſs of thoſe vapours, or of others of like nature, the ſtring comes to be wreathed, and conſequently the index to be moved another way. So that, in a ſtring of about three inches long, the point of the index will be oftentimes made to change its place very notably, by ſuch a mutation of the air, as to drineſs and moiſture, as was to be met with in the morning and at noon of the ſame day, though ſuch a change did not always need either rain, clouds or miſts, or the abſence of them, to make it notable.

EXPERIMENT III.

We took then one of theſe hygroſcopes, and conveyed it into a ſmall receiver, that the removal of the air being ſudden, the change of temperature (if any ſhould happen) in the exhauſted cavity, might be the more ſudden and conſpicuous. But we found not that the emptying of the receiver made the index ſenſibly change place. And though this experiment were carefully made, yet for the greater ſecurity we repeated it once more; and neither then perceiving the index to remove, we kept the receiver exhauſted for a pretty while, leſt there ſhould be ſome more time requiſite to the operation of the medium upon the inſtrument. But neither did this trial produce any ſenſible alteration of the index; but after the key was turned, and acceſs was thereby given to the excluded air, though the cover were ſtill kept on, we found, that then within ſome hours, the index was conſiderably removed. So that as far as theſe experiments informed us, the ether or ſubtile matter, that ſucceeds in the place deſerted by the air, if that place be not left void, and conſequently the thinner and more fluid part of the atmoſphere (in which the corpuſcles, that may be more properly called aerial, ſwim) ſeems in its own nature to be very ſenſibly, neither cold, or hot, or dry, or moiſt. I ſaid, as far as theſe experiments; I mean thoſe we made in this engine with the thermoſcope and hygroſcope, inform us; becauſe this conjecture (for I dare yet call it no more) may be examined divers other ways, whoſe events may either confirm, or oppoſe, or limit it. In the mean time I could wiſh, that if your lordſhip had one of *Kircher*'s hygroſcopes at hand, you would frequently and carefully try the laſt recited experiment with it; becauſe I have found, that if ſuch a hygroſcope be very well made, it is admirable, as well as pleaſant, to ſee how ſmall a mutation of the neighbouring air it will take notice of. But I thought fit to deſire to have it frequently tried, becauſe care muſt be taken, that ſuch motions of the index be not miſtaken for the effects of the altered temper of the medium in the receiver, which may in ſome caſes proceed from thoſe ſteams of the oil and water, which we elſewhere mention, that we now and then, though but ſeldom, obſerved to get out of the cylinder into the receiver, and play up and down there.

TITLE IX.

Of clouds, miſts and fogs.

Hearing that an excellent aſtronomer of my acquaintance had often meaſured the height of clouds, I enquired of him what height he obſerved them to have? and was anſwered, that though he had meaſured eighteen or twenty even of white clouds in fair weather, yet he obſerved ſcarce any one to be higher than three quarters of a mile, and few of them he found to exceed half a mile.

A miſt coming, driving upon the ſea towards the ſhore, though without any ſenſible wind,

wind, will riſe a greater ſwell of a ſea, than a briſk wind will do. *N.*

I HAVE obſerved in a ground near my houſe, which is ſomewhat moiſt in winter, as alſo in other places, eſpecially after a warm day, and againſt fair weather in autumn, a moiſt bluiſh miſt to aſcend about twenty or thirty foot high, and then to ſubſide again in dew. Mr. *J. T.*

TITLE X.

Of terreſtrial ſteams in the air.

ENquiring of an ingenious acquaintance of mine, who, in an incloſed ſcope of ground, has ſeveral veins of differing metals and minerals, whether he did not ſee, and ſometimes ſmell ſteams aſcending out of this or that ſpot of his ground, in circumſtances where their aſcenſion could not be imputed to the action of the ſun? he and his ſon, who was alſo a virtuoſo, told me, that they had divers times ſeen as it were pillars of fumes aſcending like ſmoke, whereof ſome would be inodorous, ſome ill-ſcented, and ſome, though but ſeldom, well-ſcented. And you may have obſerved, as well as I, that fogs, ſome of which I have known to be very laſting, and to have a large ſpread, did require no tender noſtrils to perceive them to ſtink.

I HAVE frequently obſerved the ſmoking ſteams, that aroſe out of the ſhafts of mines not wrought in: and it is certain, the charcoal made in *Cornwal* (eſpecially of that wood, that grows in the mineral part thereof) doth afford a manifeſt arſenical and ſulphureous ſmell beyond other charcoal. *N.*

Journal des Sçavans III. 1685.

Tel eſt par exemple ce nuage horrible d'une fumée epaiſſe, qui s'eleva de la mer de Crete au commencement de l'eſte de l'an 721. & qui s'etant repandu dans l'air le fit paroiſtre tout en feu. La mer n'en fut pas meſme exempte; car les groſſes maſſes de pierres enflammées qu'on en vit ſortir, & qui ſe joignirent a l'iſle qu'on nomme Hiera, échauferent ſi fort les eaux, qu'elles en bruloient les mains.

TITLE XI.

Of ſalts in the air.

IT is ſufficiently known, that the peripatetick ſchools teach the air to be an element warm and moiſt; and if it be an element, it ought, according to their principles, and thoſe of the greateſt part of other naturaliſts, to be a ſimple and homogeneous body. But becauſe ſuch an elementary or uniform purity is much eaſier to be found in the writings of ſchoolmen, than amongſt the works of nature, many of the modern philoſophers have juſtly forſaken this doctrine of the elementary ſimplicity of the air in ſome meaſure; but perhaps very few of them, if any, have aſſerted the air to be ſo exceedingly compounded a body, as in my opinion it really is. For divers of them grant indeed, that the atmoſphere is not abſolutely pure, but yet think, that it differs but gradually from true and ſimple air, as water a little moved and troubled does from clear and ſettled water. But for my part, I confeſs I acquieſce not in either of thoſe notions of the air. For, as I have elſewhere more fully declared in a ſhort diſcourſe, purpoſely treating of the ſubſtance of the air, although I will not deny, that there is an ethereal matter more ſubtile than the common air, which ether I take to be diffuſed through all the interſtellar part of the univerſe known to us, reaching to and ſurrounding all its great globules; yet, ſpeaking of the air, which we men live and breathe in, I take our atmoſſpere to conſiſt not only of the purer ether, but in great part of a vaſt multitude of effluvia emitted by the terraqueous globe, and the various bodies it is made up of, and perhaps in ſome parts alſo of ſubſtantial emanations from the celeſtial bodies; and that that, whereby the atmoſphere differs from ſuch pure air, as the ſchools tell us of, is not a bare and indeterminate feculency, but a confuſed aggregate of ſeveral diſtinct and perhaps diſagreeing kinds of effluvia. And amongſt thoſe, one of the principal ſorts I take to be the ſaline ones, which rove up and down amongſt others in that vaſt ocean of effluxions, we call the atmoſphere: wherein yet I do not think there are to be met with, either all ſorts of them every where, or perhaps any ſort in like plenty, in all places, and at all ſeaſons.

To ſhew, that the air is not unfurniſhed with parts of a ſaline nature, I might alledge ſome conſiderations, that ſeem to make it probable *à priori*, as they ſpeak, that there are always ſome ſuch corpuſcles emitted into the air. But, inſtead of inſiſting on ſuch particulars, becauſe they may ſeem too little of an hiſtorical nature, to be fit for this paper, I ſhall content myſelf to take notice in the general, that almoſt (if not more than almoſt) all the arguments I have employed, to prove the copious aſcenſion of ſubterraneal ſteams into the air, may be applied to our preſent purpoſe, ſince, amongſt the effluviating ſubſtances of the terraqueous globe, there are, as I have declared in another paper, huge quantities of common or marine ſalt, beſides nitrous, aluminous, vitriolate, and perhaps other kinds of ſalts. To which I ſhall add, that the emiſſion of ſubterraneal aporrheas or effluxes, is not the only means, whereby the air may be impregnated with ſaline particles; ſince the exhalations and vapours produced by the action of the ſun-beams upon the more ſuperficial parts of the earth and ſea may ſupply the air with ſwarms of corpuſcles, as well of ſaline, as of any other nature. Not to mention, that the number of theſe may, in divers places, be much increaſed by thoſe vulcanos, that have opened vents to diſcharge their fumes into the air; by thoſe numerous fires, which, burning in our chimnies, produce much ſaline ſmoak; and by other ways, which I ſhall here forbear to diſcourſe of, for the reaſon lately given for my declining

arguments drawn *à priori*; though some things applicable to this purpose will in likelihood occur amongst the instances I am about to add, to make it seem probable *à posteriori*, or by some effects and phænomena, that the air is impregnated with saline corpuscles, that are none of its least active parts, and may have great interest in divers of its operations.

FROM what has been hitherto delivered, to make it probable, that there is a saline substance in the air, I thought fit to proceed to other inquiries. The first; whether the aerial salts be of differing kind? and if so, which they are? and the second, how it comes by its saline substance? But about such differing points I durst promise my self but little satisfaction, and therefore shall not pretend to give you much.

AND yet, to say something to the first of the two enquiries, I am prone to think, that the saline particles of the atmosphere are not all of one sort, but that there may be three or four differing kinds of aerial salts.

I KNOW, that divers learned men, some physicians, some chemists, and some also philosophers, speak much of a volatile nitre, that abounds in the air, as if that were the only salt wherewith it is impregnated. But though I agree with them, in thinking, that the air is in many places impregnated with corpuscles of a nitrous nature; yet I confess I have not been hitherto convinced of all that is wont to be delivered about the plenty and quality of the nitre in the air: for I have not found, that those, that build so much upon this volatile nitre, have made out by any competent experiment, that there is such a volatile nitre abounding in the air. For having often dealt with salt-petre in the fire, I do not find it easy to be raised by a gentle heat; and when by a stronger fire we distil it in close vessels, it is plain, that what the chemists call spirit of nitre, has quite differing properties from crude nitre, and from those that are ascribed to the volatile nitre of the air; these spirits being so far from being refreshing to the nature of animals, that they are exceeding corrosive: And even when I caused earth to be dug up in an old pigeon-house, because that is accounted the most nitrous sort of earth, and distilled it with moderate fires, I did not find the volatile saline parts, that came over, to be like that, which these learned men conceive the air to be stored with. Nor have I met with among them any positive proof, to evince the truth of their opinion; which yet, as I was saying, I am content to admit, as an ingenious supposition, until something be offered, that shall prove it to be more; which I think not impossible to happen, at least as to some times and places. But I am not yet sure, that the exhalations, that ascend from the subterraneal parts, and perhaps also the sun-beams themselves, may volatilize many of the nitrous corpuscles they chance to act upon, and elevate them into the air, without analyzing them, or destroying their texture, as our fires are wont to do. But however, I do not take the hitherto mentioned nitre to be the only salt, that impregnates the air: for when I consider, how vast a portion of the terraqueous globe is covered with the salt sea, and how vast quantities of fossile salt, as well fine and clear, as coarse, are dug up in *Poland*, especially near *Cracovia*, in *Hungary*, *Transylvania*, and in divers other parts of the earth; when I consider too, that we seldom find salt-petre in the earth, but that there is sea-salt mixed with it, which puts the salt-petre-men to a great deal of trouble to separate it; and that even from salt-petre, that passes for good, I had trouble enough, when I had the curiosity purposely to refine it, to free the purely nitrous from the other saline particles; I am prone to suspect, that in very many places, especially maritime ones, the effluvia of common salt do, at least as plentifully as those of salt-petre, abound in, or impregnate the air: which conjecture might be favoured by divers things, if I had leisure to insist on them.

THAT in some places, that abound with marchasites, there is a kind of fretting vitriolate salt, copiously dispersed through the air, I have been inclined to think, partly by other inducements, and partly by the answers made me by a very observing man, who lived in a place, that I remember I visited; where being forced to reside a good while, he found the hangings of his chamber, and the curtains of his bed, rotted by the vitriolate steams expired by the soil, whose effluvia had also very manifest and unwelcome effects on divers other things, that were kept near that place; though on the opposite side of the river, in a town, that is not half a mile distant from this place, neither I, at my being there, heard any such thing complained of, nor the relator, who had often occasion to repair thither, observed any such mischievous effects, the soil of this latter place being chalky; whereas the other above mentioned is vitriolate, insomuch that he observed, that when the moist and blackish mould had been beaten upon by the sun, that here and there the superficial parts would be as it were besprinkled with a somewhat whitish saline efflorescence.

BESIDES the hitherto-mentioned kinds of salts, it seems not improbable to me, that the air (especially about great towns, and some other particular places) may be impregnated with volatile salts, that are of a nature contrary to acids. For that there may be places in the earth, even at a good depth under ground, that lodge such salts, I have been induced to think by the experience of an acquaintance of mine; who, hoping to find in the salt of what he supposed to be virgin-earth, the true receptacle of an universal spirit, from which he promised himself great and profitable matters, caused to be dug up a great deal of a certain clay, in a place abounding with minerals, and obtained thence, by mere distillation, no inconsiderable quantities of spirit and salt, which in divers qualities, as smell, *&c.* I judged to be near of kin to the spirit of urine or hartshorn. And yet this earth was dug up at the depth of many

feet, not to ſay yards, beneath the ſurface of the ground (as an ingenious potter, from whom the chemiſt had the clay, aſſured me upon the place itſelf) which I once viſited, to ſee ſome other choice minerals, that ennobled that ſoil; whence I would have got a quantity of the abovementioned clay, but that it being then the midſt of winter, the rain had (as the workmen ſpeak) drowned the pit.

In great cities, and alſo towns, where much wood is burnt, it is probable, that numerous particles of volatile ſalt may be diſperſed through the neighbouring air. For, as I have elſewhere ſhewn, the ſoot of burned wood, which is but that ſmall part of the ſmoke which chances in its paſſage upwards to ſtick to the chimney, does very much abound in a volatile ſaline ſpirit, which by many trials are found to have ſo much affinity to that of urine and of hartſhorn, as not to be eaſily, but by the ſmell diſtinguiſhed from it.

Beside, in ſeveral places the putrefaction of ſubſtances, that once were parts of animal bodies, may furniſh the air with volatile ſalts, as I have elſewhere mentioned, that I found, that urine, without diſtillation, will by bare putrefaction afford ſaline and ſpiritous parts, that whilſt they yet ſwim in the copious phlegm, that makes up the body of the liquor, will manifeſtly diſcover themſelves to be volatile, not only by their ſmell, but by their hiſſing with acid ſpirits, and by their diſſolving ſome bodies, and precipitating others, according to the manner of volatile ſulphureous ſalts, as thoſe that abound in ſpirit of harts-horn, blood, *&c.* And I am apt to think, that it is not only in the parts of animals, but alſo in thoſe of many vegetables, that putrefaction may either extricate or produce volatile ſalts. And I remember, I have obſerved in ſome ſucculent vegetables, that chancing to lie in a heap together, in a convenient ſeaſon of the year, to make them rot; I obſerved, I ſay, when the putrefaction was come to a certain point, that the ſtink did ſo reſemble that of carrion, that it was not eaſy for me to believe it came from cadaverous plants, not animals. And that it is not impoſſible for a vegetable to afford, without the help of an additament, a volatile ſalt, even *in forma ſicca*, may be gathered from what I elſewhere relate, of my having diſtilled ſuch a ſalt from a certain ſpiritous ſeed, though, I freely confeſs, I never obtained any (without previous incineration) from above two or three vegetables. But of this enough in this place.

I shall now add, that beſides the more ſimple ſalts hitherto enumerated, it is not unlikely, that in ſome places the air may ſometimes contain compounded ſalts. For I have elſewhere ſhewn, that ſome ſorts of ſaline ſpirits, meeting one another in the air, may there convene. And I elſewhere teach how to order a couple of liquors ſo, that one will never of itſelf afford any thing in a dry form; and yet the ſpiritous effluvia of this liquor, meeting with thoſe of the other, will exhibit a volatile and ſaline body in a dry form; though the liquors themſelves being mingled will not afford any ſuch ſubſtance. What I have elſewhere delivered concerning ſubterraneal ſteams, may make it probable, that at leaſt now and then, and in ſome places, there may be ſent up from under ground into the air, among other effluvia, ſtore of ſaline ones, which needs not be ſuppoſed all of them to be of an uncompounded nature. With which that agrees very well, that was related to me by a very intelligent acquaintance of mine, that lived long in parts of *America*, where there was a vulcano, which he and ſome others having the curioſity to viſit, told me, that before they came any thing near the fire, or were offended by the heat, not only the ſkin of his face was almoſt corroded by the ſharpneſs of the exhalations, but the colour of his hair was altered by it, which kept him from proſecuting his intended diſcovery. It is a known thing, and I have received information of it from more than one eye-witneſs, that about mount *Veſuvius*, the aſcending exhalations, that iſſue out at ſome of the holes, are of ſo ſaline and ſulphureous a nature, that part of them ſtick about the orifices of thoſe vents, in the form of flower of brimſtone, of which a learned acquaintance of mine brought away ſome quantity. And I have had brought me from ſome of thoſe vulcanos a ſtone, whoſe cavities abounded with a white ſalt, which, by fit trials purpoſely made, was found near a-kin to ſal-armoniac, and eaſily reſoluble into a ſalt, whereof one part was ſomewhat fixed, and the other very volatile; which made it highly probable, that the ſalt was compounded in the bowels of the vulcano: whence I have been credibly informed, that great quantities of it have been caſt up in the fiery eruptions, and therefore ſtore of it might in likelihood be diſperſed through the air, ſince I found the ſalt itſelf to be ſublimable.

But, beſides the ſaline ſubſtances hitherto mentioned, which may be referred to determinate ſpecies, I think it not impoſſible, that the air may, at leaſt in ſome times and places, be impregnated with corpuſcles of a ſaline nature, whether ſimple, or compounded, or of both kinds, not eaſily reducible to any of the ſorts we have been ſpeaking of, or are acquainted with. For which reaſon I ſhall not preſume to give them any other denomination, than that indefinite one of anonymous. And I have been inclined to think, there may be ſuch bodies in the air by theſe two inducements. The firſt, that the particular aerial ſalts, that have been hitherto recited, are but few, as it ſeems probable by what I have ſaid in other papers of ſubterraneal ſteams and menſtruums; and that therefore there may aſcend out of the earth into the air ſaline fumes, differing enough from thoſe, whoſe kinds we have hitherto deſcribed. But beſides this conſideration *à priori*, (as they ſpeak) experience has preſented us with ſome phænomena, that ſeem *à poſteriori* to confirm this conjecture. For there happen ſuch changes to ſome bodies, by being expoſed to the air, as though I am not ſure, and therefore ſhall not be confident, that they are mainly produced by ſome nameleſs ſubſtance of a ſaline

line nature, may yet make it allowable to ſuſpect them to proceed thence. And amongſt theſe I ſhall take leave to inſert ſome, which I deny not to be probably referrible, either to one or other of the formerly enumerated kinds of aerial ſaltneſs. For laying theſe inſtances before you together, they may, by appearing thus aſſociated, give the ſtronger probability to our opinion, that there are ſaline ſubſtances in the air. And thoſe inſtances, that are not ſo proper to perſuade you, that there are anonymous ſalts, may ſerve to confirm, that there are, at leaſt in divers places, differing ſorts of aerial ſalts. I remember I have more than once viſited old glaſs-windows, in high and ancient buildings, and found ſome of the panes of glaſs here and there corroded, as if they had been worm-eaten; which probably enough argued the ſharp and fretting corpuſcles to have been carried along with the winds, to which they were expoſed, as will not eaſily be reduced to any formerly named ſalts, whoſe being unable to corrode glaſs, eſpecially no finer than that was I ſpeak of, is ſufficiently known to chemiſts.

Besides the above-mentioned phænomena, others have occurred to me, which poſſibly it would not be thought impertinent to ſubjoin on this occaſion; but I chooſe rather to reſerve them for another diſcourſe; and now ſhould put an end to this, but that I dare not conceal from you, that I ſometimes had thoughts of trying, whether a diſcovery may not be made, what kind of ſaltneſs there is to be found in the air, and whether the aerial ſaltneſs does or does not abound there, at leaſt at this or that time. But this I freely confeſs to be ſo difficult an attempt, that all that I can offer pretends but to diſſuade you from rejecting it, as too deſperate and extravagant a thing to be fit to be tried.

And I ſpeak the leſs promiſingly of what I am to ſay in the remaining part of this paper, becauſe I have not by me any notes to aſſiſt my memory, (which I dare not truſt alone) concerning the iſſues of the not numerous trials, I had opportunity to attempt in purſuance of thoſe thoughts. This I well remember, that among other ways of making the intended aerial diſcoveries, I looked upon this as the leaſt unpromiſing, that ſuch ſubjects ſhould be carefully choſen out, as being diſpoſed to be differingly wrought upon, according to the differing ſorts of ſaltneſs, that may be found predominant in the air.

This more general way of inveſtigating the ſalts of the air may contain divers particular methods, of which I ſhall now touch upon the following three.

First, It may be worth while to expoſe to the air ſuch bodies, as we judge fitteſt to be wrought upon by the ſalt, that we think likelieſt to be met with in it. So where we gueſs the air to be impregnated with nitre, we may expoſe lime to it, or ſome other body, that we think diſpoſed to imbibe or retain ſuch a ſaltneſs. We may alſo hang up in ſuch an air clothes or ſilks died with ſuch colours, that nitrous (for inſtance) or ſalino-ſulphureous ſpirits (as ſome chemiſts call them) have been found peculiarly apt to make to fade, or to diſcolour them. In the places where we ſuſpect vitriolate ſteams to abound, ſome appropriated preparations of ſulphur, either common or metalline, may be expoſed to try, whether they will acquire a blackneſs, as I have ſeveral times found ſome of thoſe ſulphurs, though otherwiſe of no dark colour, to do upon the leaſt contact of vitriolate corpuſcles. In ſome places alſo, which are judged likely to afford ſubterraneal ſteams, gueſſes may be made, whether this or that kind of ſalt aſcends into the air, by ſpreading upon the ground, in places free from dirt and duſts, large pieces of clean and white linen cloth, that has no reliſh of ſoap or lees; and obſerving, after they have lain a competent while, whether, and how they are diſcoloured, and what kind of ſaltneſs, if any, is to be found in the moiſture imbibed by them, from the aſcending ſteams and falling dew.

The next of the above-mentioned ways of enquiring after the ſaltneſs of the air may be, to find, if it be poſſible, ſome one body, that is both capable to be wrought on by ſeveral aerial ſalts, and will be ſo differingly wrought on by them, as to diſcover which kind of ſalt it is, that has produced the change. That it is very difficult to find ſuch a body, I will readily grant; but that it may be poſſible, I will not be forward to deny. For having pitched upon copper to make this trial with, though the attempt did not ſucceed according to my wiſh, yet perhaps it was chiefly for want of time and accommodations that it miſcarried. For having taken plates of copper beaten thin, (without regarding their bigneſs, or figure, or ſmoothneſs, as things not neceſſary to my purpoſe) I cauſed the ſurfaces to be made very clean, that the colours might be the more eaſily produced, and the better diſcerned: then keeping theſe over glaſſes, wherein were placed divers ſpirits, as of common ſalt, and of nitre, partly ſincere, and partly diluted with water, I obſerved, as I expected, that though I put the glaſſes in no heat, yet there aſcended fretting particles out of the liquors, and that within leſs than a day, the ſteams of the two above-mentioned liquors had much darkened the ſurfaces of the copper plates they met with in their way, the keeping them a while in the air was not hard to know by the differing diſcolorations that appeared, which plate had been invaded by the ſaline corpuſcles, and which by the nitrous; which I did not at all wonder at, becauſe I have formerly found, as I have elſewhere noted, that whereas ſpirit of nitre will make of copper a greeniſh blue ſolution, ſpirit of ſalt will, if duly employed, diſſolve that metal into a graſs-green liquor, as the ſpirit of ſoot and that of urine will into a deep blue, almoſt like ultramarine. But, as I ſaid, the want of time, of which good ſtore may be requiſite for ſuch trials, kept me from proſecuting my attempt to an iſſue. Notwithſtanding which I look not upon the deſign as deſperate, not only becauſe of the encouragement I have already mentioned to reſume Experiment I.

ſume it; but becauſe I have obſerved pieces of malleable copper, brought me, to examine, out of an Engliſh mine, (which is yet concealed) to be overcaſt here and there with a fair verdegreaſe, which by circumſtances I judged to have been produced, not by groſs liquors, but by the air impregnated with ſteams fit to work on that metal. And poſſibly there may be other ſubterraneal bodies, and even metalline ones, that by their degree of colour, or peculiar kind of ruſt or ſtain, that they will acquire in the air, may help us to gueſs what ſubſtances, and among others what ſalts the air of that place is impregnated with. I have been in a great and ſtately houſe, which being oddly ſeated, had this peculiar inconvenience, upon the ſcore of the ſteams that infeſted the air, that thoſe that dwelt in it, as one of the chief of themſelves complained to me, could not keep their ſilver plate, of which they had great ſtore, from being blemiſhed by odd diſcolorations, or, as they ſeemed to think it, ruſt; though when it was not uſed, they carefully kept it in a place judged convenient for ſuch a purpoſe. And I have been informed by an obſerving man, who lived there ſome time, that there is nothing more generally known in *Amſterdam*, than that their ſilver plate there, expoſed a little while to the common air, tarniſhes immediately, contracting a dirty colour, partaking of yellow and black. Another inſtance or two, though not afforded by plate, I could mention to the ſame purpoſe; but I reſerve them for another place, my haſte obliging me to paſs on to the laſt of the three ways I propoſed of inveſtigating the differences of aerial ſalts.

THE third way may be looked upon, if you pleaſe, as a variation of the ſecond; but there is this difference betwixt them, that here we make uſe of metalline bodies, not crude, but already prepared by ſome chemical operations; ſo that being before hand reduced to very ſmall parts by the intervention of ſaline ſubſtances, the operation of the air upon them is wont to be much the ſooner performed. In this third way then we employ ſuch fictitious minerals or other bodies, as having for the moſt part an adventitious colour already, will change that colour by being expoſed to the air. For it ſeems not impoſſible, but that by diligently obſerving, what difference may be found in the diſcolorations produced in theſe ſubſtances by the differing kinds of ſalts, as nitrous, ſalino-ſulphureous, *&c.* that we have ſhewn may be met with in the air, ſome gueſſes may be made in a ſhort time of this or that ſalt, which has the chief ſtroke in the production of the exhibited colour. And I ſhall on this occaſion mention two or three bodies, without determining, till I be better ſatisfied, whether their changes proceed only or chiefly from the ſalt of the air; but I am content not to pretermit them, becauſe if they do not prove what I propoſe, they will at leaſt clear the meaning of it, and may however help us to gueſs at the reſemblance or difference of airs in ſeveral places, by the likeneſs or unlikeneſs of the produced changes of colour, whether theſe changes proceed from ſaline, or from any other ſubſtance intermingled with the air.

IF we precipitate a ſtrong ſolution of good ſilver made in aqua fortis, with a competent quantity of ſpirit of ſea-ſalt, we ſhall have a powder, which at firſt will be very white; but if the liquor be not poured off, this being expoſed for a good while to the air, it would acquire on the ſurface a dark colour, which perhaps an attentive eye will diſcern ſomewhat various, as this or that kind of ſaltneſs happens to be predominant in the air. Experiment II.

WE took an equal weight of good filings of copper, and powdered ſal-armoniac, which being well mixed, were put into a covered crucible, and kept in a moderate fire over ignited coals, till the ſal-armoniac had either quite or almoſt done ſmoking: then as much of the remaining maſs as could be parted, was taken out, and looked of a dark colour; but this maſs being groſly beaten, and expoſed for ſome time to the air, looked like a kind of verdegreaſe, which is a ſubſtance, whoſe colour may be obſerved ſomewhat to vary, according to the nature of the particular ſalts, which by working on, and embodying with the copper, produce the pigment. But a parcel of the ſame maſs being, before the air had time to work much upon it, groſly powdered, and hermetically ſealed in a glaſs egg, to fence it from the air, and left in a ſouth window, did not appear diſcoloured, when the out-ſide of the other parcel ſhewed like verdegreaſe: which ſeems to argue the change of colour to have been made by the aerial ſalt, if we ſuppoſe the moiſture of the air to have had no intereſt in the change, or to have concurred to it, but as a kind of vehicle aſſiſtant to the ſalt. Experiment III.

I ALSO took ſpirit of the ſoot of wood, and having poured a little of it on the filings of copper, my expectations were anſwered by my finding, that the liquor diſſolved ſome parts of the metal into a deep and lovely azure like ultramarine; and that this ſolution being ſuffered to grow dry in an open glaſs, by the mere operation of the air, the ceruleous colour very ſoon degenerated, even before the matter was quite dry, into a cyanious colour, ſuch as may be ſeen in good turquoiſes. And to manifeſt, that this change proceeded not from any peculiarity in the ſpirit of ſoot, and that this ſpirit acted as abounding with a ſalino-ſulphureous ſalt; I ſhall add, that I had the ſucceſs in a trial made with an urinous ſpirit drawn from animal ſubſtances, and put upon crude filings of copper. And in thoſe trials I ſometimes obſerved the differences of colours, that did not diſcourage me from hoping, that the proſecution of them might not be inſignificant to my purpoſe. Experiment IV.

I HAVE not been ſolicitous to deſcribe the fore-mentioned changes of colours more particularly, becauſe it had been very difficult to do ſo, and therefore I judged it more expedient not to attempt it. For there is ſo great a variety of colours, that few but painters can exactly

exactly enumerate, and distinguish them by proper names. And yet, besides those more noted ones, there are many others, for which, though our language, nor perhaps any other, is not copious enough to furnish us with distinct appellations, yet our eyes, especially when they have been attentively conversant with such objects, are sharp enough to discern them: and by the help of these nameless, as well as the stated colours, I am apt to think a heedful observer may perceive divers variations in the colours of the bodies we have been speaking of, that may assist him to guess, what substance it is in the air, whereto these diversities may be ascribed. And as nature is much more rich in things, than our dictionaries are in words, so has she furnished men with sensories capable of distinctly perceiving a far greater variety of objects, than they are able verbally to express. And this might be shewn by instances, in the organs and objects of senses less acute than sight, whose subtilty in distinguishing things I could exemplify, not only by what is related, but by what has been performed by some persons not unknown to me, particularly our famous Doctor *Harvey*. But examples of this kind I have not leisure to stay on; and therefore without spending more words upon this third way of discovering aerial salts, I shall barely recommend the care of such observations to their curiosity, who shall think it worth while to make them,

WITH how little confidence of success, trials, that have the aims of those I have been speaking of, are to be attempted, not only consideration, but experience hath made me sensible. But yet I would not discourage human curiosity from adventuring even upon slight probabilities, where the nobleness of the subjects and scope may make even small attainments very desirable. Those adventurous navigators, that have made voyages for discovery in unknown seas, when they first discerned something of obscure near the horizon, at a great distance off, have often doubted, whether what they had so imperfect a sight of, were a cloud, or an island, or a mountain: but though usually it were more likely to be the former, (as that which more frequently occurred than the latter) yet they judged it advisable to steer towards it, till they had attained a clearer prospect of it: for if it were a deluding meteor, they would not however sustain such a loss in that of no great labour, as in case it were a country, they would in the loss of what might prove a noble and rich discovery. And if they desisted too soon from their curiosity, they could not rationally satisfy themselves, whether they slighted a cloud, or neglected a country.

I DO not perceive, that the air of our inland parts is considerably impregnated with esurine salt; since I do not find the bars and casements of our windows much impaired by rust after near eighty years standing, or that they are more rusty towards one quarter than another; though the air hereabout, (*viz. Oakly* in *Buckinghamshire*) is very damp about the end of autumn, and beginning of winter. So that I conceive this salt either proceeds from the sea-vapours near the sea-coasts, or else from the dissolution of this esurine salt in the air, upon the burning of sea or other mineral coles. Mr. *J. T.*

Agricolâ de re metallica, lib. duodec.

Mox ollam ex igni removent; postea ex refrigerata eximunt halinitrum purissimum: quod candidi marmoris speciem gerit; atque tunc etiam id, quod terrenum est, in fundo residet. At terra, ex qua dilutum fuit factum, & rami quernei vel consimilis arboris alternis sub dio ponantur, & aqua quæ combibit halinitrum conspergantur: quò modo quinque vel sex annis rursus apta fit ad conficiendum dilutum. Halinitrum quodammodo purum, quod dum terra tot annos quievit interea, ortum fuit, & quod lapidei parietes in cellis vinariis & locis opacis exudant, cum primo diluto permistum decoquatur.

Si verò locus aliquis talium venarum copiam suppeditaverit, ipsæ statim non conjiciantur in castella; sed primo convehantur in areas, atque cumulentur: quanto enim diutius aeri & pluviis expositæ fuerint, tanto meliores fiunt. Nam in ejusmodi cumulis, aliquot post mensibus, quam venæ in areas fuerunt congestæ, nascuntur fibræ longe venis bonitate præstantes: deinde vehantur in sex, pluravæ castella, longa & lata ad novem pedes, ad quinque alta.

Si verò dum dilutum recoquitur, separata non fuerint, mox ex minoribus vasis infundatur in majora, eaque concludantur: in quibus item atramentum sutorium separatum ab alumine concrescit: utrumque excisum, & in hypocausto siccatum dividendatur dilutum, quod in vasis & cupis non concrevit in cortinam refusum recoquatur: sed terra, quæ in fundo cujusque cortinæ resedit, ablata in castello unà cum venis, denuo aqua & urina diluatur. At terra, quæ in castellis diluto, postquam effluxit, superfuit egesta & coacervata quotidiè, rursus magis ac magis fit aluminosa, non aliter atque terra, ex quâ halinitrum fuit confectum, suo succo plenior fit: quare denuo in castella conjicitur, & aquæ affusæ ea percolantur.

A LEARNED observer, who practised physick in one of the most southern of the English colonies, being asked by me about the effects of the air there upon iron; affirmed to me, that the great guns there are so subject to become rusty, that after they have lain a very few years in the air, one may with a hammer knock off whole scales, or rather cakes of crocus martis: and he observed, that those guns, that lay only exposed to the air, did this much more than those, that by accidents were drowned, and lay covered with the salt water.

AND since dew is made of steams of the terrestrial globe, which whilst they retain that form, and were not yet convened into drops, did swim to and fro in the air, and made part of it; the phænomena, that shew the power of dew in working on solid bodies, may help to manifest, how copiously the air may be impregnated with subtil saline parts. Wherefore I shall here add, that having met with a person, that was bred as well a scholar as a traveller,

veller, and had viſited not only ſome of the maritime places of *Braſil*, but ſome of the inward parts of that vaſt country, I enquired of him about the ſubtilty of Braſilian dew, and its power to ruſt metals: about which he told me, that it was certainly very great, and would not only ruſt knives and ſuch inſtruments, but likewiſe money, which he aſſured me he had particularly obſerved; adding, that in ſeveral places the Portugueſe kept their great guns caſed over, that the dew might not fall upon them, and by its corroſiveneſs ſo ruſt them, as to be apt, after a while, to break in the diſcharge. And when I demanded whether he taſted the dew, to obſerve the ſaltneſs of it? he replied, that he had not, but that he had in divers places obſerved, that it left the graſs, *&c.* that it had reſted on, covered over with a pure white ſalt, as if it had been a hoar froſt.

An ingenious traveller, and ſtudent of phyſick, being diſcourſed with by me about ſome particularities of his country (which is *Swedeland*) relating to minerals, and their effects upon the air, aſſured me, that in a city, or notable town called *Fahlun*, which is built on the lower part of an hill, containing one of the beſt copper mines in *Sweden*, the exhalations, that are copiouſly emitted by the latent minerals, do ſo affect the air in and about the place, that their ſilver coins are oftentimes notably diſcoloured by them, not ſeldom made even black or blackiſh, though the money be kept well tied up in bags or purſes, and theſe perhaps placed one within another, and the whole aggregate be kept locked up in coffers or preſſes made of wood of perhaps an inch thick: he added, that theſe ſubterraneal ſteams have manifeſt effects upon braſs, (wherewith that country abounds) inſomuch that there being kept in the principal church ſeven crowns made of that metal upon a particular occaſion, the ſulphureous ſteams made thoſe, that looked to them, take the pains to cleanſe and brighten them at a month's end, till finding, that the labour was every month to begin again, they at length grew weary of it, and ſuffered theſe crowns to grow, as they yet continue, as black (to uſe his own phraſe) as the tunnel of a chimney; this he averred to be true, as having a good opportunity to be ſure of it, in regard of his being a native of this town. And he further aſſured me, that the corroſive exhalations did ſo penetrate the bars and veſſels of iron, that lye expoſed to the air, that after a while, it is eaſy with a hammer to knock off ſcales of Mars, which are friable into a powder, like crocus, ſave that the colour is more dark.

TITLE XII.

Of Sulphur, and inflammable particles in the air; and of lightening, and its effect.

YESTERDAY a Neopolitan lord, a perſon of high quality, and very curious, being aſked by me ſome queſtions about ſome natural phænomena relating to *Veſuvius* and the adjacent country? aſſured me, that having had occaſion to ſtay for divers months at a country houſe but little diſtant from *Naples*, he took much pleaſure, taking the air on horſe-back upon a very ſulphureous ſoil, to take notice of divers obſervables to be met with there; and that he often found, that when his horſe trod ſomething hard upon the ground, there would be produced a great, and as it were a crackling noiſe, which would have frighted a ſtranger; and that oftentimes he could diſcern, that where his horſe had trod, there would preſently ariſe a duſt, and fumes that were manifeſtly ſulphureous and ready to take fire: adding, that ſometimes he thought that they actually did ſo. He further told me, that he ſometimes, for curioſity ſake, cauſed ſome clods, or as it were turfs, to be cut out of that ſoil, and laid in a kind of heap; and that then in the night he could obſerve, that the ſteams, that plentifully iſſued thence, would ſometimes be kindled by or in the air, as they aſcended in it.

The ſame nobleman told me, that when ſome years ago there were eruptions of fire in mount *Veſuvius*, he and others obſerved, with amazement and horror, that the flame, which ſhot up into the air, from the *Volcano*, was of ſo prodigious a height, as invited them to meaſure it with a quadrant, by which they found it to be near two miles high: and when I aſked, if he compriſed in that height the altitude of the mountain itſelf? he anſwered, that he did not, for the flame, that appeared above the top of the mountain, appeared as high as the mountain itſelf; and it was from the top of the hill, and not the bottom, that they computed the height of the flame. He added, that ſometimes the earth would tremble, and there would be diſcharges of ſuch vaſt ſtones, and other heavy things, that he ſaw ſome maſſes of ignited matter thrown up a great way into the air, that were bigger than the chamber he did me the honour to viſit me in, though that were a large room for a bed-chamber.

Voila tout ce qu'on peut dire de cette iſle, qui ſemble un enfer, car on voit la mer du port, & de la coſte toute noire & brûlée d'un petit eſcueil, qui paroiſt depuis environ ſoixante ans, & d'ou on vit ſortir en ce temps là une grande flamme, qui y a laiſſé une ouverture ſi profonde, que ſi on y jette une pierre, on ne l'entend point tomber. Mais ce qui eſt arrive depuis en ce port, n'eſt pas moins eſtonnant: je le rapporteray icy comme je l'ay appris de diverſes perſonnes en pluſieurs endroits. *Voyage de Levant, p.* 203.

Il y a environ 18. *ans, que durant la nuit d'un certain dimanche, commenca dans le port de Santorini un tres grand bruit, lequel s'entendit juſques à Chio, qui en eſt eloigné de plus de deux cent milles, mais de telle ſorte, qu'on crut à Chio, que c'eſtoit l'armée Venitienne, qui combattoit contre celle des Turcs, ce qui fit que dés le matin chacun monta aux lieux les plus élevez pour en eſtre ſpectateur, & me ſouviens que le reverend pere* Bernard *ſuperieur des Capucins de Chio, homme venerable,* *Accident extraordinaire à Santorini.*

venerable, & tres digne de foy, me conta, qu'il y avoit eſté trompé comme les autres, car il crut auſſi bien qu'eux entendre pluſieurs coups de canon; cependant ils ne virent rien, & en effet ce fut un feu, qui ſe prit dans la terre du fond du port de Santorini, & y fit un tel effet, que depuis le matin juſqu' au ſoir il ſortit du fond de la mer quantite de pierres de ponce, qui montoient en haut avec tant de roideur & tant de bruit, qu'on euſt dit, que ce fuſſet autant de coups de canon, & cela infecta tellement l'air, que dans la dite iſle de Santorini, il mourut quantité de perſonnes, & pluſieurs de la meſme iſle en perdirent la veue, qu'ils recouvrerent pourtant quelques jours apres. Cette infection s'eſtendit auſſi loin, que le bruit qui l'avoit precede, car non ſeulement dans cette iſle, mais meſme a Chio, & à Smyrne, tout l'argent devint rouge, ſoit qu'il fut dans les coffres, ou dans les poches; & nos religieux demeurans en ces lieux là me dirent que tous leurs calices en eſtoient devenus rouges. Au bout de quelques jours cette infection ſe diſſipa, & l'argent reprit ſa premiere couleur. Ces pierres de ponce, qui ſortirent de la, couvrirent tellement la mer de l'Archipel, que durant quelque temps, quand il regnoit de certains vents, il y avoit des ports qui en eſtoient bouchez, en façon qu'il n'en pouvoit ſortir aucune barque, pour petite qu'elle fut, que ceux qui eſtoient dedans ne ſe fiſſent le chemin au travers de ces pierres de ponce avec quelques pieux; & on en voit encor à preſent par toute la mer Mediterranée, mais en petite quantité, cela s'eſtant diſperſé ca & là. Seneque raconte en une de ſes epiſtres, que Santorini eſt baſtie ſur des mines de ſouphre, & ce ſont elles, qui fourniſſent aſſeurement la matiere pour allumer ce feu. On dit qu' Alexandre le Grand meſura la mer en cet endroit, & n'y trouva point de fond. Il y a pourtant une petite iſle appellée Fireſia, à la pointe de laquelle on peut donner fonds, & point en aucun autre endroit.

It has been often obſerved, that upon the falling of thunder there has been produced in the air, near the places where it fell, a ſtrong odour of burnt brimſtone. And I remember, that being one night at a town built almoſt upon the great lake of *Geneva*, anciently called *Lacus Lemanus*, the thunder was ſo violent, as much frighted the inhabitants; though (by reaſon of the neighbourhood of the high mountains of *Savoy* and *Switzerland*) thunders be very frequent there: and the next day I had a great complaint made me, of the ſtrong ſtink of ſulphur, produced by the thunder, that fell hard by into the lake and was ready to overcome by its ſmell, even a ſoldier, that ſtood centinel near it.

On *July* 24. *An.* 1681. the ſhip Albemarl, whereof Mr. *Edward Lad* was then maſter, being an hundred leagues from cape *Cod* in latitude 48. about 3 P. M. met with a thunder ſtorm, the lightning burnt the main-top-ſail, ſplit the main cap in pieces, rent the maſt all along. There was in ſpecial one dreadful clap of thunder, in report bigger than of a great gun, at which all the ſhip's company were amazed: then did there fall ſomething from the clouds upon the ſtern of the boat, which it broke into many ſmall parts, ſplit one of the pumps, the other pump much hurt: it was a bituminous matter, ſmelling much like fired gunpowder: it continued burning in the ſtern of the boat. They did with ſticks diſſipate it, and poured much water on it, and yet they were not able, by all they could do, to extinguiſh it, until ſuch time as all the matter was conſumed. But the ſtrangeſt thing of all is yet to be mentioned.

When night came, obſerving the ſtars, they perceived, that their compaſſes were changed. As for the compaſs in the biddekel the north point was turned clear ſouth. There were two other compaſſes unhung in the locker in the cabin, in one of which the north point ſtood ſouth like that in the biddekel. As for the other the north point ſtood weſt, ſo that they ſailed by needle, whoſe polarity was quite changed. The ſeamen were at firſt puzzled to work their veſſel right, conſidering, that the ſouth point of their compaſſes was now become north; but after a little uſe it was eaſy to them: thus did they ſail a thouſand leagues. As for the compaſs, wherein the lightning had made the needle to point weſtward; ſince it was brought to *New England* the glaſs being broken, it has, by means of the air coming to it, loſt its virtue. One of their compaſſes, which had quite changed the polarity from north to ſouth, is ſtill extant in that country, in the hands of Mr. *Increaſe Mather*; the north point of the needle doth remain fixed to this day, as it did immediately after the lightning cauſed the alteration.

An induſtrious gentleman, that was long an eminent planter of trees, wherewith he furniſhed many of his neighbours, preſented me with a piece of a branch, that ſeemed to have had a ſlit, for it reached thorough the bark almoſt to the very wood, from one end to the other, but had now the lips of the wound overgrown on each ſide with new bark: of this kind of gaſhes, he told me, he found in other branches of the ſame tree, which made him think, that ſome envious knave had done this in ſpite: but conſidering the circumſtances more curiouſly, he found that conjecture much diſcountenanced by ſome of them, and ſuſpected, that theſe wounds muſt have been made by ſome deſignleſs agent. For by his own obſervations, and thoſe of his friends, it appeared, that theſe fiſſures are to be met with, not only in divers others of his own trees of differing kinds, and in differing plantations, but alſo in the trees of ſeveral others, which though growing in the ſame country, were remote enough from his: ſo that it having been obſerved with ſome wonder, that in the foregoing ſeaſon, lightnings had been very numerous and frequent, he and his friends concluded, for reaſons, that need not be here repeated, that the above-mentioned gaſhes were ſome of the odd effects of thoſe lightnings, which kept me from wondering at his negative anſwer, to the curioſity I had to know, whether all theſe wounds of the trees looked the ſame way, as eaſt or weſt,

weſt, north or ſouth. For I had formerly obſerved, that the ſame fulmen or flaſh of lightning reaching to the earth in the form of fire, appeared by the recent effects, as well of its impetuous motion, as of its violent heat, to have moved in an irregularly winding-line; which made me compare its motion to that of a ſquib, and helped me to ſolve ſome odd phænomena of lightning, that this is not the fitteſt place to diſcourſe of: the foregoing mention of what happened to the trees, being deſigned, partly to preſerve the memory of an unuſual phænomenon, and partly to ſhew, that whatever is wont to happen in animals, lightning is not always deſtructive or corruptive of vegetables, ſince the wounds inflicted to trees were happily cicatriſed, and did not kill or poiſon the plants. And whether this phænomenon were produced by ſome mineral exhalations kindled in the air, or by the violent and irregular motion of ſome ſuch ſubſtance, or by both together, the phænomenon will be pertinent to the ſubject or deſign of the preſent tract.

TITLE XIII.

Of celeſtial influences or effluviums in the air.

To Mr. *HARTLIB.*

DEAR SIR,

I SHALL not I hope altogether forget the charge, which you have been pleaſed to lay upon me, in reference to the conſideration of all winy liquors, their affections, and the ſeveral diſtempers incident to them, with my thoughts about the preſerving of them, ſo as may beſt retard the quickneſs of their motion, and hinder their dyſcraſy and corruption.

To which end an exact ſcrutiny into the air, its quality, temperament and motion, and an enquiry of the efficacy and force, that this hath upon all ſuch bodies, will be in ſome meaſure neceſſary.

AND this puts me in mind to leave one requeſt with you, *viz.* to beg your aſſiſtance and countenance on all occaſions to Mr. *Streete*, when he ſhall at any time wait on you, who both as to his undertaking, and to the modeſty and ſimplicity of his ſpirit, doth very much emulate our ſo much joint eſteemed friend Mr. *Mercator*, who, though he may differ from the former, in reference to his method, or to ſome of the profounder parts of learning; yet I think it very poſſible to reconcile them in the main, and cannot but expect ſomething extraordinary in the aſſerting and perfecting of the theory of the planets, will be brought forth between them, which I ſhould the more gladly ſee, by how much moſt ſcholars complain of it, as of a thing hitherto wanting, by how much alſo I gueſs, that having the examples of ſo many who have already attempted the ſame thing in vain, they will find themſelves the more conſtrained to lay down ſome new choice, ſingular and undeniable hypotheſis, for the better invitation of the admittance of their opinion among learned men, although ſuch a work be no leſs neceſſary alſo for other reaſons.

FOR if we aſſert not the theory of the planets rightly, and upon ſuch ground as are indubitably demonſtrable, we ſhall never be free from errors and diſagreements in opinion about their motions, and the right calculation of them.

AND if we miſtake in either of theſe, we muſt miſtake of the true place in the heavens, in which each planet is, or conſtantly ought to be: and if we at all err in our judgment of their due places, it is impoſſible we ſhould aſſert their ſeveral aſpects, and the mutual influences and virtues they have (through this) one upon another: and ſo the phyſical uſe of their motions falls to the ground wholly, or at leaſt becomes ſubject to very much uncertainty.

AND truly, if there be no ſuch uſe at all of the motions of theſe bodies, as that which I may call phyſical, *viz.* for predicting, and for (in ſome meaſure) determining the affections, diſpoſitions, and alterations, that are introduced into ſeveral things here, either immediately, or into the air immediately, by reaſon of the courſe of theſe ſuperior bodies, it would very much leſſen and depreciate with me that toil, coſt, pains, watchings, and continual exerciſes and endeavours, that have been uſed for the gaining of exact obſervations in aſtronomy. Seeing when we have done all, and obtained all beyond the mere bare knowledge of them, we can propound no end, benefit, uſe or advantage, that may recompenſe the trouble and pains beſtowed upon them, (at leaſt upon ſome of them) nor ſo much as any real or particular relation between us and them; and if ſo, we know them only to know them.

BUT we ſhall at preſent preſume the contrary, and therefore ſhall crave leave to ſay, that although ſeveral objections are commonly brought againſt any ſuch uſe or application of theſe bodies, or of their power, influence or motions, which are occaſioned partly by the ſuperſtition and paganiſm incident to this kind of doctrine, partly by the impoſture, ignorance, and want of learning, generally obſerved in the perſons profeſſing this knowledge, partly by the manifeſt miſtakes and uncertainty, that there is in the predictions of this nature, and partly by the inexplicableneſs of the way or manner how they come to affect one another, which admits not, as many conceive, of an eaſy, viſible, or familiar demonſtration: yet all theſe objections, if thoroughly examined, do not, as we humbly conceive, really null or take away the poſſibility of the thing ſimply, but are raiſed rather againſt the enormities and imperfections, that are confeſſed to be in it; and it may, notwithſtanding all thoſe objections, ſtill be certain, that theſe celeſtial bodies, (according to the angles they make one upon another, but eſpecially with the ſun or

with the earth in our meridian, or with ſuch and ſuch other points in the heavens) may have a power to cauſe ſuch and ſuch motions, changes, and alterations, (ſtronger or weaker, according to the nature of the angle) as the extremities of which ſhall at length be felt in every one of us: and this may be evidenced, 1ſt, by undeniable experiments, not only from things inanimate and vegitative, but from the undoubted obſervations of phyſicians, as well in ſeveral chronical as acute diſtempers, and more eminently in all lunatick, epileptick, paryalitick, or lethargick perſons. 2dly, It may further admit of a demonſtration; for if the extreme motions of phyſick be generation and corruption, and the mean motions rarefaction and condenſation, allowing then theſe bodies to have a ſhare in promoting the mean motions, (*viz.*) of rarefaction and condenſation, we ſhall or may ſoon be convinced, that their effects then upon all other things here cannot but be exceeding conſiderable.

For the better underſtanding of which, I ſhall offer a little more largely to you my conceptions, *viz.*

That to ſpeak properly and ſimply, I take generation and corruption to be the extremes of motion, rather than motions themſelves; for the ſcope, intentions, or effects of all phyſical motions (ſtrictly ſo taken) are only to one of theſe ends, *viz.* either for generation or corruption; and theſe two are they alſo, which limit and bound all motion; for beyond theſe metes there is no phyſical progreſſion, and therefore theſe two muſt be the true *termini*, as well *à quo*, as *ad quem*, of all ſuch motion, ſeeing all things are corrupted to be generated, and all things generated are at length corrupted.

But if theſe be rather the *termini* and extremes of motion, than motion itſelf, we muſt acknowledge there are motions, which nature uſeth as means, between theſe two extremes; which mean motion muſt be as oppoſite alſo one to another, as the two extremes. Otherwiſe we ſhould never be at a certainty, which way nature intends by her motion: otherwiſe alſo we muſt ſay one and the ſame courſe, or one and the ſame thing in nature, may ſimply and of itſelf be the immediate cauſe of generation and corruption, of life and of death, of hardneſs and ſoftneſs, which is abſurd and impoſſible.

Now as theſe two motions of rarefaction and condenſation are oppoſite one to the other, as is required, ſo do they ſquare to all other the inſtruments and phænomena in nature, (*viz.*) the one anſwering to heat, the other to cold; the one to hardneſs, compactneſs, and aridity, the other to gentleneſs, ſoftneſs, ſweetneſs, maturity, *&c.*

For which reaſons therefore, as well as for many other, which might be urged, (if inſiſted on) we do conclude, (ſubmitting it nevertheleſs to be examined) that generation and corruption, rarefaction and condenſation, is the ſimpleſt, plaineſt, and trueſt analyſis, that can be found in nature, for all phyſical motions, as unto ſome of which all motion, purely phyſical, may (as we humbly conceive) without ſtraining, be immediately referred, and as by and through which all may likewiſe with as little difficulty be reſolved.

And having laid this as a ſecond argument, we ſay thirdly, that it cannot be denied, but all the affections and diſpoſitions of moiſture, heat, cold, drought, the courſe of all winds, ſhowers, thundering, or whatſoever elſe is uſed by nature, to produce theſe two general and univerſal effects of rarefaction and condenſation, do in great meaſure, if not wholly depend upon, and are altogether regulated by the courſe, motion, poſition, ſituations or aſpects of the ſuperior and celeſtial bodies or planets. And therefore, 4thly, we ſay, that every planet hath its own proper light: and as the light of the ſun is one thing, the light of the moon another, ſo every plant hath its diſtinct light, differing from all the other. Now we muſt either ſay, that this light is a bare quality, and that the utmoſt uſe and end of it is only to illuminate; and there is no light but is accompanied further with ſome power, virtue or tincture, that is proper to it; which if granted, it will inform us then, that every light hath its own property, its own tincture and colour, its own ſpecifick virtue and power; and that according to the ſeveral bodies of light, there are ſeveral properties, tinctures and powers; and that as one ſtar differs from another in glory, (according to the apoſtle) ſo one ſtar and one planet differs from another in its virtue, in its colour, in its tincture, and in its property.

And conſequently, that thoſe eminent ſtars and planets, that are in the heavens, are not to be conſidered by us as ſluggiſh inergetical bodies, or as if they were ſet only to be as bare candles to us, but as bodies full of proper motion, of peculiar operation, and of life; the ſun not only ſhining upon the reſt of the planets, but by his quickning warmth, awakening, ſtirring, and raiſing the motions, properties and powers, that are peculiar to them. According therefore to the angles, they make with the ſun, and according as they are more or leſs enlightned by him; according alſo as they are at the ſame time more directly or more obliquely, more remotely or more nearly ſituated and placed in reſpect to us; ſo muſt the effects of the powers, virtues and tinctures, that are proper to them, be more or leſs felt by us. 5thly, For the manner of the planets tranſmitting theſe their properties and powers, and of their affecting other bodies at ſo remote diſtance, there is nothing begged or required in it, that is inſuperable to a man's apprehenſion or belief: ſeeing,

1. We affirm not any property, operation, virtue, or power, to be tranſmitted from any of the ſaid planets, but what doth deſcend with its light, and is the real property of its light.

2. No man judgeth, that the light of any planet, or of the ſun itſelf, is refracted, or by any other means weakned, hindred, or impaired by the æther, (or that ſubſtance which fills up the ſpace between one planet and another) through which it paſſeth; but that it doth deſcend whole directly and inrefracted unto, or upon our atmoſphere.

3. But whatsoever is received by the atmosphere, is also received by the thin and subtile air, that is contiguous to the atmosphere: and this air therefore cannot but be capable of being moved, stirred, altered, and impressed by these properties, virtues and lights, as penetrating each part of it.

4. Not only the air, by reason of its thinness and subtilty, is capable of being thus penetrated, moved and altered by these planetary virtues and lights; but forasmuch also as our spirits, and the spirits likewise of all mixed bodies, are really of an aerious, ethereal, luminous production and composition; these spirits therefore of ours, and the spirits of all other bodies, must necessarily no less suffer an impression from the same lights, and cannot be less subject to an alteration, motion, agitation and infection through them and by them, than the other, (*viz.*) the air: but rather as our spirits are more near and more analogous to the nature of light than the air, so they must be more prone and easy to be impressed than it. And if our spirits, and the spirits of all mixed bodies may be altered, changed, moved and impressed by these superior bodies, and their properties; then these spirits being the only principles of energy, power, force and life, in all bodies wherein they are, and the immediate causes through which all alteration comes to the bodies themselves. It is impossible therefore spirits should be altered and changed, and yet no alteration made in the bodies themselves: and therefore a less limit or extreme cannot be set to the power or operation, or force of the superior bodies upon the inferior, than what must terminate at length into the very bodies themselves.

5. As a further confirmation or proof of this, in reference at least to ourselves, I shall offer to your consideration the accidents, that often happen to men, by the mere air, as convulsions, cramps, blastings, lameness, colds, many of which endure a man's life-time; and which (with many bitter infirmities, that sometimes seize upon a man, while standing, walking, or lying in the air) are rarely or never felt or discerned at the instant of their approach or insults upon a man, nor yet accompanied with the sense of any excess in the air for heat or cold at that time, and therefore not well referrible to any cause in the air, if not to the power of those properties and operations of the celestial bodies that we speak of; and this I submit to the judgment of common experience.

6. Lastly, as the sun shining on the rest of the planets doth not, as we said, only barely illuminate their bodies; but besides this, through the power, virtue, and activity it hath, doth also raise, excite, awaken and stir up the several properties and dispositions, that are in those several and respective bodies, whereby they are more lively and effectually brought forth upon us; so we are to suppose it is in reference to this our planet, which is the earth, which is not only enlightned, warmed, cherished and fructified by the power, virtue and influence of the sun, but hath its proper magnetical, planetary virtue also fermented, stirred, agitated and awakened in it, which it remits back with the reflected light of the sun; and together with this magnetick planetary property of the earth, which is stirred and raised by the sun, are awakened also the seminal dispositions, odours and ferments, that are lodged in, and proper unto particular regions or places, which do likewise emit and diffuse through the air, as their several and respective benign, grateful, so their several malignant, congelative and fracedonous natures and qualities.

And hence therefore, though the air, its temperament, disposition and quality in general, is to be looked at according to the motions, influences and aspects of the several superior bodies; yet the particular healthfulness and unhealthfulness of the places, the evil disposition of the air, evenings, nights, and early in the mornings, in some parts more than in others; the superabundant moisture, excessive winds, droughts or other seasons proper to one country, and not to be observed in another neighbouring to it; all these are rather to be allowed and referred to those odours, vapours and exhalations, that are through the power of the sun, or other planets, drawn forth from their particular seats into the air, from the planets themselves.

And thus I have hinted, as well as I may, at the solutions of all the phænomena pertaining to this matter, that I can think of.

And if this be so, then wholly to neglect this physical use (and consideration) of the motion of these bodies, and either to reject it, because of the superstition, that hath been mixed with it, or to exclude it from all manner of care, and from all other further scrutiny, as a thing not worth our enquiry or search at all after, is as great an extreme on the other hand, and a mistake, that must not pass untaxed among learned men.

You did not expect, I am sure, I should have adventured into so particular an apology for astrology; nor do I intend it, when I begun my letter; nor do I now aim to justify any thing farther, than what may properly, if not necessarily fall into the consideration of natural philosophy, being indeed much induced to think, that were the theory of the planets so exactly stated, so perfectly, or so undeniably demonstrated, that we might be sure we rightly understood the place, course and position of each of their bodies in the heavens; this other doctrine of their physical use, with the weight, dignity, extent, considerableness or inconsiderableness of it, would soon confirm and demonstrate itself by the evidence and proof of itself; especially if any will please to take the pains to calculate these motions for his own private use, and according to the meridian he was in, and so compare them with his own observations of the change and alteration of the air from day to day. Which doubtless, as it is the way at first taken by the ancients, to find out their efficacy, I mean the making such a constant observation, and keeping such a diary) so the doing

doing of that again, and giving us firſt an hiſtory or diary of the obſervations of the weather, and its changes in all reſpects, and then an account of the ſeveral places, motions, or aſpects, each day, of the ſeveral bodies of the heavens, with the agreements, doubts, or diſagreements, that theſe bear one to another, and that muſt neceſſarily riſe thereupon, would be that, that could not but prove both ſatisfactory and delightſom to us in this great point, about their phyſical power and uſe.

AND the commodity of this in our oeconomical or civil concerns in huſbandry, in gardening, in phyſick, and to the producing many other very ſtupendous effects, cannot poſſibly be ſo well credited or diſcerned as it would, if ſome ſuch plain foundation and demonſtration of the power of theſe bodies in general were laid. Which methinks we ſhould be much the more encouraged to undertake, having an advantage given us in this age, beyond what moſt ages ever had, by the uſe of thoſe rare inſtruments, that they call the thermometers, or weather-glaſſes.

AND truly when I conſider, that things of the greateſt conſequence do oft-times depend upon the moſt common obſervations; and that matters of the higheſt improvement do receive their beginning from mean, ſmall, ordinary experiments; I would have no man, who hath leiſure, opportunity, and time, to think it a ſlight thing to buſy himſelf in collecting obſervations of this nature. It being much more commendable for a man to preſerve the hiſtory of his own time, though but in the obſervation of the motions of this kind, than to ſay, upon every occaſion that offers itſelf, this is the hotteſt, or this is the coldeſt, or this is the rainieſt, or this is the moſt ſeaſonable or unſeaſonable weather, that ever he felt; whereas it may perhaps be nothing ſo.

AND if there were no other uſe, yet obſervations of this nature would much conduce to compleat the natural hiſtory of any place; as we may obſerve by that learned author, who writ *Hiſtoriam Naturalem Braſiliæ*; and who, to prove not only the habitableneſs, but healthfulneſs of that climate and country, exhibits the account of every day's weather, obſerved by him for many years together, and ſo the agreement of it to that temper, which we account healthful.

BUT the inſtituting and perfecting of accurate obſervations of this nature, by the help of ſeveral large and exact thermometers, placed in ſeveral rooms, or expoſed after ſome convenient manner to the air itſelf, would be a more noble and uſeful undertaking than ordinary. I ſay, the doing this accurately, by large and exact glaſſes, by placing ſeveral of them, either together, or at ſome fit diſtance one from another; it being much to be lamented, and that which I cannot but complain to myſelf of, that no improvement conſiderable hath, as I can learn, been made by any man, of theſe glaſſes, either in our own country, or any where elſe, ſince their firſt invention, (but only to hang them in a room for ornament ſake) there being many things yet wanting, that were much to be deſired for the perfecting of them. For,

1. NONE hath hitherto given us the beſt proportions between the diameter of the head, and the diameter of the bodies or cylinder, although this be indeed the very firſt conſideration, and that which is moſt neceſſary in the uſe of theſe inſtruments; for as by how much the bigger the cylinder is, and by how much the leſſer the head, by ſo much the more ſlow and imperceptible the air's alteration and motion will be; ſo by how much the bigger the head, and ſmaller the cylinder is, by ſo much the more quick, ſubtile, and diſcernible will every ſmall difference of the air appear; which therefore being on both ſides capable of an extreme, ought to be regulated neceſſarily according to ſome mean.

2. ADMITTING a mean or convenient proportion between theſe two diameters, to be as one to 16, or one to 24; we in the next place do no leſs want the fitteſt proportion for the length of the cylinder, which muſt doubtleſs alſo be varied anſwerably, as we vary the proportion of its diameter; the ſmaller cylinder in proportion to its head requiring the greater length, the bigger cylinder on the contrary the ſhorter length.

3. I HAVE not hitherto ſeen any cylinder, that hath been well graduated, 12 or 16 degrees being the moſt, that are ſet upon the common weather-glaſs; whereas to the making of accurate obſervations, it would require a cylinder to be divided into at leaſt 360 parts; though I think it neither unreaſonable nor unpracticable, to have one divided into 1000 parts, allowing but 10 degrees to each inch, which is no unuſual diviſion, ſeeing ſuch an one will much better diſcover, not only the ſmall, but the more ſudden and remarkable changes of the weather, (which are of chiefeſt uſe) than any others, that are common and ordinary.

4. ALTHOUGH no liquor ought to be uſed in theſe glaſſes, that is ſubject to froſt, yet we have little or no account what thoſe liquors are, that might be beſt or fitteſt for the accurate making of thoſe experiments, whether thoſe, whoſe property it is ſomewhat to attract the air, and ſo to preſerve themſelves in at leaſt their firſt quantity, as *oleum ſulphuris per campanam, ol. vitrioli, liquor ſalis tartari*, &c. Or 2dly, whether thoſe, whoſe parts are fineſt, ſubtileſt, and neareſt of kin to the air, ſuch as is ſpirit of wine, ſpirit of terebinth well rectified, and according as there is occaſion ſtill freſh ſupplied. Or 3dly, whether thoſe, that are of a middle nature, as ſtrong ſpirit of vinegar. Or 4thly, whether inſtead of theſe, and beyond theſe, it may not be beſt to uſe only well refined quickſilver.

ALL which ſeveral particulars, as they are neceſſary, and ought to be firſt aſcertained, yet they are but preliminary to the experiments themſelves.

IN the making of theſe experiments themſelves, therefore it would be convenient, 1ſt, That ſeveral thermometers of one proportion, length,

length, and graduation in the cylinders in all reſpects, as near as may be, were ſet in one frame together, either with one and the ſame, or with variety of liquors. 2dly, That ſeveral of theſe frames were ſet in ſeveral rooms; and that ſome were expoſed immediately to the air itſelf; yet ſo as it may be conveniently ſheltred from the actual rays of the ſun, and from the injury of ſtorms, rain, and winds.

In the hiſtory itſelf there cannot be too much care and exactneſs; provided the air of the chimney, cranny of a wall or door, breath of people, or other ſuch accidents do not interpoſe to deceive a man's obſervation, which muſt be circumſpectly foreſeen and conſidered.

The proportion between the warmth of the day and night in conſtant weather; the agreement or diſagreement of the motion of the air, with the motions of the ſuperior bodies, in all uncertain, changeable, and inconſtant weather; the efficacy or inefficacy through theſe in foretelling of winds and rain; the air its particular diſpoſition under thunder, under times of mildews or blaſtings, eminent eclipſes, conjunctions, with many other the like particulars, which will of themſelves be incident to an ingenious, diligent, apprehenſive perſon, may be the ſubject of this hiſtory.

I shall not digreſs ſo far, as to tell you, what other things may be done by the help of this excellent inſtrument, this being not pertinent to our preſent purpoſe.

Yet it is certain, that *Drebble*, that great, ſingular, learned mechanick, did by the help of this inſtrument, make a dial continually to move of itſelf, regularly ſhewing both the time of the day, and other motions of the heavens; did alſo make an automatous inſtrument of muſick, and found out a furnace, which he could govern to any degree of heat: but whether theſe have died with him, or how far the meditations of others have wrought upon them, I ſhall humbly refer to a more leiſurable enquiry. And if you can inform me among any of your acquaintance or correſpondents, I ſhould be glad to hear and to learn any thing of this nature, or relating to the further uſe, experiment, or improvement of this rare little inſtrument, or to the further clearing, ventilating, or diſcuſſing the theory or doctrine of the planets, or the phyſical uſe and power of theſe bodies, that we have thus briefly made an eſſay of. Thus far that letter.

They have a received tradition in *Java*, and probably in divers other iſlands of the *South Sea*, that the beams of the moon are wont to cauſe contractures in the body of thoſe men, that ſtay too long expoſed to them: the truth of which tradition was lately confirmed to me by an ingenious doctor, that with applauſe practiſed phyſick in thoſe parts; who aſſured me, that he had obſerved, that upon the account before-mentioned ſome were made lame, or elſe had ſome of their limbs contracted for divers weeks, and ſome for many months, or even a longer time. And when I aſked him, whether he had at any time been ſubject to that miſchief himſelf? he anſwered, that whilſt he was a novice in thoſe parts, after a very hot day, he laid himſelf down very ſlenderly covered, to ſleep (according to the cuſtom of the place) near the door of the houſe he lodged in; but being unacquainted with the tradition, he unſkilfully choſe a place, upon which the moon could fully beat for a good part of the night, which being paſt before he waked, when he went to riſe, he found his neck ſo ſtiff, that he was ſcarce able at all to ſtir it; and his mouth was ſo drawn away, that it was hideous to behold, and continued ſo unſightly, that ſhame forced him to keep within for ſome days, during which he made uſe of briſk aromatick medicines, by whoſe help he got off a contracture, that uſed to ſtay very much longer with others. And when I aſked him, if theſe diſtempers were not occaſioned rather by the coldneſs of the night and ſubtility of the air, than the operation of the moon's beams? he anſwered me, that it was generally obſerved, that the other cauſes, without the direct beams of the moon, were not wont to produce ſuch bad effects; and that his landlord, when he ſaw his mouth awry, told him, that if he had made him acquainted with his deſign to paſs the night in the open air, he would have prevented this miſchief, by lodging him in a place unexpoſed to the moon's light.

TITLE XIV.

Of the height of the atmoſphere.

TITLE XV.

Of the motion of the air, and of winds.

Extract of a letter from Fort St. George, *dated* January 23, 1668.

Although the bar of *Porta Nova* proved more ſhallow and dangerous than we were informed, yet ſhe (our ſhip) got ſafe in thither; and it was well ſhe did ſo. Had we kept her here, there had been no poſſibility of her eſcape from periſhing in a dreadful ſtorm, or rather hurricane, which happened here the 22d of *November*; the like hath not been known here in any man's memory. The tempeſt of wind and rain was ſo exceeding violent, that nothing could ſtand before it; men and beaſts carried into the ſea by the violence of the winds and floods; the generality of the houſes in this and the neighbour towns were ruined; ſcarce any trees left ſtanding in gardens or elſewhere; the wall in this town laid flat in ſeveral places; your

your godownes and other houſes in and about the fort uncovered, and exceedingly ſhattered: no place in the fort, where we could keep our perſons, books or papers free from the wind or rain; nor ſcarcely any doors could ſtand againſt the violence of it; and we hourly feared the falling of the fort down upon us, it was ſo exceedingly rocked; and yet abroad we could have no ſhelter, nor were able to ſtand againſt it. The repairing of the damage will neceſſarily require a great charge, which at firſt we thought would have amounted to 3000 pagothes; but hope it will come ſhort thereof.

CAPTAIN *Brookehaven* told me, that about the iſland *Mauricius*, hurricanes were the moſt frequent of any place he knows; and that near that iſland he met with one which laſted four days in all: in one of which days the ſtorm had ſeven paroxyſms or exacerbations, which the ſeamen call frights of weather, each of which he obſerved to differ two points of the compaſs from the preceding, by which means the ſurface of the ſea, by the colliſion of the waves, became to be all white, as if the ſhip had been among rocks. He added, that the ſtorm made the day exceeding dark; and that the noiſe was rather like that of thunder, than of wind, inſomuch that thoſe on the ſhrowds could not hear thoſe on the deck.

A LEARNED phyſician, that travelled into *America*, affirmed to me, that thoſe countries only have conſtant winds from the land in the night, which are furniſhed with hills; and therefore the *Barbadoes* wants ſuch winds, becauſe it has no hills.

One of the Eaſt-Indian committee, (who had lived years in the iſland of *Teneriff*) anſwered me, that he uſually obſerved there the breezes to come in from the ſea about nine of the clock in the morning, and that about two hours after ſun-ſet, there blew a ſharp land wind, every way from the iſland to the ſeaward, which continued all night till the next morning.

A LEARNED traveller anſwered me, that though the air were generally calm and clear at the top of the mountains, yet ſometimes he had met there with winds conſiderably ſtrong.

In lettere di Venetia.

MARTEDI ſui li 29 Agoſto 1679. alle hore 19, incirca ſi leuolevò nelle paludi della villa di Fauis del dominio Ceſareo tre miglia lontana da Palma Nova dominio Veneto un vento chiamato Biſſa Boua, che allargandoſi per circa cinquanta paſſi ſcorſe con tanto empito, è furore, che portò per aria diverſi huomini, che tagliavano il fieno in quei prati, è anco alcuni carri carichi di fieno con i buoui precipitandoli aſſai lontano con la rouina delli animali, de carri, è degli huomini, è paſſando per i campi ſbarbicando ogni ſorte di piante le portò per aria gettandole molti paſſi lontano, rendendo la terra per oue ſcorſe coſi arſa, che pare non vi ſii mai ſtata piantata coſa alcuna. Arrivò nella villa detta Bagnaria del dominio Veneto doue gettò à terra molte caſe ſino à fondamenti, et altre diſcoperſe, è rouinò portando per ari atavole, travi, et ogni altra coſa che era dentro eſſe caſe reſtando mal trattate molte perſone ſenza però la morte di alcuno. Fuori di dettata villa vi è una chieſa chiamata S. Tomaſo, la quale reſto ſcoperta, è rouinata una parte del muro portando via il campanile, è campane che nel giorno ſeguente non ſi erano per anco trovate;— di là ſi portò verſo Seuigliano dominio Veneto, è rouinò tutta la campagna ſenza danno però della villa, mentre li paſsò poco lontano, è girando poco lungi dalla villa ſteſſa ſpiantò da fondamenti un palazzo del d. co. Horatio Straſoldo, nel quale gli amazzò ogni ſorte di animali che vi erano, portando per aria li mobili è ſino le botti, eſterminando parte della poſſeſſione. Non reſtorono però offeſe perſone, perche erano alla campagna à lavorare, è nel camino getto pure à terra due altre caſe che ſono nel taglio per andare à Straſoldo ſpiantendole affatto con la morte di una donna, d'un fanciullo, è diverſi animali.

Di là voltò verſo Palma, et arrivando ſino alle mura della fortezza giò verſo la villa di Privano mezo miglio diſtante quale rouinò la meta, ſpiantando da fondamenti beliſſimi palazzi, portando per aeria travi, tavole, et ogni altra coſa con la morte di molti, quantità di feriti, è diverſi ſtrapazzati con far alla campagna di molto male. Di poi ſcorſe nella villa di Viſco dominio Imperiale, è tra li altri danni fatti rouinò tutto il palazzo novo del D. Marco Foſcolini gentilhuomo di Cinidal, nel quale eſſendoni una gran remiſſa da Carozze, la di cui porta havena tre Cadenazzi, & entrando il turbine per li balconi gettò la carozza con tanto empito nella porta ſteſſa che la ruppe, è portò fuori la carozza tutta fracaſſata gettandola ſopra un muro della corte aſſai alto, portando il cielo della ſteſſa mezzo miglio lontano, è vertò nel medeno palazzo ferito, è mel trattato un ſervitore di eſſo foſcolini, di cui rouino pure una braida, & un brolo eſſendo in detta villa reſtati due morti, è diverſi feriti;— s' inoltrò poi nella villa di S. Vido di Crauglio ſtato Imperiale, la quale rouino tutta affatto ſenza reſtarvi nemeno una caſa, portando per aria coppi, travi, legne, ſaſſi, è mobili con la morte di moltiſſime perſone, è moltiſſimi feriti è rouinati, et in detta villa non ſi può andare, ne con carri, ne con cavalli per la grande moltitudine di rouinazzo, arbori et altro che hanno attraver-ſato le ſtrade, eſſendo rimaſſi morti gran numero di animali—.

Da queſto luoco ſi portò verſo villes villa Imperiale buona parte della quale gettò à terra per andar al territorio di Monfalcone con la morte di molte perſone, et quantità di animali con laſciar le campagne per dove è paſſata ſenza piante, è come ſtrada battuta———.

Hà danneggiato anco altre ville, ma leggiermenre, ne per anco ſi sà quello haverà fatto piu avanti nel detto territorio.

Queſto ſucceſſo hà laſciato un ſpavento grande in queſte parti, eſſendoſi vedute coſe incredibili mentre pioveuano ſaſſi, tavole, arbori, travi, coppi, huomini, donne, fanciulli, botti, ſorghi, uva, galline, animali, et in concluſione ciò che incontrava portava per aria con un rumore, è fracaſſo così gradne, che faceva terrore, eſſendo per dette ville un concorſo grande di popolo vicino per vedere coſe che, ſi rendono incredibili.

Doctor *B.* anſwered me, that though the eaſtern winds blew near ⅓ of a year at *Tangier*, yet they ſeem not to reach far into the inland country, where he obſerved them to be very unfrequent.

An ingenious gentleman, who is owner of a mine or two near the ſea, being aſked by me, whether he could by any peculiar change appearing in the deeper parts of the mines, foretel any alterations of weather? he anſwered me, that the only preſage he had conſtantly obſerved, was of the change of the wind. For many hours before the wind was to ſhift from ſome other corner, and get into the ſouth, the water at the bottom of the mine would appear manifeſtly more troubled, or leſs limpid than before: and when the wind was to blow from the eaſt, he was uſually forewarned of it by an unuſual degree of clearneſs in the waters, which would appear more diaphanous than ordinary, though the ſouth wind had not immediately before operated on the waters. The depth of the mine was between fifteen and twenty fathom.

He told me, that the hurricanes about *Goa* are obſerved to come uſually but at two ſeaſons, about the beginning of *March*, and the 4th of *October*.

TITLE XVI.

Of the air as the medium of ſounds, and of ſounds and noiſes in the air, and particularly thunder; and of the air's operation on the ſounds of bodies.

THIS variety of the air is the cauſe of moſt dreadful thunders; which when *Gregory* deſcribed, he aſtoniſhed his hearers. For upon the riſing of ſeveral tempeſts all together, the ſky is of a ſudden covered over with black and thick, as it were, globes of ſmoky clouds: by and by the thunder breaks forth on every ſide, rattling continually with lightning, as inceſſantly flaſhing, enough to amaze the moſt reſolute and moſt accuſtomed to the noiſe. *Ludolph's Hiſt. of Ethiop.* L. I. c. 5.

The ſtring of a viol has been by Mr. *F.* obſerved to give a ſharper ſound againſt or in rainy weather, by almoſt half a note.

Mr. *F.* alſo aſſures me, that more than once or twice it has happened to him, that having put up falſe ſtrings in his pocket, to make frets of, as judging them uſeleſs for any other purpoſe, the want of ſtrings having driven him to make uſe of thoſe, he has found them not falſe any more, but good ſtrings. And alſo that he obſerves ſome ſtrings apter to receive a tenſion from the moiſt air, than others are.

TITLE XVII.

Of the weight of the air.

A ſhort account of the ſtatical baroſcope, imparted by Mr. Boyle, *March* 24, 1665. *In a letter to Mr.* H. Oldenburgh.

AS for the new kind of baroſcopes, which not long ago * I intimated to you, that my haſte would not permit to give you an account of, ſince your letters acquaint me, that you ſtill deſign a communicating to the curious as much information as may be, in reference to baroſcopes, I ſhall venture to ſend you ſome account of what I did not name (in my former letter) to you.

Though by a paſſage you may meet with in the 19th and 20th papes of my *Thermometrical Experiments and Thoughts*, you may find, that I did ſome years ago think upon this new kind of baroſcope; yet the changes of the atmoſphere's weights not happening to be then ſuch as I wiſhed, and being unwilling to deprive myſelf of all other uſe of the exacteſt balance †, that I (or perhaps any man) ever had, I confeſs to you, that ſucceſſive avocations put this attempt for two or three years out of my thoughts; till afterwards returning to a place, where I chanced to find two or three pair of ſcales I had left there, the ſight of them brought it into my mind; and though I were then unable to procure exacter, yet my deſire to make the experiment ſome amends for ſo long a neglect, put me upon conſidering, that if I provided a glaſs bubble, more than ordinary large and light, even ſuch balances as thoſe might in ſome meaſure perform what I had tried with the ſtrangely nice ones above-mentioned.

I caused then to be blown at the flame of a lamp ſome glaſs bubbles as large, thin, and light, as I could then procure; and chooſing among them one, that ſeemed the leaſt unfit for my turn, I counterpoiſed it in a pair of ſcales, that would loſe their æquilibrium with about the 30th part of a grain, and were ſuſpended at a frame. I placed both the balance and the frame by a good baroſcope, from whence I might learn the preſent weight of the atmoſphere. Then leaving theſe inſtruments together, though the ſcales being no nicer than I have expreſſed, were not able to ſhew me all the variations of the air's weight, that appeared in the mercurial baroſcope; yet they did what I expected, by ſhewing me variations no greater than altered the height of quickſilver half a quarter of an inch, and perhaps much ſmaller than thoſe: nor did I doubt, that if I had had either tender ſcales, or the means of ſupplying the experiment with convenient accommodations, I ſhould have diſcerned far ſmaller alterations

* See number 11. p. 185. of the Philoſophical Tranſactions.

† The ſcales here meant were before competent eye-witneſſes made to turn manifeſtly with the thouſandth part of a grain.

of

of the weight of the air, ſince I had the pleaſure to ſee the bubble ſometimes in an æquilibrium with the counterpoiſe; ſometimes, when the atmoſphere was high, preponderate ſo manifeſtly, that the ſcales being gently ſtirred, the cock would play altogether on that ſide at which the bubble was hung; and at other times (when the air was heavier) that which was at the firſt but the counterpoiſe, would preponderate, and upon the motion of the balance, make the cock vibrate altogether on its ſide. And this would continue ſometimes many days together, if the air ſo long retained the ſame meaſure of gravity; and then (upon other changes) the bubble would regain an æquilibrium, or a preponderance; ſo that I had oftentimes the ſatisfaction, by looking firſt upon the ſtatical baroſcope (as for diſtinction's ſake it may be called) to foretel, whether in the mercurial baroſcope the liquor were high or low. Which obſervations, though they hold as well in winter, and ſeveral times in ſummer, (for I was often abſent during that ſeaſon) as the ſpring, yet the frequency of their viciſſitudes (which perhaps was but accidental) made them more pleaſant in the latter of theſe ſeaſons.

So that the matter of fact having been made out by variety of repeated obſervations, and by ſometimes comparing ſeveral of thoſe new baroſcopes together, I ſhall add ſome of theſe notes about this inſtrument, which readily occur to my memory, reſerving the reſt till another opportunity.

And firſt, if the ground, on which I went in framing this baroſcope, be demanded, the anſwer in ſhort may be, 1. That though the glaſs bubble, and the glaſs counterpoiſe, at the time of their firſt being weighed, be in the air, wherein they both are weighed, exactly of the ſame weight, yet they are nothing near of the ſame bulk; the bubble, by reaſon of its capacious cavity (which contains nothing but air, or ſomething that weighs leſs than air) being perhaps a hundred or two hundred times (for I have not conveniency to meaſure them) bigger than the metalline counterpoiſe. 2. That according to a hydroſtatical law (which you know I have lately had occaſion to make out) if two bodies of equal gravity, but unequal bulk, come to be weighed in another medium, they will be no longer equiponderant; but if the new medium be heavier, the greater body, as being lighter in ſpecie, will loſe more of its weight, than the leſſer and more compact; but if the new medium be lighter than the firſt, then the bigger body will outweigh the leſſer: and this diſparity ariſing from the change of mediums, will be ſo much the greater, by how much the greater inequality of bulk there is between the bodies formerly equiponderant. 3. That laying theſe two together, I conſidered, that it would be all one as to the effect to be produced, whether the bodies were weighed in mediums of differing gravity, or in the ſame medium, in caſe its (ſpecifick) gravity were conſiderably altered: and conſequently, that ſince it appeared by the baroſcope, that the weight of the air was ſometimes heavier, and ſometimes lighter, the alterations of it, in point of gravity, from the weight it was of at firſt counterpoiſing of the bubble of it, would unequally affect ſo large and hollow a body as the bubble, and ſo ſmall and denſe a one as a metalline weight: and when the air by an increaſe of gravity ſhould become a heavier medium than before, it would buoy up the glaſs more than the counterpoiſe; and if it grew lighter than it was at firſt, would ſuffer the former to preponderate: (the illuſtrations and proof can ſcarce be added in few words; but, if it be deſired, I may, God permitting, ſend you them at my next leiſure.) And though our Engliſh air be about a thouſand times lighter than water, the difference in weight of ſo little air, as is but equal in bulk to a bubble, ſeemed to give ſmall hopes, that it would be ſenſible upon a balance; yet by making the bubble very large and light, I ſuppoſed and found the event I have already related.

Secondly, the hermetically ſealed glaſs bubble I employed, was of the bigneſs of a ſomewhat large orange, and weighed about 1 drachm and 10 grains. But I thought it very poſſible, if I had been better furniſhed with conveniencies (wherein I afterwards found I was not miſtaken) to make among many, that might be expected to miſcarry) ſome that might be preferable to this, either for capacity or lightneſs, or both, eſpecially if care be taken, that they be not ſealed up whilſt they are too hot. For though one would think, that it were advantageous to rarify and drive out the air as much as is poſſible, becauſe in ſuch ſealed bubbles the air itſelf (as I have elſewhere ſhewn) has a weight; yet this advantage countervails not the inconvenience of being obliged to increaſe the weight of the glaſs, which when it includes highly rarified air, if it be not ſomewhat ſtrong, will be broken by the preſſure of the external air, as I have ſufficiently tried.

Thirdly, I would have tried, whether the drineſs and moiſture of the air would in any meaſure have altered the weight of the bubble, as well as the variation of gravity produced in the atmoſphere by other cauſes; but the extraordinary conſtant abſence of frogs, kept me from making obſervations of this kind, ſave that one morning early, being told of a miſt, I ſent to ſee (being myſelf in bed) whether it made the air ſo heavy as to buoy up the bubble, but did not learn, that that miſt had any ſenſible operation on it.

Fourthly, by reaſon of the difficulties and caſualties, that may happen about the procuring and preſerving ſuch large and light bubbles, as I have been lately mentioning, it may in ſome caſes prove a convenience to be informed, that I have ſometimes, inſtead of one ſufficiently large bubble, made uſe of two, that were ſmaller. And though a ſingle bubble of competent bigneſs be much preferable, by reaſon, that a far leſs quantity and weight of glaſs is requiſite to compriſe an

equal

equal capacity, when the glaſs is blown into a ſingle bubble, than when it is divided into two; yet I found, that the employing of two inſtead of one did not ſo ill anſwer my expectations, but that they may for a need ſerve the turn inſtead of the other, than which they are more eaſier to be procured: and if the balance be ſtrong enough to bear ſo much glaſs, without being injured, by employing two or a greater number of large bubbles, the effect may be more conſpicuous, than if only a ſingle bubble (though a very good one) were employed.

THIS inſtrument may be improved by divers accommodations. As

FIRST, there may be fitted to the anſa (or checks of the balance) an arch (of a circle) divided into 15 or 20 deg. (more or leſs, according to the goodneſs of the balance) the cock reſting over-againſt theſe diviſions, may readily, and without calculation, ſhew the quantity of an angle, by which, when the ſcales propend either way, the cock declines from the perpendicular, and the beam from its horizontal parallelism.

SECONDLY, thoſe that will be ſo curious, may inſtead of the ordinary counterpoiſe (of braſs) employ one of gold, or at leaſt of lead, whereof the latter being of equal weight with braſs, is much leſs in bulk, and the former amounts not to half its bigneſs.

THIRDLY, theſe parts of the balance, that may be made of copper or braſs, without any prejudice to the exactneſs, will, by being made of one of thoſe metals, be leſs ſubject than ſteel, (which yet, if well hardned and poliſhed, may laſt a great while) to ruſt with long ſtanding.

FOURTHLY, inſtead of the ſcales, the bubble may be hung at one end of the beam, and only a counterpoiſe to it at the other, that the beam may not be burthened with unneceſſary weight.

FIFTHLY, the whole inſtrument, if placed in a ſmall frame, like a ſquare lanthorn with glaſs windows, and a hole at the top for the commerce of the internal and external air, will be more free from duſt, and irregular agitations; to the latter end of which it will otherwiſe be ſometimes incident.

SIXTHLY, this inſtrument being accommodated with a light wheel and an index, (ſuch as have been applied by the excellent Dr. *Chr. Wren* to open weather-glaſſes, and by the ingenious Mr. *Hook* to baroſcopes) may be made to ſhew much more minute variations than otherwiſe.

SEVENTHLY, and the length of the beam, and exquiſiteneſs of the balance, may eaſily, without any of the foregoing helps, (and much more with them) make the inſtrument far exacter than any of thoſe I was reduced to employ. And to theſe accommodations divers others may be ſuggeſted, by a farther conſideration of the nature of the thing, and a longer practice.

THOUGH in ſome reſpects this ſtatical baroſcope be inferior to the mercurial, yet in others it has its own advantageous conveniencies above it.

AND firſt, it confirms *ad oculum* our former doctrine, that the falling and riſing of the mercury depends upon the varying weight of the atmoſphere; ſince in this baroſcope it cannot be pretended, that a fuga vacui, or a funiculus, is the caſe of the changes we obſerve. 2. It ſhews, that not only the air has weight, but a more conſiderable one, than ſome learned men, who will allow me to have proved it has ſome weight, will admit; ſince even the variation of weight in ſo ſmall a quantity of air, as is but equal in bulk to an orange, is manifeſtly diſcoverable upon ſuch balances as are none of the niceſt. 3. This ſtatical baroſcope will oftentimes be more parable than the other; for many will find it more eaſy to procure a good pair of gold-ſcales, and a bubble or two, than a long cane ſealed, a quantity of quickſilver, and all the other requiſites of the mercurial baroſcopes; eſpecially if we compriſe the trouble and ſkill, that is requiſite to free the deſerted part of the tube from air. 4. And whereas the difficulty of removing the mercurial inſtrument has kept men from ſo much as attempting to do it, even to neighbouring places, the eſſential parts of the ſcale baroſcope (for the frame is none of them) may very eaſily in a little room be carried whither one will, without the hazard of being ſpoiled or injured. 5. There is not in ſtatical baroſcopes, as in the other, a danger of uncertainty as to the goodneſs of the inſtruments, by reaſon, that in theſe the air is, in ſome more, and in ſome leſs perfectly excluded; whereas in thoſe, that conſideration has no place. (And by the way, I have ſometimes upon this account been able to diſcover by our new baroſcope, that an eſteemed mercurial one, to which I compared it, was not well freed from air.) 6. It being, as I formerly intimated, very poſſible to diſcover hydroſtatically, both the bigneſs of the bubble, and the contents of the cavity, and the weight and dimenſions of the glaſſy ſubſtance, (which together with the included air make up the bubble) much may be diſcovered by this inſtrument as to the weight of the air, abſolute or reſpective. For when the quickſilver in the mercurial baroſcope is either very high, or very low, or at a middle ſtation between its greateſt and leaſt height, bringing the ſcale barometer to an exact æquilibrium; (with very minute diviſions of a grain) you may, by watchfully obſerving, when the mercury is riſen or fallen juſt an inch, or a fourth, or half an inch, *&c.* and putting in the like minute diviſions of a grain to the lighter ſcale, till you have again brought the balance to an exquiſite æquilibrium; you may, I ſay, determine, what known weight in the ſtatical baroſcope anſwers ſuch determinate altitudes of the aſcending and deſcending quickſilver in the mercurial. And if the balance be accommodated with a divided arch, or a wheel and index, theſe obſervations will aſſiſt you for the future to determine readily, by ſeeing the inclination of the cock, or the degree marked by the index, what pollency the bubble hath by

by the change of the atmosphere's weight, acquired or lost. Some observations of this nature I watchfully made, sometimes putting in a 64th, sometimes a 32d, sometimes a 16th, and sometimes heavier parts of a grain, to the lighter scale. But one, that knew not for what uses those little papers were, coming to a window, where my baroscopes stood, so unluckily shook them out of the scales, and confounded them, that he robbed me of the opportunity of making the nice observations I intended, though I had the satisfaction of seeing, that they were to be made. 7. By this statical instrument we may be assisted to compare the mercurial baroscopes of several places (though never so distant) and to make some estimates of the gravities of the air therein. As if, for instance, I have found by observation, that the bubble I employ, (and one may have divers bubbles of several sizes, that the one may repair any mischance, that may happen to another) weighed just a drachm, when the mercurial cylinder was at the height of 29½ inches, (which in some places I have found a moderate altitude;) and that the addition of the 16th part of a gr. is requisite to keep the bubble in an æquilibrium, when the mercury is risen an 8th, or any determinate part of an inch above the former station: when I come to another place, where there is a mercurial barometer, as well freed from air as mine (for that must be supposed) if taking out my scale instrument, it appear to weigh precisely a drachm, and the mercury in the baroscope there stand at just 29½ inches, we may conclude the gravity of the atmosphere not to be sensibly unequal in both those two places, though very distant. And though there be no baroscope there, yet if there be an additional weight, as for instance, the 16th part of a grain, requisite to be added to the bubble, to bring the scales to an æquilibrium, it will appear, that the air at the second place is at that time so much heavier, than the air of the former place was, when the mercury stood at 29½ inches.

But in making such comparisons, we must not forget to consider the situation of the several places, if we mean to make estimates, not only of the weight of the atmosphere, but of the weight and density of the air. For though the scales will shew (as has been said) whether there be a difference of weight in the atmosphere at the two places; yet, if one of them be in a vale or bottom, and the other on the top or some elevated part of a hill, it is not to be expected, that the atmosphere in this latter place should gravitate as much as the atmosphere in the former, on which a longer pillar of air does lean or weigh.

And the mention I have made of the differing situation of places, puts me in mind of something, that may prove another use of our statical baroscope, and which I had thoughts of making trial of, but was accidentally hindered from the opportunity of doing it. Namely, that by exactly poising the bubble at the foot of a high steeple or hill, and carrying it in its close frame to the top, one may, by the weight requisite to be added to counterpoise there, to bring the beam to its horizontal position, observe the difference of the weight of the air at the bottom and at the top; and in case the hill be high enough, at some intermediate stations. But how this may assist men to estimate the absolute or comparative height of mountains, and other elevated places; and of what other uses the instrument may be put to when it is duly improved; and the cautions, that may be requisite in the several cases, that shall be proposed, I must leave to more leisure, and farther consideration.

Weight of a cubick inch of water.

I caused to be made with great care, by a skilful mathematical instrument-maker, a hollow cube of brass, whose every side was as exactly as could be procured an English inch. This we carefully counterpoised in a very good pair of scales, and found it to weigh 11 drachms, 1 grain and ½ (Troy-weight:) then placing it in one of the scales as horizontally as we were able, we warily filled it with clear common water, (of the best sort of that called pump-water) till the surface of the water seemed to lye as level as we could make it, to the brims of the vessel: then weighing it carefully, we found the water alone (for the cube had been counterpoised before) to weigh to 254$\frac{7}{16}$ grains: so that in regard it is scarce possible to know, that such a vessel is so filled, as to come nearer exactness, than within a drop or two, I presume we may, without any sensible error, suppose an inch of water to weigh 256 grains, which latter number I rather chuse, because its aliquot parts make it more convenient, and it agrees well enough with some trials, that I made with solid cubes, to measure the true weight of a cubick inch of water.

This done, the vessel was well dried within, and the same scales being well counterpoised, the instrument was so too; and being placed on one of the scales as horizontally as we could, mercury (distilled to have it more pure) was warily put into it, till by degrees it had filled the vessel as to sight; but we neither expected, nor found, that it would be brought to an exact level, and exquisitely fill all the corners of the vessel. But when it seemed to be so well filled, that even a critical eye could not readily find fault with it, though the mercury appeared capable of some accession without overflowing, we weighed the quicksilver itself (for the vessel had been counterpoised before) and found it to weigh 7 ounces, 2 drachms (Troy) which falling somewhat short, (though not very much) of what the above-mentioned weight of the water required, we tried to add a little more quicksilver, without making it run over, and found the encrease of 82 grains; so that now the quicksilver weighed 7 ounces, 3 drachms, 22 grains; but it seemed when the eye was placed in a level with the brims of the vessel,

The weight of a cubick inch of quicksilver.

that it was rather a little of the higheſt, than any way depreſſed, and yet was not ſo full, but that we could add 112 grains to the former weight, without making it run over; and perhaps we might have added yet more, but I decline doing it, becauſe the laſt mentioned acceſſion ſeemed manifeſtly to make it ſo much ſwell above the brims of the veſſel. By all which it is evident, that it is ſcarce poſſible to determine preciſely, by ſuch hollow inſtruments, the true weight of a cubick inch of quickſilver. And therefore, ſince by other ways of trial, I have found the proportion of the weight of mercury to water of the ſame bulk, to be ſomewhat leſs than that of 14 to 1, I think we may, without any conſiderable inconvenience, ſuppoſe the weight of a cubick inch of quickſilver to be 3580 grains, which is near 14 times the above-mentioned weight of a cubick inch of water, and comes near enough to the ſecond or middlemoſt of the three eſtimates lately ſet down; and by the leaſt eſtimate of all it appears, that a cubick inch of quickſilver weighs $7\frac{1}{2}$ ounces troy weight, that is, 8 ounces averdupois weight: and conſequently when the quickſilver of the baroſcope, kept up by the counterpoiſe of the air 30 inches, (as I have obſerved it ſeveral times to be within a month laſt paſt) the weight of the air, that is incumbent on an inch ſquare here below, amounts to $18l.\frac{1}{2}$ troy weight; that is in averdupois weight $15l.\frac{1}{17}$.

The weight of a pillar of the atmoſphere.

As 11 to 14, or rather as 355 to 452, ſo is the area of a ſquare inſcribed in a circle to the area of the circumſcribed circle.

Hence 355 : 452 :: 1 : 1,2732394.

Hence if the ſide of an inſcribed ſquare be an inch, that multiplied by an inch renders a cubick inch for the ſolid content.

In like manner if the height of a cylinder erected on the circumſcribing circle be an inch, the ſolid content of that cylinder is 1,2732394.

Wherefore 1, and 1,2732394 multiplied by the weight of the cubick inch of any kind of metal, give the weight of a cubick inch, and of a cylindrick inch, that circumſcribes the ſame, whence an inch table for both is eaſily made by continual addition, or for any height propounded, multiplying both by the ſame.

Mr.

Mr. *Townly*'s Regiſter, if I miſremember not.

An industrious young man, that, whilst he was my domestick, I bred up to chemistry, (of which he now teaches courses) related to me the other day, that toward the latter end of the last month (which was *June*) being at *Oxford*, where his house is, he had occasion to cast his eyes upon his baroscope, and was not a little surprised to find, that the quick-silver was in an extraordinary measure altered from the height it stood at but a while before: whereupon, though the weather were very hot and fair, as is usual in *June*, and had continued so for some days, yet he took upon him to foretel from this great and quick subsidence of the mercury, that there would be before long some notable change of weather. And accordingly it happened within about four or five hours, that the sky was all overcast; and there fell a hideous storm of rain, lightning, thunder, and accompanied with such a whirlwind, as scarce any remember to have seen in that city.

A letter to the author.

Honoured Sir,

I HAVE been able to do so little in the attempts I have made to serve you, that I am ashamed to have been so well furnished to so small purpose. The barometer I had from you was conveyed safe into the country, and as soon as it came to my hands, I rode to *Minedeep*, with an intention to make use of it there in one of the deepest gruffs (for so they call their pits) I could find: the deepest I could hear of was about 30 fathom, but the descent so far either from easy, safe, or perpendicular, that I was discouraged from venturing on it. They do not, as in wells, sink their pits strait down, but as the cranies of the rocks give them the easiest passage; neither are they let down by a rope, but taking the rope under their arm, by setting their hands and legs against the sides of the narrow passage, clamber up and down, which is not very easy for one not used to it, and almost impossible to carry down the barometer, both the hands being employed. This information I should have suspected to come from their fear, had not an intelligent gentleman, neighbour to the hill, assured me it was their usual way of getting up and down. For the sight of the engine, and my desire of going down into some of their gruffs, gave them terrible apprehensions; and I could not persuade them but that I had some design: so that I and a gentleman, that bore me company, had a pleasant scene, whilst their fear to be undermined by us made them disbelieve all we told them; and do what we could, they would think us craftier fellows than we were. But, Sir, I will not trouble you with the particulars of this adventure: but certain it is the women too were alarmed, and think us still either projectors or conjurers. Since I could not get down into their gruffs, I made it my business to enquire what I could concerning them: the workmen could give me very little account of any thing, but what profit made them seek after; they could apprehend no other minerals but lead ore, and believed the earth held nothing else worth seeking for: besides, they were not forward to be too communicative to one they thought they had reason to be afraid of. But at my return, calling at a gentleman's house, who lives under *Minedeep* hills, and who had sent out his son to invite me in; amongst other things he told me this, that sometimes the damps catch them, and then, if they cannot get out soon enough, they fall into a swoon, and die in it, if they are not speedily got out; and as soon as they have them above ground, they dig a hole in the earth, and there put in their faces, and cover them close up with turfs; and this is the surest remedy they have yet found to recover them. In deep pits they convey down air by the side of the gruff, in a little passage from the top; and that the air may circulate the better, they set up some turfs on the lee side of the hole, to catch, and so force down the fresh air: but if these turfs be removed to the windy side, or laid close over the mouth of the hole, those below find it immediately by want of breath, indisposition, and fainting: and if they chance to have any sweet flowers with them, they do not only lose their pleasant smell immediately, but stink as bad as carrion. Notwithstanding this ill success, I had attempted some trials once more, had not the spreading of the contagion made it less safe to venture abroad, and hastened me out of the country sooner than I intended. But I have some hopes, the next journey I make into those parts, to give you a better account than this that follows. Near the house, where I sometimes abode, was pretty steep and high hill. *April* 3. *hora inter* 8 & 9. *matutin.* the wind west, and pretty high, the day warm, the mercury was at 29 inches and $\frac{1}{8}$, being carried up to the top of the hill, it fell to 28 inches $\frac{3}{4}$, (or thereabouts, for I think it was a little above 28 inches $\frac{3}{4}$:) both going up and coming down, I observed, that proportionably as I was higher or lower on the hill, the mercury fell or rose. At my return to the bottom of the hill, the mercury wanted of ascending to its former height $\frac{1}{2}$ of inch, which I impute to the sun's rarifying some particles of air, that remained in the upper part of the tube, rather than to any other change in the air; for I find it harder to clear the tube of the air perfectly, than at first I thought, or of water, if that have been put in with the mercury, and I fear liable to the same inconvenience with air inclosed. I know this is far short of what you might have expected, and has, I fear, but little answered your desires, since I guess it was the perpendicular height of the place I made the experiment in, that you would have had, and perhaps other considerations of air, inclosed, and liable to mineral steams, would have made a trial in one of the gruffs more acceptable to you. I do not think any thing in this letter worthy of you, or fit for

the publick. But ſince I find by the two laſt Philoſophical Tranſactions, that obſervations on the Torricellian experiment are much looked after, and deſired to be compared; if for want of better, this ſhould be thought fit to fill an empty ſpace in the philoſophical newsbook, I ſhall deſire to have my name concealed. But I fear, that this very caution of being in print, where there is no danger of it, has too much of vanity in it. I am ſure it is boldneſs enough, though allayed with obedience, to venture ſuch ſlight things to your ſight. I viſited the incruſted ſpring I formerly mentioned to you, and could not find any thing incruſted within at leaſt 20 yards of the riſe of it. The place, where it works moſt, is about 40 or 50 yards from the ſpring head, and is at a fall higher than my head: there it ſheaths every thing with ſtony caſes, and makes the ſides of the bank hard rock, and from thence all along its ſtream it covers ſticks, *&c.* with a cruſt; and ſome ſo candied I found above this fall, but not ſo frequent; whether the mixing of air with the water in the fall contributes any thing to the effect, I cannot gueſs; but that the fall does, I ſuppoſe: for beſides, that at the abovementioned fall, it ſeems to operate moſt ſtrongly, I obſerved, that though I could not find any thing incruſted within a good diſtance of the ſpring, yet that the moſs above the ſpring was a little incruſted, (but not ſo firmly as at the other place) for the water in the winter, when the ſprings are full, runs out alſo at a hole two or three yards above the place, where now only it riſes, and from thence falls perpendicularly into this lower ſpring, from whence it runs by an eaſy deſcent to the next fall. A gentleman, in whoſe field it riſes, and by whoſe houſe it runs, told me upon enquiry, that he uſes it both in his kitchen and brewhouſe, without any ſenſible ill effects, he being a pretty ancient, but healthy man, and long inhabitant of that place. It will bear ſoap, freezes quickly, and waters his grounds upon occaſion, with advantage. All the ill effects of it, that he can gueſs, are, that his horſes are uſually ſhort-breathed, which he imputes to the drinking of that water. I brought with me from *Minedeep* ſome ore, and ſome ſtones; but I think them ſo inconſiderable, that I ſhall not judge them worth ſending, unleſs you pleaſe to command them. I am, Sir,

Your moſt humble, and
moſt obedient ſervant,

Ch. Ch. 5° May, 1665. JOHN LOCKE.

POSTSCRIPT.

I HAD forgot to mention to you, that in their gruffs, after burning, (when they meet with hard rocks in their way, they make a fire upon them, that they may dig through the eaſier) they find it very dangerous to go down into them, as long as there remains any fire or heat in any chinks of the rocks.

SOME days ago the king doing me the honour to diſcourſe with me about the uſe of baroſcopes, was pleaſed to ſay, among other remarkable things, that at a time his majeſty then named, he went from *Whitehall* about ſix in the morning, towards the mouth of the river, attended by divers of the nobility, and particularly by one lord then preſent, whom his majeſty put in mind of the adventure; and then he added, that though the weather were exceeding fair, and likely to continue ſo, inſomuch that ſome of the courtiers congratulated to his majeſty ſo promiſing a morning; yet when they were once gone too far to return, he told them he thought they would be much miſtaken, and that they were to prepare for a ſtorm; which conjecture his majeſty grounded upon his having, unknown to the company, conſulted a good baroſcope before he went out, and found the mercury in it to have ſuddenly, and very notably ſubſided. And accordingly within a very few hours the event verified his majeſty's prediction, a ſudden ſtorm driving on the yatch he was in for divers leagues, at a very unuſual rate.

Nous apprenons de ces experiences, que puiſque le poids de l'air et le poids de l'eau, qui eſt dans les pompes, ſe tiennent mutuellement en equilibre, ils peſent preciſement autant l'un que l'autre; & qu'ainſi en connoiſſant la hauteur, ou l'eau s'éleve en tous les lieux du monde, nous connoiſſons en meſme temps, combien chacun de ces lieux eſt preſſé par le poids de l'air, qui eſt au deſſus d'eux; et partant.

Que les lieux, qui ſont au bord de la mer, ſont preſſez par le poids de l'air, qui eſt au deſſus d'eux juſques au haut de ſa ſphere, autant preciſement, que ſi au lieu de cét air on ſubſtituoit une colomne d'eau de la hauteur de 31 pieds deux poulces.

Ceux, qui ſont plus élevez de dix toiſes, autant que s'ils portoient de l'eau de la hauteur de 31 pieds un poulce.

Ceux, qui ſont élevez au deſſus de la mer de 500 toiſes, autant que s'ils portoient de l'eau à la hauteur de 26 pieds onze poulces: & ainſi du reſte.

Nous apprenons par ces experiences, que l'air, qui eſt ſur le niveau de la mer, peſe autant que l'eau, à la hauteur de 31 pieds deux poulces; mais parce que l'air peſe moins ſur les lieux plus élevez que ſur le niveau de la mer; et qu'ainſi il ne peſe pas ſur tous les points de la terre egalement, & meſme qu'il peſe differemment par tout, on ne peut pas prendre un pied fixe, qui marque combien tous les lieux du monde ſont chargez par l'air, le fort portant le foible; mais on peut en prendre un par conjecture bien approchant du juſte; comme par exemple, on peut faire eſtat, que tous les lieux de la terre en general, conſiderez comme s'ils eſtoient également chargez d'air, le fort portant le foible, en ſont autant preſſez, que s'ils partoient de l'eau à la hauteur de 31 pieds; et il eſt certain, qu'il n'y à pas un demy pied d'eau d'erreur en cette ſuppoſition.

Or nous avons veu, que l'air, qui eſt au deſſus des montagnes hautes de 500 toiſes ſur le niveau de la mer, peſe autant que l'eau à la hauteur de 26 pieds 11 poulces.

Et

Et par conſequent tout l'air, qui s'étend de puis le niveau de la mer juſqu' au haut des montagnes, hautes de 500 toiſes, peſe autant que l'eau à la hauteur de 4 pieds un poulce, qui eſtant à peu prés la ſeptiéme partie de la hauteur entiere; il eſt viſible, que l'air compris depuis la mer juſques à ces montagnes eſt à peu pres la ſeptiéme partie de la maſſe entiere de l'air.

Nous apprenons de ces meſmes experiences, que les vapeurs, qui ſont épaiſſes dans l'air, lors qu'il en eſt le plus chargé, peſent autant que l'eau à la hauteur d'un pied huit poulces; puiſque pour les contrepeſer, elles font houſſer l'eau dans les pompes à cette hauteur, par deſſus celle, ou l'eau contrepeſoit déja la peſanteur de l'air: de ſorte que ſi toutes les vapeurs, qui ſont ſur une contrée, eſtoient reduites en eau, comme il arrive, quand elles ſe changent en pluye, elles ne pourroient produire que cette hauteur d'un pied huit poulces d'eau ſur cette contrée. Et s'il arrive par fois des orages, ou l'eau de la pluye qui tombe vienne à une plus grande hauteur; c'eſt parce que le vent y porte les vapeurs des contrées voiſines.

Nous voyons auſſi de là, que ſi toute la ſphere de l'air eſtoit preſſée & comprimée contre la terre par une force, qui la pouſſant par le haut, la reduiſiſt en bas à la moindre place qu'elle puiſſe occuper, & qu'elle la reduiſiſt comme en l'eau, elle auroit alors la hauteur de 31 pieds ſeulement.

Et par conſequent, qu'il faut conſiderer toute la maſſe de l'air en l'eſtat libre ou elle eſt, de la meſme ſorte, que ſi elle euſt eſte autrefois comme une maſſe d'eau de 31 pieds de haut à l'entour de toute la terre, qui euſt eſté rarefiée et dilatée extremement, et convertie en cet eſtat, ou nous l'appellons air, auquel elle occupe à la verite plus de place, mais auquel elle conſerve preciſement le meſme poids, que l'eau à 31 pieds de haut.

Et comme il n'y auroit rien de plus aiſé, que de ſupputer, combien l'eau, qui environneroit toute la terre à 31 pieds de haut peſeroit de livres; et qu'un enfant, qui ſcait l'addition et la ſouſtraction le pourroit faire; on trouveroit par le meſme moyen, combien tout l'air de la nature peſe de livres, puiſque c'eſt la meſme choſe; et ſi on en fait l'épreuve, on trouvera, qu'il peſe à peu prés huit millions de millions de millions de livres.

J'ay voulu avoir ce plaiſir, et j'en ay fait le compte en cette ſorte.

J'ay ſuppoſé, que le diametre d'un cercle eſt à ſa circonference, comme 7 à 22.

J'ay ſuppoſé, que le diametre d'une ſphere eſtant multiplié par la circonferehce de ſon grand cercle, le produit eſt le contenu de la ſuperficie ſpherique.

Nous ſçavons, qu'on à diviſé le tour de la terre en 360 degrez: cette diviſion à eſté voluntaire, car on l'euſt diviſée en plus ou moins, ſi on euſt voulu, auſſi bien que les cercles celeſtes.

On à trouvé, que chacun de ces degrez contient 50,000 toiſes.

Les lieues autour de Paris ſont de 2500 toiſes; et par conſequent il y à 20 lieues au degré: d'autres en comptent 25; mais auſſi ils ne mettent que 2000 toiſes à la lieue; ce qui revient à la meſme choſe.

Chaque toiſe à 6 pieds.

Un pied cube d'eau peſe 72 livres.

Cela poſé, il eſt bien aiſe de faire la ſupputation, qu'on cherche.

Car puiſque la terre à pour ſon grand cercle, ou pour ſa circonference ..... 360 *degrez.*

Elle à par conſequent tour de ..... 7200 *lieues.*

Et par la proportion de la circonference au diametre aura ..... 2291 *lieues.*

Donc en multipliant le diametre de la terre par la circonference de ſon grand cercle; ou trouvera, qu'elle à en toute ſa ſuperficie ſpherique ..... 1649200 *lieues quarrées.*

C'eſt à dire ..... 103, 095, 000, 000, 000, *toiſes quarr.*

C'eſt à dire ..... 3711, 420, 000, 000, 000, *pieds quarr.*

Et parce qu'un pied cube d'eau peſe 72 livres:

Il s'enſuit, qu'un priſme d'eau d'un pied quarré de baſe, et de 31 pieds de haut, peſe 2232 livres.

Donc ſi la terre eſtoit couverte d'eau juſques à la hauteur de 31 pieds, il y auroit autant de priſmes d'eau de 31 pieds de haut, qu'elle à de pieds quarrez en toute ſa ſurface. (Je ſcay bien, que ce ne ſeroient pas des priſmes, mais des ſecteurs de ſphere; et je neglige exprés cette preciſion.)

Et partant elle porteroit autant de 2232 livres d'eau, qu'elle à de pieds quarrez en toute ſa ſurface.

Donc cette maſſe d'eau entiere peſeroit,

8283, 889, 440, 000, 000, 000, *livres.*

Donc toute la maſſe entiere de la ſphere de l'air, qui eſt au monde, peſe meſme poids de

8283, 889, 440, 000, 000, 000, *livres.*

C'eſt à dire, huit millions de millions de millions, deux cent quatre vingt trois mille huit cent quatre vingt neuf millions de millions, quatre cent quarante mille millions de livres.

Mr. *Paſcal* in his ſmall tract, either *De la Peſanteur de l'air*; or in that *De l'Equilibre des liqueurs.*

De cætero, feci haud ita pridem experimentum ponderandi aeris, quod pulchrè ſucceſſit; nam ſumptâ vitreâ lagenâ, valde levi et ad lampadem ſufflatâ, ejus figuræ, qualem hic excuſam vides, magnitudine parvæ pilæ, quales habentur in ſphæriſteriis, non habente niſi minimam quandam aperturam, per quam immittatur pilus in extremitate orificii ſui B. ponderavi eam in bilance valde exacta, & frigida pondus habuit 78 granorum cum dimidio: poſtea calefeci eam carbonibus impoſitam, & repoſui in bilancem eo ſitu, quo hic deſcriptum vides, nimirum orificio in imum verſo, & deprehendi eam vix habere pondus 78 granorum, tum immergendo orificium in aquam, refrigeſcere feci, & dum aer ſe condenſat pro modo, quo refrigeſcit lagena, intravit tantundem aquæ, quantum aeris calor antea expulerat; denique ponderans eam cum omni illa aqua deprehendi eam habere pondus 72 granorum & dimidii plus quam antea: unde concludo aerem, qui per ignem expulſus erat, ſe habere ad aquam, quæ in locum ſuum regreſſa erat uti ½ ſe habet ad 72½, aut uti ſe habet 1. ad 145. ſed potui in eo erraſſe; difficile quippe eſt in ea re omnino exactum eſſe; id ſaltem certò ſcio, quòd pondus aeris hoc modo ſit ſenſibile, & prolixe hic deduxi proceſſum meum, ut ſi te eadem curioſitas inceſſat, poſſis id eodem modo perficere experimentum. Vale.

TITLE XVIII.

Of the consistency of the air, its rarity, density, fluidity, subtilty.

A THIN but large bladder, wherein there was about the third part of the air it was capable of containing, being strongly tied at the neck, and at the opposite part suspended and clogged at the bottom, with a weight of 14 pound, so that it rested on the floor, which sustained it; the strings, that tied the bladder, were well stretched before, and could not shrink a quarter of an inch without drawing up the weight. Then two fire-shovels, with small coals and ashes were applied at a convenient distance, and kept moving to warm and rarify the included air, without cracking the bladder; by which means, after some of the wrinkles of the bladder had been displayed, not without noise, the air being expanded, and consequently the bladder a little swelled, and the whole string shortened, the weight was raised and made to swing like a pendulum. The same experiment being tried two or three times with a quarter of an hundred, succeeded not, though with large bladders, the heat still either breaking the bladder with noise, or occasioning some little leak, which hindered the desired success; though once we came so very near it, that it is scarce to be doubted, that if we had had good accommodations, it would have succeeded well, and that perhaps if the weight had been greater.

To try whether the corpuscles of the air would dive into a liquor, that was exposed but to the ordinary pressure of the free air or atmosphere. We covered the bottom of a cylindrical vial with filings of copper, and then poured on it an urinous spirit, to the height of about three fingers breadth; and on this liquor we poured oil of almonds to the thickness of a crown piece of silver, or that of about the fifth part of an inch; then we stopped the vial well, and left it in a quiet place for several days. The event was such as we expected, namely, that the urinous liquor did then first acquire, and then lose a blue tincture, both were done but slowly. And when the colour was pretty well lost, (for the liquor was not clear, but somewhat troubled) we took out the cork, and kept the vial unstopped for one minute of an hour, and then stopped it again, that in that short time the upper part of the urinous spirit began to be tinged with blue, and within an hour, though the vessel were all the while kept stopped, the sky-colour reached to the lower part of the liquor, which at this time is wholly and deeply of that colour, the oil that swims above it being clear.

TITLE XIX.

Of the heat and coldness of the air.

THOUGH the peripatetick doctrine about the limits and temperaments of the three regions, into which they divide the air, hath been so plausibly proposed, that it has been readily entertained, not only by the Aristotelian schools, but by the generality of philosophers, as well modern as ancient: yet since I think it becomes a naturalist to consider, not so much how easy a doctrine is, by reason of its concinnity, to be remembred or supposed, as how strongly it is to be proved, I must not dissemble, that as to this vulgar theory, I think it fitter we should wish it to be true, than that we should believe it is so: for I confess, that upon the best informations I have been able to procure from travellers by land and sea, or from writers, that relate rather what they have observed, than what they have been taught, I have been much tempted to question the received doctrine of the schools about the regions of the air. And that you may judge, whether or no my thoughts be rational, the ensuing discourse shall acquaint you with several of the particulars on which they are grounded.

WHAT I have in other papers written concerning cold, does not only make it less proper for me to treat of it indefinitely in this place, but would make it difficult for me to say much on this subject without repetition. And it were perhaps fittest for me to say nothing on an occasion, wherein I have left myself little to say, that is new and pertinent; but yet since this title promises not any thing about cold in general, but only some less heeded particulars relating to the coldness of the air; that I may not leave it wholly unfurnished, I will refer to it a few instances that ensue.

THE physician elsewhere mentioned, that was lately at *Morocco*, answered me, that notwithstanding the excessive heat reigned there in the day time, he felt the night very cold, and so he did the mountainous air in those parts.

AN intelligent gentleman, that stayed a year in *Guinea*, and spent part of that time in the land, answered me, that notwithstanding the excessive heat of the climate, he was divers times, about four of the clock in the morning, reduced to be ready to tremble for cold, as he lay in his hammock, for about an hour together.

A LEARNED man, that lived at *Jamaica*, assured me, that when he laid in his hammock, about three or four foot from the ground, though he had much clothes under him, and little or none over him, he felt it cold beneath, and hot above.

IT is obvious to every man's sense or observation, that the greater heat, that is usually found in our air, during the summer, than in other seasons of the year, has manifest effects upon such easily agitable bodies as liquors, and upon the juices and flesh of animals, and the softer parts of vegetables. But that even in places sheltered from the sunbeams, the warmth of a temperate summer should be able sensibly to rarify and expand so cold and compact a body, as glass itself, would not be easily suspected or believed. And

An Explication of the foregoing Regiſter.

THE firſt column with *d.* at the top, contains the day of the month.

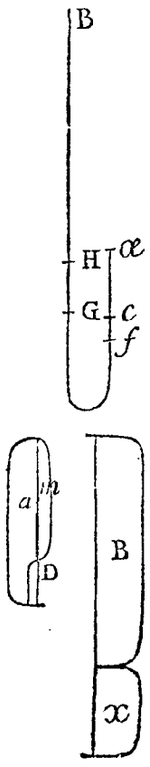
THE ſecond column, with *h.* at the top, contains the hour of the day, which beginning from midnight, I count to 24, which is midnight again; ſo that 13 ſtands for 1 afternoon, and ſo on.

THE third column, with *Th.* at the top, marks the degrees of my thermoſcope, which having been blown up at a lamp, though the ſpaces of the degrees were equally divided, yet becauſe of the unequal bigneſs of the ſmall tube, towards the extremities, where it grew bigger, it did not always in every degree mark equally proportionable degrees of heat and cold. The points to be obſerved in that and the next column, which is that for the baroſcope, ſhew the juſt place, where the top of the tinged ſpirit of wine in the one, and the mercury in the other, ſtood between the line of the degree marked, and the following, when the obſervation was made. The thermoſcope I made uſe of till *December*, 1669, was a ſealed one, with all the degrees encreaſing with the heat in one continued ſeries. The thermoſcope, which I uſed from *December* 1669, to *June* 1675, and is marked 2, was one of Mr. *Cotgrave*'s adjuſting, which beginning the reckoning from the temper of freezing, hath the numbers increaſing both upwards and downwards; the points ſhew it to be in the degrees, above 0, if ſet over, and under 0, if ſet under: and ··· or ··· ſhew it higher or lower in each degree. The thermoſcope uſed from *March* 1681, to the end, is marked 3, and is of the kind of that uſed firſt.

THE column having *Hy.* at the top, contains the degrees of moiſture, as marked by an hygroſcope made of the beard of a wild oat.

IN the column of the wind, I not having the convenience to obſerve the points exactly, have marked but 8, but yet with this variety, that where I ſet two letters, the wind was moſt from that point whoſe letter ſtands firſt, *v. g.* W. N. ſignifies more weſt than north. When I ſet only one letter, it was in or very near that cardinal point.

THE ſtrength is marked by 0, 1, 2, 3, 4. 0 ſignifies not ſo much wind, that moved any leaf that I could ſee in a garden I looked into out of my window, but the letter joined to it ſignifies which way the weather-cock then ſtood, whether the former wind left it ſo, or the preſent breeze blew that way. 1 ſignifies a gentle gale, juſt perceivable by the moving of the leaves or plants. 4 ſignifies a very violent ſtorm: 2 and 3 the ſeveral degrees between 1 and 4, as well as I could judge. Theſe degrees, though not ſo exactly meaſured as I could have wiſhed, I yet thought better than nothing.



LE tuyau recourbé eſtoit fermé au bout æ et ouvert à l'autre extremité B. *la recourbure depuis.* G. *juſq' à* C. *eſtoit pleine de mercure, & tout le reſte eſtoit plein d'air. La longueur* Æ. C. *eſtoit* 4 *pouces ou* $2\frac{3}{8}$. *J'echauffay cet air, et il fait baiſſer le mercure juſques en* f. *qui eſtoit* $\frac{3}{8}$ *plus bas, & en meſme temps il monta juſq' en* H. *qui eſtoit* $\frac{5}{8}$ *plus haut que* G. *ou* C.

Pour ſçavoir quélle hauteur de mercure auroit eſte neceſſaire pour empeſcher la dilatation de l'air, &retenir le mercure en C. *je n'ay que trouver ce qui ſeroit neceſſaire pour repouſſer le mercure en* C. *et ainſy contenir l'air dans l'eſpace* Æ. Experiment made at the ſpire of the cathedral church in Sarum, *by colonel* John Windham, *aſſiſted by Mr.* Thomas Naſh, *clerk of the works, and* John Warner *in* November, 1684.

HAVING gotten together all the ſurveying chains the city afforded, and carefully examined their truth, and having prepared a proper frame for the baroſcope, we went into the church, filled the tube, and with all the nicety we could uſe purged it of the airy particles; and then immerſing it as in the Torricellian experiment, the mercury was there ſuſpended 30 inches, and 50 cents of an inch, meaſuring it from the ſurface of the ſtagnum: then drawing it up to the firſt floor above the vaulting, which is 1033 inches and $\frac{1}{2}$ high from the pavement, the mercury ſubſided 9 cents of an inch: from thence drawing it up to the middle floor, which is 935 inches higher, the mercury ſubſided 8 cents lower than before: and from thence drawing it up to the weather-door, which is 2313 inches higher than the laſt, the mercury ſubſided 23 cents below its ſtation. So the whole height it was drawn up is 4281 inches and a half; and the whole difference of the mercury's ſtanding is 40 cents of an inch. And letting it down the ſame way, the mercury reaſcended to its firſt ſtations.

AT another time with an inverted baroſcope, like the figure in the margin, having made a mark, where the liquor ſtood, when it was below in the church, and drawing it up to the firſt floor over the

Vaulting	Which is above the pavement of the church	1033 and $\frac{1}{2}$.	The liquor aſcended	1 25
To the middle floor		1968.		2 39
To the 8 doors floor		2467.		3 $\frac{2}{2}$
To the weather-door		4281.		5 64
To the top		4800, or 400 feet.		6 40

If your honour deſires to have any other experiments made at the ſpire, Mr. *Naiſh*, whom I have mentioned above, is a perſon well ſkilled in the practical parts of mathematicks, and a great lover of learning, but more eſpecially natural and experimental philoſophy, having all of your honour's philoſophical works. This perſon I know would moſt gladly and heartily embrace any opportunity of ſerving your honour, whenſoever you will be pleaſed to let me impart any thing to him in a letter.

This is humbly advertiſed by, Sir,

your honour's moſt obliged,

and moſt obedient ſervant,

♆ *Decembris* 17.
Anno 1685. *JOHN WARNER.*

AT a place in the great continent in *Europe*, but not far from the ocean, a learned acquaintance of mine keeping a baroſcope ſome years, and being diſcourſed with by me about the difference of the phænomena, that may be expected in places ſituate upon the continent, from what we find in this country, as it is an iſland: he related to me, that a few years ſince, caſting his eyes upon the baroſcope in ordinary weather, and that was calm enough, he was ſurpriſed to ſee the mercury ſo ſtrangely raiſed, as to exceed above two inches its wonted ſtation, which great alteration he found within few hours to have been the forerunner of ſo hideous a ſtorm, as was generally wondred at, and did a great deal of miſchief both in the towns and country of thoſe parts, where it left ſad inſtances of its fury. This wind came all along the continent; but my relator divers times obſerved, that when very boiſterous winds blew from the ſea, and the ſtorms came thence, (which lying to the ſouthward) the mercury in the baroſcope would conſiderably ſubſide, as has likewiſe been obſerved here in *England* by an ingenious gentleman, living within leſs than two leagues of the ſea, to whom I preſented a baroſcope to make obſervations with.

AN

And yet, that this is one of the effects of the temperature of the air in ſummer, ſeems very probable by this experiment, that having two large fictitious cryſtal vials, I cauſed ſome ſtopples of the ſame matter to be exquiſitely ground, and fitted, this or that veſſel exactly cloſed, when the ſtopple was in it, was very eaſy to be opened in winter, and in the colder parts of the neighbouring ſeaſons; but in ſummer it was oftentimes ſo difficult to unſtop the ſame veſſel, that a man's force, though aſſiſted with a ſtring, was not able to pull out the ſtopple: ſo that I was often reduced to cauſe the necks of the vials to be held under a pump, or to be ſtirred to and fro in a veſſel full of water, that the coldneſs of that liquor might take off the expanſion, that the heat of the ſeaſon had given the glaſs, which being by this means made to ſhrink into its former dimenſions, the vial and ſtopple would be eaſily enough disjoined. This was tried in ſeveral veſſels, and in more than one more year. But to make this experiment ſucceſsful, two parts muſt at firſt have been exquiſitely adjuſted to one another, which in thoſe glaſſes, with ſtopples of the ſame matter, that are commonly ſold, they are not uſually found to be.

We are wont to attribute the effects, we feel of the ſummer's heat, to the bare warmth of the air, and to the agitations, that ſuch warmth produces in the parts of our bodies, eſpecially in the blood, juices, and ſpirits; whereas it may very well happen, that we may find odd changes in ourſelves, upon very hot weather, which proceed not from the heat of the air as ſuch, but rather from this cauſe, that by ſuch a degree of heat, divers bodies, that we think not of, may be ſollicited to ſend forth effluvia, that have emitted none by force, or at leaſt no ſuch quantity as could make them ſenſibly operative. And theſe effluvia may be the true and immediate cauſes of divers effects, that are unwarily aſcribed to the mere heat of the air, and that, which it produces in our bodies. To illuſtrate and confirm this conjecture, I ſhall propoſe the following experiment.

Being in the heat of ſummer in the country, I took a ſomewhat large piece of fine amber, that I uſually employed about electrical experiments; and when the ſun had reached a conſiderable height above the horizon, I placed it in a ſhaded part of a window, on which he ſhined freely: though I left the amber here for a competent time, yet I could not find, that it would draw a piece of ſtraw, feather, or other light body, that at a convenient diſtance was held to it. But when I removed it a very little farther into a part of the window, into which the ſun-beams fell freely, they quickly put its parts into ſuch an agitation, as made it emit electrical effluvia, and readily attract thoſe light bodies, that would not ſtir before, and which it would ſoon, though not immediately, loſe the power of drawing, as before, if it were removed back into the neighbouring ſhaded part of the window.

May 26. Mr. *Nickſon*, who was four years governor of the Engliſh colony in *Hudſon*'s bay, anſwered me, that when they ſailed within a certain diſtance of floating iſlands of ice, if the wind blew from thence toward the ſhip, or, as the ſeamen ſpeak, if they were to the leeward of the ice, they could by the new and ſenſible cold they felt, know, that ſuch ice lay to windward of them, ſometimes even before they were able to diſcover it by ſight. And when I farther aſked, at what diſtance that might be, he anſwered, that it was ſometimes twelve or fifteen miles, if not twenty. He added, that uſually, when the wind blew from thoſe great maſſes of congealed water, it brought along with it a foggy air, which he ſuppoſed to come (as well as the cold) from the ice.

The ſame gentleman anſwered me, that in that part of *Hudſon*'s bay, wherein he wintered, the rivers began to freeze about the latter end of *October*, or beginning of *November*, and uſually were not free from ice till about the middle or latter end of *May*, though he divers times took the latitude of *Charleton* iſland, the place moſt frequented by the Engliſh, and ſeated at the bottom of the bay, and found it to be near the ſame with that of *London*, and at moſt but about 52 degrees.

When I enquired about the depth of the ice in the rivers, he anſwered, that they had often occaſion to obſerve it; for in the winter they made their wells there, (not in the ground) and were obliged to dig about ſix foot deep in the ice, before they could come at unfrozen water.

He anſwered me, that when they ſent their men up into the country, their bottles of brandy would oftentimes ſo freeze, that about a fourth part of it would be turned into ice. And when I aſked, whether the unfrozen part of the liquor was not exceeding ſtrong, he anſwered me, that it was, and ſometimes ſo much ſo, as to be too fiery and unpleaſant to the taſte.

He anſwered me, that he always found the ice freſh, that floated upon the ſea-water; and that when they wanted freſh water, or had a mind to ſpare what they had aboard, they often ſupplied themſelves out of the cavities of great floating maſſes of ice; in which hollow places the ſun-beams thawing ſome parts of the ice, they frequently found ſtore of liquor, that was produced by the action of the ſun-beams upon the ſuperior parts of the ice, whence the water ran into theſe cavities. He added, that when the ſeamen were in haſte, they uſed to relieve themſelves by cutting or breaking off pieces of the floating ice, and preſently melting it in their pots.

A learned traveller, that made ſome conſiderable ſtay among the high Pyrenean mountains, anſwered me, amongſt other notable things, about which I made enquiry, that he had ſeveral times obſerved at the top of one or other of thoſe tall hills, that the air would be very hot, and that yet the ſame day, and perhaps within very few hours, the

place would be covered with ſnow, though it were then ſummer time.

Doctor *N.* anſwered me, that the winds he felt at *Morocco* were ſo very hot, that they were ready to ſtifle him, ſeeming to him like the ſteams and ſmoke coming out of the mouth of an oven.

The Ruſſian emperor's phyſician confirmed to me, that at *Archangel* (where he was more than once) they averred to him, that in winter time a northerly wind (which comes from the ſea) produces a kind of thaw, ſo as to make the eves drop, though a north-eaſt wind rather confirms the froſt; but on the contrary, a ſoutherly wind which, blows over a thouſand or a hundred miles of frozen land, does rather increaſe the froſt, than bring the thaw.

A very inquiſitive perſon, that viſited the lofty Pyrenean mountains, anſwered me, that he and his company had more than once obſerved, from the top or higher part of one of thoſe hills, that though it were fair weather there, yet a great way beneath them, the hill was ſurrounded with thick clouds, which produced ſtorms of rain on the lower grounds: and that (which was the chief point I enquired after) they could manifeſtly ſee, that out of thoſe clouds, when it thundered, lightnings flaſhed upwards as well as they are generally obſerved to do it downward.

October 19. Doctor *Stubbs* aſſured me, that having at *Jamaica* taken a bolt-head about two foot and a half in length, he uſually fonnd, that betwixt 7 and 8 in the morning, which they there call the faint time (of the day) becauſe for want of the daily breezes, the exceſſive heat makes them to faint away; the water was wont to riſe in the neck but a quarter of an inch and a half, though at that time, by reaſon of the winds, men found the heat very ſupportable: and after noon was paſt, the water would ſubſide by degrees till towards the above mentioned time the next morning. This happened in a ſouth window, where the freſh winds come fully and freely in to beat upon the bolt-head, without any glaſs to ſkreen the veſſel from the wind.

He added, that though the bolt-head were not ſtopped, yet the water did not even in that hot country decreaſe ſenſibly in eight or ten months.

A heedful perſon, that frequented the coaſt of *Sumatra* in the *South-Sea*, anſwered me, that he never obſerved ice or froſt, or ſnow, in that great iſland, but that he had known hail fall even in that torrid climate.

Though the famous iſland of *Ceylon* lyes almoſt in the midſt of the torrid zone, namely, between the 6th and 10th degrees of northern latitude, yet an obſerving man, that lived many years upon it, told me, that in hills not ſo high, but that we might eaſily aſcend to the top in half an hour, the inequality of the air's temperature, as to heat and cold, was very great: for he had divers times obſerved in himſelf and others, that though at the bottom of the hill the heat was ſo great, as to oblige them to go almoſt ſtark naked, yet when they aſcended the hill, they found the air quite altered; and as they went up higher and higher, the cold increaſed upon them; ſo that notwithſtanding the heat, ſo uneaſy a motion as climbing had given them, the coldneſs of the air obliged them to put on unuſually warm clothes, and at the top of the hill they would for all that be ready to quake for cold.

Captain *Knox* anſwered me, that in 18 years, that he ſpent in the inland of *Ceylon*, he never obſerved any ice or ſnow, nor any more than a little kind of meteor, that was between dew and hoar froſt, which ſometimes in winter mornings appeared very oddly, but quickly vaniſhed. And when I aſked, if he had not ſeen hail itſelf, he anſwered, that he never ſaw it but once, but the inhabitants looked upon it as a wonderful thing, unſeen by them before; that the hail was as large as a black cherry, but not very round, and ſeemed to have the corners melted, which made him think it had been formed high in the air; that for fear of miſtaking, he not only gathered ſome of it, but champed it between his teeth, and found it cold and hard, like our European hail; and that he was fain to be nimble in making his trials, becauſe when the hail came to touch the ground, it would melt away much more ſuddenly than one would have expected.

Gregory being aſked, upon a very ſultry day, whether it were not very hot in *Germany*, made anſwer, to day has been ſomething hot; ſuch is the winter in *Suaquena*. *Ludolf.* hiſt. of *Ethiop.* L. I. c. 5.

The heat of the iſland *Suaquena*, *Gregory* uſed to call infernal: for, ſays he, it excoriates the ſkin, melts hard Indian wax in a cabinet, and ſears your ſhoes like a red hot iron. *Ludolp.* hiſt. of *Ethiop.* L. I. c. 5.

The higher you aſcend the mountains of *Ethiopia* from the coaſt of the *Red Sea*, the more temperate you ſhall feel the air, inſomuch, that as *Tellezius* witneſſes, in many regions of *Ethiopia* the ſummer heats are more mild than in *Portugal*, ſo many degrees diſtant towards the north; nay, there are ſome mountainous countries, as in *Samen*, where the cold is more dreadful than the heat. Nevertheleſs there falls none, or very little ſnow in theſe parts, only a certain ſmall ſort of hail ſometimes covers the ground, which at a diſtance looks like ſnow. *Ludolp.* hiſt. of *Ethiop.* L. I. c. 5.

An intelligent perſon, that was for many years conſul of the Engliſh Nation at *Tripoli* in *Barbary*, being aſked ſome queſtions about the air, and the winds in thoſe parts, anſwered me, that when in ſummer time the wind blew over the great ſandy deſerts, that reach very far into the country, the wind, and the ſand it brought along with it, oftentimes felt as hot as the ſteams, that come out of an oven, when the mouth is opened, inſomuch, that he could not, without great inconvenience, turn his face towards the quarter whence the wind blew.

An ingenious gentleman, that was employed in the French colony, on the coaſt of *Africk*, and lived in thoſe parts about five

yoars, anſwered me, that in the iſland of St. *Louis*, or near it, at a certain ſeaſon of the year, when the hot winds blew from the continent, the ſand on the ſhores would be ſo ſcorching hot, that he was not able to ſtand upon it, but it would, through the ſoles of his ſhoes, ſcorch his feet, unleſs he walked very faſt. And then the air ſeemed to him to be thick, and, as he expreſſed it, heavy and hot, as if it came out of an oven. And when the wind blew from a wood, where divers elephants and other wild beaſts lay dead, the ſteams of their carcaſſes would make the air ſo ſtinking and offenſive, that it was ſcarce ſupportable.

In ſummo ejus montis, Idæ ſc. faſtigio ſacellum eſt, quod ædificiolo duntaxat conſtat ſaxis ſibi invicem impoſitis, & ſine calce cohærentibus, fornicis in modum conſtructo, ad tectum præbendum. Sublimi adeo loco eſt, & à vehementioribus ventis interdum ita perflato, ut lapilli inde transferantur. Paulo infra id ſacellum planities conſpicitur montibus undique cincta, in quâ multa ſunt paſcua, ubi arietes & capræ Cretenſes æſtate pingueſcunt. Si quis ex ſummo montis vertice undique proſpiciat, parum aberit, quin totius inſulæ ambitum videat cum aliis vicinis inſulis, Miſo, Cerigo, ſive Cythera reliquiſque Archipelagi. Aeris intemperies in hoc monte adeo magna eſt, quemadmodum ut in cæteris præcelſis montibus, ut in ipſis caniculæ ardoribus meridie, nullo etiam ſpirante vento, ingens ſentiatur frigus: qua de cauſa nec hyeme, nec æſtate quiſquam eum incolit. Nam licet paſtores interdiu ovium greges ad paſcua agunt, noctu tamen in valles ſe recipiunt.

Petri Bellonii, Lib. I. cap. 1.

In the next chapter.

Latè porro patet hic mons, ejuſque radices utrinque maris littora, ut ante diximus, attingunt; nam licet urbi Candiæ ſunt vicinæ, meditullium tamen inſulæ occupat ipſe mons, adeo in ſublime evectus, ut nives ejus verticem perpetuo tegant; tamque frigida aura mediis etiam æſtatis ardoribus iſthic eſt, ut vix ferri queat; tametſi in convallibus magnus ſit æſtus.

Contigit id meæ experientiæ, quod etiam aliis contigiſſe audivi, ut aſcenderem ad ſummitatem uſque montis Veneris, qui omnium in Patavino agro altiſſimus eſt, ibi per totum diem habui aerem ſereniſſimum, ſed infra circiter medium montis vidi nubes, quæ me viſione vallium prohibebant, veſperi autem, poſtquam de illo monte deſcendi, inveni factam eo die infera parte magnam pluviam, cum in montis cacumine nihil pluiſſet; ex eo intellexi me tranſiiſſe per mediam aeris regionem, in qua eſt facta pluvia, nec tamen eam ſenſi frigidiſſimam, imò vix aliquam animadverti differentiam frigidioris & calidioris aeris, nam æſtivum tempus erat, pro æſtivo tempore eram veſtitus, nec tamen tantum frigoris, quod me læderet, ex eo loco percepi; pars igitur illa non eſt abſolutè frigida, ſed ſolùm comparatione inferi aeris calidioris.

Jacobi Zabarelli de regionibus aeris, c. 8.

Idem de Alpibus proprio exemplo edoctus teſtatum reliquit Bartholinus Syſt. Phyſ. Inſtit. Succinct. de Terra, Aere, & Igne, c. 4. Reſp. 1.

Doctor *B.* anſwered me, that being at and near *Morocco*, he could ſee mount *Atlas* covered with ſnow, though it was then in the heat of ſummer, and exceſſively hot where he was.

An intelligent traveller, that had viſited ſome high mountains, and particularly the *Alpes*, and the *Pico* of *Teneriffe*, anſwered me concerning this prodigious hill, that he found it very cold in aſcending towards the top; and that as for the mount *Cenis*, one of the famouſeſt of the *Alpes*, when he paſſed over it into *Italy*, though it were in *Auguſt*, and the weather very clear, yet he felt at the top a wind ſo cold, that he could ſcarce poſſibly endure it, and ſeemed to him the coldeſt, that in all his various travels he had ever felt; and yet ſome of the mountains ſeemed much higher being then covered with ſnow.

An intelligent gentleman, that had been a traveller into the *Eaſt-Indies*, told me, that he never ſaw nor heard of any ſnow or ice in *Guinea*, but that in ſome parts of *Barbary*, where in the plains and vallies he found the heat ſcorch inſupportable, he could ſee the top of the mountains covered with ſnow, in which ſtate they continued all the year.

A man of letters, that lived in many countries of the *Eaſt-Indies*, being aſked by me divers queſtions, partly about other things, and partly about the temperature of the air in ſeveral regions, gave me, among other anſwers, this, that on the high mountain in the iſland of *Ceylon*, notwithſtanding the heat of the country, there was ſnow; and the like he ſaw on the tops of the mountains of *Congo*, though in the lower parts of the country they never have, that he heard of, either ice, ſnow, or hail.

About Midſummer, 1688, I placed in the cave a glaſs, with ſpirits, which ſtood above temperate about ½ of one of the ſmall diviſions: another glaſs placed without, in a common room, ſtood at hot.

The Chriſtmas following I placed the ſame glaſſes in the ſame places, and the glaſs in the cave ſtood, as before, about temperate; that without ſtood at froſt.

The cave is cut into the bottom of a clift, that fronts to the ſea: the earth is about 80 foot above it, and it is cut right in about 130 foot.

The other day two gentlemen belonging to the province of *New-Hampſhire* in *New-England*, (whence they came not long ſince) and employed by that colony to his majeſty here, anſwered me, that in the winter the coldeſt wind, that blows in the country, is the north-weſt; and being aſked again, what was their hotteſt wind in ſummer, they told me, it was likewiſe the north-weſt. At which anſwer being ſurpriſed, I aſked them, whether they could give any reaſon of ſo odd a phænomenon. Whereto they anſwered, that they aſcribed it to the large tract of the continent, and the great woods that lay to the north-weſt; which woods, they ſaid, in the winter had their branches, through which the wind paſt, all laden with ſnow: and in the ſummer, they ſaid, the cloſe air of the vallies, and the thick ſteams, that filled it, would

would conceive ſo intenſe an heat, that ſometimes in the heat of ſummer, when a ſudden puff of wind blew upon their faces from thoſe ſultry vales, it ſeemed to them, as if it came out of the mouth of a furnace, and would be ready to overcome them with the faintneſs produced by the heat and vapours it brought along with it.

Balbini hiſt. Bohem. L. 1. c. 9. *De montibus, & de valle Lauezka, p.* 29. *Chanowſki in veſtigio Bob. piæ, c. ult. Montes parte altera æſtatem, alterâ hiemem referentes.*

De montibus ad Bavariam ſtantibus mira eſt Alberti Chanowii noſtri narratio: poſt Bergreichenſteinam (oppidum fodinis hodieque nobile) eſſe montes non tam ſitu (alii enim ad ſeptentrionem, alii ad meridiem latus obvertunt) quam cœlo & temporibus adverſantes, vallibus latiſſimis montes illos dirimentibus; monſtri inſtar eſt (quod ſe vidiſſe, & anno 1639. *in rem præſentem veniſſe religioſiſſimus ille & apoſtolicus vir aſſerit) in altero monte ſæpius æſtatem, in altero appoſito hiemem dominari, ita ille ſiccus æſtivat, hic altiſſimis nivibus obſitus à viatore ſuperari non poteſt; ob eamque cauſam meſſes ipſæ variant, & dum in montibus ad nos obverſis demeſſa ſunt omnia, altera montium parte ſeges vireſcit: mirius illud, quod in Bieſſinenſibus & Czachrovienſibus agris in tractatu Plſnenſi, contiguis, quos unus tantum ſulcus dirimit ac dividit, deprehenditur: Czachrovienſes adhuc hibernant, cum in Bieſſinenſi cœlum ardeat; ibi caput attollit humo frumentum, cum Czachrovii adoleſcit in culmum; elemento quoque diſpari, illud riget, hoc tepet & fervet, eâque ex causâ, dum Czachrovienſes bene pelliti ingrediuntur, Bieſſinenſes pellibus onerari ſe ſentiunt, villoſque deponunt. Aliquid tale anno* 1652. *mihi quoque accidiſſe memini: nam cum Glacio Zambergam in Bohemia contenderem, & Glacio ob nives altiſſimas certum vehiculi genus, quod trahas dicimus, ſumpſiſſem, ſuperatis montibus, qui comitatum Glacenſem à Bohemia dividunt, ſubitò alia rerum facies apparuit: altero enim montium latere viridia omnia reperimus, ſic ut trahæ nulli jam rei & uſui eſſent, & currum petere cogeremur, niſi in luto natare placuiſſet; at accolæ montium illorum quotannis id ſibi accidere confirmabant, ut unum latus montium profundiſſimæ nives contegerent, quando alterum latus lectiſſimos flores proferret, & cum ibi omnia ventis verti viderentur, apud ſe è floribus ſuaviſſimos odores effiari.*

Id. ibid.

I LEARNED, by enquiry of an ingenious gentleman, who ſeveral times went into the Hungarian gold-mine at *Cremnitz*, that when he was drawn up out of the deep pit, or perpendicular groove, whoſe depth exceeded 100 feet; when he had aſcended above half the way, he found the air ſenſibly warm, and ſo it continued, till he came by many foot nearer the day, as the workmen call the orifice of the pit. And when I aſked, whether this notable and ſudden heat did not proceed from ſome mineral, through which he paſſed in that region of the earth, or part of the groove, he anſwered me, that he believed it did, in regard he was there ſurrounded with a vein or bed of native vitriol, ſome of one colour, ſome of another, which he found to be ſoft under ground, though it ſoon after hardened in the air: and of theſe differingly coloured ſorts of vitriol he brought up thence ſeveral pieces, ſome of which he preſented me. And when I aſked, whether the new heat he found in that part of the mine, did not proceed from its being much nearer than the lower part to the air, which at that time was hot; and whether he found the heat to increaſe as he came nearer the day; he anſwered in the negative, and told me, that after he had in his aſcent left beneath him that warm region, he found himſelf cold again in the ſuperior part of the groove, to which the vitriolate region did not reach.

I REMEMBER on this occaſion, that aſking an intelligent perſon, who had more than once croſſed the torrid zone, what expedient they uſed in his ſhip, to keep their beer and other liquors cool enough to be drinkable in thoſe ſultry climates; he anſwered, that their way was to take the bottle they mean to uſe, and wrap it about with a coarſe linen cloth dipped in the ſea-water, and then in ſome more convenient place of the ſhip hang it in the wind, which beating freely and inceſſantly upon it, would in no long time cool it to be potable enough. And this gentleman, who was an obſerving perſon, added farther, that having ſometimes for curioſity ſake taken away a bottle before it had been expoſed above half the uſual time, he was able to find by the taſte, that part of the beer or wine, that was next the ſides of the bottle to be refrigerated, whilſt the more inward parts of the liquor did yet continue hot.

THE *Czar*'s chief phyſician confirmed to me, that in the year 1664, or 63, extraordinary dry and great ſcopes of land were ſet on fire, and miſerably waſted by the great heat of the ſun. And he added, that the very laſt year he found the like to have happened in *Norway*, particularly in a place called by us *Bear-haven*; where having ſeen the ruin of divers wood houſes burnt, and enquiring into the cauſe, he was anſwered, that the weather being very dry and hot, not only the graſs and other vegetables were ſcorched up, but thoſe wooden houſes among others were ſet on fire, which was confirmed to him by the governor of the place, and countenanced by this circumſtance, that he ſaw the country covered with a freſh and verdant livery of new graſs, brought up inſtead of that which was burnt, by ſome rains, that fell a while before.

A TRAVELLER and ſcholar being aſked by me, whether at *Mozambique*, which is thought the hotteſt place in the known world, he had never obſerved the houſes to be ſet on fire with the mere heat of the ſun? he anſwered me, that in the three months he ſtayed there, he ſaw no ſuch thing, but the inhabitants affirmed it to be not very unfrequent; and as he paſſed to and fro, ſhewed him divers houſes that had been ſo burnt; which was the leſs ſtrange, becauſe the houſes are not built of ordinary ſtone, whereof they have none there, but fetched from another place he named, where the ſtone is mingled with a ſubſtance, much of the nature of a ſulphur vivum.

vivum. And he added, that he himſelf had divers times ſeen the ſtones ſo heated in hollow places, that muſket-bullets being expoſed there to the direct beams of the ſun, were in no very long time melted. He ſaid farther, that much of the exceſſive heat of *Mozambique* proceeded from the ſoil, which is exceeding bare and dry, conſiſting of white ſand, and that it is not covered with graſs, nor ſhaded with trees.

An obſerving traveller, that had been at *Mozambique*, being for the moſt part, where it is not ſhaded with trees, ſandy, he found the ſun, which was almoſt in the zenith, to heat the ground ſo much, that he was not able to ſtand ſtill for ſome time, but was fain to keep walking to avoid burning the ſoles of his feet.

Un gentilhomme de mes amis plein de merite et digne de creance me mande, entre pluſieurs choſes extraordinaires, qu'il à obſervées proche de Barege aux Pyrenées, qu'il y à des ponts de niege d'un rocher à l'autre pardeſſous leſquelles paſſent des torrents. Il en a vu un, qui embreſſe deux torrents, et qui a vint neuf toiſes de long et autant de large par deſſus. Il y a par deſſous ce pont neuf toiſes et demi entre les naiſſances de la voute, les ponts ſont tellement forts, qu'il eſtime que du canon y paſſeroit, et il a fait rouler de groſſes pieces par deſſus.

Le tremblement de terre, que ſouffrit la Syrie l'an 750. *ne fut gueres moins ſurprenant; puiſque la terre s'eſtant ouverte de toutes partes, pluſieurs villes furent abîmées, d'autres renverſées, et quelques unes, qui eſtoient elevées ſur des hauteurs, tranſportées dans des plaines eloignées de ſix mille de leur ſituation. On en peut dire autant da froid extreme, qui l'an* 753. *glaça le Pont-Euxin à la longueur de cent mille, et toute l'eſtendue de la mer voiſine, juſqu' à* 30 *coudées de profondeur, quoy qu'on ne fût encore qu'au commencement de l'automne. Journal de Sçavans* III. 1685.

Asking an intelligent perſon, that lived a good while in *Guinea*, how they did to keep their water cool in ſo hot a place, he told me, that in ſome corner of their huts they were wont to make holes in the ground, in which they buried over night the long earthern jars, or other veſſels, ſo as that the orifice of the veſſels might be lower (though not very much ſo) than the level of the ground. By this means the water would become drinkable, with ſome coolneſs, from the beginning of the morning to nine or ten of the clock, after which it would grow diſtaſtefully hot. He added, that when they were abroad in the fields, he did as well cool his water, by putting it into callibaſhes, and hanging them all night upon the branches of trees, eſpecially where they were expoſed to the wind.

February. Since now I have ſpoken ſo much of the cold, I hope it will not be too coldly taken, if in a few words I make it ſome way to appear unto our readers.

We made three differences of the cold, all according to the places: in our houſe, in the woods, and in the open air, upon the ice, in our going to the ſhip.

For the laſt, it would be ſometimes ſo extreme, that it was indurable; no clothes were proof againſt it, no motion could reſiſt it. It would, moreover, ſo freeze the hair on our eye-lids, that we could not ſee; and I verily believe, that it would have ſtifled a man in a very few hours: we did daily find by experience, that the cold in the woods would freeze our faces, or any part of our fleſh that was bare; but it was yet not ſo mortifying as the other. Our houſe on the outſide was covered two third parts with ſnow, and on the inſide frozen and hung with icicles. The clothes on our beds would be covered with hoar froſt, which in this little habitacle was not far from the fire. But let us come a little nearer to it. The cook's tubs, wherein he did water his meat, ſtanding about a yard from the fire, and which he did all day ply with melted ſnow-water; yet in the night-ſeaſon, whilſt he ſlept but one watch, would they be firm frozen to the very bottom: and therefore was he fain to water his meat in a braſs kettle cloſe adjoining to the fire; and I have many times both ſeen and felt, by putting my hand into it, that ſide, which was next the fire, was very warm, and the other ſide an inch frozen. I leave the reſt to our cook, who will almoſt ſpeak miracles of the cold. The ſurgeon, who had hung his bottles of ſyrups, and other liquid things, as conveniently as he could, to preſerve them, had them all frozen. Our vinegar, oil and ſack, which he had in ſmall caſks in the houſe, were all firm frozen. It may further in general be conceived, that in the beginning of *June*, the ſea was not broken, and the ground was yet frozen; and thus much we found by experience in the burying of our men; in ſetting up the king's ſtandard towards the latter end of *June*; and by our well, at our coming away in the beginning of *July*, at which time, upon the land, for ſome other reaſons, it was very hot weather. Capt. *James*.

Obſervations on the top of the Pyreneans.

Monſieur *L. J.* confirmed to me what he had formerly told me, that upon the higheſt mountain of the Pyreneans, called *Pic de Midi*, he aſcended at the end of *Auguſt*, or the beginning of *September* (in the morning) to the very top, where he and his company ſpread a tent, and ſtaid till the evening: he ſays, he found the air temperate where the ſun did not beat; but on that ſide of their bodies, whereon the ſun ſhone, the heat was exceeding great, and was offenſive, even to them, that ſat in the tent of oiled cloth, if they ſat too near the ſunny ſide of the tent: they ſometimes had wind at the top of the hill, which they found to blow cool enough, (and found it very cold, when they returned to the bottom.) This hill is ſo high, that it may be ſeen from *Montauban*, which is 27 leagues diſtant.

When I aſked, whether the air in thoſe places, where the ſun did not beat, was conſiderably cold? he told me, that the exerciſe they had been put to in aſcending the top of the hill (for the moſt part of the way they

rid up) kept them from being very competent judges of that; but they found the wind northerly, though weak, yet very cooling; and the north ſide of the mountain was even then covered with ſnow, and ſcarce at all paſſable.

An ingenious phyſician, Dr. *B.* that has been in divers of the inland parts of *Africa*, among other anſwers, that he returned to the queſtions that I aſked him, about the temperament of the air in thoſe parts, gave me this memorable one, that having had occaſion at *Morocco* to uſe ſome good dried fine jalap, that he had brought with him out of *England*, he found it by the heat of the air to be melted, and by conſequence to be impulverable, in which ſtate it continued whilſt he lived in that country; but when he was returned to *Tangier*, he found it both there, and in the neighbouring parts, pulverable again.

P. Franceſco Barretto relatione della provincia di Malavar. p. 52.

Nel capo di Comorino ſi termina coſi l' eſta, come l' inverno dalla parte, di la dal capo verſo Notte, & dal' altra parte correſpond il tempo aſſai contrario è diverſo, di maniera che, chi va navigando, per quella coſta nel meſe di Ottobre, ſino ad Aprile, naviga nel eſta, è non puo in tutto queſto tempo paſſare il capo per eſſer ivi la ſtagione dell inverno, et il Padre, che reſtede nelle Chies ch'appartengono al Capo di Comorino ne alcune la ſtate, il che è coſa di gran meraviglia, eſſendo cio nel medeſſimo tempo nella diſtanza ſolamente di due, ò tre miglia.

An eminent virtuoſo anſwered me, that in *Tirol* he had viſited a very deep mine, into which he deſcended three hundred Klaſters, which by his computation makes about eighteen hundred of our feet: that he paſſed not through, that he took notice of, one hot region by the way. That at the bottom of the mine he breathed very freely, becauſe of the air ſhafts, by which acceſs was given laterally to the ſuperior air; and that being thinly clothed with one of the digger's habits, he found at the bottom the air temperate, as to heat and cold, though it were then ſummer-ſeaſon of the year: ſo that notwithſtanding what is ſaid of antiperiſtaſis, no intenſe cold was retreated thither, to ſhun the heat of the ſuperior air.

An ingenious gentleman, very converſant in our Engliſh mines, of one of which he is owner, anſwered me, that the deepeſt mine he had particularly viſited, was a tin mine, whoſe depth was ſixty ſix fathoms, that is almoſt four hundred foot. That deſcending into this mine in ſummer, he found it very cold at the bottom, and the greateſt part of the way going down, without perceiving any hot region. And when I aſked him, how ſoon he begun to find a ſenſible cold in deſcending, he told me, that he found it within two fathom or leſs of the orifice of the pit; and that in this and divers other mines he perceived a ſenſible cold to begin before he got down a yard, or perhaps half a yard beneath the upper part of the faſt, as the minemen call the ſolid earth, in which they diſtinguiſh from the looſe earth, that lyes above it; and is, if I may ſo call it, the ſcurf of the earth, that is far more light and porous than the other, though it be upon this looſe earth that plants grow, and into which even great timber trees themſelves ſhoot, and ſpread their roots ſeldom or never reaching to, or penetrating into the faſt, though this lye ſometimes near enough to the external ſurface of the cruſty earth.

An exact relation of the Pico Teneriff, *taken from Mr.* Clappham.

About the 20th of *Auguſt*, 1646, Mr. *Clappham*, together with Mr. *Philip Ward*, *John Webber*, *John Cowling*, *Thomas Bridge*, and *George Cove*, all of them very conſiderable merchants, and worthy of credit, with one guide, ſervants and horſes to carry their wine and proviſions, did ſet out from *Oratava*, a port-town in the iſland of *Teneriff*, ſituated on the north, at two miles diſtance from the main ſea: they travelled from twelve at night till eight in the morning, by which time they got to the top of the firſt mountains towards the *Pico de Teraira*; here, under a very great and conſpicuous pine-tree they brake their faſt, dined, and refreſhed themſelves till two in the afternoon, and then proceeded through much ſandy way, over many lofty mountains, but naked and bare, and not covered with pine-trees, as their firſt night's paſſage was, which expoſed them to exceſſive heat, till they arrived to the foot of the *Pico*, where they found many huge ſtones, which ſeemed to have been fallen down from ſome ſuperior part. But before we proceed farther to give any account of this journey, give me leave here to interſert the opinion of Dr. *Pugh*, a perſon of very great reputation, at this time in the city, who lived twenty years himſelf on the place, both in the quality of a phyſician, and a merchant, and was very curious and inquiſitive into all that was in the iſland: his opinion is, that the whole iſland of *Teneriff*, being a ground mightily impregnated with brimſtone, did in former times take fire, and blow up all, or near upon all at the ſame time; and the many mountains of huge ſtones calcined and burnt, which appear every where about the iſland, eſpecially in the ſouth-weſt parts of it, were raiſed and heaved up out of the bowels of the earth, at the time of the general conflagration; and the greateſt quantity of this ſulphur lying about the centre of the iſland, raiſed up the *Pico* to that height, at which it is now ſeen. And he ſays, that any one upon the place, that ſhall carefully note the ſituation and manner of theſe calcined rocks, how they lye for three or four miles almoſt round the bottom of the *Pico*, and in ſuch order one above another, almoſt to the very ſugar-loaf (as it is called) as if the whole ground, and riſing up together with the accenſion of the brimſtone, the torrents and rivers of it did with a ſudden eruption, roll and tumble them down from the

reſt of the rocks, eſpecially (as we ſaid before) to the ſouth-weſt; for on that ſide, from the very top of the *Pico*, almoſt to the ſea-ſhore, lye huge heaps of theſe burnt rocks, one under another; and there remain to this time the very tracts of the rivers of brimſtone, as they ran over all this quarter of the iſland, which has ſo waſted the ground beyond recovering, that nothing can be made to grow there, but broom. But on the north ſide of the *Pico*, few or none of theſe ſtones appear; and he concluded hence, that the vulcano diſcharged itſelf chiefly to ſouth-weſt. He adds farther, that mines of ſeveral metals were broken and blown up at the ſame time; theſe calcined rocks reſembling ſome of them iron ore, ſome ſilver, and others like copper, particularly at a certain place in theſe ſouth-weſt parts, called the *Azuleios*, being very high mountains, where never any Engliſh but himſelf (that he ever heard of) was. There are vaſt quantities of a looſe blueiſh earth, intermixed with blue ſtones, which have on them a yellow ruſt, as that of copper and vitriol, and likewiſe many little ſprings of vitriolate waters; here he ſuppoſes was a copper-mine. And he was told by a bell-founder of *Oratava*, that out of two horſe-loads of earth, he got as much gold as made two large rings: and a *Portugueſe* told him, who had been in the *Weſt-Indies*, that his opinion was, there were as good mines of gold and ſilver there, as the beſt in the *Indies*. There are likewiſe hereabouts nitrous waters and ſtones covered with a deep ſaffron coloured ruſt, and taſting of iron. And farther he mentions one Mr. *Gilbert Lambell*, a friend of his, who of two lumps of earth or ore, brought from the top of this ſide the mountain, made two ſilver ſpoons. All this he confirms from the late inſtance of the *Palm* iſland, eighteen leagues from *Teneriff*, where a vulcano was fired about twelve years ſince, the violence whereof made an earthquake in this iſland ſo great, that he and others ran out of their houſes, fearing they would have fallen upon their heads: they heard the noiſe of the torrents of flaming brimſtone, like thunder, and ſaw the fire as plain by night, for about ſix weeks together, as a candle in the room; and ſo much of the ſand and aſhes brought from thence, by the wind, by clouds, fell on his hat, as filled a ſand-box for his ink-horn, Thus far he.

To reſume therefore the narrative of their journey; about ſix a clock this evening, they began to aſcend on the *Pico*; but being now a mile advanced, and the way no more paſſable for their horſes, they quitted and left them with their ſervants. In this mile's aſcent ſome of their company grew very faint and ſick; and from Dr. *Pugh*'s report of eighteen in his company, that went up about the middle of *Auguſt*, long after this, but ten got up, and theſe had all drank very plentifully below; the reſt ſo diſordered by fluxes, vomitings, and aguiſh diſtempers, they could go no farther: their horſes hair ſtood upright, like briſtles, with the vehement cold, who ſtood ſhaking, and refuſed to eat any thing till they came down. But calling for ſome of their wine, which was carried in ſmall barrels on a horſe, they found it ſo wonderfully cold, that they could not drink it, till they had kindled a fire to warm it, although yet the temper of the air was very calm and moderate; but when the ſun was ſet, it began to blow with violence, and grew ſo cold, that taking up their lodging under certain great ſtones in the rocks, they were conſtrained to keep great fires before the mouth of them all night. About four in the morning they began to mount again, and being come about a mile up, Mr. *Cowling*, one of the company, failed, and was able to proceed no farther. Here begin the black rocks. The reſt purſued their journey till they arrived to *Sugar-Loaf*, where they begin to travel again in a white ſand, being foreſhod with ſhoes, whoſe ſingle ſoles are made a finger broader than the upper leather, to encounter this difficult and unſtable paſſage, till they are half way up; and a ſpaniel, that went up afterwards with Dr. *Pugh*, (as he relates) went crying all the way, having his ſkin burnt off his feet; and then being aſcended as far as the black rocks, which are all flat, and lye like a pavement, they climbed within a mile of the very top of the *Pico*: but Mr. *Clappham*, who was the foremoſt, would have perſuaded Mr. *Cove* to deſcend again, as imagining the top of all on fire; but at laſt overcoming that apprehenſion, and perſiſting, they gained the ſummit, where they found no ſuch ſmoke as appeared a little below, but a continual breathing of a hot and ſulphureous vapour, which made their faces extremely ſore.

In this paſſage they found no conſiderable alteration of air, and very little wind; but being at the top, it was ſo impetuous, that they had much ado to ſtand againſt it, whilſt they drank the king's health, and fired each of them a piece: here they alſo broke faſt, but found their ſtrong waters had quite loſt its force, and was become almoſt inſipid, whilſt their wine was rather more ſpirituous and briſk than it was before.

The top on which they ſtood being not above a yard broad, is the brink of a pit called the *Caldera*, which they judged to be about a muſket-ſhot over, and near fourſcore yards deep, in ſhape like a cone, within hollow like a caldron, and all over covered with ſmal looſe ſtones, mixed with ſulphur and ſand, from heat; and ſtirred up with any thing, puffs and makes a noiſe, and ſo offenſive, that Dr. *Pugh* was almoſt ſtifled with the ſudden emanation of vapours, upon the removing of one ſtone of theſe; theſe ſtones are ſo hot, as they are not to be eaſily handled: they deſcended not above four or five yards into the *Caldera*, in regard of its ſliding from their feet, and the difficulty; but ſome have adventured to the bottom. Other obſervable materials they diſcovered none, beſides a clearer ſort of ſulphur, which looks like ſalt upon the ſtones.

From

FROM this famous *Pico* they could ken the grand *Canaries*, fourteen leagues diſtant; *Palma* 18, and *Gomera* 7 leagues; which interval of ſea ſeemed to them no larger than the river of *Thames* about *London*: they diſcerned alſo the *Hierro*, being diſtant above twenty leagues, and ſo to the utmoſt limits of the ſea much farther.

So ſoon as the ſun appeared, the ſhadow of the *Pico* ſeemed to cover not only the whole iſland, and the grand *Canaries*, but the ſea to the very horizon, where the top of the *Sugar-Loaf*, or *Pico*, viſibly appeared to turn up, and caſt its ſhadow into the air itſelf, at which they were much ſurpriſed. But the ſun was not far aſcended when the clouds began to riſe ſo faſt, as intercepted their proſpect, both of the ſea, and the whole iſland, excepting only the tops of the ſubjacent mountains, which ſeemed to pierce them through.

WHETHER theſe clouds do ever ſurmount the *Pico*, they could not ſay; but to ſuch as are far beneath, they ſometimes ſeem to hang above it, or rather wrap themſelves about it, as conſtantly when the north weſt winds blows: this they call the Cap, and is a certain prognoſtick of enſuing ſtorms.

MR. *John Webber*, one of his company, who had made a journey two years after, arriving at the top of the *Pico* before day, and creeping under a great ſtone to ſhroud himſelf from the cold air, after a little ſpace, found himſelf all wet, and admiring whence it ſhould proceed, perceived it at laſt to come from a perpetual trickling of the water from the imminent rocks above him.

MANY excellent and very exuberant ſprings they found iſſuing from the tops of moſt of the other mountains, guſhing out in great ſpouts, almoſt as far as the huge pine-tree which was mentioned.

HAVING ſtayed ſome time upon this top, they all deſcended by the ſandy way, till they came to the foot of the ſugar-loaf, which being ſteep, even almoſt to a perpendicular, they ſoon paſſed: and here they meet a cave of about ten yards deep, and fifteen broad, being in ſhape like an oven or cupola, having a hole at the top, which is near eight yards over; by this they deſcended (an active Spaniard ſhewing them the way) by a rope, which their ſervants held at the top, whilſt the other end being faſtened about his middle, he ſwings himſelf, till being over a bank of ſnow, he ſlides down and lights upon it. They are forced to ſwing thus in the deſcent, becauſe in the middle of the bottom of this cave, oppoſite to the overture at the top, is a round pit of water, reſembling a well, the ſurface whereof is about a yard lower than the ſnow, but as wide as the mouth at the top, and is about ſix fathom deep, as Mr. *Lambell* reports, who plumbed it. They ſuppoſe this water not a ſpring, but diſſolved ſnow, or water blown in; for ſome years it lyes ſo full, one cannot get into the cave for water trickling through the rocks.

ABOUT the ſides of the grott, for ſome height is ice, and icicles hanging down to the ſnow: but being quickly weary of this exceſſive cold place, and drawn up again, they continued their deſcent from the mountains, by the ſame paſſages they went up the day before, and ſo about five in the evening arrived to *Oratava*, from whence they ſet forth: their faces were ſo red and ſore, that to reduce them and cool them, they were forced to waſh and bathe them in whites of eggs, *&c.*

THE whole altitude of the *Pico* in perpendicular is vulgarly eſteemed to be two miles and a half.

No trees, herbs, or ſhrubs, in all the paſſage, but pines; and amongſt the white ſands a kind of broom, being a buſhy plant; and at the ſide where they lay all night, a kind of cardon, which has ſtems of eight foot high, the trunk near half a foot thick, every ſtem growing in four ſquares, and emerging from the ground like tuffets of ruſhes; upon the edges of theſe ſtems grow very ſmall red buttons or berries, which being ſqueezed, produce a poiſonous milk, which lighting upon any part of a horſe, or other beaſt, fetches off the hair from the ſkin immediately: of the dead part of this they made their fires all night. This plant is alſo univerſal over the iſland, and is happly, and as I conjecture, a kind of euphorbium.

IN ſome part of this iſland alſo there grows a crooked ſhrub, which they call Legnan-vell, which they bring for *England* as a ſweet wood. There are likewiſe apricots, peaches, and in ſtandards, which bear twice a year: pear-trees alſo which are as pregnant; almonds of a tender ſhell, palms, plantanes, oranges and lemons, eſpecially the pregnadas, which have ſmall ones in their bellies, from whence they are ſo denominated. Alſo they have ſugar-canes, and a little cotton and colloquintida; the roſes blow at Chriſtmas; there are good carnations, and very large, but tulips will not grow or thrive there: ſampier clothes the rock in abundance, and a kind of clover the ground. Another graſs growing near the ſea, which is of a broader leaf, ſo luſcious, as it will kill a horſe that eats of it, but no other cattle. There is alſo an herb which they make thread of. Eighty ears of wheat have been found to ſpring from one root, but it grows not very high; the corn of this is tranſparent and bright, like unto the pureſt yellow amber; and one buſhel has produced 130 in a ſeaſonable year.

THE canary-birds (which they bring to us in *England*) breed in the barrancos of gills, which the water has fretted away in the mountains, being places very cold. There are alſo quails, partridges larger than ours, and exceeding beautiful; great wood-pigeons, turtles at ſpring, crows; and ſometimes from the coaſts of *Barbary* appears the falcon. Bees are carried into the mountains, where they proſper wonderfully.

THEY have wild goats on the mountains, which climb to the very top of the *Pico* ſometimes.

ſometimes. Alſo hogs, and multitudes of conies: camels are brought from *Lancerote*, beſides other cattle.

Fish. The cherna, a very large and excellent fiſh, better taſted than any we have in *England*. The mero, dolphin, ſhark, lobſters without the great claws, muſcles, periwinkles, and the clacas, which is abſolutely the very beſt ſhell-fiſh in the world; they grow on the rocks, five or ſix under one great ſhell, through the top whereof they peep with their nebs, from whence (the ſhells being broken a little more open with a ſtone) they draw them forth. There is likewiſe another fiſh like an eel, which has ſix or ſeven tails of a ſpan in length, united to one head and body, which is alſo as ſhort. Beſides theſe they have turtles and cabridos, which are preferable before our trouts.

The iſland is full of ſprings of pure water, taſting like milk; and in *La Laguna*, (where the water is not altogether ſo limpid and clear) they percolate it through a kind of ſpungy ſtone cut in form of a baſon.

The vines which afford thoſe excellent wines, grow all about the iſland, within a mile of the ſea; ſuch as are planted farther up, are nothing eſteemed, neither will they thrive in any other iſlands.

For the Guanchios, or the ancient inhabitants, Dr. *Pugh* gives this full account.

September 3. about twelve years ſince, he took his journey from *Guimar*, a town inhabited for the moſt part by ſuch, as derive themſelves from the old Guanchios, in the company of ſome of them, to view their caves, and the bodies buried in them. This was a favour they ſeldom permit to any, (having in great veneration the bodies of their anceſtors, and likewiſe being moſt extremely againſt any moleſtation of the dead) but he had done many ſeveral eleemoſinary cures amongſt them, (for they are generally very poor, yet the pooreſt thinks himſelf too good to marry with the beſt Spaniard) which endeared him to them exceedingly, otherwiſe it is death for any ſtranger to viſit thoſe caves or bodies.

These bodies are ſewed up in goat-ſkins, with thongs of the ſame, with very great curioſity, particularly in the incomparable exactneſs and evenneſs of the ſeams; and the ſkins are made very cloſe and fit to the bodies: moſt of theſe bodies are entire, the eyes cloſed, hair on the head, ears, noſe, teeth, lips, beard, all perfect, only diſcoloured, and a little ſhriveled; likewiſe the pudenda of both ſexes. He ſaw about three or four hundred in ſeveral caves, ſome of them are ſtanding, others lye on beds of wood, ſo hardned by an art they had, (which the Spaniards call *curar*, to cure a piece of wood) which no iron can pierce or hurt. He ſaid, that one day being a hunting, a ferret (which is in uſe there) having a bell about his neck, ran after a coney into a hole, where they loſt the ſound of the bell; the owner being afraid he ſhould loſe his ferret, ſeeking about the rock and ſhrubs, found the mouth of a cave, entring in, was ſo affrighted, that he cried out: it was at the ſight of one of theſe bodies, very tall and large, lying with his head upon a great ſtone, his feet ſupported by a little wall of ſtone, the body reſting on a bed of wood, as before was mentioned.

The fellow being now a little out of his fright, entered in, and cut off a great piece of the ſkin, that lay on the breaſt of his body, which the doctor ſays was more flexible and pliable than ever he felt any kid leather glove, and yet ſo far from being rotten, that the man made uſe of it for his flail many years after.

These bodies are very light, as if made up of ſtraw: and in ſome broken limbs, he obſerved the nerves and tendons, and alſo ſome ſtrings of the veins and arteries very diſtinctly.

His great care was to enquire of theſe people, what they had amongſt them of tradition, concerning the embalming and preſervation of theſe bodies? From ſome of the oldeſt of them (above a hundred and ten years of age) he received this account: that they had of old one particular tribe of men, that had this art amongſt themſelves only, and kept it as a thing ſacred, and not to be communicated to the vulgar; theſe mixed not with the reſt of the inhabitants, nor married out of their own tribe, and were alſo their prieſts and miniſters of religion: that upon the conqueſt of the Spaniard, they were moſt of them deſtroyed, and the art loſt with them, only they held ſome traditions yet of a few ingredients, that were made uſe of in this buſineſs.

They took butter of goat's milk, (ſome ſaid hog's greaſe was mingled with it) which they kept in the ſkins for this purpoſe; in this they boiled certain herbs; 1ſt, A ſort of wild lavender, which grows there in great quantities on the rocks. 2dly, An herb called jara, of a very gummy and glutinous conſiſtence, which now grows under the tops of the mountains only. 3dly, A kind of a cyclamen, or ſow bread. 4thly, Wild ſage growing plentifully in this iſland. Theſe, with ſtones bruiſed and boiled in the butter, rendered it a perfect balſam. This prepared, they firſt unbowelled the corps; and in the poorer ſort, to ſave charges, they took out the brain behind: and theſe poor alſo were ſewed up in ſkins with the hair on, whereas the richer were (as was ſaid before) put up in ſkins ſo finely and exactly dreſſed, as they remain moſt rarely pliant and gentle to this day. After the body was thus ordered, they had in a readineſs a lixivium, made of the bark of pine-trees, with which they waſhed the body, drying in the ſun in ſummer, and in ſtoves in winter, this repeating very often. Afterwards they began their unction with the balſam, both without and within, drying it again, as before: this they continue till the balſam had penetrated itſelf into the whole habit, and the muſcles in all parts appeared through the contracted ſkin, and the body became exceeding light; then they ſewed them

them up in the goat-ſkins, as already mentioned. He was told by theſe ancient people, that they have above twenty caves of their kings and great perſons, with their whole families, yet unknown to any but themſelves, and which they will never diſcover. Laſtly, he ſays, that bodies are found in the caves of the grand *Canaries*, in ſacks, and quite conſumed, not as thoſe in *Teneriff*. Thus far of the bodies and embalming. Anciently when they had no knowledge of iron, they made their lances of wood, hardened as before, ſome of which the doctor has ſeen: he has alſo ſeen earthern pots ſo hard, that they cannot be broken, of theſe ſome are found in the caves, and old barrancos, and uſed by the poorer ſort of people, that find them, to boil meat in; likewiſe they did curar ſtone itſelf, that is to ſay, a kind of ſlate now called tabona, which they firſt formed to an edge or point, as they had occaſion to uſe them, either as knives, or lancets to let blood.

THEIR food was barley roaſted, and then ground with little mills, which they made of ſtones, and mixed with milk and honey; this they ſtill fed on, and carried it on at their backs in goat ſkins.

To this day they drink no wine, nor care for fleſh; they are generally very lean, tall, active, and full of courage.

HE himſelf has ſeen them leap from rock to rock, from a very prodigious height, till they came to the bottom, ſometimes making ten fathom deep at one leap. The manner is thus.

FIRST, they tertiate their lance, (which is about the bigneſs of a half-pike) that is, they poiſe it in their hand; then they aim the point of it at any piece of a rock, upon which they intend to light, ſometimes not half a foot broad; at their going off they clap their feet cloſe to the lance, and ſo carry their bodies in the air; the point of the lance firſt comes to the place, which breaks the force of their fall; then they ſlide gently down by the ſtaff, and pitch their feet upon the very place they firſt deſigned, and from rock to rock, till they come to the bottom.

THEIR novices ſometimes break their necks in learning. He added ſeveral ſtories to this effect, of their great activity in leaping down rocks and clifts, and how eight and twenty of them made an eſcape from the battlement of an extraordinary high caſtle in the iſland, when the governor thought he had made ſure of them.

HE told alſo, (and the ſame was ſeriouſly confirmed by a Spaniard, and another Canary-merchant then in the company) that they whiſtle ſo loud, as to be heard five miles off; and that to be in the ſame room with them when they whiſtle, were enough to endanger breaking the tympanum of the ear: and added, that he being in the company of one, that whiſtled his loudeſt, could not hear perfectly for fifteen days after, the noiſe was ſo great.

HE affirms alſo, that they throw ſtones with a force as great as that of a bullet, and now uſe ſtones in all their fights, as they did anciently.

MR. *Sydenham* told me this day, that upon the 18th of *Auguſt*, he and his company began their journey toward the pike of *Teneriff*, ſetting out from *L'Oratava*, a town ſeated on the lower part of the mountain, from which town to the ſea there are three miles of way always deſcending.

HE began his journey on ſunday about 10 a clock at night, and travelled till five in the afternoon of the monday following, reſting two hours by the way; the ground was continually riſing, and during this time they travelled about 10 miles of their way upon mules.

RESTING upon monday till 12 a clock at night, they reſumed their journey, and travelled till about 9 in the morning, at which time they arrived at the top of the ſugar-loaf, or higheſt pile of the mountain.

THEY went up on the ſouth ſide of the hill, on which ſide there was no ſnow, though on the north ſide there were much. They ſtayed about two hours on the top of the ſugar-loaf, and then returned to that part of the hill, where they had lodged the night before.

I ASKED Mr. *Sydenham*, what was the eſtimate made by the moſt knowing perſons of the iſland, of the height of the hill? and he told me, that the guides accounted it to be one and twenty miles high from the town, which, as was noted before, is ſeated three miles above the ſea. And he added, that a ſeaman with great confidence affirming himſelf to have accurately enough meaſured by obſervations made in a ſhip, and to have found the perpendicular height of the hill to be about ſeven miles.

I ASKED him alſo from what diſtance the top of the ſugar-loaf could be ſeen at ſea, according to the common opinion of ſeamen? he anſwered, that the diſtance was wont to be reckoned threeſcore ſea-leagues, of three miles to a league, adding, that he himſelf had ſeen it above forty leagues off, and yet it appeared exceeding high, and like a bluiſh pyramid, manifeſtly a great deal higher than the clouds. And he alſo told me, that ſometimes men could from thence ſee the iſland of *Madeira*, though diſtant from it 70 leagues; and that the great *Canary*, though 18 leagues off, ſeemed to be very near them, as if they might leap down upon it.

HE told me, that the higher part of the region of ſnow was two miles, or two miles and a half lower than the foot of the ſugar-loaf; and that on the upper part of the hill they felt no wind.

MR. *Sydenham* told me, that being at the top of the ſugar-loaf, drinking the king's health, he endeavoured to ſhoot off a birding-piece he had carried up with him, but though he ſnapped it above twenty times, he could not make it go off; whereas when he came down into the ordinary air, the firſt time he tried to ſhoot, it went readily off. I aſked him, whether he had taken notice, that the flint

ſtruck

ſtruck out any ſparks of fire or no at the top of the hill, and whether he had mended and altered the flint coming downwards? To the firſt he anſwered he did not remember; to the other, that he remembered he did not.

He alſo told me, that having carried up a borracha of ſack, when they came to the top of the mountain, they drank divers healths very freely, but could not find themſelves heated, or ſenſibly diſcompoſed by the wind; whereas when they were come down into a thicker air, they manifeſtly felt the heady operation of the liquor, which then made their guide and one of their company drunk.

He deſcribed the ſugar-loaf to be in the midſt of a barren plain, in the upper part of the mountain, and to be exceeding ſteep. The top of the ſugar-loaf is made ſhelving inward almoſt like a diſh. But in many places of it there appear little holes (regularly placed) as it were ſo many little vents to a great fire burning in or below the bowels of the mountain. He told me, that the guide diſſuaded him from going to the middle of this ſhelving top, affirming it to be exceeding dangerous: but he ventured to thruſt the ſcouring ſtick of his gun ſomewhat deep and rudely into one of thoſe holes, from whence there aroſe a hot ſteam, which had like to have killed him, and hindred him from further trials. He added, that the top of the mountain ſeemed to be little elſe than ſtones and ſulphur, and that there were great ſtore of pieces of brimſtone, which are gueſſed to be ſublimed up from the internal parts of the hill.

Being aſked, whether he was ſick or no in the aſcent? he ſaid, that both he and all his company, which were about a dozen men, were ſick for three or four hours, when they came into the ſubtile and piercing air of the upper part of the mountain; but as they went down again, they were not ſick. And being aſked, what kind of ſickneſs it was they felt? he ſaid, it was like ſea-ſickneſs.

He told me, that the ſack they carried up with them to refreſh themſelves, ſeemed to them at the top of the mountain ſo very cold, that they were not able to drink above two or three drops at a draught, by reaſon of the operation of the exceſſive cold upon their teeth. He added upon my enquiry, that his feet were not more than ordinarily warm, and yet one of the two pair of pumps he carried up with him were burnt off his feet by the brimſtone.

When I aſked him about the difference of ſeaſons at the ſame time in the ſame mountain, he told me, that he paſſed over one of them by name.

On the one ſide of which it was exceſſively hot near the top or ridge, as well, though not quite ſo much, as in the lower regions on the ſide of the mountain; but within a mile or two on the other ſide of the ridge he found winter-weather, as to cold and ſtormineſs, and yet there was ſnow as well on the other ſide as on this.

To what depth the water will be frozen in hard winters.

To what depth the earth will be frozen in that ſeaſon.

Whether Muſcovian ice be conſiderably, or at leaſt ſenſibly harder than Engliſh ice.

Whether by caſting up water, or by ſpitting, the liquor will freeze before it comes to touch the ground.

Whether brandy, ſack, *&c.* will freeze in *Ruſſia*.

Whether inſtruments of iron and ſteel be much more brittle there than here.

Of the cracking of the timber in wooden houſes, and the cauſes of it.

Of the preſervation of fleſh, fiſh, herbs, eggs, *&c.* in hard weather.

Of the curing of thoſe whoſe noſe, cheeks, *&c.* are frozen.

Of the ſymptoms of thoſe, that are frozen to death.

Of the keeping of dead bodies.

TITLE XX.

Of the air in reference to light, its perſpicuity, opacity, reflections, refractions, colours, light, and lightning.

A very learned traveller affirmed to me, that having occaſion to reſide ſometimes on the *Riviera* or coaſt of *Genoa*, he had often obſerved, that from a high place he could both morning and evening clearly diſcern the iſland of *Corſica*, and ſometimes alſo other places in that ſea, though he could not ſee them at noon, how fair and clear ſo ever the weather was, when the ſun was in or near the meridian.

His late majeſty king *Charles* the ſecond, doing me one day the honour to diſcourſe about ſeveral marine obſervations, was pleaſed among other things to acquaint me with this rare phænomenon. He was one day walking upon the beach on the ſtrand, not far from *Dover*, to enjoy the freſh air, and the proſpect of the ſea, when caſually looking forwards to the verge of the viſible horizon, he was very much ſurpriſed to diſcover there a new coaſt, with riſing and falling grounds, newly, as it were, emerged out of the ocean, in a place, where no ſuch thing had been ſeen before. The ſtrangeneſs of this unlooked-for apparition made him ſuſpect ſomething of illuſion offered to his eyes by the beams of the ſun, that ſhone upon the neighbouring objects; wherefore he rubbed his eyes, and the new ſcene not vaniſhing, he called to his royal highneſs the duke of *York*, (who was preſent when his majeſty was pleaſed to make me the relation) and to ſome of the attending courtiers, that were neareſt at hand, to make them partakers and witneſſes of this delightful ſpectacle, which, after it had been gazed on a little while, did ſomewhat ſlowly diſappear, as if it had ſunk down again into the ocean. Of the cauſe of this rare phænomenon, I ventured to propoſe to the king this

conjecture: that the place, where it was ſeen, lying the ſame way that the coaſt of *France* did, and that coaſt being but a little too far off to be diſcerned before, it might very well happen, that either by action of the ſun, or rather by ſubterraneal ſteams, the air interpoſed between the ſhore and his majeſty's eyes was filled with vapours and exhalations, that made it much more refractive than formerly; and by help of this ſupervening refraction, the French coaſt, that lay beyond it was raiſed, and as it were lifted up, in reference to the ſight, and ſo became viſible as long as that new refraction laſted: and when the ſteams, that occaſioned it, were either got up too high, or were by the winds or ſun too much diſſipated or diſperſed, the apparition ceaſed, together with the unuſual refraction that cauſed it. And in favour of this conjecture I alledged that familiar experiment, in which a piece of gold, or the like convenient object, being put into the bottom of an empty cup, and the eye being ſo placed, that the object is but juſt hid from it by the interpoſition of the ſide of the cup, if water be poured into the veſſel, though neither the eye nor the object be at all removed, yet the piece of gold will be plainly ſeen, becauſe the ſurface of the water, which is a thicker medium than the air, breaking the rays, that tend from the object towards the beholder's eye, according to the laws of refraction, that is from the perpendicular they are ſo bended, that thoſe fall now into the pupil, that, if it were not for the water, would either fall upon the ſide of the cup, and ſo be hindered from paſſing forward; or elſe would fall upon the eye-lids or eye-brows, or ſome other part above the pupil, and ſo would not make the object viſible.

The duke of *York* was alſo pleaſed to tell me, that he was ſomewhat ſurprized, when being near the borders of *Scotland*, in a ſeaſon, that did not promiſe much fair weather, he ſaw one morning the ſky very red, and thereupon ſaid, that he feared they ſhould have foul weather, according to the uſual prognoſtick of countrymen and mariners: but ſome of the Scotiſh nobility, that attended his highneſs, told him, that in that country ſuch red mornings did not bode a foul day, but rather promiſe a fair one, which prediction of theirs was juſtified by the event. Upon which occaſion I enquired of a very intelligent Scotiſh nobleman, how far the obſervation held in his country? to which he anſwered, that with a due limitation it was moſt commonly true; for though when the redneſs ſeems to be very near the ground, and appears in ſomewhat narrow ſtreaks of an intenſed red, it ſignifies bad weather; yet if the morning redneſs appears elevated in the air or ſky, eſpecially if the wind be eaſterly, it uſually foretels a fair day.

Some obſervations of capt. James, *in his northern voyage, Mr.* J. T. *and others.*

February. I practiſed ſome obſervations by the riſing and ſetting of the ſun, calculating the time of his riſing and ſetting, by very true running glaſſes. As for our clock and watch, notwithſtanding we ſtill kept them by the fire-ſide in a cheſt, wrapped in clothes, yet were they ſo frozen, that they could not go. My obſervations by theſe glaſſes I compared with the ſtars coming to the meridian: by this means we found the ſun to riſe twenty minutes before it ſhould; and in the evening to remain above the horizon twenty minutes (or thereabouts) longer than it ſhould do: and all this by reaſon of the refraction. Captain *James.*

March. This evening the moon roſe in a very long oval alongſt the horizon.

April. The weather continued with this extremity until the fifteenth, at which time our ſpring was harder frozen than it had been all the year before. I had often obſerved the difference betwixt clear weather and miſty refractious weather, in this manner: from a little hill, which was near adjoining to our houſe, in the cleareſt weather, when the ſun ſhone with all the purity of air that I could conceive, we could not ſee a little iſland, which bare off us ſouth ſouth-eaſt ſome four leagues; but if the weather were miſty (as aforeſaid) then we ſhould often ſee it from the loweſt place. This little iſland I had ſeen the laſt year, when I was on *Danby* iſland. The 13th I took the height of it inſtrumentally, ſtanding near the ſea-ſide, which I found to be 34 minutes, the ſun being 28 degrees high. This ſhows how great a refraction here is. Yet may this be noted by the way, that I have ſeen the land elevated, by reaſon of the refractious air, and nevertheleſs the ſun hath riſen perfect round.

January 6. I obſerved the latitude with what exactneſs I could, (it being very clear ſun-ſhine weather) which I found to be 51, 52. This difference is by reaſon, that here is a great refraction.

January 21. I obſerved the ſun to riſe like an oval alongſt the horizon; I called three or four to ſee it, the better to confirm my judgment, and we all are agreed, that it was twice as long as it was broad. We plainly perceived withall, that by degrees as it got up higher, it alſo recovered roundneſs.

Attending upon Sir *Peter Wych*, in his journey for *Warſaw* the beginning of *June* $16\frac{59}{60}$, whilſt we lay about three Poliſh miles from the city, attending the preparations for his reception there, we had very clear and extreme cold weather; and for two days together we obſerved the ſun and two parhelions, or three ſuns, from above ten a clock to near twelve, not the leaſt cloud appearing in the air, but that ſo ſerene, that we took notice of the icy ſpangles in the air, flying about like atoms in the ſun's beams. This is alſo worth taking notice of; that whereas in ordinary frofty weather any ſmooth iron, or other metal, whether heads of ſticks, pomels of ſwords, or barrels of guns, being brought out of the open air into a warm room, there will preſently, firſt a dulneſs in the glaſs, and then drops of water appear: at this time

there would immediately appear the likeneſs of an hoar froſt. Now, whether the particles of cold be ſo ſubtile as to pierce or enter into poliſhed metal, I will not determine; though the experience of wetting one finger with his ſpittle, and forthwith laying it to iron, when it freezes hard, by its immediate adheſion, even in the moment of touching it, would make ſome way for the affirmative. That ſame month returning back from *Warſaw*, I ſaw, upon my journey, the ſun riſe with a large pillar, coloured like a rain-bow, perpendicular over it, out of a clear horizon; and I remember monſieur *Hevelius* told me, he obſerved it once ſet with the like, N.

In *Cornwall* they obſerve in their driving home levels or ſink, the waters do alſo manifeſtly partake of the minerals, for in ſome mines they are ſanative, where iron is obſerved; and in others apt to cauſe wounds to feſter and rankle. As the firſt was moſt manifeſt at *Karne-Key*, the latter at *Reliſtian*, both famous tin-works.

Asking of a chemiſt, that travelled with a famous virtuoſo of my acquaintance over part of the *Alpes*, that is ſaid to be much ſubject to thunders, divers queſtions about thunder, I had, among other anſwers, this, that he and my friend being together at the top of a forked mountain, between whoſe parts there lay a valley, that ſeemed almoſt covered with a thick cloud; and though the weather were clear at both the tops, he obſerved, that the ſubjacent cloud being big with thunder, the lightning appeared quite through it, and ſeemed to lye deep in it, ſo that caſting his eyes down upon the cloud, he fancied, that what he ſaw, was (to uſe his own compariſon) as if a ſhining fiſh were moving to and fro very ſwiftly in a ſomewhat troubled water. If I had ſeaſonably had the relation, I had enquired of my friend about it; but I was the more inclined to believe it, becauſe I remember, that paſſing over a part of the *Alpes*, leſs high than that where the recited obſervation was made, though it was very fair weather, and a clear ſky at the top of the mountain where we were, yet a great way beneath us we ſaw dark clouds, through part of which we afterwards in our deſcent were obliged to paſs, though then (whether part of the matter had been in the mean while diſcuſſed, I examine not) it ſeemed to us little different from a thick fog, which when we had paſſed thorough, we found the weather fair and clear enough to the foot of the mountain.

Meeting with an inquiſitive nobleman, that lived long at *Naples*, I aſked him, whether he had ever ſeen any of thoſe famous apparitions, that are ſaid ſometimes to ſhew themſelves in or near the *Sicilian* ſtreight, and is known by the name (if I miſtake not) of *Morgane?* to this he anſwered me, that during the ſpring-time, he had once the curioſity to try, whether this tradition had ſo much ground as was commonly believed; and that accordingly on ſeveral fair mornings he roſe before the ſun, and looked ſolicitouſly along the coaſt, without ſeeing any thing that anſwered his expectation: but not being diſcouraged by theſe diſappointments, he one morning perceived, as he thought, two ſteeples in a neighbouring town, where he knew there was but one; which phænomenon inviting him to continue his curioſity, he choſe the firſt fair and cloudleſs morning to riſe early on; and caſting his eyes towards the lately mentioned town, and the coaſt it was not remote from, he was ſurpriſed with a delightful proſpect of a new town beyond the other, and incomparably greater than it, and furniſhed, as it ſeemed to him and a doctor of phyſick that accompanied him, with walls and towers, and ſteeples and houſes, and other things, that were delightful, as well as wonderful to behold. But he anſwered me, that the colours were not near ſo lively as the figures, being for the moſt part ſomewhat dim, though adorned here and there with ſome redneſs: but this odd ſpectacle, as it was not invariable during the whole time it laſted, did not continue very long; for when the ſun was gotten up to ſuch a height above the horizon, as made his beams powerful, they quickly confounded all theſe airy ſtructures in a kind of chaos, and made the fantaſtick city vaniſh.

Moist vapours are not the only cauſe or ſign of the opacity of the air, ſince that dry blighting eaſt wind, which from the effects country people call a red wind, makes the air at a diſtance ſeem bluiſh and thick. This is the wind, which theſe two years laſt paſt has been ſo pernicious to apples, and indeed to all ſorts of trees, not only to blaſt the fruit, but the very leaves of ſuch trees as it met withal, juſt in the tender (as the woodmen call it) *i. e.* when they are newly expanded out of the buds. Mr. *J. T.*

That air is ſometimes more clear and tranſparent, and ſometimes more dark, and, as it were, muddy, being clogged and opacated with terreſtrial ſteams, is every man's obſervation. But there are ſome phænomena, that depend upon the denſity, diaphaneity, *&c.* of the air, that are not ſo vulgarly taken notice of: for beſides thoſe, that require ſkill in the doctrine of refractions, on which therefore I ſhall not now inſiſt; there are ſome others, that may be worth your notice, which I ſhall give a taſte of.

Considering the differing accounts, that are given by good authors, of the number of the fixed ſtars, and comparing them with ſome obſervations of our own, I was thereby, and upon ſome other grounds, induced to ſuſpect, that the differing and unheeded conſtitutions of the air might occaſion a difference in aſſigning the number of the ſtars; which made me enquire of ſeveral navigators and travellers, ſome into the torrid zone, and others into the frigid ones, what difference they found in contemplating the ſtars in thoſe climates, and in ours; and by this enquiry, I learned, that in ſome places, where the air is very pure, celeſtial obſervations may be more happily made. And particularly becauſe I

ſuppoſed, that intenſe cold, by precipitating the darkning vapours out of the air, may probably make it more defecate and clear, I deſired an ingenious phyſician, that travelled in *Muſcovy*, to take notice of any thing, that ſhould favour or disfavour this conjecture. In compliance with which requeſt of mine he informed me, that travelling one night in a ſled in the more mediterranean parts of *Ruſſia*, the weather being extraordinary cold, he was invited to quit his ſled a little to conſider the ſky, where he ſaw ſo many ſtars, and ſo much brighter than he had ever ſeen before, that he was almoſt as much ſurpriſed as delighted with ſo glorious a ſpectacle, which he ſhewed to ſome of his fellow-travellers, that ſhared in his wonder.

And this brought into my mind, that remembring, that the ingenious captain *James* being forced to winter in *Charlton* iſland, which, though but of the latitude almoſt of *Cambridge*, is but little, if at all, leſs cold than *Nova Zembla* itſelf, I ſhould probably find ſomething pertinent to our preſent ſubject in ſo diligent an obſerver. I reſorted to his voyage, where I met with theſe notable obſervations.

January 30 and 31, there appeared in the beginning of the night more ſtars in the firmament than ever I had ſeen before, by two thirds. I could ſee the cloud in cancer full of ſmall ſtars; and amongſt the Pleiades a great many ſmall ſtars. About ten a clock the moon did riſe, and then a quarter of them was not to be ſeen. The wind for the moſt part of this month hath been northerly, and very cold, *&c.* Captain *James*, p. 62.

The Ruſſian emperor's phyſician confirmed to me, by word of mouth, what he had ſome years ſince told me in a letter, that one night, which was exceeding cold and clear, being awakened out of his ſleep by a ſhake, that had like to have overturned his ſled, he looked out and ſaw more ſtars by far than ever he ſaw in *England*, or the neighbouring parts of *Europe*, and particularly, that he ſaw many about the ſeven ſtars, or the Pleiades, and divers others he had not ſeen before in ſeveral other parts of the ſky. He farther told me, that theſe ſtars ſeemed far more beautiful and bright than was uſual, inſomuch that he doubts not, that if it had not been for the ſnow, ſome of them would have caſt a diſcernible ſhadow. For confirmation, he ſaith, that the phænomena were not only taken notice of by him, but by others, that travelled with him; and that though he often gazed at the ſky, ſince that time he never could ſee there near ſo many ſtars, nor ſo bright.

December 4. I had not time the laſt week to tell you of ſomething, that to us, that have not been long in this country, ſeems ſtrange, but the people of this place ſay happens very often.

On the 29th of the laſt month, after I had written and ſent away my letters, looking out of the ducheſſes's window, to ſee what weather it was, I ſaw towards the N. E. alongſt the horizon, it looked as light, and juſt as if it had been break of day, (it was then about a quarter paſt eleven) and gave as great a light: I went then into the drawing-room, and looking out of that window, could look more northerly, and ſaw it was more light due N. and ſaw ſeveral ſtreaks of light, like the tail of a blazing ſtar, all pointing N. and S. one of which was as long or longer than that we ſaw laſt year, for it reached from the horizon, and paſſed between *Charles*'s wain and the N. ſtar, and reached up juſt over our heads. The ſmall ones ſometimes diſappeared; and then we ſaw others of the ſame dimenſions appear in other places; they were all near the great one; two of them ſeemed as if their light had come from the two guards in *Charles*'s wain; and when they vaniſhed, others appeared more ſouth. I went to the other ſide of the houſe, and ſaw that the light reached from the W. or W. N. W. by the N to the E. or E. N. E. I did not go out, becauſe it blew very hard, and was very wet, contenting myſelf to ſee it out of the houſe; but ſent *Geo. Man* up the hill, who ſaw the ſame, and it was ſo clear they could ſee the Frith.

About the new moon before, there was ſuch a light as this ſeen by lord *Belcarras*, as he came in the night from St. *Andrew*'s to his houſe, and by the ſeamen of the yacht at *Leith*, and by ſome here in town: but though the ſky was not then ſo clear, there being broken clouds, yet it gave ſuch light, as they could read very plainly, as they told me: that began about 7, and laſted till 9. This laſt I did not ſee till after 11, and at a quarter of 12 it began to leſſen, at which time I went to bed, and the tails were then no more to be ſeen. Tell Dr. *Flamſtead* of this, and know of him, whether he has ſeen or heard of ſuch kind of things.

This was from his royal highneſs the duke of *York*, then high commiſſioner in *Scotland*.

An intelligent gentleman, that lived in *Africk*, being aſked by me, how far off he was able to ſee the top of the *Pico* of *Teneriff* at ſea? replied, that by the eſtimate of the captain of the ſhip, it was near 50 leagues, and yet it appeared to him ſo high above ſome clouds, and ſo near, that he was fain to caſt his head up to ſee it.

TITLE XXI.

Of the operation of the air on the conſiſtency of animal ſubſtances.

As on the one ſide the ſchools teach the air to be a ſimple and elementary body, that is, only hot and moiſt; ſo on the other ſide, the generality of men are ſo accuſtomed to judge of things by their ſenſes, that not finding the air to be a viſible body, they aſcribe leſs to it than even the ſchoolmen do; and what is inviſible, they think to be next degree to nothing. And indeed both the one ſort of men and the other are wont to conſider the air only as a receptacle, that barely harbours the viſible and palpable bodies committed

mitted to it, or as it were depoſited in it, without acting upon them, unleſs it be perhaps a little upon the account of its manifeſt qualities, heat and moiſture. But for my part, who look upon the air under another notion, and think it may as well alter as receive the bodies, that lye expoſed to it; I am apt to allow it, in reference to ſome bodies, certain other faculties and powers, among which ſome may be called generative and maturative, and others corruptive; and this not only in reſpect of animals and other bodies of a ſlighter texture, but even of ſalts and minerals themſelves.

An obſerving man, that had ſailed to and fro between *Europe* and the *Eaſt-Indies*, anſwered me, among other things, about their way of tranſporting cheeſe; that the cheeſe they uſed to take along were *Cheſhire*, of a very conſiderable thickneſs, which they incloſed in leaden boxes fit for them, and thereby were able to preſerve them ſound till they came to the *Eaſt-Indies*. But in caſe they were not able, or neglected to make uſe of ſuch boxes, he ſeveral times obſerved, that cutting a cheeſe in two, when they were any thing near the equinoctial, that moſt part of it would be very dry and brittle, and ſeemed as if it were ſpoiled; whereas the parts about the middle were ſo fat and ſoft, as if all the unctuous parts, that were wanting in the dried portion of the cheeſe, had retired thither, and was between cream and cheeſe. Which conjecture was not contradicted by this, that if they cut ſome of them cheeſes, when having left the torrid zone behind them, and had made a good progreſs in the temperate zone, they found their external portion good, and the conſiſtence of the cheeſe uniform enough.

Quere, whether the moiſt particles, that flie in the air, be not the great cauſe of all corruption of bodies, ſince *Acoſta* ſays, that in *Peru*, where it ſeldom rains, all things, like dead bodies, keep a great while uncorrupted? The like may be obſerved of *Egypt*, if it be not to be rather imputed to the nitrous ſalt, with which the air of that country ſo much abounds. Mr. *J. T.*

A man of letters, that divers times croſſed the line in great Portugal ſhips, anſwered me, that when they came near it and under it, he obſerved among other things, that there was a very manifeſt change made in the conſiſtence of their biſket; that moſt of their meat, and even their ſalt fiſh was much impaired, ſo that they were ſcarce able to eat it; and that their pilot, who had been 23 times in the *Indies*, aſſured them, he obſerved, when they came to the equinoctial, that freſh water would not there be at all troubled or ſtinking, but clear and ſweet, as if it were but newly put into the caſk.

Doctor *Stubbes* being enquired of by me concerning, *&c.* told me, that in *Jamaica* the ſilken ſtuffs, that were brought thither, will rot even whilſt they keep their colour, if they be ſhewn to the air; though if they be not ſhewed thereto, but kept up cloſe, they were not obſerved to rot, or be diſcoloured.

TITLE XXII.

Of the operation of the air on the conſiſtency of vegetable ſubſtances.

May 16. We opened a ſmall glaſs receiver ground to a plate of glaſs, in which there had been included for three years and ſome months, (though I know not how many) the half of a lemon cut tranſverſly, together with a mercurial gage: the lemon kept its colour pretty well, and its ſhape very well, ſave that at the orifice the upper part of the pulp was depreſſed, ſeeming as it were dried up by the receſs of the liquor contained in it; which liquor did now ſtagnate upon the glaſs plate. When this began to be diſjoined from the upper glaſs, there ruſhed in, not without noiſe, a pretty deal of external air, which argued, that the air afforded by the included lemon in ſo long a time, had not been near ſufficient to fill the cavity of the receiver. Neither the half lemon nor the liquor had any ill ſcent, or other ſign of putrefaction or corruption; neither of them had the leaſt mould, which gave me a ſuſpicion, as far as it could be grounded upon this experiment, that ſuch a mould, as might have been expected, being (as may be gueſſed by the microſcope) a congeries of a very ſmall kind of vegetables, could not, any more than many greater ones, be produced without the concurrence of the air. The liquor was clear enough, and without fæces, being in colour between brown and reddiſh. It contained an acid taſte; and when I put a little of it upon ſyrup of violets, it turned it to a purpliſh colour; and, which is more, being put upon ſmall fragments (not powder) of red coral, preſently began manifeſtly to corrode them, and that in the cold.

To the heat and piercing moiſture of the air combined together may be referred the obſervation of an intelligent ſcholar, from whom, when I aſked him, what he had taken notice of about theſe qualities, when he ſailed under or near the line, (which he did ſeveral times) he told me, that divers paſtils or lozenges, that he was wont to carry in his pockets, were ſo diſſolved, that they ſpoiled his pockets, and obliged him to cut them out; though the paſtils of the ſame kind did never loſe their old conſiſtence till he came near the equator, nor keep their new conſiſtence after he had paſſed ſome degrees beyond it, but grew ſolid again as before.

TITLE XXIII.

Of the operation of the air on the conſiſtency of mineral ſubſtances.

Inquiring of an ingenious Swediſh gentleman, that was a great dealer in the metals his country abounds with, whether the great cold of ſharp winters in thoſe northern climates had not a ſenſible operation upon iron;

iron; I learned from him, that in the chief copper mine (which he had curiouſly viſited) being to draw up the ore from an exceeding great depth, they faſtned their baſkets, not as they uſe in other mines, to iron chains, but to ropes made of ox or bull-hides; and that chiefly for this reaſon, that during the hard winter-froſts, that are there uſual, the links of their iron chains were very ſubject to be broken by the great cold joined to the weight of the ore, to the great danger, and oftentimes the deſtruction of the poor workmen, that were digging beneath: which inconvenience was avoided by employing leather, which the cold could not make brittle, inſtead of iron.

ASKING an ingenious maſter of a glaſs-houſe, whether he had not obſerved, that glaſſes, though as well nealed as is ordinary, would ſometimes of themſelves break with a noiſe long after; he anſwered me affirmatively; adding, that particularly having one time had an occaſion to lay by, for about half a year or longer, a numerous parcel of glaſſes, when he came to take them out, he found, that about a fourth part of the whole batch was frozen of themſelves; and that in moſt or all of them, the cracks proceeded from ſome ſeeming ſtone or great grain of ſand, which yet indeed was not ſand, but ſome part of ſalt, that had not obtained a ſufficient comminution.

A LEARNED gentleman, that is owner of an iron mine, informs me, that he has a houſe in *Suffolk*, within 6 miles of the ſea; and though the houſe be but 80 years old, yet the iron bars of the window, that look towards the ſea, are ſwelled, and (as he calls it) rotten, being brittle, and eaſy to be crumbled into powder. And when I aſked him, whether the wind, that came from the ſea to theſe windows, were not ſouthern, he anſwered affirmatively. And to confirm what I was ſaying of the operation of ſea-ſalt upon iron, he told me, that having had occaſion to cauſe many bars of iron to be laid in a place upon the neighbouring ſhore, above the high-water-mark, a great ſtorm chanced to increaſe the tide ſo far as to drench thoſe bars for ſome hours after; which remaining in the air, they were very much impaired, great thick flakes being eaſy to be ſtruck off from them, when they came to be hammered.

A VERY experienced maſon informed me, that the cathedral of *Saliſbury* is made of *Purbeck* ſtone, which in the air grows ſofter, and will moulder away; and ſo will ſome *Blechington* ſtone, though not expoſed to wet; whereas the ſtones dug up at *Painſwick*, within four miles of *Glouceſter*, being very ſoft and friable at firſt, will by lying in the air (as he has particularly obſerved) acquire a cruſt hard and glaſſy like marble; and the oftner it is waſhed, the ſooner will it acquire this hard and yellowiſh cruſt, which reaches but a very little way (ſcarce the thickneſs of half a crown) beneath the ſurface contiguous to the air.

TITLE XXIV.

Of the air in reference to fire and flame.

A GENTLEMAN of my acquaintance being aſked by me about the burning of candles in grooves (or ſutts) that are not furniſhed with air-ſhafts, he told me, that the depths I deſired to be informed of were very uncertain, and varied conſiderably, according to the different nature of the ſoil, and perhaps other circumſtances; ſo that ſometimes a candle will go out much ſooner, and ſometimes it would continue burning, though it were let down to the depth of eight, ten, or more fathom. That when they come into cloſe ground, though their candle will burn at firſt, yet after a while working, (more eſpecially if the ſtone be full of mundick) the duſt raiſed by their working will make their candles go out, ſo that they muſt leave working for a time, except they will be at the charge of conveying down air by pipes. I mention this as different from other ſorts of damps. *N.*

Experiments touching the relation between flame, air.

THE burning of candles, *&c.* under a glaſs bell.

THE burning of ſpirit of wine under a glaſs bell.

THE burning of match, touchwood, ſponck, *&c.* under a bell.

THE keeping of animals under the ſame inſtrument whilſt the flame is burning.

THE burning of bodies to aſhes in ſealed glaſſes.

THE doing the like in exactly cloſed receivers.

THE burning of cotton in a ſealed glaſs.

THE burning of the mixture of flames under water in an E. R.

THE burning of ſpirit of wine and oil of turpentine in glaſs veſſels with ſlender necks.

THE experiment of burning gunpowder.

ANOTHER of the piſtols not firing in an E. R.

THE burning of a ſaline ſubſtance in an E. R.

THE burning of mixtures of ſalt-petre in an E. R.

TITLE XXV.

Of the air in reference to fermentation.

WE took a ſmall handful of raiſins, and having put them into a bolt-head, (not large, but half filled with water) we drew out the air, and then we removed Novemb

the

the portable and exactly cloſed receiver, and put it on the digeſtive furnace, that the warmth of that place might promote the fermentation in ſpite of the unfavourableneſs of the ſeaſon of the year. After a while there appeared ſigns of fermentation by the emerging of the raiſins, which ſwam for ſome days on the top of the water, moſt of them beſet with numerous bubbles; nor did above very few of them ſubſide at laſt, though after ſome days the bubbles grew fewer and fewer, and there appeared a ſediment at the bottom of the glaſs.

A FORTNIGHT after they were firſt ſealed up, the upper part of the glaſs was accidentally broken whilſt I ſtood by, whereupon the external air ruſhed in with ſome noiſe: and I taking the veſſel in my hand, perceived the ſurface of the liquor to be overſpread with bubbles, almoſt like the froth of bottle-drink: there ſeemed to me to come out at the little orifice made, where the apex was broken off, a viſible fume, which had a ſomewhat languid ſmell. The liquor was high coloured of the raiſins, and ſeemed to have extracted ſomething from them, that gave it a better conſiſtence than that of water.

TITLE XXVI.

Of the air as the receptacle of odours.

TITLE XXVII.

Of the operation of the air on the odours of animal ſubſtances.

MAY 23. We opened an exhauſted receiver, wherein was pretty ſtore of verjuice, or green and ſour grapes. And though they had lain there, we are ſure, about three years, and poſſibly much longer, yet there appeared no mouldineſs at all upon any of them: but the ſurfaces of the uppermoſt grains were ſomewhat diſcoloured, perhaps by a ſaline and confuſedly formed efflorescence, which having looked upon through a glaſs, and alſo taſted, I gueſſed to be a kind of tartar. The like liquor, that the grains had afforded, had an acid taſte, and would in the cold corrode coral; but the grains ſmelled ſomewhat muſty. In all this time the verjuice had produced ſo little air, that we could ſcarce take notice of it by the mercurial gage, that had been ſhut up with it.

I INQUIRED of my lord of *Sandwich*, and a couple of gentlemen that accompanied him, whether it be true, which is reported of the purity of the air at *Madrid*, that though they have no houſes of office, but every night throw out their excrements into the ſtreets, yet by the next morning there remains no more ſmell of them. To which I was anſwered, that it was true the excrements were ſo diſpoſed of, but that *Madrid* is the ſtinkingeſt town they ever came into; yet that it was difficult to diſcern in the morning any peculiar ſmell of what had been caſt into the ſtreet by night: but they jointly affirmed, that the place, where the embaſſador's numerous family reſorted to make water in, did not ſmell of piſs; and that they often obſerved the dogs and cats, that lay dead in the ſtreets, were deprived of ſtench: and his lordſhip ſuppoſed, that the ſtench of a dead mule would in few hours vaniſh.

TITLE XXVIII.

Of the operation of the air on the odours of vegetable ſubſtances.

MAY 16. At the ſame time we opened another ſmall receiver, wherein above three years before ſome large pieces of orange had been included: the rinds of theſe were much diſcoloured, their ſurfaces being almoſt black. They had ſcarce afforded any liquor, and yet we could not perceive the leaſt mould in any of them, nor had they a putrid ſmell.

TITLE XXIX.

Of the operation of the air on the odours of mineral ſubſtances.

TITLE XXX.

Of the operation of the air on the taſtes of animal ſubſtances.

HE anſwered me, that they could very well preſerve meat, as beef, without ſalting it, as long as the froſt laſted, that is, during the whole winter. But when it was once thoroughly frozen, they could not dreſs it ſo as to make it reliſh like good meat. Mr. *Nickſon.*

TITLE XXXI.

Of the operations of the air on the taſtes of vegetable ſubſtances.

TITLE XXXII.

Of the operations of the air on the taſtes of mineral ſubſtances.

TITLE XXXIII.

Of the operations of the air on the colours of animal ſubſtances.

ENQUIRING of a man of letters, that had the curioſity to travel into the inland parts of *Braſil*, whether in that country the air had not a great influence upon the colours of clothes; he told me it had, and even upon black; inſomuch that a kind of black taffety, which is the uſual wear of the better ſort, will, after it hath been worn a very few days, degenerate into an ironiſh colour: yet he anſwered me, that in the ſhops, where it is carefully kept from the air, the taffety continued of a good black.

NOR is it only upon the colour of ſtuffs, but of animals too, that he ſays the Braſilian air has an operation; for he ſays, that at a place 50 leagues beyond *Parigua*, there is a region, where white People do in a very ſhort time grow baſannez (or tawny) though a little way out of that particular region, as for inſtance beyond it, they quickly recover their wonted colour,

HE told me, that upon *Charleton* iſland they have flocks of certain birds, which the Engliſh there call partridges, though they reſemble ours more in bulk than ſhape, being ſomewhat like wild pigeons, but a good deal bigger: theſe he ſays are white in the winter, and gray in the ſummer.

TITLE XXXIV.

Of the operations of the air on the colours of vegetable ſubſtances.

A LEARNED man, that was phyſician to the governor of *Jamaica*, being at his return aſked divers queſtions by me, concerning that iſland, gave me, among others, the following anſwer. Lignum vitæ, ſaid he, and moſt other trees at *Jamaica*, when they are newly cut down, wherever you cut the wood, that part, which is expoſed to the air, will quickly grow green, though that which is a little beneath it be yellow, or of another colour; and this lignum vitæ, when green, is as ſoft as oak, or ſofter; and many other *Jamaica* woods, that are ſoft, when newly cut down, will afterwards ſo harden in the air, that ordinary tools will make no impreſſion upon them; and the nails, that pierced them eaſily before, can no more be forced out of them; and this is chiefly conſpicuous in the cabbage-tree, which being a wood ſoft enough when it is cut down, the pith, which is very copious, will quickly rot of itſelf, and the reſt of the tree ſerves for a pipe of perhaps 100 foot long, that will not corrupt under ground, but grow almoſt as hard as iron.

ENQUIRING of an inquiſitive traveller, what he had obſerved about the power of the air, which I had been informed was great, in working upon divers bodies at the iſland of *St. Jago*; he told me, that he and his company had not ſtayed long enough there to make much obſervation of that kind; but, that ſeeing aloes growing plentifully there, they had gathered ſome plants of it, whoſe juice he found, as I have here in *Europe*, to be very clammy, and exceſſively bitter, and, which was wondred at, of a very dark colour; but having carried them in the ſhip towards the equinoctial, they found for a time the juice to be altered, having loſt almoſt all its bitterneſs, and acquired a green colour.

STAINS of linen will beſt go out at the time of the year, when the fruits or plants, whoſe juice made them, are in their prime: this a gentlewoman aſſured me ſhe had tried in new linen ſtained with juice of quinces; and the lady *N. N.* affirmed, that ſhe had particularly tried it in ſtains made with the juice of hops, which ſhe ſays are the worſt ſtains of all; and which having in vain tried to get out of her linen, ſhe laid up her linen in her cheſt, and at the time of the year, when hops flouriſh, ſhe found the ſtains vaniſh of themſelves.

TITLE XXXV.

Of the operations of the air on the colours of mineral ſubſtances.

A CONSIDERABLE inſtance of the changes, that the contact of air is able to produce even upon ſolid minerals, I gave thoſe, that ſaw it, by the following experiment. We took one part of lapis calaminaris, and about four parts of good ſalt-peter; theſe being well powdered and mixed, were put into a ſtrong crucible, and kept in a vehement fire ſome hours, by which means the matter, as we expected, was alcalized: upon the thus prepared lapis calaminaris we poured a convenient quantity of fair water, which afforded us a ſolution, that was ſomewhat muddy, but appeared of a deep red: this we poured into a wide-mouthed glaſs, which we ſet in a window, that it might be the more acceſſible to freſh air. There, after a while, our darkiſh red ſolution turned quite green, and more diaphanous than before; but, continuing for ſome days to keep the glaſs in the ſame window (which reſpected the ſouth) we found our green ſolution to loſe its colour by degrees, and at laſt to be reſolved into a tranſparent liquor, and a ſubſiding powder, that was not at all green, but red, or like brick-duſt. Theſe

changes

changes of colour ſucceeded in more than one parcel of our mineral ſolution.

We took a very ſtrong ſpirit of vinegar, and boiled it a while on crude filings of copper, without finding, that it was manifeſtly coloured by that operation, nor yet by letting it lye ſome hours in the ſame glaſs egg, wherein it had been boiled. Wherefore, ſuppoſing this want of coloration to depend upon the air's not co-operating in the beſt manner it might eaſily be made to do, we poured the liquor and the filings together into a broad flat glaſs (which we placed in a window ſhelving) ſo that though the filings were wet, yet but one part of them was covered to any depth by the menſtruum. This done, we obſerved, as was expected, that the filings, expoſed to the air, changed colour, and became of a greeniſh blue; whilſt thoſe, that were under the liquor, manifeſted no change of colour, but kept that, which belongs to copper, till the menſtruum evaporating by degrees, they alſo being acceſſible to the air, acquired the ſame colour with the former vinegar. Q. Whether in a longer time the coloration would not have been made?

We took ſome filings of copper, and divided it into two parcels; one we put into a flat and ſhallow glaſs with a wide mouth, and the other into a glaſs vial, whoſe neck was of the breadth uſual to ſuch veſſels. Upon each of theſe parcels of filings we poured a convenient quantity of one and the ſame ſtrong ſolution of ſal armoniac made in fair water, and without covering each of the veſſels, let them ſtand by one another for a competent time. Of which trial the event was ſuch as was expected; namely, that the liquor in the vial was but faintly coloured, when that in the open glaſs, that had a large ſurface expoſed to the free air, was very richly tinged. And this circumſtance is not to be forgotten, that whereas all the lower part of the ſolution was of a deep blue, almoſt like ultra-marine, that part, which was contiguous to the air, was covered over with a kind of film like thin ice, which was of a very differing blue, exceeding like that of the finer ſort of turquoices.

We took two ſmall parcels of filings of copper, and put each of them into a ſmall piece of paper, with the edges turned upward, and then put upon each of them three drops of good ſpirit of ſal armoniac. One of theſe papers we left in the window; the other we put into a ſmall receiver, which, by help of our engine, was emptied in little more than a minute of an hour. At the end of two minutes, after the putting on of the ſpirit, there appeared a manifeſt blue on ſome parts of that paper, that was left in the window; but that, which was in the exhauſted receiver, being deprived of the air, that ſhould befriend its operation, continued there full a quarter of an hour or more (by a minute clock) without appearing to be at all coloured: wherefore taking off the receiver, we removed the paper to the ſame window, where the other ſtood, and within about two minutes it began to diſcloſe a blueneſs, which within about two minutes more was conſiderably heightned.

Into a ſlender vial, wherein we put a convenient quantity of the volatile or urinous ſpirit of the lees of wine (elſewhere by us deſcribed) which was of a yellow colour, we let fall ſome filings of copper; and ſtopping the glaſs well, we drew a tincture, which according to expectation was manifeſtly green, but not of the pleaſanteſt and moſt tranſparent ſort of green liquors: then ſuffering the vial to reſt in a window for many days, we obſerved, that the liquor did then but ſlowly return to a yellow colour, which when it had acquired, without any mixture of greenneſs, we opened the vial for a very little while to let in the air, and then ſtopped it well again; the admitted air quickly began to change the ſurface of the liquor into a green colour; which, though ſlowly, extended itſelf downwards, till it had tinged the whole liquor. This colour afterwards, by long ſtanding, did by degrees grow to a pale yellow.

The 19th of *Auguſt* preſented me with ſome phænomena, that made me almoſt deſpair of reducing all thoſe of our variable liquors to a ſettled theory. For coming that day at about ten a clock in the forenoon to a cloſet, where I kept ſeveral vials furniſhed with this liquor, I perceived one of them, that ſtood in the window, that had once almoſt quite loſt its colour, to have re-acquired a very fair blue, at leaſt as deep as that of the ſky in a fair day. This vial I the rather watched, becauſe I had taken notice, not without ſomewhat wondring at it, that for two days before, inſtead of loſing, according to cuſtom, the little remains of colour, that after many days ſtanding is yet retained, the colour began again to increaſe, though the vial were conſtantly kept ſtopped as before; and that, which made this regaining of the colour ſeem more ſtrange, was, that there ſtood juſt by it another vial furniſhed with the ſpirit, and with filings taken out of the ſame parcels, yet the liquor of this parcel continued colourleſs. Wherefore, ſuſpecting, that ſome accident might have happened, whereby ſome little portions of air might have inſinuated themſelves thorough the cork of the altered liquor, I caſt up my eyes to another vial, that ſtood in ſo high a place, that it was not eaſy to reach it, and where it had long reſted, and loſt its colour: but upon this view I was confirmed, that the change lately mentioned in one of the vials was not from the cork, but from ſome unobvious cauſe: for though this upper vial was furniſhed with a good glaſs ſtopple; yet the liquor it contained was again grown cæruleous, though the liquor of another vial, that ſtood juſt by it, continued colourleſs. Wherefore, to ſatisfy myſelf farther, I preſently went to a private place, where I had in a cavity made in the thickneſs of a wall ſet aſide two vials, that ſeveral days before had quite loſt their colour; and my former ſurprize was increaſed, when I found that one of them, which was ſtopped with a cork, continued colourleſs; yet the other that had a glaſs ſtopple, and ſtood juſt by it, had regained a fair

cæruleous colour. Both theſe were fitted for trial, with the ſame ſpirit and filings, and the ſame day with the others abovementioned; and the heat of the weather had ſo little influence upon this effect, that this day was remarkably cold, being made ſo by a northern wind, which made me obſerve it more ſo than I had found it for ſome time before.

I MUST not forget on this occaſion, that I was invited by the foregoing phænomena, to look upon ſome ſpirit, not oil of amber, that I had kept in a vial for ſeveral days upon filings of copper, and had ſometimes expoſed to the air by unſtopping the glaſs, and found, that though formerly the ſpirit kept its native colour better than I deſired, yet it had acquired a green colour, which whether it will loſe again by longer ſtanding, time muſt determine.

THE ſlender vial, with ſpirit of honey, mentioned N°. the though it had been wont to exchange its yellow colour for a blue, by the contact of the external air in a very ſhort time, and ſometimes within a minute or two; yet being opened this afternoon, in the ſame place where it uſed to be ſo, did not in above an hour's time turn blue, but remained a tranſparent yellowiſh colour.

THE vial, with a glaſs ſtopple, mentioned N°. 945. being for divers weeks left unſtirred in the window where it ſtood before, I ſeveral times obſerved it to loſe and regain colour; and though ſometimes it would only appear of a more faint or a more rich blue, yet ſometimes alſo it would appear either quite or almoſt colourleſs, and, perhaps, in a day or two after it, would be again as blue as the ſky. And this, though I could not find, that any thing in the weather was the true cauſe of this change, ſince the liquor would not only gain, but loſe colour in colder weather; and ſo it would alſo do in warmer: but on Michaelmas day I found it to have attained a deep blue; and though ſince it has been now and then ſomewhat more dilute, yet during all the paſt month of *October*, I remember not to have ſeen it any thing mere colourleſs; and this day being the firſt of *November*, I found it to have reſumed a high colour, though a vial with a glaſs ſtopple, which had for many weeks ſtood juſt by it, and formerly did divers times correſpond with it in its changes, has continued all the laſt month of a very pale blue, without either deepning its colour, or growing quite colourleſs.

AN inquiſitive gentleman of my acquaintance, being aſked by me about a mountain in *Wales*, called where ſolid ſtones are ſaid to change their colour very oddly, told me, that within ſight of that hill, in a large piece of ground, that was then newly put under tillage, he ſaw good numbers of ſtones that looked like flints, and were full as hard, if not harder; the colour of moſt of them was dark, the reſt gray: theſe ſtones, which, when the ground was newly turned up, were ruſt-coloured, he obſerved afterwards to grow lighter and lighter coloured; ſo that after three or four years, being invited by this obſervation to take notice of it at his coming to that place again, he found theſe ſtones almoſt all of them turned white. About which phænomenon, queſtioning the ancient inhabitants, with ſome expreſſions of wonder, they ſeemed to make little of it, and aſſured him, in the neighbouring mountain, almoſt all the ſtones, that were expoſed to the air, underwent the like changes, and within a few years were blanched.

HAVING put ſome *mercurius ſublimatus dulcis*, and *vitriolum Romanum* (tied up in ſeveral papers apart) into one box, at the end of twenty two months I found the ſublimate mercury wholly changed into a ſubſtance ſo like antimony, that ſome not ignorant of the *materia medica* have taken it for the ſame; and the ſuperficies only of the vitriol had acquired the ſame colour, but was not at all altered within. This from a credible relator.

TITLE XXXVI.

Of the air deſtroying or introducing other leſs obvious qualities into animal ſubſtances.

TITLE XXXVII.

Of the air deſtroying or introducing other leſs obvious qualities into vegetable ſubſtances.

AN intelligent gentleman, that ſtayed a year in *Guinea*, related to me, that he and his company found the great heat and moiſture of the air to diſpoſe bodies ſo to putrefaction, that he obſerved the white ſugar to be ſometimes full of maggots; and found, that divers drugs, ſalves, and other medicinal things that were brought with him, had quite loſt their virtue; and ſome of them, eſpecially ointments, were verminous. And he added, that in the iſland St. *Jago* (one of thoſe of Cabo-verde) they laid ſtore of ſweetmeats upon tables to the heat of the ſun, to dry up the ſuperfluous moiſture, which in ſtrange abundance they had contracted the preceding night, which otherwiſe would quite ſpoil the ſweetmeats, and bring them to putrify.

OXFORD, though ſeated for the moſt part of it on a gravelly hill, I have known to be very diſagreeable to ſome moiſt ſplenetick and valetudinary bodies, whom I have heard complain, that they could not be ſo well there as elſewhere, eſpecially in the ſpring; ſo that I take the air of that place to be generally moiſt. Mr. *J. T.*

AIR too dry, though ſufficiently hot, is not favourable for the production of divers inſects; for I have obſerved theſe two laſt dry ſprings, that there have been no ſoft garden-ſnails to be found abroad, and very few fleas bred

bred in the houſe, which I impute to extraordinary long drineſs of the air, for want of moiſt vapours to nouriſh them; ſince in wet ſummers we always ſwarm with ſnails, gnats, fleas, &c. whereas this year we have few or none.

TITLE XXXVIII.

Of the air deſtroying or introducing other leſs obvious qualities into mineral ſubſtances.

Zwelfer, pag. 800. *OBSERVANDUM etiam, quòd antimonium diaphoreticum quocunque modo, ſive cum ſolo nitro aut addito etiam tartaro, paratum ſit, tractu temporis aeri expoſitum pravam & quaſi malignam induat naturam, ſumptumque intra corpus cordis anguſtias, cardialgias, lipothymias, vomituſque, & ſimilia prava ſymptomata procreet, quæ facilè tamen evitabimus, ſi vel ſingulis diebus vel tribus menſibus recenter illud conficiamus, vel jam paratum antimonium diaphoreticum vetuſtum, additâ portiunculâ nitri, aut etiam abſque nitro, per unam vel alteram horam Vulcano tradamus, penituſque ighiamus, iterumque, ſi nitrum additum fuerit, edulcoremus, & parumper reverberemus.*

Purchas's 2d part, *lib.* vi. *cap.* 8. A vulgar experiment generally affirmed, as by *Alpinus in Med. Egypt. lib.* iv. *cap.* 8. who long lived here upon the teſtimony of *Paulus Moucilus*, the French conſul, *Baptiſtæ Elianus* a Jeſuit, and *John Varot* an Engliſhman.

To prove, that it proceedeth from a natural cauſe, this one, though ſtrange, yet true experiment, will ſuffice. Take of the earth of *Egypt*, adjoining to the river, and preſerve it carefully, that it neither come to be wet nor waſted; weigh it daily, and you ſhall find it neither more nor leſs heavy until the 17th of *June*, at which day it beginneth to grow more ponderous, and augmenteth with the augmentation of the river, whereby they have an infallible knowledge of the ſtate of the deluge, proceeding, without doubt, from the humidity of the air, which having a recourſe through all paſſible places, and mixing therewith, increaſeth the ſame as it increaſeth in moiſture.

A LEARNED phyſician of the college of *London* confeſſed to me, that he found by his own obſervation, that antimonium diaphoreticum, being kept ſome years, though in a covered veſſel, acquired a vomitive quality, which it had not before; and that having long kept in a ſtopped glaſs a parcel of his own ceruſs of antimony, of which he uſed to give 12, 15, or more grains, without finding it emetick; he found, that in proceſs of time it was ſo degenerated, that when he gave four or five grains, it would cauſe vomits.

EARTH laid up together in the air, for four, five or ſix years, does make far better pots for cloſeneſs, and holding of the fire, than that, which has lain but one ſeaſon above ground, though that itſelf be much better than that, which is newly dug up, which will be very apt to crack in the fire, or when it comes to wet; as alſo thoſe bricks, that lye at the top of the furnace, and therefore are not ſo thick covered as they burn, and are apt to deceive builders, when they come to be expoſed to the rain and weather.

TITLE XXXIX.

Of the air in reference to the propagation and vegetation of plants.

AN ingenious traveller, that frequented the Pyrenean mountains, eſpecially that, which many count the higheſt of them, and is known by the name of *Pic de Midi*, affirmed to me, that he, as well as ſeveral others, had manifeſtly obſerved a ſcarce credible difference between that ſide of thoſe mountains, that regards *France*, and that, which reaches to *Spain*; for at the ſame time the former was verdant and flouriſhing, and yielded a delightful proſpect to the traveller, as well as plentiful proviſions to the inhabitants; the Spaniſh ſide of the hills was parched, and ruſſet, and barren, and looked diſmally, like a wilderneſs: which great difference of countries, obſervable in the ſame hills at the ſame time of the year, he imputed to the fierce parching, and ſometimes blaſting winds beat upon the Spaniſh ſide, and made that look ſo ſqualid, whilſt the hills, that ſuffered this miſchief on one ſide, did by their height check theſe hurtful winds, and ſkreening from them the French ſide of the mountains, left them to enjoy advantages, that the ſoil and climate furniſhed them with.

TITLE XL.

Of the air in reference to the generation, life, and health, of animals.

DE vitâ igitur ac morte, & iis pene omnibus, quæ huic conſiderationi affinia ſunt, dictum eſt. De ſanitate verò morboque non ſolum medici, ſed & phyſici eſt, cauſas quadantenus referre. Quatenus verò hi differant, & quatenus diverſa contemplantur, ignorare non convenit. Equidem quòd confinis ſit quadantenus hæc medici phyſicique tractatio, & res ipſa teſtatur. Nam & medici, quicunque paulò elegantiores & diligentiores ſunt, de natura dicunt, & artis ſua principia inde ſumere dignantur; & phyſici omnes fere, qui concinnitatis aliquid habent, tractationem naturæ uſque ad medicinam perſequuntur. *Ariſtot. de Reſpirat. cap.* 21. & *parag.* 87.

AUGUST 13. The temperature of the air, both as to ſalubrity and other regards, may be derived as well from the ſubterraneal ſteams, as the ſuperficial effluviums of the earth, and both theſe ſorts of ſteams being variouſly tranſported and ſhuffled, and compounded by the winds and other motions of the air, upon the mixtures of them, the local qualities of the air, in differing places, may be ſuppoſed to reſult.

ABOUT three months before the late great plague began in *London* (in the year 1665) there came to Dr. *M.* a patient of his, to deſire his advice for her huſband; and the doctor having inquired what ailed him, ſhe anſwered,

ſwered, that his chief diſtemper was a ſwelling in his groin, and upon that occaſion added, that her huſband aſſured her of his being confident, that the next ſummer the plague would be very rife in *London*: for which prediction he gave this reaſon, that in the laſt great plague he fell ſick of that diſeaſe, and he then had a peſtilential tumour; ſo in two other plagues, that ſince happened, though much inferior to that great one, each of them had a riſing in his body to be its forerunner; and now having a great tumour in the forementioned place, he doubted not but it would be followed by a raging peſtilence, which accordingly enſued. Having heard much talk of ſomething of this nature, as related by the doctor, I enquired of him how much of it was true, and received for anſwer the foregoing narrative.

You did not perhaps expect, that the mere local motion of the air ſhould be mentioned by me among the cauſes of the effects of its changes: and indeed the phænomena I have yet met with reducible to this kind have been but very few, notwithſtanding which I ſhall take notice, that this local motion may in certain caſes operate on other bodies, either as it turns the air into a wind, or as the tremulous motion of the air is modified into ſound, or as the air is put into a vehement and diſorderly motion by thunder.

As to the firſt of theſe it is evident, that upon the vehemence or ſlackneſs, and the places whence and where the changing wind happens to blow, there may divers effects enſue, eſpecially in animated bodies. And this not only as the wind is accompanied with cold and heat, or moiſture, or drineſs, but (to reſtrain ourſelves to inſtances more cloſely pertinent to our preſent purpoſe) as the wind is flowing air, or an aereal ſtream, for only as ſuch it may ventilate the places, through which it paſſes, and by expelling the ſtagnant air, and introducing other air, may contribute to many of thoſe changes (eſpecially as to the health of animals) that we ſee to depend upon the alteration of air, and perhaps among the more tender ſort of animals, there may be found ſome, in which the motion of the external air, though excluded by walls and windows, may have a conſiderable and immediate operation: for I have learned by enquiry from ſome curious natives of *Languedoc* (where I had the curioſity to look after ſilk-worms, abounding in that province) that in caſe it happened, when the worms having eaten their fill began to diſpoſe themſelves to work their ſilken eggs; in caſe, I ſay, it then happened to be thundering weather, a great part of the worms, eſpecially the leſs vigorous, would be deſtroyed.

He affirmed to me, that in ſome mines of above a thouſand foot deep, he ſaw horſes, that had been let down by ropes to the third part of the depth, that is above a hundred yards; and that ſeveral of them died either in the letting down, or by the change of the air; yet ſeveral of them ſurvived, and were employed about the engines belonging to the mines, and ſeemed not to have any ſenſible inconvenience as to reſpiration, though in the receptacles they wrought in, they were furniſhed with air but from the groove, through which they were let down, and by a moderately big ſhaft.

An ingenious traveller, that has had the curioſity to viſit the mines of ſeveral countries, as *Bohemia*, *Saxony*, *Swedeland*, *&c.* anſwered me, that the deepeſt mine he ſaw in *Bohemia* was of about 2000 of our feet.

An intelligent perſon, that was for many years conſul of the Engliſh nation at *Tripoli* in *Barbary*; and at another time governor of the caſtle (called) of the Coaſt, belonging to the Engliſh African company in *Guinea*, being diſcourſed with by me, about the diſeaſes incident to that very unhealthy place, and about the worms, that bred in men's legs, told me, that the great noxiouſneſs of the air was not conſtant, but frequently ceaſed, and returned within no long compaſs of time; inſomuch that all his men would continue in health for many days together, and then on a ſudden divers of them would fall ſick, eſpecially of fevers and fluxes, that uſually killed them in forty eight hours or leſs.

Dr. *C.* chief phyſician to the Ruſſian emperor, confirmed to me, that being in *Ruſſia* in the winter, when the froſt was very hard, and the eaſt or north-eaſt wind blew cold, if he turned his face toward the wind, and walked againſt it, (which at other times he was wont, and took a delight to do) he found himſelf unable to fetch his breath, and almoſt ſtifled, as if the air were very thick, or rather a great ſtiffneſs brought upon the organs of reſpiration, whereby he was unable to move them as at other times, ſo that he was fain to turn his head from the wind, that he might be able to fetch his breath.

An obſerving perſon being aſked about a tradition of ſeamen, that the lice of Europeans die when the ſhips paſs the line; anſwered me, that he did not find it to be true, as it is wont to be delivered; but this he plainly obſerved in ſeveral of our Engliſh, with whom he ſailed, that all the lice quitted their bodies, and got up into their heads, whence they diſperſed themſelves again, when the ſhip had left the equator a pretty way behind it.

But I remember, that another acquaintance of mine, that divers times paſſed the equinoctial in Portugal ſhips, which uſed to go to the *Indies* well crowded with people, many of them more poor than cleanly, anſwered me, that he had heedfully obſerved thoſe people's numerous lice to die away as they croſs the line, though in no long time after the ſame ſort of cattle would begin to moleſt them again.

His royal highneſs the duke of *York*, at his return out of *Scotland*, having been pleaſed to diſcourſe with ſome of us, that had the honour to be then near him, of ſome obſervations he made in his journey, mentioned among other things, that agues were very unfrequent in *Scotland*, which yet that year were very rife over almoſt all *England*. This gave

me

me afterwards the curiosity to inquire of a studious person, who is one of the chief of the Scotish nobility, what he knew about the unfrequency of agues in his country. To which his lordship replied, that as to quartan agues it was generally taken notice of, insomuch that when news was brought, that a gentleman, whom he named, fell sick of that disease, amongst them in the country it was looked upon as a strange and remarkable thing. And though divers persons bring quartans out of *England* to *Edinburgh*, yet they so seldom keep them long there, that a Scotish physician, whom he named to me, offered to lay five to one of the quick recovery of several patients of his, if they would make some reasonable stay in that city.

Roderici Fons. de Sanit. tuend. pag. 105, 106.

Aer autem corrigetur causa corruptionis ablata, & quod jam inductum est mali extinguendo: si igitur ex nimio humore aer putrescit, ignibus accensis, qui omni putredini remedio sunt, exsiccandus, sic ignes, per vias & domus fiant ex odoratis plantis, qualis Laurus est, Myrtus, Pinus, Cupressus, Rosmarinus, & reliquæ ejus generis, qua ratione pestem Athenis Hippocrates extinxit; vapores præterea maligni per aeram sparsi dissipandi sunt, id quod à magnis ventis fieri solet. Sic Olyssiponi, cum trium dierum ingens procella venisset, pestis extincta nuper, est & in Maroco ingens pestilentia vento quodam evanuit; qui veluti è fornace (adeo calidus erat) exire videbatur, aerem autem nos imitando ventos commovere poterimus; si bombardarum strepitus multos fieri curemus; si verò vapores ex paludibus ac stagnantibus aquis fieri videntur, eas resiccare aut novare oportet frequenter, maximè per æstatem. Renovantur autem novis supervenientibus aquis, quas è fluminibus per canales traducere oportet; aut siccandæ sunt factis rivulis & fossis, per quæ superfluant ad flumina; quod cum primus magnus Etruriæ dux Cosmus Pisis fecisset, & magna animi contentione nunc faciat Ferdinandus, factum est, ut saluberrimus ejus urbis aer per omne anni tempus sit redditus: verum si cadaverum inhumatorum multitudo aerem inficit, magna & profunda facta fovea sepeliantur; si ab immunditie, & excrementis, quæ per urbem & domos sparguntur, id quod, ut reor, Bizantii, & Olyssiponi, in causa est, cur pestis adeo sæviat, ac duret, mundare oportet omnia; viæ ac domus quotidiè, vel saltem semel in septimanâ, repurgandæ.

1. Joh. Beguinus in Tyrocin. Chymic. Lib. II. cap. 13. *Dignum admiratione est, quod quamvis in viciniâ Hydriæ comitatûs Goricienſis, ubi reperitur copiosè mercurius, singulis ferè annis lues pestifera grassatur, illa tamen semper immunis ab hac manere soleat; idque viri provectæ ætatis se observasse, & à majoribus suis accepisse, mihi sanctè confirmarunt. Hinc patet, mercurium esse summum omnis putredinis ac corruptionis alexipharmacum.* 2. Michael Majerus in lusu de mercurio. *Argentum vivum est plurimorum morborum alexipharmacum, &, ut testantur quidam, ipsius pestis (cum eo loco, ubi mercurius effoditur, & tractatur, nunquam aut rarissimè hoc contagium grassetur) dummodò maneat in suâ propriâ naturâ, & non à salibus aut aquis corrosivis inficiatur, ac venenosus reddatur.*

A very ingenious physician, that travelled much in the *East-Indies*, and visited some islands in the *South Sea*, to which our English were not permitted to have access, being asked of me some questions about the effects and changes of the air in those parts, related to me, that having made some stay in the famed island of *Ternate*, he learned, that the Dutch (who had mastered the inhabitants) did, upon a composition made with the king for his damages, cut down almost all the numerous clove-trees, that grew in that island, that thereby they might keep up the high rate of that spice, as indeed they have done. Whereupon there happened a change in the temperature of the air, that gave cause to conclude, that the exhalations of the blossoms which (being dried) afford the cloves, were not only very pleasant, but very healthful too: for no long time after the excision of these fragrant trees, the island became very unhealthful, which this physician very probably imputed to the corrosive and noxious steams, which plentifully issuing out from a kind of vulcan, or smoking, and sometimes burning hill, depraves the air of that island that is but little, but had their hurtful effects formerly prevented by the aromatick and benign emanations of those numerous blossoms and trees, that richly impregnated the air, and by their volatile and oily salts, opposed and hindred the effects of the sulphureous and other sharp steams of the vulcan. And my relator assures me, that this change of the air's constitution was so remarkable and acknowledged, when he was there, that whereas formerly sick and valetudinary persons used to be sent thither from *Batavia* to recover their health by the goodness of the air (as we often send consumptive persons into *France*) the air at his being in *Ternate* had been for divers years so unhealthful, that the Dutch were fain (from *Batavia*, or other more healthy places) to send men twice a year to relieve the garrisons, and bring back the many sick they usually found at their arrival in that formerly healthy island.

An observing physician lately returned from *Tangier*, answered me, that though otherwise it be a healthy place, he took notice, that it was not unusual for new comers to find themselves feverish for many weeks, or some months after their arrival, especially if the piercing easterly wind happened to reign. This, he says, he found in himself, not only by a constant heat and some other symptoms, but by that main one of the preternatural quickness of his pulse. He added, that this disease, though very mild, held him near four months; when the easterly winds happened to blow, on which his feverishness so depended, that he could easily, when he awaked in the morning, know without asking, whether that wind blew or not.

May 16. We put into a small receiver five or six litle ants, which ran about very briskly; but the air being pumped out, they presently lost their motion, which they soon recovered upon the restoring of the air to them.

them. Then the air was again withdrawn, and the inſects thereby brought to lye (ſome upon their backs) as ſtark dead: in which condition they were ſuffered to remain about five or ſix hours; after which the air being let in upon them, they nevertheleſs continued ſeemingly dead for many minutes, (as we gueſſed between 15 and 30) but at length all recovered, running nimbly up and down the glaſs, though it were late at night.

Relatione della Provincia di Malavar. pag. 64 & 65.

Si patrono queſte barche dalla coſta della peſcaria, è vanno all iſola di Ceilam, nella coſta della quale per la lunghezza di venti miglia, tre ſole miglia lontane da terra, ſette braccia abbaſſo arrivando ſino alli dieci nel fondo, ſi ritrova infinita quanta di madreperle, eſcono per queſta peſca la barche la matina col vento di terra, & arrivando al poſto delle madreperle, gettare l'ancore, è fermareſi in quel poſto, cominciano à tuffarſi nel mare i marinari, de quali ogni barca ne ha quindeci, è venti, è ciaſcuno di eſſi ſi lega nel mezzo, con una ſune, della quale ha cura uno, che reſta in barca è con un'altra ſune legandoſi una pietra alla gamba, un'altro ha pure cura di quella, e cingendoſi un' ſacco di cuoio dinanzi, mettendoſi le guante alle mani, coſi legato ſi tufta con violenza nel mare, lentando quelli le funi, è col peſo della pietra, va con grandiſs' violenza giu, & arrivato ch' e ſcioliaſi dalla gamba quella ſune, con la quale ſta legata la pietra, reſta egli libero, & la pietra viene ſubito tirata ſoprada quello, che n'ha cura, et il marinaro poi comincia con molta ſollecitudine à pigliare quelle madreperle, che li vengono dinanzi, e le mette nel ſacco, e ſentendoſi mancare la reſpiratione, tocca la ſune, con la quale ſta legato nel mezzo, e quello ſubito con grandiſs' velocita lo tira et arrivando nella barca, ſcaricando le madre perle ripiglia fiato, è dopo torna a legarſi di nuovo la pietra, e di nuovo ſi tufta come ſopra's e detto, e ſempre coſi per tutta la giornata. Et e tanto faticoſa queſta peſca, ch'eſſendo, tanto profunde le madre perle nel mare, molti mancando loro la reſpiratione ſi trovano affogati.

It is, by long obſervation and often repeated experience, found certain, that if any foreigner lye on ſhore all night at *Johanna*, they ſeldom miſs to be taken with ſickneſs there, or within a few days after their departure from the iſland, and are commonly ſeized with putrid fevers, whereof moſt die in two or three days, though thoſe, that have remained upon the place all day long, for ſeveral days together, are almoſt always ſafe, if they go on board of ſhip every night about a mile, or a little further from the ſhore. The iſland abounds with the greateſt variety of plants and trees, that can be almoſt imagined in that circumference, and is generally exceſſive hot in the day time, but cold after ſun-ſet. Whence it may poſſibly be ſuppoſed, that the moſt volatile parts of thoſe promiſcuous (and probably many of them poiſonous) plants, exalted in the day time by degrees, and ſuddenly condenſed at night, may by inſpiration infect the maſs of blood much after the ſame manner as in peſtilential airs. The inhabitants themſelves are very much ſubject to fevers, (of what ſort I could not learn) for which they cut or ſcarify their breaſt or abdomen in ſeveral places: but they obſerve, that few live, except their fever terminates in a conſiderable number of botches in divers parts of the body. There is one hill there remarkable for height, which is ſeldom or never free from thick fogs or clouds hovering over the top of it; ſometimes higher, ſometimes lower, according as the weather alters.

Upon the coaſt of *Cormandell*, and moſt maritime places of the *Eaſt Indies*, there are ſometimes (I think yearly) fogs ſo thick (notwithſtanding it is then very hot) that all, or moſt inhabitants from other nations, and the tenderer ſort of the natives, are neceſſitated to keep their houſes, with the doors and windows faſt ſhut, there being little or no commerce at that time.

At *Bâlaſſore* in the bay of *Bengale*, and in divers other parts in that country, there happens after great rains, ſo great corruption of the air, that the ſtinking ſmell is very nauſeous to the inhabitants; which I preſume may be chiefly occaſioned by a great number of frogs, and other reptiles (wherewith thoſe places abound) left upon the dry places after the inundation, and then putrified by the exceſſive heat of the ſun. At this time there is great ſickneſs and mortality amongſt the natives, chiefly by violent fevers.

In the return of Engliſh ſhips from the *Eaſt Indies*, they generally put their ſick people on ſhore at St. *Helena*, where they find ſo ſenſible alteration, that although carried thither, there are few, that do not recover ſo much ſtrength, as to walk about in two or three days, which, in all probability, muſt chiefly be attributed to the alteration of air, not of food, there being in moſt ſhips much the ſame benefit of freſh proviſion for thoſe, that are diſeaſed.

Le chemin plus court de Moſul a Bagdad eſt par la Meſopotamie; mais on n'y trouve aucun village, & le Samiel y regne toute l'eté depuis Moſul juſques à Sourat; ce qui oblige à prendre l'eau ſur le Tigre, où ce vent ne ſouffle point. Le nom de ce vent eſt compoſé des mots, ſam et jel, c'eſt à dire poiſon et vent, comme qui diroit vent de poiſon. Ce pourroit être le vent urens, dont parle Job xxvii. 21. *Lorſque quelqu'un à reſpiré ce vent, il tombe mort ſubitement, quoi qu'il en ait quelques uns, qui ont le temps de dire, qu'ils brûlent au dedans. D'abord qu'on eſt mort, on devient tout noir, et ſi on tire le mort par le bras, où par la jambe, où par un autre endroit, la chair quitte les os, et reſte entre les mains de ceux, qui la touchent.* Thevenot dans le bibliotheque univerſel: Tom. XIII. *p.* 266.

Doctor *Collins* relates, that in *Muſcovy* their horſes are much ſubject to a very ſcurvy diſeaſe, whoſe Ruſſian name I have forgot, from which the natives are wont to preſerve them, by keeping goats in their ſtables: and being aſked by me, whether he had this by tradition, or upon his own trial? he affirmed, that

that he had found it true himself, and that he therefore was wont to keep goats in his own stable.

The ingenious Mr. *Rycaut*, English consul at *Smyrna*, being asked of me, whether at *Smyrna* as well as at *Aleppo*, he observed, that the plague, that uses to rage in the former part of the summer, degenerates into other diseases about the latter end of *June*, and beginning of *July*; he answered me, that at *Smyrna* the observation does not hold so much as at *Aleppo*; but yet at *Smyrna* they generally observe, that about that time of the year, though exceeding hot, the malignity of the plague does notably lessen, for it is not quite so infectious, nor near so generally mortal, as it was in the former part of the summer. When many years ago I heard of this strange phænomenon of the pestilence at *Aleppo*, I began to think, whether a possible, though not perhaps the true cause of it may not be such as this; that the pestilential corpuscles, that rove up and down in the air, during the former part of the summer, require such a bulk or grossness to enable them to exercise their pernicious operations; but when the weather grows to be exceeding hot, that heat of the air becomes able to dissipate those corpuscles, and deprive them of that bulk, that we have supposed necessary to their destructive efficacy. For illustration of this conjecture, we may take notice of the smoke, that issues out of the weik of a candle newly blown out; for whilst the sooty corpuscles retain their bigness and texture, they are able to offend the nostrils very much by their stink, and sometimes to cause convulsive motions and abortions in teeming women: but if you apply a flame to this smoke, it presently discusses this fuliginous matter, and dissipates it into particles of quite another nature, which by this means are deprived of all their offensive smell, and some other ill qualities. It may also be said, that the great increase of heat in *July* may enable the sun-beams, by penetrating the earth deeper, and agitating its lower parts stronger, and producing crevisses, and other new or formerly obstructed passages in the upper parts of it, may elevate into the air divers saline and other new corpuscles, which may either divide or dissipate the pestilential ones, or else by associating themselves with them, make up new concretions, differing from the pestilential corpuscles, in bulk, shape, texture or motion, in most or all of these, by which means the morbifick corpuscles being much altered, their operations on the human bodies they invade, may be so too, and the diseases they produce may become less malignant, or degenerate into some other disease. And if it be demanded, why this does not happen elsewhere as well as at *Aleppo* and *Smyrna*? it may be answered, that the concourse of causes may not be the same, and particularly, that the soil of those two places may be peculiarly disposed to emit pestilential corpuscles of such a determinate nature, with such a degree of heat, and dissipable by a greater, or with a more intense heat, to afford also exhalations capable to correct the former, as it is delivered by good authors, and ingenious men have confirmed it upon their own observation, that yearly, at grand *Cairo*, in the heat of summer the plague ceases to be mortal, and almost to be infectious, when the *Nile* begins to overflow; which wonderful change I should not so much ascribe to a frigeration of the air, that usually accompanies the swellings of the waters, (since pestilences rage in much cooler weather, than can be supposed in so hot a climate as that of *Egypt* in *July*) as to some nitrous and other corrected exhalations, that are plentifully emitted by the freshly arriving waters.

There is an account, that has not, that I know of, been taken notice of, upon which the supervening coldness and heat of the air may *pro tempore* very much alter the qualities of it, in reference to the bodies and health of men: for the air being a fluid body as well as water, and impregnated with salts of different kinds, some merely saline, and others associated with sulphureous and other kinds of particles; it seems not improbable, that what happens in that grosser fluid water, impregnated with differing sorts of salts, and altered by succession of heat and cold, takes place also in the air. I purposely tried in water, that by dissolving in it convenient quantities of two differing salts, though whilst the liquor was hot, or perhaps so much as lukewarm, they would swim together undistinguishably in the liquor, and so were in a capacity to act jointly, and, as the schools speak, *actione communi*, on divers occasions; yet when the liquor was cold, and sometimes when there was only a considerable remission of the heat, the saline particles of one kind, being not capable of being any longer sufficiently agitated by so faint a degree of heat, would convene into grains or crystals; and losing their fluidity and motion, visibly separate themselves from the other kind of salts, which yet continued fluid in the water, where it could now act but by its own particular qualities, and not as formerly, *actione communi*.

The clearest instance I found of this observation, was afforded me by an experiment made with the solutions of alum and nitre; a relation of which I find among my adversaria, in the following terms.

Equal parts of alum and nitre being dissolved in the same portion of fair water; and the liquor being in good measure evaporated, the earthen vessel, that contained it, was set in the cold, by which means, at the bottom and the lower part of the sides, the alum appeared to be first coagulated in many octaedrical grains, no crystals of nitre yet being visible. Afterwards, upon a further evaporation of the water, and the removal of the vessel from the fire, there appeared more grains of alum, but as yet no nitre: wherefore having yet further evaporated the liquor, at length the nitre shot plentifully into fine little crystals of the shape proper to that salt.

THIS is the account my note-book contains of this trial, which seems to invite us to conjecture, that of the numerous sorts of saline corpuscles, that rove up and down in the air, whilst it is well heated by the sun, or other causes, some sorts may by the absence of that heat, or some supervening causes of coldness, be made to separate from the others, which were thereby contemperated, or perhaps enabled to co-operate to divers purposes, that they were not fit for alone; and to form concretions, which, though not singly visible, may be too great to be kept in a state of fluidity by the diminished heat of the air.

A MOUSE lived ten minutes at least with a quarter air, and three afterwards.

TITLE XLI.

Of heavy bodies sustained in or taken up into the air.

TITLE XLII.

Of dew.

TITLE XLIII.

Of rain.

AN eminent virtuoso informed me, that in the country of *Campen*, he had seen divers pits, that are digged for turf, or rather peat, which were not deep for the most part, but reached to a kind of quick-sand, upon which the rain falling did by degrees, in some years, form a kind of slimy earth or clay, which was much of a martial nature; and being skilfully handled, would yield good iron.

THE same person assured me, that he had divers times distilled the water of *Campen* in new and fine glasses, and still found them to leave a considerable quantity of stony matter at the bottom, notwithstanding the rectification.

L. I. c. 8. De Mont. Bohemiæ, p. 26. *A Milessow monte temporum præsagia capiuntur.*

Quicquid erit, sine fuco significat, velut Rotenberg, Silesiæ compastum appellant, perinde Milessow temporum prognostes jure merito dici posset. Vidi ex proximo totum aliquando montem densissimis nebulis contectum, eâ prorsus imagine, qua mons Sinai Moyse in nebula latente depingitur, at cæteri circum montes innubes & hilares, velut rerum gerendarum ignari, stabant, sol ipse formosissimus ibat; at accolæ locorum domum fugiebant, pecora urgebant, meque, ut domum protinus reciperem, properarem, & equos currum trahentes concitari juberem, monebant, neque horæ quadrans interceſſit, jam cœlum obduci, sol contegi, eripi omnis aspectus.

VIRG. *Immensum cœlo ruit agmen aquarum;*
——ruit arduus æther,
Et pluvia ingenti sata læta, boúmque labores.
Diluit, implentur fossæ,

& quæ divinus poeta prosequitur. At contrà etiam accidere vidi, ut cæteri fumârint montes, Milessow nihil se commovente, nihil aut nubilum aut turbidum minante; incolæ rogati, nihil esse magnopere timendum à cæteris spondebant, hunc unum intuendum esse, horum nubila omnia à Milessow quodammodo devorari.

TITLE XLIV.

Of hail.

ON ecrit de l'isle en Flandres le 25 May, style nouveau, qu'il tomba dans cette ville la une graisle, dont les moindres grains estoient comme des oeufs de pigeon. Cet orage a passé sur la citadelle & la ville, & n'a pas laissé une vitre entiere du coste du vent: les maisons sont toutes decouvertes, & les arbres rompus, les bleds coupez, & les perdrix & les lievres morts. On a pesé plusieurs grains de cette graisle, dont les uns estoient d'un quarteron, de demi livre, de trois quarterons, et les plus gros d'une livre & davantage. Il y en avoit un entr' autres, qui avoit dans le milieu une espece de matiere brune, qu'on mit dans le feu, qui fit faire un grand bruit. Il y en avoit un, qui estoit diaphane, lequel estant mis aupres du feu, fondit tout aussi tost comme du plomb, quoy qu'il fut beaucoup plus dur que les autres.

TITLE XLV.

Of snow.

TITLE XLVI.

Of other things falling out of the air.

EO ipso anno, quo dux Eboracensis postremo rediit è Scotia Londinum, depluere tanta copia pisciculi halecibus colore, figurâ, sapore quam simillimi, in superiore Gallocidiæ in Scotia parte non procul à mari, ut duo terræ jugera ad Robertum Murray de Brughton equitem pertinentia nunc Londini, ut audio, degentem, cooperuerint. Rem autem totam serenissimo duci Eboracensi prius de eadem ab eo interrogatus, quod tum certior ab aliis de hâc pluvia factus esset, tanquam testis oculatus, ut qui aliquos horum pisciculorum videram, confirmavi: is porro ingeniosissime, summâque veri specie nodum ita solvit, ut diceret hos

pisciculos

piſciculos unà cum aquis furentium ventorum gyro in turbinem actis evectos eſſe nubes, è quibus non procul inde pondere rurſus ſuo relapſi fuerint in vicinam terram.

TITLE XLVII.

Promiſcuous experiments and obſervations of the air.

TITLE XLVIII.

Deſiderata in the hiſtory of the air, and propoſals towards ſupplying them.

GENERAL HEADS FOR THE NATURAL HISTORY OF A COUNTRY, Great or Small;

Drawn out for the Uſe of TRAVELLERS and NAVIGATORS.

Printed firſt in the *Philoſophical Tranſactions*, N°. XI. p. 186. N°. XVIII. p. 315. and N°. XIX. p. 330. and afterwards reprinted with *other Directions for Navigators by another Hand*, at *London* 1692, in 12mo.

THE things to be obſerved in ſuch a hiſtory, may be variouſly (and almoſt at pleaſure) divided: as, into ſupraterraneous, terreſtrial, and ſubterraneous, and otherwiſe; but we will at preſent diſtinguiſh them into thoſe things, that reſpect the heavens, or concern the air, the water, or the earth.

1. To the firſt ſort of particulars belong the longitude and latitude of the place (that being of moment in reference to the obſervations about the air, *&c.*) and, conſequently, the length of the longeſt and ſhorteſt days and nights, the climate, parallels, *&c.* what fixed ſtars are, and what not ſeen there; what conſtellations it is ſaid to be ſubject to: whereunto may be added other aſtrological matters, if they be thought worth mentioning.

2. ABOUT the air may be obſerved its temperature, as to the firſt four qualities (commonly ſo called) and the meaſures of them; its weight, clearneſs, refractive power; its ſubtlety or groſſneſs; its abounding with, or wanting an eſurine ſalt; its variations according to the ſeaſons of the year, and the times of the day; what duration the ſeveral kinds of weather uſually have; what meteors it is moſt or leaſt wont to breed; and in what order they are generated; and how long they uſually laſt: eſpecially, what winds it is ſubject to; whether any of them be ſtated and ordinary, *&c.* what diſeaſes are epidemical, that are ſuppoſed to flow from the air: what other diſeaſes, wherein that hath a ſhare, the country is ſubject to; the plague, and contagious ſickneſſes: what is the uſual ſalubrity or inſalubrity of the air; and with what conſtitutions it agrees better or worſe than others.

3. ABOUT the water may be obſerved the ſea, its depth, degree of ſaltneſs, tides, currents, *&c.* Next, rivers, their bigneſs, length, courſe, inundations, goodneſs, levity (or their contraries) of waters, *&c.* Then, lakes, ponds, ſprings, and eſpecially mineral waters, their

kinds, qualities, virtues, and how examined. To the waters belong alſo fiſhes, what kinds of them (whether ſalt or freſh-water fiſh) are to be found in the country; their ſtore, bigneſs, goodneſs, ſeaſons, haunts, peculiarities of any kind, and the ways of taking them, eſpecially thoſe that are not purely mechanical.

4. In the earth may be obſerved,

1. Itſelf.

2. Its inhabitants, and its productions, and theſe external, and internal.

Firſt, in the earth itſelf may be obſerved its dimenſions, ſituation, eaſt, weſt, north and ſouth; its figure, its plains and valleys, and their extent; its hills and mountains, and the height of the talleſt, both in reference to the neighbouring valleys or plains, and in reference to the level of the ſea: as alſo, whether the mountains lye ſcattered, or in ridges; and whether thoſe run north and ſouth, or eaſt and weſt, *&c.* what promontories, fiery or ſmoking hills, *&c.* the country hath, or hath not; whether the country be coherent, or much broken into iſlands: what the magnetical declination is in ſeveral places, and the variations of that declination in the ſame place (and, if either of thoſe be very conſiderable, then, what circumſtances may aſſiſt one to gueſs at the reaſon, as ſubterraneal fires, the vicinity of iron mines, *&c.*) what the nature of the ſoil is, whether clay, ſandy, *&c.* or good mould; and what grains, fruits, and other vegetables, do the moſt naturally agree with it: as alſo, by what particular arts and induſtries the inhabitants improve the advantages, and remedy the inconveniencies of their ſoil: what hidden qualities the ſoil may have (as that of *Ireland*, againſt venomous beaſts, *&c.*)

Secondly, above the ignobler productions of the earth, there muſt be a careful account given of the inhabitants themſelves, both natives and ſtrangers, that have been long ſettled there: and in particular, their ſtature, ſhape, colour, features, ſtrength, agility, beauty (or the want of it) complexions, hair, diet, inclinations, and cuſtoms that ſeem not due to education. As to their women (beſides the other things) may be obſerved their fruitfulneſs or barrenneſs, their hard or eaſy labour, *&c.* and both in women and men muſt be taken notice of what diſeaſes they are ſubject to, and in theſe whether there be any ſymptom, or any other circumſtance, that is unuſual and remarkable.

As to the external productions of the earth, the enquiries may be ſuch as theſe: what graſſes, grains, herbs (garden and wild) flowers, fruit-trees, timber-trees, (eſpecially any trees, whoſe wood is conſiderable) coppices, groves, woods, foreſts, *&c.* the country has or wants: what peculiarities are obſervable in any of them: what ſoils they moſt like or diſlike, and with what culture they thrive beſt. What animals the country has or wants, both as to wild beaſts, hawks, and other birds of prey; and as to poultry, and cattle of all ſorts; and particularly, whether it have any animals that are not common, or any thing that is peculiar in thoſe that are ſo.

The internal productions or concealments of the earth are here underſtood to be the riches, that lye hid under the ground, and are not already referred to other enquiries.

Among theſe ſubterraneal obſervations may be taken notice of, what ſorts of minerals of any kind they want, as well as what they have; then, what quarries the country affords, and the particular conditions both of the quarries and the ſtones; as alſo, how the beds of ſtone lye, in reference to north and ſouth, *&c.* what clays and earths it affords, as tobacco-pipe-clay, marls, fullers-earths, earths for potters wares, bolus's, and other medicated earths: what other minerals it yields, as coals, ſalt-mines, or ſalt-ſprings, alum, vitriol, ſulphur, *&c.* what metals the country yields, and a deſcription of the mines, their number, ſituation, depth, ſigns, waters, damps, quantities of ore, goodneſs of ore, extraneous things, and ways of reducing their ores into metals, *&c.*

To theſe general articles of enquiries (ſaith their propoſer) ſhould be added, 1. Enquiries about traditions concerning all particular things relating to that country, as either peculiar to it, or at leaſt uncommon elſewhere. 2. Enquiries, that require learning or ſkill in the anſwerer: to which ſhould be ſubjoined propoſals of ways, to enable men to give anſwers to theſe more difficult enquiries.

What is the proportion of ſalt, that is in the water of differing ſeas? and whether in the ſame ſea it be always the ſame? and if it be not, how much it differs?

What is the gravity of ſea-waters in reference to freſh waters, and to one another; whether it vary not in ſummer and winter, and on other ſcores? and whether in the ſame ſeaſon its gravity proceed only from the greater or leſſer proportion of ſalt that is in it, and not ſometimes from other cauſes? and what are the differing gravities of the ſea-water, according to the climates *.

What are the odors, colours and taſtes, obſervable in ſea-water?

What is the depth of the ſea in ſeveral places, and the order of its increaſe and decrements? and whether the bottom of the ſea does always riſe towards the ſhore, unleſs accidentally interrupted?

Of the bottom of the ſea, and how it differs from the ſurface of the earth, in reference to the ſoil, and evenneſs or roughneſs of the ſuperficies; and the ſtones, minerals and vegetables to be found there?

* This laſt clauſe containing a difficult query, and that may ſeem ſomething odd, Mr. *Boyle* thinks fit to note, that having recommended this matter, among others, to a learned phyſician, that was ſailing into *America*, and furniſhed him with a ſmall hydroſtatical inſtrument, to obſerve from time to time the differences of gravity he might meet with; this account was returned him, that he found by the glaſs, the ſea-water to increaſe in weight, the nearer he came to the line, till he arrived at a certain degree of latitude, as he remembers it was about the 30th, after which the water ſeemed to retain the ſame ſpecifick gravity, till he came to the *Barbadoes*, or *Jamaica*.

WHAT the figuration of the ſeas from north to ſouth, and from eaſt to weſt, and in the ſeveral hemiſpheres and climates?

WHAT communication there is of ſeas by ſtreights and ſubterraneal conveyances?

OF the motion of the ſea by winds, and how far ſtorms reach downwards towards the bottom of the ſea?

OF the grand motions of the bulk or body of the ſea; eſpecially of the tides: their hiſtory as to their nature and differences.

The particulars whereof (ſaith the author) are here omitted; Sir *Robert Moray* and Dr. *Wallis* having by their more accurate inquiries about tides made them needleſs.

WHAT power the ſea hath to produce or haſten putrefaction in ſome bodies, and to preſerve others; as wood, cables, and others, that are ſunk under it?

OF the power aſcribed to the ſea to eject dead bodies, ſuccinum, ambergreaſe?

OF the ſhining of the ſea in the night?

WHAT are the medical virtues of the ſea, eſpecially againſt hydrophobia?

WHAT is its virtue to manure land? and what are the plants, that thrive beſt with ſea-water?

Articles of enquiries touching mines.

THE firſt, the neighbouring country about the mines.

THE ſecond, the ſoil where the mines are.

THE third, the ſigns of mines.

THE fourth, the ſtructure and other particulars belonging to the mines themſelves.

THE fifth, the nature and circumſtances of the ore.

THE ſixth, the reduction of the ore into metal.

Queries about the firſt title.

1. WHETHER the country be mountainous, plain, or diſtinguiſhed with vales? And in caſe it be mountainous, what kind of hills they are; whether high or low, or indifferently elevated? Whether almoſt equal, or very unequal in height? Whether fruitful or barren, cold or temperate, rocky or not; hollow or ſolid? Whether they run in ridges, or ſeem confuſedly placed; and, if the former, what way the ridges run, north or ſouth, *&c.* and whether they run any thing parallel to one another?

2. WHETHER the country be barren or fruitful? and, if any way fruitful, what it produces, and what it moſt abounds with?

3. WHAT cattle it nouriſhes, and whether they have any ſuch thing peculiar in point of bigneſs, colour, ſhape, longevity, fitneſs or unfitneſs to make good meat, *&c.* as may be rather aſcribed to the peculiar nature of the place, than to the barrenneſs of the ſoil, or other manifeſt cauſes?

4. WHETHER the natives, and other inhabitants, live longer or ſhorter than ordinary? Whether they live more or leſs healthy? Whether they be ſubject to any epidemical diſeaſes, that may very probably be imputed to the mines; and what theſe diſeaſes are, and what remedies are found ſucceſsful?

5. WHETHER the country be or be not furniſhed with rivers, brooks, ſprings, and other waters; and how theſe waters are conditioned?

6. WHETHER the air be dry or moiſt, hot or cold, clear or foggy, thick or thin, heavy or light; and eſpecially, whether the weather be more or leſs variable than ordinarily; or whether it be ſubject to great and ſudden changes, that may probably be imputed to the mineral and ſubterraneous ſteams; and what they are?

About the ſecond title.

7. WHETHER the ſoil, that is near the ſurface of the earth, be ſtony; and, if it be, what kind of ſtones it abounds with? Whether it be clayey, marley, chalky, *&c.?* And, if it be of ſeveral kinds, how many they are; and by what properties they are diſtinguiſhed?

About the third title.

8. BY what ſigns they know or gueſs, that there is a mine in ſuch a place?

9. THESE ſigns are either upon the ſurface of the earth, or beneath it.

To the former belong theſe queries.

10. Whether the ground be made barren by metalline or mineral effluviums?

11. WHETHER it be obſerved, that trees and other greater plants ſeem to have their tops burnt, or other leaves or outſides diſcoloured? or whether there be any plants, that do affect to grow over ſuch mines; and whether it have been tried, that other plants, that would proſper in the adjacent places, will not be made to grow or thrive?

12. WHETHER the ſtones and pebbles, that are waſhed by the brooks, ſprings, or other waters, have any coloured ſubſtance left upon them; and if they have, of what colour, weight, *&c.* theſe adherences are?

13. WHETHER the waters of the place propoſed do by their taſte, ſmell, ponderouſneſs, *&c.* diſcloſe themſelves to contain minerals? and, if they do, what minerals they or their reſidences, when they are evaporated away, do appear to abound with, or to participate of?

14. WHETHER ſnow will not lye, or froſt continue ſo long, or dew be generated or ſtay upon the ground in the place propoſed, as on other neighbouring grounds?

15. WHETHER the dew, that falls on that ground, will diſcolour white linen or woollen cloths, ſpread over night on the ſurface of the ground, and employed to collect the dew? And whether the rain, that falls there, and may be ſuppoſed to come thither from elſewhere, will diſcolour ſuch clothes, or afford any reſidence of a mineral nature?

16. WHETHER the place be more than ordinary ſubject to thunder and lightning, and to ſudden ſtorms or earthquakes, as likewiſe to nocturnal lights and fiery meteors.

17. WHETHER miſts uſe to riſe from grounds ſtored with minerals? What is obſervable in them, and what minerals they ſignify, and may be ſuppoſed to be produced by?

18. WHETHER the virgula divinatoria be uſed to find out the veins of propoſed mines; and, if it be, with what ſucceſs?

19. WHAT other ſigns above ground afford probability of mines, or direction for

following a vein over hills, vallies, lakes, rivers, *&c.?*

THE ſecond ſort of ſigns belonging to theſe queries are ſuch as follow.

20. WHETHER there be any clays, marles, or other mineral earths, yellow or liquid matters, that uſually give notice of the ore? and if there be more than one, how, and at what depths, they are wont to lye reſpectively? Of what thickneſs and conſiſtence they are; and in what order the diggers meet with them?

21. WHETHER there be any ſtones or marchaſites to be found near, or not very far from the ſurface of the ground, by which one may have ground to expect a mine? As is often obſerved in the tin mines of *Cornwall*, over which ſuch kind of ſtones are divers times found lying above ground.

22. WHETHER all ſtones of that kind do equally ſignify that mine? And, if not, how the ſignificant ſtones are to be known, as by colour, bigneſs, ſhape, weight, depth under ground, *&c.?*

23. WHETHER there be any earths of peculiar kinds, as to colour, conſiſtence, *&c.* that indicate a mine beneath or near them; and if there be, what they are, and what is their conſecution, if they have any?

24. WHETHER heat or damps give any aſſurance or a probability of finding a mine?

25. WHETHER water of any kind met with in digging, eſpecially at this or that depth, do betoken a mine?

26. WHETHER there be any ſigns of the nearneſs of the mine, and what they are?

27. WHETHER there be any ſigns of one's having miſſed the mine, either by being paſt above, or beneath, or having left it on either hand, and what they are?

28. WHETHER there may be any ſigns, not only of the diſtinct and determinate kind of metals or minerals, but of the plenty and goodneſs of the vein, and what they are?

29. WHETHER there be any ſigns of the depth of the vein beneath the ſurface of the earth, and what they are?

30. WHETHER there be any proper or peculiar ſigns, that ſhow it to be hopeleſs, or at leaſt unlikely to find a vein in the place where it is digged for, and what thoſe are?

About the fourth title.

31. WHAT is the depth of the ſhaft or groove (which though named in the ſingular number, the queſtions about it are generally applicable) till you come at the vein or ore?

32. WHETHER the vein run, or lye horizontally, or dip? And, if it dip, what inclination it hath, how deep the loweſt part lyes, and conſequently how much deeper than the uppermoſt? As alſo, what its flexures, if it have any, are? And whether it runs directly north or ſouth, eaſt or weſt; or ſeem rather to have a caſual tendency, than any determinate one by nature? And how far it reaches in all?

33. WHAT is the wideneſs of the groove at the top, and elſewhere? Whether the groove be perpendicular or crooked; and if crooked, after what manner, and with what diſtance it winds?

34. How the groove is ſupported? What are the kinds, length, bigneſs, and way of placing the timber, poles, *&c.* that are employed to ſupport it? And how long the wood will laſt, without being ſpoiled with the ſubterraneous fumes and waters? And what wood laſts longeſt?

35. WHAT air-ſhaft belongs to the mine? Whether it be ſingle or more than one? Of what breadth the air-ſhaft is at the orifice? Whether it be convenient enough, or not? How near it is placed to the groove, and in what poſition? And if there be ſeveral air-ſhafts, what their diſtances and ſituation are in reference to the groove, and to each other? Or how air is ſupplied, if there be no air-ſhafts?

36. WHETHER they meet with any waters in the mine? And, if they do, how copious they are; at what depths they occur, how they are qualified, and what way they ſpring, *&c.?*

37. WHETHER they are conſtant or temporary? whether they increaſe or diminiſh notably in ſummer or winter, or at any other time of the year, and if they do, at what ſeaſon that is; how long it is wont to laſt; and the proportions of increaſe and decreaſe?

38. WHAT expedients and engines are employed to free the mines from water? The materials, the parts, the bigneſs, the ſhapes, the coaptation; and in ſhort, the whole ſtructure, number, and way of applying the inſtruments, that are made uſe of to free the mines from water?

39. WHAT are the conditions, number, *&c.* of the adits?

40. WHETHER the mine be troubled with damps, and of what kind they are; whether they come often or ſeldom at any ſet time, or altogether irregularly; what ſigns forerun them; what miſchief they do; what remedies are the moſt ſucceſsfully employed againſt them, as well in reference to the clearing of the mine, as to the preſervation and recovery of the workmen?

41. WHAT methods the mine-men uſe in following the vein, and tracing their paſſages under ground (which they call plumming and dialling) according to the ſeveral exigencies? And whether they employ the inſtruments, made with the help of the loadſtone, the ſame way that is uſual; and if not, wherein they differ in the uſe of the ſame inſtruments; or what inſtruments they ſubſtitute in their place?

42. WHAT ways they take to ſecure themſelves from the uncertainty, incident to the guidance of magnetick needles from the iron-ſtone or ore, that they may meet with under ground? (of which yet perhaps there is not ſo great danger, as one may imagine; as far as I could find by a trial, I purpoſely made in a groove, where I was ſure there wanted not iron ore.) And what other ways may be

uſed

uſed to direct miners without the help of a loadſtone?

43. How the miners deal with the rocks and ſpars they often meet with, before they come at the ore? Whether they uſe fire to ſoften, calcine, or crack them? How they employ it, and with what meaſure of ſucceſs?

44. WHAT ways and cautions they uſe to free the mine and ſecure the workmen from the inconveniencies and danger accruing from the uſe of much fire in it?

45. WHAT inſtruments they uſe to break the rock, *&c.* And how thoſe inſtruments are conducive, and how long they laſt?

46. How the mine-men work, whether naked or clothed? And what lights they uſe to work by, what materials they are made of, what meaſure of light they give, how long they laſt? And by what ways they are kept burning in that thick and foggy air?

47. How veins are followed, loſt, and recovered? And how ſeveral miners work on the ſame vein? And what is the beſt way of getting all the ore in a vein, and moſt conveniently?

48. How they convey out their ore and other things, that are to be carried out of the mine? Whether they do it in baſkets drawn up by ropes, or upon men's backs; and if this laſt named way, what kind of veſſels they uſe for matter, ſhape, and capacity? And whether the workmen deliver them one to another, or the ſame workmen carry them all the way? And whether the diggers deſcend and aſcend by ladders of wood, or of ropes, *&c.?*

About the fifth title.

49. WHETHER the ore runs in a vein, or lye diſperſed in ſcattered pieces; or be divided partly into a vein, and partly into looſe maſſes; or like a wall between two rocks, as it were in a clift, or be interſperſed in the firm rock, like ſpeckled marble? Or be found in grains like ſand or gravel; as ſtore of excellent tin is ſaid to be found in ſome parts of *Cornwall* at the ſides and in the channels of running waters, which they call . . . . . ; or whether the ore be of a ſofter conſiſtence, like earth or lome, as there is lead ore in *Ireland* holding ſtore of ſilver; and iron ore in the north parts of *Scotland* and elſewhere? And what is obſervable in it as to weight, colour, mixture, *&c.?*

50. WHETHER any part of the metal be found in the mine perfect and complete? (As I have had preſented me good valuable copper, and pieces of perfect lead, that were taken up, the one at *Jamaica*, and the other by an acquaintance of mine, that took them out of the ground himſelf in *New England.*)

51. WHETHER the mine affords any parcels of metal, that ſeem to grow like plants? (As I have ſometimes ſeen ſilver growing, as it ſeemed, out of ſtone, or ſpar almoſt like blades of graſs; as alſo great grains of a metal, which appeared to me, and which thoſe, that tried ſome of it, affirmed to be gold, abounding in a ſtony lump, that ſeemed to conſiſt chiefly of a peculiar kind of ſpar.)

52. WHETHER the vein lye near, or much beneath the ſurface of the earth, and at what depth?

53. WHETHER the vein have or have not any particular concomitants, or coats (if I may ſo call them;) and, if any, what they are, and in what order they lye? (As the veins of lead ore with us, have frequently annexed to them a ſubſtance called ſpar, and next to that another called caulk.)

54. WHETHER (beſides theſe coats) the vein have belonging to it any other heterogeneous ſubſtance? (As in tin-mines we often find, that yellow ſubſtance, which they call mundick.)

55. WHAT are the principal qualities of theſe extraneous ſubſtances? (As that ſpar is white, but tranſparent, almoſt like coarſe cryſtal, heavy, brittle, eaſily diviſible into flakes, *&c.* Caulk is of a different texture, white, opacous, and like a ſtone, but much more ponderous. Mundick I have had of a fine golden colour; but, though it be affirmed to hold no metal, yet I found it in weight, and otherwiſe, to differ from marchaſites; and the mine-men think it of a poiſonous nature.)

56. WHETHER the vein be incloſed every way in its coats, or whether it only lye between them?

57. WHETHER the vein be every way of an uniform breadth, and thickneſs; and, if it be, what theſe dimenſions are; and, if not, in what places it varies, and in what meaſure? (The like queſtions are to be made concerning the ſpar, caulk, and other teguments or mixtures of the ore.)

58. WHETHER the vein be uninterrupted, or in ſome places broken off; and whether it be abruptly or not; and whether it be by vales, brooks, gullets, *&c?*

59. How wide the interruptions are; what ſigns whereby to find the vein again; whether the ulterior part or diviſion of the vein be of the ſame nature, and hold on in the ſame courſe, as to its tendency upwards or downwards, or horizontally, northward, ſouthward, *&c.* with the vein, from which it is cut off?

60. WHETHER, in caſe the laſt end of the vein be found, it terminate abruptly, or elſe end in ſome peculiar kind of rock or earth, which does, as it were, cloſe or ſeal it up, without leaving any crack or cranny, or otherwiſe? And whether the terminating part of the vein tend upwards, downwards, or neither? And whether in the places, where the vein is interrupted, there be any peculiar ſtone or earth, that does, as it were, ſeal up the extremity of it?

61. WHETHER it be obſerved, that the ore in tract of time may be brought to afford any ſilver or gold, which it doth not afford, or more than it would afford, if it were not ſo ripe? And whether it have been found, that the metalline part of the vein grows ſo, that ſome part of the mine will afford ore or metal in tract of time, that did not ſo before?

And whether to this maturation of the mine, the being expoſed to the free air be neceſſary; or whether at leaſt it conduce to the acceleration of it, or otherwiſe?

62. WHETHER all the ore contained in the mine be of the ſelf-ſame nature and goodneſs; and, if not, what are the differing kinds, and how to be diſcriminated and eſtimated?

63. WHAT is the fineneſs and goodneſs of the ore, by which the mine is wont to be eſtimated? And what are the marks and characters, that diſtinguiſh one ſort from another?

64. WHAT proportion of metal it affords? (As in our iron mines it is obſerved, that about three tons of iron ſtone will afford one ton of metal: and I have had lead ore, which an ingenious man, to whom I recommended ſuch trials, affirmed to me to afford three parts in four of good lead.)

65. WHETHER the ore be pure in its kind from other metals, and, if not, of what metals it participates, and in what proportion? Which is eſpecially to be enquired into, in caſe the mine be of a baſe metal, that holds a noble metal: (as I have known it obſerved, that lead ore, that is poor in its own metal, affords more ſilver than other; and I remember, that the ore lately mentioned, being rich in lead, ſcarce afforded us upon the cupel, an atom of ſilver. And *Matthеſius* informs us, that a little gold is not unfrequently found in iron ore. And I have by me ſome gold, that never endured the fire, taken out of a lump of tin ore.)

About the ſixth title.

66. WHAT are the mechanick and previous operations, as beating, grinding, waſhing, *&c.* that are uſed to ſeparate the ore from the heterogeneous bodies, and prepare it for the fire? Or whether the ore requires no ſuch preparation? (as it often happens in lead, and ſometimes in iron, *&c.*)

67. WHETHER mercury be made uſe of to extract the nobler from the baſer metals? (as is their practice in *Peru*, and other parts of the *Weſt Indies.*)

68. WHETHER the leaving the ore expoſed to the open air and rain for a good while, be uſed as a preparative? (as I have ſeen done in iron-ſtone.)

69. WHETHER the burning and beating of the ore be uſed to prepare it for the furnace? (as is practiſed in iron, and almoſt always in copper:) and in caſe they uſe more than once, how often they do it; (for copper ore is in ſome places waſhed eight or ten times, and in others twelve or fourteen) and with what circumſtances; as how long the ignition laſts at a time, whether the ore be ſuffered to cool of itſelf, or be quenched? Whether it be waſhed betwixt each ignition?

70. WHAT flux-powders, and other ways they have to try and examine the goodneſs of the ore in ſmall quantities?

71. WHETHER when they work in great, they uſe to melt the ore with any flux or additaments, or only by the force of the fire, or in any way between both? (as throwing in of charcoals, when they melt iron-ſtone, does not only ſerve to feed the fire, but perhaps by the alcali of its aſhes to promote the fuſion; ſo lime-ſtone, *&c.*)

72. WHAT kind of furnaces they uſe to melt the ore in, whether they be all of one ſort and bigneſs, or of differing?

73. WHAT are the ſituation, materials, dimenſions, ſhape, bigneſs, and in ſhort, what is the whole ſtructure and contrivance of the furnace? If there be any thing peculiar and remarkable? What tools are uſed in ſmelting their figures, uſe, *&c.* and the whole manner of working?

74. WHAT kinds of fuel, and what quantities of it are wont to be employed in the furnace, within the compaſs of a day, or week? How much is put in at a time? How often it is renewed? And how much ore in a determinate time, as a week, or a day, is wont to be reduced to metal?

75. IN caſe an additament be employed, what that is, and in what proportion it is added? Whether it be mingled with the ore, before that be put into the fire, or caſt in afterwards, and if ſo, at what time, *&c.?*

76. WHETHER the ore be melted by a wind, excited by the fire itſelf, as in wind-ovens? Or by the courſe of waters? Or acuated by the blaſt of bellows; and if ſo, whether theſe bellows be moved by a wheel, turned by water running under it, or falling on it? And what are the dimenſions, ſituation, *&c.* of the bellows?

77. WHAT contrivance they have to let or take out the metal, that is in fuſion, and caſt it into bars, ſows, pigs, *&c.?*

78. WHAT clay, ſand, or mould they let it run or pour it through? And after what manner they refrigerate it?

79. WHETHER or no they do either to facilitate the fuſion, or to obtain the more or better metal, mingle differing ſorts or degrees of ore of the ſame metal? As in ſome places it is uſual to mingle poor and rich ore; and at *Mendip* they mix two or more of thoſe differing kinds of lead ore, that they call frim-ore, ſteel-ore, potern-ore, *&c.*

80. WHETHER or no, having once brought the ore to fuſion, they melt all the metal itſelf to have it the more pure? And, if they do, with what circumſtances they make the fuſion?

81. WHETHER they have any ſigns, whereby to know, whether the fuſion have been well or ill performed; and the metal have obtained the perfection to be expected from ſuch ore, melted in ſuch a furnace?

82. WHETHER they obſerve any great difference in the goodneſs of the metal, that firſt melts, from that of the reſt of the metal, which comes afterwards in the ſame or another operation? And whether the rule holds conſtantly? (For, though they obſerve in tin-mines, the beſt metal comes firſt; yet in the works of an induſtrious friend of mine, he informs me, that the beſt metal comes laſt.)

83. WHETHER

83. WHETHER the produced metal be all of the ſame goodneſs? And, if it be, how good it is in reference to the metal of other mines, or other parts of the ſame mine or vein? And, if it be not, what differences are obſerved between the produced portions of metal, and what diſparity that amounts to in the price?

84. WHAT are the ways of diſtinguiſhing them, and eſtimating their goodneſs?

85. WHETHER they do any thing to the metal after it is once brought to a fuſion, and, if need be, melt it over again, to give it a melioration? (as when iron is refined, aud turned into ſteel,) and what diſtinct furnaces, and peculiar ways of ordering the metals, are employed to effect this improvement? With a full deſcription of them and the tools in all circumſtances, obſerved in the refining of metals.

86. WHETHER in thoſe places, where the metal is melted, there be not elevated ſome corpuſcles, that ſtick to the upper parts of the furnace, or building? And, if there be, whether they be barely fuliginous and recrementitious exhalations, or at leaſt in part metalline flowers? (As in the Corniſh tin-mines, after ſome years they uſually deſtroy the thatched houſes, where the ore hath been melted, to get the ſtuff, that adheres to the inſides of the roofs, out of which they melt ſtore of excellent tin.)

87. WHETHER the metal being brought to fuſion affords any recrements? (As iron ſtone affords ſtore of a dark glaſs or ſlagg) and if it do, what thoſe recrements are? How they are ſeparated from the metal? And to what uſes they are employed?

88. WHETHER, after the metal has been once melted, the remaining part of the ore being expoſed to the air, will in tract of time be impregnated, or ripened, ſo as to afford more metal? (For this is affirmed to me of the Corniſh tin ore; and what remained after the fuſion of iron ore in the foreſt of *Dean*, is ſo rich in metal, that a tenant of mine in *Ireland*, though he had on the land he held from me, an iron mine, found it leſs profit to work it, than to ſend croſs the ſea to the foreſt of *Dean* for this already uſed ore, which having lain for ſome ages, ſince it was thrown aſide in great heaps expoſed to the air, he affirmed to yield as well great ſtore of iron, as very good; though I ſomewhat doubt, whether this be totally to be aſcribed to the air and length of time, or to the leaving of metal in the ſlaggs in old times, before great furnaces were in uſe.)

Promiſcuous enquiries about mines, from the ſame author.

1. WHETHER the territory, that bears the mine, abounds with no other kind of mineral in diſtinct parts of it? (As in *Kent* near *Tunbridge*, one part of the country which is hilly, abounds all along with iron-mines; the other, which is alſo hilly, and divided from it but by a ſmall valley, abounds exceedingly (as the diggers and inhabitants told me upon the place) in quarries, which the metalline country wants, but is quite deſtitute of iron-ſtone. And ſo at *Mendip*, in one part of the hill, I ſaw ſtore of lead-mines, containing ſeveral kinds of ore of that metal; another part of the hill I found to be full of coal pits, which had ſome marchaſites, but no metal; and in another place, iron ore, and mixed with ores, which yet they did not think fit to work.)

2. WHETHER the air appear to be really cold in ſummer, and hot in winter at the bottom of the mines, by ſurer proofs than the teſtimony of our touch?

3. WHETHER they ever meet with places and ſtones actually very hot, as *Matthefius* relates? And whether that ſpring not from the quenching of marchaſites?

4. WHETHER they find in the mines any mineral gelly, ſuch as the German naturaliſts call ghur? And whether in proceſs of time it will harden into a metal, or mineral concretion?

5. WHAT are the laws, conſtitutions, and cuſtoms, œconomical, political, ethical, that are received and practiſed among the minemen?

6. WHETHER the diggers do ever really meet with any ſubterraneous demons; and, if they do, in what ſhape and manner they appear; what they portend, and what they do, *&c.*?

7. WHETHER they obſerve in the trees and other plants, growing over or near the mine, not only (as hath been already intimated) that the leaves are any whit gilded or ſilvered by the aſcending mineral exhalations, but alſo, that the trees or other plants are more ſolid and ponderous? And if they have not alſo ſome diſcernible metalline or mineral concretes, to be met with in the ſmall cavities and pores of their ſubſtance?

8. WHETHER there be not ſprings, and alſo greater ſtreams of water near the mine, that riſe, and run their whole courſe under ground, without ever appearing above it?

9. WHETHER the ſubterraneous ſprings do riſe with any wind or determinate change of weather?

10. How much heavier the atmoſphere is at the bottom of the mine, than at the top? And whether damps conſiderably increaſe the weight of it?

11. WHETHER they find any ſtrange ſubſtances in the mines, as veſſels, anchors, fiſhes incloſed in ſpar or metal, *&c.*?

A

PAPER

OF THE HONOURABLE

ROBERT BOYLE's,

Depoſited with the Secretaries of the Royal Society, *October* 14, 1680. and opened ſince his Death; being an Account of his making the Phoſphorus, &c.

Printed firſt in the *Philoſophical Tranſactions*, N° CXCVI. p. 583. January 1692-3.

Sept. 30. 1680. THERE was taken a conſiderable quantity of man's urine, (becauſe the liquor yields but a ſmall proportion of the deſired quinteſcence) and of this a good part at leaſt, had been for a pretty while digeſted before it was uſed. Then this liquor was diſtilled with a moderate heat, till the ſpirituous and ſaline parts were drawn off; after which the ſuperfluous moiſture alſo was abſtracted (or evaporated away) till the remaining ſubſtance was brought to the conſiſtence of a ſomewhat thick ſyrup, or a thin extract. This done, it was well incorporated with thrice its weight of fine white ſand; and the mixture being put into a ſtrong ſtone retort, to which a large receiver (in good part filled with water) was ſo joined, that the noſe of the retort did almoſt touch the water: then the two veſſels being carefully luted together, a naked fire was gradually adminiſtred for five or ſix hours, that all that was either phlegmatick or volatile might come over firſt. When this was done, the fire was encreaſed, and at length for five or ſix hours made as ſtrong and intenſe as the furnace (which was not bad) was capable of giving: (which violence of fire is a circumſtance not to be omitted in this operation.) By this means there came over good ſtore of white fumes, almoſt like thoſe, that appear in the diſtillation of the oil of vitriol; and when thoſe fumes were paſſed, and the receiver grew clear, they were after a while ſucceeded by another ſort, that ſeemed in the receiver to give a faint bluiſh light, almoſt like that of little burning matches dipped in ſulphur. And laſt of all, the fire being very vehement, there paſſed over another ſubſtance, that was judged more ponderous than the former, becauſe it fell through the water to the bottom of the receiver; whence being taken out, (and partly even whilſt it ſtayed there,) it appeared by ſeveral effects, and other phænomena, to be ſuch a kind of ſubſtance as we deſired and expected.

A N

A C C O U N T

OF THE HONOURABLE

ROBERT BOYLE's Way of examining Waters, as to Freſhneſs and Saltneſs.

To be ſubjoined as an Appendix to his lately printed Letter about the ſweetned Sea-Water, *October* 30, 1683.

Printed firſt in the *Philoſophical Tranſactions*, N°. CXCVII. p. 627.

I. HAVING ſince the publication of the foregoing letter, been commanded by the king, to ſhow his majeſty an experiment of the way herein mentioned, to examine the freſhneſs and ſaltneſs of waters; I did in his preſence (and that of his royal highneſs, his grace the duke of *Grafton*, and ſeveral perſons of quality) make trial of it, both upon ſome water prepared according to the patentees way, and upon two or three natural waters, that were ordered to be brought. In all which trials (in ſome whereof his majeſty, for greater certainty, was pleaſed to employ his own hands) the ſucceſs was ſuch, as moved him to vouchſafe the experiment the honour of his ſpecial approbation, and to give me an encouraging permiſſion to communicate it, as a thing, that may prove not unuſeful to the publick. This I think fit to mention, not only to procure to my way of trying waters, the high advantage of a royal, and (on philoſophical accounts) illuſtrious patronage; but that, if this method be found as beneficial as I wiſh it may, men may know, to whom they ought to acknowledge the early publication of it. This is all my haſte allows me to premiſe to the account I am going to deliver of the way of trying waters hitherto ſpoken of: which account I ſhall ſet down, as I drew it up to be diſpatched to a friend, in caſe I ſhould have his majeſty's permiſſion to impart it to him.

II. MY way of examining the freſhneſs and ſaltneſs of waters, though (becauſe it is wont to be ſurpriſing the firſt time one ſees it tried, and has had the luck to be much talked of in many good companies) it is thought to be an invention very difficult, to be either found out or practiſed, is yet really no ſuch myſterious thing as men imagine it. And for my part, I hope it will be found much more conſiderable for its uſe, than I think it is for the degree of ſkill and ſagacity, that was neceſſary to deviſe it. For when I remembered and conſidered, that (as I have found by various trials) divers metalline and other mineral ſolutions could be readily precipitated, not only by the ſpirit of ſalt, but by crude ſalt, whether dry or diſſolved in water, it was no very difficult matter for me to think, that by a heedful application of the precipitating quality of common ſalt, one might diſcover, whether any particles of it, (at leaſt in a number any way conſiderable) lay concealed in a diſtilled water, or any other propoſed to be examined.

III. TO find, whether I was not miſtaken in this conjecture, as alſo becauſe it is very convenient to be as little as one can confined to one material, I employed ſeveral drugs, and thoſe not at all prepared by one menſtruum, to make the intended diſcovery. And, though two or three of my other trials had ſucceſſes, that I diſliked not when I made them, yet that, which at length I pitched upon as the moſt certain, and which therefore I meant, when I had the honour to be ſent for by his majeſty about the patentees water, was that, which I think may be beſt underſtood, as well as recommended by this ſhort narrative.

IV. I TOOK ſome common diſtilled water in glaſs veſſels, that it might leave its corporeal ſalt, if it had any, behind it, and put into a thouſand grains of it one grain of dry common ſalt: into a convenient quantity, for example, two or three ſpoonfuls of this thus impregnated liquor, I let fall a fit proportion, for inſtance, four or five drops, of a very ſtrong and well filtrated ſolution of well refined ſilver, diſſolved in clean aqua fortis; [for a ſhift, common or ſterling ſilver will ſerve the turn:] and I made the experiment N. B.

N. B. This paſſage was depoſited with the Secretaries of the Royal Society, *An.* 1683. ſealed up and opened ſince the author's death.

* Which ſhould have been to the worthy doctor *John Beal*, to whom the letter this paper refers to was written; but to the author's grief, and the great loſs of the commonwealth of learning, he died before this paper was written.

ſucceed

ſucceed with ſpirit of nitre, inſtead of aqua fortis, upon which there immediately appeared a whitiſh cloud, which though but ſlowly, deſcended to the bottom, and ſettled there in a white precipitate.

V. THIS experiment having been ſeveral times, for the main of it, reiterated with ſucceſs, I thought fit to keep conſtant to the way of probation I made uſe of in it, (and which trials had recommended to me for between 20 and 30 years) though (by reaſon of ſome things, that haſte forbids me to mention) I pitched upon this way without at all denying, that men of ſagacity, eſpecially if well verſed in chemical operations, may upon the ſame ground that I went upon, find ſome other and cheaper ways, though ſcarce any more nice and certain of compaſſing the ſame end.

VI. AFTER what has been hitherto ſaid, I preſume I may ſeaſonably proceed, to ſubjoin the four enſuing advertiſements.

AND firſt, I ſhall give notice, that to make the experiment rather ſeverely, than at all favourably, there was uſually taken ſomewhat more than a thouſand parts of water to one of ſalt.

VII. NEXT I obſerved, that having let fall a few drops of our metalline ſolution into the liquor obtained from the ſea-water by the patentees way of ſweetning it, there did not preſently enſue any white cloud or precipitate, much leſs ſuch an one as had been newly afforded by the water, that was impregnated with leſs than a thouſandth part of ſalt. And if after ſome time there happened to appear, (for it is not abſolutely neceſſary it ſhould) a little cloudineſs in this fictitious liquor, it was both ſlowlier produced, and much leſs than that, which appeared in the impregnated water *.

IX. THIRDLY, the uſefulneſs of this experiment is not to be eſtimated only by the examen, it helps us to make of dulcified ſea-water, but much more by the eſtimate, that by its means may be made of natural freſh waters, whether ſprings, rivers, clouds, lakes, wells, *&c.* For it being generally granted, that thoſe waters, *cæteris paribus*, are the beſt, as well for the wholeſomneſs, as divers œconomical uſes, as waſhing, brewing, *&c.* that are freeſt from ſaltneſs, which is an adventitious, and in moſt caſes, a hurtful quality in waters; by our way of examining theſe liquors, a heedful eye may in a trice diſcover, whether there be any latent ſaltneſs in them, (as moſt waters imbibe from the ſoil they have traverſed, or do ſtagnate in) and may enable one, eſpecially by the help of a little practice, to give a near gueſs, how much one water is freſher than another, as I have purpoſely tried with pleaſure in differing waters, that were ordinarily drunk, even by conſiderable perſons. And if once you have attentively marked, what change four or five drops, for inſtance, of our diſcovering liquor will make in two or three, or ſome other ſmall determinate number of ſpoonfuls, (or rather of half ounces) of water; it will not be difficult for a heedful obſerver, keeping the ſame proportion between the two liquors, to make a near eſtimate, whether any natural water propoſed to him have a greater, an equal, or a leſſer degree of freſhneſs or ſaltneſs, than that water, that he has choſen for his ſtandard; and how much, in caſe there be a difference, the propoſed liquor is leſs or more free from ſaltneſs than the other.

AND that (to add this by the by) ſuch a difference in a liquor of ſuch frequent inward uſe as water (which is the baſis of beer, ale, mead, and ſome other common drinks) may have conſiderable effects upon human bodies in reference to health, may be probably argued from the differing effects, that waters more or leſs impregnated with ſalt have upon divers other bodies. Since moſt pump waters, for inſtance, will not boil peas and beef, and ſome other aliments, near ſo well as ſpring-water or rain-water, which are uſually ſofter, and more free from the ſaltneſs we ſpeak of. It is commonly known to barbers and laundreſſes, that the ſame pump-water will not ſo well and uniformly, or without little curdlings, diſſolve waſh-balls and ſoap, as rain-water, and ſome running waters uſually will: nay, when I was curious of tempering ſteel, I remember it was confeſſed by the ſkilfulleſt artiſts I made uſe of, that ſome tools, (as gravers, *&c.*) made of that hardeſt of metals, would receive a differing temper, if they were X.

* VIII. And perhaps it may be proper, that I here obſerve (what is not wont to be taken notice of) that divers ſolutions of mineral bodies may be precipitated by dilution, that is, (to explain this expreſſion) when the ſolution has time enough allowed to diffuſe itſelf, through a great quantity of water, the ſaline parts are thereby ſo diluted and weakned, that they are no longer able to ſuſtain the mineral corpuſcles, they kept ſwimming before, but make with them, and the water, a confuſed and ſubſiding mixture, uſually of a whitiſh colour. This may appear, when the butter of antimony, being put into common water, is thereby quickly and plentifully precipitated in the form of that white powder, that chemiſts (not over-deſervedly) call mercurius vitæ. To which I may add, that I have alſo produced a powder of that colour, by pouring into common water a ſtrong ſolution of tin glaſs made in aqua fortis. And by the ſame way we have precipitated the tincture for ſolutions of the finer parts) of julap, benjamin, true labdanum, antimonial ſulphur, and divers other bodies made in vinous ſpirits. If it were not for this power, that water has to weaken moſt ſolutions of bodies, I could have employed, inſtead of that ſilver, either quickſilver diſſolved in aqua fortis, or lead crude or calcined in the ſame liquor, or (which is more convenient) in ſtrong ſpirit of vinegar; ſince theſe, and ſome others, are found to be precipitable by ſalt water into whitiſh powders. But though a very heedful obſerver may, for a ſhift, make uſe of theſe metalline ſolutions, to gueſs at the quality of water, as to freſhneſs and ſaltneſs; yet the precipitation, that is made by dilution, is not difficult to be diſtinguiſhed from that which is performed by a true and proper precipitant, (as in our caſe by the common ſalt, that is harboured in the pores of the water) both by the quickneſs of the effect, and the copiouſneſs of the white ſubſtance produced, and on both thoſe accounts is very much inferior to it, as may evidently appear in the very different effects, that our ſolution of —— had upon the patentees water, or upon well diſtilled common water, compared with thoſe it had upon water impregnated with a thouſandth part of ſalt, and upon divers common undiſtilled waters. This advertiſement I have placed in the margin, as not thinking it fit either to omit it, or by inſerting it in the body of the writing, to give too great an interruption to the ſeries of my diſcourſe.

quenched

quenched in pump-water, from that, which the like extinction in ſpring water, or river water, would give them. But how to make our eſtimate of the freſhneſs or ſaltneſs of water come neareſt the truth, is a problem, of which I have now neither time nor conveniency enough to deliver my thoughts. And by what has been ſaid, I hope it does already ſeem ſufficiently probable, that the way above propoſed may prove of good uſe, both to navigators, that are often neceſſitated to water in unknown places, and to others, that only, or frequently drink that liquor, without having any better way than the taſte, (which is but an incompetent one) to eſtimate its freſhneſs and ſaltneſs by *.

XII. FOURTHLY (and laſtly) though both in my letter to Dr. *I. B.* and in this preſent poſtſcript, I did not for certain reaſons aſcribe to our method of examining waters, a greater nicety, than to be able to diſcover one part of ſalt in a thouſand of water, that proportion being great enough to recommend it, and expreſſed by a round number eaſy to be retained in one's memory: yet I would not have it thought, but that, if it were requiſite, our method may make more nice diſcoveries. For having ſometimes, for curioſity's ſake, put one grain of ſalt into no leſs than fifteen hundred of diſtilled water, we could manifeſtly, (though not quite ſo conſpicuouſly as before) make it appear by our way, that even this ſo lightly impregnated liquor was not devoid of ſalt, but had more of that in it, than ſome of the patentees water, that I kept by me, had; nay, I once found, that a grain of dry ſalt, being diſperſed through two thouſand, and another time, that being diſſolved in three thouſand times its weight of the ſame kind of liquor, ſo inconſiderable a proportion of ſalt was plainly diſcoverable by our precipitant.

XIII. BUT here philoſophical candour forbids me to conceal an objection, that I made to myſelf, though it be the chief, if not the only conſiderable ſcruple, that occurred to me, about our way of examining waters. For I foreſaw, that it may be objected, that, whereas the experiments hitherto mentioned have been tried only upon waters impregnated with groſs or corporeal ſea-ſalt, this perhaps may not hinder, but that they may be imbued with the ſpirits of marine ſalt, which, by reaſon of their activity, may be as unhealthful to the drinker, as the groſſer ſalt itſelf. But though to this ſurmiſe I might anſwer, that a very ſmall proportion of ſpirit of ſalt may in many caſes make the water ſeaſoned with it, rather medicinal than unwholſom; yet I ſhall anſwer more directly to the objection, by ſaying, that to manifeſt its not being well grounded, I took above a thouſand grains of diſtilled water, and inſtead of corporeal ſalt, put to it one ſingle drop of moderately ſtrong ſpirit of ſalt, (for I had much ſtronger by me, that I purpoſely declined to employ) and having ſhaked it into water, I let fall into a portion of this unequally compoſed mixture ſome drops of our ſolution of ſilver, which preſently began to precipitate in a whitiſh form; inſomuch, that, for ought appeared to the eye, this trial ſucceeded better, than if the water had been impregnated with but a thouſandth part of corporeal ſalt. The like experiment was made with the patentees water inſtead of the other. And to purſue this trial a great way farther, I had the curioſity to diffuſe one drop of ſpirit of ſalt into two thouſand grains of diſtilled rain water; and upon letting fall ſome drops of our precipitant into it, I found, that the ſucceſs well anſwered my expectation. And then, to urge the trial yet farther, I added as much of the ſame diſtilled rain water, as by a modeſt conjecture made it amount to at leaſt as much more. So that one grain of ſpirit of ſalt had a manifeſt operation, though not quite ſo conſpicuous as the former, upon above three thouſand grains of water, whoſe immunity from common ſalt we tried apart; and poſſibly, if the vial could have contained more, and would not have been, when filled, too heavy for our tender balance, the diſcolouration of the mixture would have been diſcernible, though but one grain of ſpirit of ſalt had been put upon four, or even five thouſand grains of water. And that a drop of the ſaline ſpirit we made uſe of, did not equal in weight a grain of dry ſalt, I found by this, that having let fall into a counterpoiſed piece of glaſs ten drops of that ſpirit, I found them to want near half a grain of nine grains weight; which way of eſtimating I choſe, as leſs ſubject to any conſiderable error, than that of weighing a ſingle drop by itſelf.

XIV. THE like trial I made by ſubſtituting above a thouſand grains of rain water, in the room of the like quantity of diſtilled water. And theſe two experiments I the rather mention, becauſe they do not only ſhow, how free the patentees water was from ſpirituous, as well as from corporeal ſea-ſalt; but alſo manifeſt, that, whereas it is the opinion of ſome ſeamen, and of a perſon, for whom I have a profound reſpect, that water ought to have a little ſaltiſhneſs to preſerve it; if this be really a deſirable quality in our artificial water,

* XI. I might add on this occaſion, that, whereas experience has informed ſeveral perſons, who have conſulted it, that divers medicinal waters, that are preſumed to owe their virtues to the participation either of metalline, or of other mineral bodies, do upon trial appear to leave ſometimes little, and ſometimes nothing behind them, except a kind of common ſalt; our precipitant may much aſſiſt men to diſcover, whether a mineral water, propoſed to be examined, do or do not contain ſuch a ſalt, and if it do, whether it contain it copiouſly or no. This I have tried upon more than one of our Engliſh mineral waters, and thereby found in a trice, that one, that is reputed of another nature, contained pretty ſtore of ſaline matter; and that another (which is ſtill, for ought I have learned, of an unexamined and unknown nature) is impregnated with a ſurpriſing plenty of ſaltiſh ſubſtance. But how and with what cautions our precipitant may be the moſt uſefully employed about the examen of medicinal and other mineral waters, belongs not to this place, (but to ‖ another.) Upon which account I forbear to declare the uſe I have ſometimes made of our precipitant, in examining the freſh urine of men, the ſerum of human blood, and other bodies belonging to what the chemiſts call the animal kingdom.

‖ About the examen of mineral waters.

it may in a trice be ſupplied with as much ſaltneſs, whether corporal or ſpirituous, as ſhall be required, and conſequently as will bring it to be equal in that quality to the common water of rivers, or of ſprings. And perhaps it will not be impertinent to add on this occaſion, that in ſome places, eſpecially lying in hot climates, it may ſometimes be of good uſe to know, whether on the account of the ſun's heat, or that of the ſubterraneal regions of the earth, the rain water is impregnated with volatile (not acid) ſpirits, like thoſe, that are diſtilled from urine, and which I have, for curioſity's ſake, obtained from a mineral body, native ſal-armoniac; upon which account I made a trial, that informed me, that if five or ſix drops of ſtrong ſpirit of urine (whoſe drops I obſerved to be but ſmall) were ſhaken into a thouſand grains at leaſt of diſtilled or rain water, impregnated with but one of ſalt, our precipitant would make a diſcovery of ſome ſaltiſhneſs in the liquor. And it were neither to be admired nor cenſured, if the patentees water ſhould ſometimes ſhow a change, when our precipitant is plentifully put or long kept in it, eſpecially that change being a more light one, than that I came from ſpeaking of; ſince, for ought I have yet obſerved, not only ſuch undiſtilled waters as are generally allowed to be freely potable, but even thoſe, that nature herſelf diſtils, are not always quite devoid of ſaltneſs. For I have found rain water, that I cauſed to be carefully ſaved, after the houſe-tops had newly been well waſhed with former rain, to grow a little troubled, if any ſtore of our precipitant were kept for ſome competent time in it. And being gently diſtilled off, it left a reſidence, which with a little of our ſolution afforded a far more ſuddenly made and copious precipitate, than had been produced with the like quality even of pump-water itſelf. And, though I have met with rain-water, that was more free from ſalt than any ſpring or river-water, that I remember I have examined; yet, having for curioſity's ſake, made a trial of ſnow-water, (which if the weather had been ſomewhat milder, would have been rain) this liquor, I ſay, which is thought to afford the lighteſt water of all natural ones, I manifeſtly found by our way of examining it, not to be devoid of ſaltneſs.

XV. But to return to the trial we made with the ſpirit of ſalt, theſe experiments may not a little confirm the patentees water. And whereas ſome have either really ſuſpected, or invidiouſly pretended, that even a moderate action of the fire upon water, will make it brackiſh and putrify; as I ſee no ſubſtantial grounds of this ſurmiſe, ſo it appears by the foregoing trials, that really the patentees water is not brackiſh, but is more free from ſaltneſs, than moſt of the waters men do without ſcruple drink. And if it were true, that this water ſhould not keep quite ſo long as others, yet that were no more than is objected (how truly I now enquire not) to the generality of diſtilled waters: and that this we ſpeak of may keep ſweet longer than is neceſſary in a ſhip, that can from time to time, within a few days, ſupply itſelf with freſh out of the ſea, may be gathered from theſe two things. The firſt is, that to ſatisfy myſelf, whether cloſeneſs would make the prepared water ſoon putrefy, (as ſeemed obvious to be ſurmiſed) or at leaſt afford dregs, I cauſed a pint, or a pound of it, to be hermetically ſealed in a vial, whereof I left by gueſs about a third part empty; and having above ſix weeks after held this veſſel againſt the light, I found the water to be clear and limpid; though I did not judge it had depoſited ſo much as the tenth part of a grain of feculency. And having opened the ſeal, and taken out a little of the liquor, I did not find it altered, either as to ſmell or taſte. The ſecond of the two things, that were to be mentioned, is, that I have kept the bottle of prepared water mentioned in my letter to Dr. *Beal*, in the ſame unſtopped veſſel ever ſince *March*, that is ſo long, that it is near eight months old, and yet it continues ſweet and well conditioned. And if that, which is called crudity in water, does conſiſt (as probably it oftentimes does) in certain groſs particles, that are mingled with the purely aqueous ones, it is likely, that the action of the fire may divide and diſſipate theſe into minuter particles, and thereby deſtroy the texture, that makes them hurtful; and by cauſing innumerable tumblings and rovings among the more earthy particles, give them opportunity to make little coalitions, whoſe weight precipitating them to the bottom frees the pure water from them.

XVI. And becauſe it is but too probable, that the unwholeſomneſs of divers waters proceed, not only, or perhaps not ſo much, from bare crudity, as from a great quantity of groſſer particles, that are not eaſy to be raiſed, becauſe of their being combined with fixed and earthy ones, that ſwim up and down in the water they impregnate, as ſilver or mercury does in a ſolution made with aqua fortis, or rather as the particles of ſalt do in pump-water, and many other common waters: on this account, I ſay, the patentees invention may very much correct ſuch waters, ſince by their way of ſweetning thoſe liquors, the truly aqueous parts are not only freed from the ſaline ones, but from the mineral, and other groſs and hurtful corpuſcles, that may have lain concealed in the liquor. As may be argued from hence, that having purpoſely in the gentle fire of a digeſtive furnace ſlowly diſtilled off a pound of the patentees water, it left us in the cucurbit ſo light and thin a feculency, that the bottom of the glaſs ſeemed to be rather ſullied than covered by it; and I did not judge, that the whole feculency, if we could have got it out, would have amounted to ſo much as two grains.

XVII. But to return, after this ſhort, and I hope not impertinent digreſſion, to what I was lately ſaying of the virtue of the fire, to correct the crudity of waters, I ſhall proceed and ſay, that perhaps it was upon ſome ſuch reaſons, (to which others might be added, if

I could in few words confirm paradoxical ones) that the laſt great duke of *Tuſcany*, when he drank water, (for it was not, as I perceive ſome have miſunderſtood, his only drink) preferred, for wholeſomneſs, that, which was diſtilled, to that which was not; and if herein that learned prince, and thoſe of the ſame opinion, were not miſtaken, it will highly recommend the uſefulneſs of the patentees invention to mankind: for I ſhall on this occaſion obſerve, that there are multitudes of waters, that are not conſiderably brackiſh to the taſte, that yet, by reaſon of ſome unheeded ſaltneſs, as in moſt pump-waters, are more frequently, by reaſon of crudity, not only unfit, or (at beſt) leſs fit, for divers oeconomical uſes, as waſhing, boiling of ſome meats, *&c.* but are very unwholeſom; ſometime to a degree, that makes them miſchievous to whole communities, and perhaps nations. Of this it were to be wiſhed, that it were harder to give inſtances. I remember I have ſeen a notable one, in thoſe high and unſightly tumours about the throat, which are obſerved by travellers to be exceeding common among thoſe, that inhabit the lower tracts of ground, that lye between the Rhætian, Helvetian, and ſome other neighbouring mountains; which monſtrous ſwellings are generally imputed to the ſnow-waters, that flow from the mountains, and make the uſual drink of the meaner ſort of people; whence it is obſerved, that perſons of better condition, who drink wine more than water, are either not at all, or far leſs troubled with theſe diſfiguring *goitres*, (as they call them.) But much more notable inſtances to our preſent purpoſe are afforded me by that great (and yet living) traveller, monſieur *Tavernier*, baron of *Aubonne*, who ſpeaking of a nation of Cafres or negroes, that comes ſometimes to trade with the Portugueſe from a remote part of *Africk*, informs us, that the water of their country is very bad, which is (ſays he) the reaſon that their thighs do ſwell, and it is a wonder to ſee any one of them free. Nay, which is far more, where he ſpeaks of the African kingdom (or empire) of *Monomotapa*, he has this memorable paſſage, "the natives "never live long, by reaſon of the badneſs of "the waters in the country. For at the age "of twenty five they begin to be dropſical, "ſo that it is a great wonder, if any among "them live above forty years." *Tavernier*'s travels, part II. book II. chap. 23. page 156.

XVIII. WHAT monſieur *Tavernier* delivers being taken for granted, it ſeems very probable, that theſe people may be much relieved, and be brought to live as long as other nations, if they had ſo compendious a way as that of the patentees, to provide themſelves plentifully with waters, whoſe crudity is corrected, its groſſer and heavier parts ſeparated, and its brackiſhneſs deſtroyed by the fire, as its action is regulated and helped by their invention.

[THE experiment mentioned in this paper was tried at a meeting of the Royal Society, *February* 17, 169½, by Dr. *Sloane*, with a ſucceſs anſwerable to the aſſertions of the honourable author, and that a drop or two of ſpirit of ſalt mixed with common water would be by the ſame method diſcovered.]

A FREE DISCOURSE AGAINST Cuſtomary Swearing. AND A DISSUASIVE FROM CURSING.

To the Right Honourable

RICHARD, Earl of *Burlington* and *Cork*,

Lord High Treaſurer of IRELAND,

And the Honourable

Sir *HENRY ASHURST*, Baronet;

Executors to the Honourable *ROBERT BOYLE*, Eſq;

IT has been an injury too often done to the memory of perſons eminent for knowledge, learning, and virtue, to have after their death ſuch works obtruded upon the world for theirs, as have been deſervedly ſuſpected; or, if theirs, yet were never intended by them, in that ſqualid, broken, and imperfect condition, to have been publiſhed. But as for this tract you were pleaſed to put into my hands to peruſe, it is not only certain, that it was wrote by the honourable perſon, whoſe name it bears; but alſo, that it was deſigned by him for the preſs, as ſome paſſages in it do apparently ſhew.

1647. AND if this noble and learned author thought it ſeaſonable for thoſe times of uncontrolled liberty and confuſion, in which it was wrote, it is as ſeaſonable, if not more, at the preſent; when that vice, againſt which it is directed, has of late years ſo far prevailed to the great diſhonour of our nation, as well as our religion, that the patriots of our country aſſembled in parliament have been thereby juſtly provoked to prepare that late bill (which ſince has paſſed the royal aſſent) for the better and more effectual puniſhment and ſuppreſſion of it. A deſign becoming ſo auguſt an aſſembly; and in the proſecution of which your honours muſt be eſteemed to have done conſiderable ſervice, eſpecially by the publication of this treatiſe, which has been ſo happily recovered, and by a ſingular providence reſerved, as it were, for ſuch a ſpecial ſeaſon and ſervice.

I am, moſt honoured,

your moſt humble,

and faithful ſervant,

JOHN WILLIAMS.

THE

THE PUBLISHER TO THE READER.

THESE two tracts againſt cuſtomary ſwearing and curſing, lately met with amongſt the papers of a perſon of quality, and an intimate acquaintance of the honourable Mr. *Robert Boyle*, tranſcribed by his own hand, were found upon peruſal, perfect and fitted for the preſs, except the cloſe of a dedicatory epiſtle to his noble ſiſter, the counteſs of *Kildare*, which (as far as appears by the copy) he had but juſt began.

THE year inſerted on the title page, as well as a paſſage or two in the former of theſe, ſhews, that it was penned towards the latter end of the late unhappy times, when he was about twenty years old; by which time (if I am not miſtaken) this was the third treatiſe he had prepared for the publick; the other two being that of *Seraphick Love*, afterwards printed, and an *Eſſay of miſtaken Modeſty*, referred to in this.

I CANNOT ſay, (though there is a ſenſible conformity between the ſtyle of theſe and others of his books) but that this honourable author, if he had been to write upon this argument in his riper years, might have given it a finer turn; and added, out of his vaſt ſtore of learning and thought, much to the weight and force of it. But there is in the management of it ſuch a ſtrain of modeſty and unaffected piety, ſuch an affectionate zeal for the honour of Almighty God, and ſuch a paſſionate concernment for the well-doing and happineſs of thoſe of his acquaintance, for whoſe uſe this ſeems more eſpecially deſigned; and in fine, ſo much truth, reaſon, and obſervation, (as the pleas and excuſes here undertaken and anſwered, ſhew) that muſt above all recommend it to ſuch, as have his name in remembrance and veneration.

A NAME, methinks, better than that of ſons, than of daughters, than that of blood and deſcent; and that ſhould provoke thoſe of eminent extraction and ſtation, to an imitation of ſo worthy and glorious an example.

WHAT happy inſtruments might they then be of good to mankind, by their wiſe conduct and their exemplary virtues! What a reſtraint would this lay, above that of laws, on their dependents and inferiors! For how would ſuch dare to offend, that are ſure to find no countenance or protection? And what protection or countenance could they expect from their ſuperiors, whoſe lives would be a continual reproof, and where they could find no more a precedent, than they do a law to encourage them in their wicked oaths and blaſphemies. To bring theſe vices into diſparagement, and to repreſent the folly, as well as the ſin of them to the better bred part of mankind, was the generous and pious deſign of this learned author; and of thoſe honourable perſons, that from their relation to him by blood or friendſhip have been concerned in the publication.

TOWARD the utter extermination of which amongſt us, there ſeems to be, as human means, nothing more neceſſary than the vigilance of our magiſtrates, who are now as well and fully empowered, as obliged by the law to ſee to the puniſhment of it; and for the due execution of which, they will moſt certainly have the good wiſhes, aſſiſtance, and prayers of all good men, and, which is more than all, the bleſſing and rewards of heaven.

I HAVE only this to add, that the ſecond tract, or letter, ſeems to proceed from the ſame hand with the firſt, being agreeable to it in the ſtile as well as the deſign of it; and ſo the naming Mr. *Boyle* in it is but a decent cover for the concealment of himſelf.

A

DISCOURSE

AGAINST

Cuſtomary Swearing.

THOUGH I doubt not, but that it is much more eaſy to make moſt ſwearers proſelytes than converts, and a taſk of leſs difficulty to convince their judgments, than to reform their practice; yet, that they may not have any colour to father upon ignorance, what is uſually the child of ſome much guiltier parent, it will be (poſſibly) no leſs uſeful than neceſſary, briefly to direct them to thoſe texts of ſcripture, where all thoſe, that acknowledge God's word, may find the condemnation of that vice.

FIRST then, the third commandment flatly forbids unneceſſary oaths, in terms, that are ratified by theſe words of our Redeemer, in St. *Matthew*'s goſpel; "Ye have heard what "hath been ſaid by them of old time, thou "ſhalt not forſwear thyſelf, but ſhalt perform "unto the Lord thy oaths: but I ſay unto "you, ſwear not at all; neither by heaven, "for it is God's throne, nor by the earth, *&c.*" Mat. v. 33, 34.

And a little under, "But let your commu- V. 37.
"nication be yea, yea; nay, nay; for what-
"ſoever is more than theſe cometh of evil."
The ſum of which prohibition is thus repeated by St. *James*, towards the cloſe of his catholick epiſtle; "But above all things, my James v. 12.
"brethren, ſwear not, neither by heaven,
"neither by the earth, neither by any other
"oath, but let your yea be yea, and your
"nay, nay, leſt you fall into condemnation."
And ſuitable to theſe clear paſſages of both teſtaments, the wiſe man characters a ſinner Ec. ix. 2.
by him, that "ſweareth;" and paraphraſeth a righteous man by him, that "feareth an "oath." So in *Hoſea*, ſwearing has the van of the moſt trying and provoking ſins in that Hoſ. iv. 2, 3.
ſame diſmal paſſage; "By ſwearing, and ly-
"ing, and killing, and ſtealing, and com-
"mitting adultery, they break out, and blood
"toucheth blood: therefore ſhall the land
"mourn, and every one that dwelleth therein
"ſhall languiſh with the beaſts of the field,
"and with the fowls of heaven; yea, the
"fiſhes of the ſea alſo ſhall be taken away."
And in another prophet we find this threat Zech. v. 3.
recorded; "And every one that ſweareth
"ſhall be cut off." Which paſſage might eaſily be reinforced with others of the ſame nature, if I did not think theſe, that are already alledged, abundantly ſufficient; where we pay not our faith to the number of the texts, but to the authority of the inditer.

BUT alas! how much more eaſy is it to make men condemn their ſins, than to perſuade them to forſake them? Certainly our underſtandings are (uſually) much honeſter than our wills; it being far eaſier to reconcile men's judgments to the truth, than their practice to their judgment. Cuſtomary and unneceſſary ſwearing (for that is the ſole enemy I undertake) is ſo confeſſedly unlawful, that they are aſhamed to defend it, that bluſh not to practiſe it; and even they renounce it in their opinions, that moſt cheriſh it in their diſcourſe. But methinks this knowledge of the ill they act ſhould make them apprehend that menace of our Saviour, which he threatens, "He that knoweth his maſter's Luke xii.
"will, and doth it not, ſhall be beaten with 47.
"many ſtripes:" for ſtumbles are more pardonable by night than by day; and the knowledge of what we do, whilſt it lends us direction, robs us of excuſe; and if it do not impede, it aggravates our faults; ſince he, that does what he condemns, condemns what he does. Upon which ſcore our bleſſed Saviour ſaid, "That *Tyre* and *Sidon* ſhould Mat. xi.
"feel a milder torment at the day of judg- 21, 22.
"ment, than thoſe ungrateful towns *Chorazin*
"and *Bethſaida*," where the light of his doctrine had ſhone ſo clearly, and the miracles of his life had been ſo familiar. And accordingly we may obſerve, that the devils, that had no tempter to their fall, have found no pardon for it; but having ſinned againſt ſo clear a light, are hopeleſsly reſerved in chains of utter darkneſs, to endure hideous torments unto all eternity.

SECT. I.

BUT that we may leave our ſwearer as little pretence as reaſon for his obſtinacy, let us ſingly and orderly examine his allegations, and tear off thoſe fig-leaves of evaſions and excuſes, the devil teaches him to ſow together, to hide his own deformity from himſelf.

PLEA I.

AMONGST theſe, the firſt allegation we are to remove, is this, that ſwearing is indeed a ſin, but that (as *Lot* ſaid of *Zoar*) it is but a "little one;" for were it of the blacker dye, Gen. xix.
in what a ſad condition were mankind, ſince the 20.
number of ſwearers is not inferior to that of men?

ANSWER

ANSWER. But certainly he, that ſeriouſly conſiders, whom the leaſt ſin offends, and what it merits; how infinite a juſtice, majeſty, and goodneſs, it provokes, and how intolerable and immortal a puniſhment is due unto it, will eaſily concede, that to believe any ſin otherwiſe than comparatively little, is in it ſelf an error abſolutely great; for the moſt dwarfiſh are to be called ſmall, but in the ſenſe, that the aſtronomers call the earth a point; for ſo indeed it is, compared to the firmament; but in it ſelf conſidered, it is ſo vaſt, that the ſpots and ſhreds of it are both the ſtage and the ſubjects of the ambition of conquerors, and the jars of monarchs. And truly, ſince the leaſt (unpardoned) ſin is ſufficient to damn us, methinks we ſhould as little ſlight petty faults, becauſe there are fouler crimes, as we do piſtols, now there are cannons uſed. But granting this aſſertion to be true in the general, it will forfeit that attribute in this application; for this ſin is one of thoſe, that are expreſly and by name forbidden in the ten commandments; where it is not only liſted among, but has the precedency of murther, theft, and of adultery; being the ſole commandment (ſave one) that has a threat annexed to the law; which in this paſſage is, "For the Lord "will not hold him guiltleſs that taketh his "name in vain." In which laſt words, the great lawgiver foreſeeing men would be very remiſs in the proſecution of a fault, in which their want of zealous piety makes them not to be concerned, declares that he himſelf will take the vindication of his honour into his own hands, and inflict himſelf the puniſhment of a crime, that fears it but from him. And then if thoſe treſpaſſes be not ſeverely dealt with, that are alone puniſhable by the ſupreme magiſtrate, let all conſider, what "a "fearful thing it is to fall into the hands of "the living God." Which brings into my mind a pretty extravagancy, that is reported of the Turkiſh laws; which puniſh blaſphemy (as they call it) againſt Mahomet with inevitable death, but enact no penalty upon the like diſhonour offered to God. Becauſe Mahomet (ſay they) is not in a condition to vindicate himſelf; but God is ever able to revenge his own affronts, and therefore they reſign that care to him. Who indeed many times has (in ſuch caſes) done it ſo ſoundly, and ſo much to the purpoſe, that thoſe ſaucy wretches have had cauſe to think it as poor a privilege, to have their oaths out of the cognizance of the laws of men, as thieving beggars do to be exempted from the danger of the beadle and the ſtocks, becauſe their crimes are reſerved for the gallows.

Exod. xx. 7.

Heb. x. 31.

BUT to reſume our proofs of the ſinfulneſs of ſwearing; admit the guilt of ſingle oaths were no leſs venial than is pretended, yet certainly, when in moſt ſwearers the frequency of ſwearing is ſo great, that one day may be guilty of more than a thouſand oaths; (theſe ſins not growing ſingle, as apples or cherries, but like grapes by cluſters; the ſwearer's devil having a title to the name of the Gadarene ſpirit, that, anſwering our Saviour, called himſelf Legion) their multitude cannot but render them conſiderable; and he, that remembers, that a thouſand holes may as well ſink a ſhip, as ſome great leaks, will conclude oaths to be extremely dangerous, at leaſt for their number, though they were not ſo for their heinouſneſs. Nor are they only ruinous to the perſons, that uſe them, but have a deſtructive influence upon that ſtate, that ſuffers them. For whether or no what the prophet related once of *Judah*, "Becauſe of ſwearing, "the land mourneth," be not a fulfilled prophecy of *England*, I wiſh it were rather charity than partiality to doubt. For though the multitude and variety of our ſins be ſo great, that it is a puzzling taſk to determine, to what particular crimes our calamities are due, yet certainly our oaths are too conſiderable an acceſſion to our ſins, not to infuſe a ſuitable proportion of gall and wormwood into that bitter cup (of affliction) theſe gaſping kingdoms drink ſo deeply of; and whatſoever feathered, I am confident our oaths have ſtrangely pointed thoſe fatal arrows, that deſtroy theſe nations.

Mark v. 9.

Jer. xxiii. 10.

As for the ſuppoſal this miſtake is built on (the involvedneſs of all men in the guilt of ſwearing) it is as weak, as it is uncharitable; for (beſides that to allow no body an innocence from ſwearing, is as much a ſlander to mankind in its preſent condition, as it would be its crime, if the accuſation were true) our Saviour gives us the world's example rather for a caution, than for imitation; where he tells us, that the way to hell is a road, and thronged with numerous travellers; but heaven's path is narrow, and the gate, that inlets to thoſe manſions of bliſs, as unfrequented as it is ſtrait. Even Mahomet himſelf (in his diſcourſe with the Jew *Adia*) having at the laſt day divided mankind into threeſcore troops, makes but three of them believers, and all the reſt reprobates. But certainly he, whoſe command this is, "Thou ſhalt not fol- "low a multitude to do evil," will hardly take the practice of that multitude for a juſt diſpenſation of the law of that God, who having commanded us to live by good precepts, will ſcarce accept it for an excuſe, that we have erred by bad examples. It would be a ſtrange abſurdity in phyſick, becauſe a peſtilence is more diſperſed and epidemical, to think it therefore the leſs dangerous; or to believe, that the multitude of ſtinking carcaſſes can leſſen the noiſomneſs of the ſtench. But as in pious duties the general concurrence contributes to the acceptation, ſo in ſins, the like conſent but haſtens on revenge; it being with the guilty kingdoms as with leaking boats, where the number of the paſſengers but makes them ſink more nimbly. And accordingly we read, that the univerſality of the Sodomites beaſtlineſs was ſo far from juſtifying each ſingle ſinner, that they were all conſumed with fire from heaven, for the ſole want of ten righteous perſons. It is for them only, that think it no miſery to burn in hell with others, to fancy it no ſin to ſwear with company: but for the reſt of men, let them

Matt. vii. 13.

Exod. xxiii. 2.

Gen. xviii. 32.

them take this from me, that ſins, whoſe ſeeming pettineſs makes them leſs formidable, do oftentimes prove the moſt dangerous; and he, that dares eſteem any ſin ſmall, may ſoon be brought to think none great.

PLEA II.

WELL, but objects the ſwearer, I do not ſwear ſo often, and my conſcience by ſeldom accuſing me of that ſin, aſſures me, that I do but unfrequently commit it.

ANSWER. But ſure in vice, whoſe eſſence conſiſts in a repugnance to mediocrity, every little is too much; and he, that ſwears feweſt oaths, ſwears yet too many by the whole number, that he ſwears. One oath is too many by one, when one is enough to damn. And who would ſwallow poiſon, becauſe obliged ſeldom to repeat his draught? To paſs over this, that the ſame conſiderations, that contract the number of your oaths, do aggravate their guilt, by arguing both a clearer knowledge of the ill you act, and a more bridling power to reſtrain it. But alas! how ſeldom does the ſilence of his conſcience make for the ſwearer? We know, that inſenſibility of pain may as well proceed from the deadneſs and ſtupifiedneſs of the part, as from a perfect and unmoleſted health. In fighting, that is held a heavier blow, that (ſtunning) takes away the ſenſe of pain, than that, which pains the ſenſe. Beware your tranquillity reſemble you not to the toad, that feels not poiſon, becauſe he is all poiſon; and reſents no alteration from it, becauſe it is natural to him. There are legions of ſwearers, in whoſe mouths cuſtom ſwears undiſcernedly; and who being taxed with it, (and believe what they ſpeak too) ſwear, that they are no ſwearers, and thus commit the fault they would wipe off the imputation of. But wiſe phyſicians hold it a fatal ſymptom, when excrements are voided without the patient's knowledge; and it is a ſign, that the thief has haunted long, when the maſtiff forbears to bark at him. In ſuch caſes, conſcience, like oppreſſed ſubjects under an armed tyrant, forbears expoſtulations, not out of want of the cauſes of complaint, but out of uſe of ſufferings. But certainly this lethargy of ſecurity is much more dangerous, than the fever of a reſtleſs conſcience; ſince in the one, the ſmart ſoon drives us to the ſearch of phyſick, but the other is ſo far from addreſſing us to remedies, that it never lets us know we need them. In ſuch ſtill conſciences, as in the ſea, the ſmootheſt ſeas, the ſmootheſt calms forerun the rudeſt tempeſts: for conſcience, when long forced to play the mute, turns to a ſcold at laſt; being like overladen muſkets, which, whilſt no fire comes near them, can ſcarce be known from them, that are not charged; but at the leaſt ſpark (of ſerious terror) that falls into the touchhole, they will be ſure to fly about our ears.

PLEA III.

TRUE; but (may you anſwer) there are others, that ſwear as much as I, and oftner; why then are not they more reprehended for more frequent faults?

ANSWER. To this I may reply in the terms of the apoſtle, "Am I therefore your "enemy, becauſe I tell you the truth?" And add out of *Solomon*, "That reproofs of in- "ſtruction are the way of life." "That po- "verty and ſhame ſhall be to the man, that "refuſeth inſtruction, but he, that regardeth "reproof, ſhall be honoured." And laſtly, "That he, that being often reproved, hard- "neth his neck, ſhall ſuddenly be deſtroyed, "and that without remedy." I know there are many *Sauls*, whoſe choler flames againſt thoſe *Davids*, that endeavour their diſpoſſeſſion, though they attempt the cure even with muſick, I mean, the mildeſt and the gentleſt way. But I muſt beg my ſwearer to conſider, that it is an inſpired writer, that aſſures me, "There is a generation, that are pure in "their own eyes, and yet is not waſhed from "their filthineſs." Your excuſe is juſt as if in an hoſpital a deſperate patient ſhould ſay to his phyſician, Why I can need no phyſick, for there are others here as ſick, and many more diſeaſed than I.

Gal. iv. 16. Prov. vi. 23. Prov. xiii. 18. Prov. xxx. 12.

To complain of being reprehended for vice, is to complain, that one is cared for; like the favourite child, that cries for having the knife taken away from him, when it is not from others, for whom we care not, whether they cut themſelves or no: which is as if our eyes had right to quarrel with us, for not enduring that duſt there, we ſuffer in our ſhoes. Certainly, as we deſerve not praiſe for other mens virtues; ſo can we not decline cenſure by the allegation of their faults. Take heed there be not places hot enough in hell, though others fry in more tormenting flames; and remember, that as it is not health to be not altogether as ſick as gaſping people; ſo it is but a very ſorry goodneſs not to be as bad as the worſt. How ſtrangely are our affections miſplaced! In tranſitory goods, which he rates juſtlieſt, that prizes leaſt, we think we never have enough, if any body elſe has more; but in the goods of the mind, which cannot be overvalued, we think our ſelves ſufficiently ſtored, if others enjoy leſs. We are diſcontented at another's wealth, and proud of his vices; and whereas his greater poverty ſhould exalt our gratitude, and his greater piety create our emulation, his riches make us envious, and his ſinfulneſs ſecure.

PLEA IV.

WELL, (may you reply) but I ſcorn to ſwear falſly; and what I know to be true, why may I not ſafely ſwear?

ANSWER. This weak objection ſatisfies many ſwearers, (ſo eaſily men believe what they deſire) but with as little reaſon as they ſwear with need: for that not falſe alone, but raſh and unneceſſary oaths are forbidden, appears evidently by the expreſſion made uſe of in the third commandment; where perjury is not alone condemned, but it is flatly written, "Thou ſhalt not take the name of the

" Lord, thy God in vain." Which if needleſs and cuſtomary ſwearing do not, it will be a ſtrange riddle to me, what the commandment means to prohibit. But that this is the genuine ſenſe and deſign of thoſe words, is cleared by theſe expreſs ones of our Saviour, (cited before in St. *Matthew*'s goſpel)
Mat. v. 33, 34, &c. " Ye have heard, that it hath been ſaid of " old time, thou ſhalt not forſwear thyſelf, " but ſhalt perform unto the Lord thine oaths. " But I ſay unto you, ſwear not at all, nei- " ther by heaven, for it is God's throne, nor " by the earth, *&c.*" And to this ſenſe the annexed affirmative precept expounds the negative law; the word communication in the former ſhewing the interdict to be chiefly meant of oaths employed in common diſcourſe and converſation. Nay, God himſelf ſeems manifeſtly to determine all the controverſy, by that clear diſtinction expreſſed in a paſſage of *Leviticus*, whoſe words run thus,
Lev. xix. 12. " And ye ſhall not ſwear by my name falſly; " neither ſhalt thou profane the name of " thy God: I am the Lord." And certainly if we muſt anſwer at the laſt day for every idle word, how much more will that account be exacted of us for every idle oath?

THE *Jews* at this day, (as I learned whilſt I lately converſed with them at *Amſterdam*) have ſo profound a reverence for that great name of Jehovah (commonly called Nomen Tetragrammaton, and ineffable, ſo frequently recorded in the ſcriptures) that they hold it unlawful for mortal lips ſo much as to pronounce it: but though I eſteem this fancy ſuitable enough to the reſt of the extravagancies of their modern tenents, yet certainly their ſuperſtition will condemn our irreverence. I remember an expoſitor obſerves upon the vith of *Deuteronomy*, and the 13th verſe, that the word there, which ſignifies ſwear, is put in the Hebrew in the paſſive ſenſe, to imply, that our ſwearing ought to be a kind of neceſſitated act. And a father tells us of one *Clinias*, a Pythagorean, who being fined in a great ſum of money, which he might have eſcaped with an oath, choſe rather to pay the penalty impoſed, than not to pay unto God the reverence, that he thought due unto his name. Beſides, he, that makes no conſcience of ſwearing vainly, will ſoon make but little of ſwearing falſely; for he, that in a lower degree ſo voluntarily breaks God's commandment for nothing, may ſoon be drawn to break it in a little higher degree for his profit.

AND though many of our gallants (doubtleſs in a pure compliment to the devil) are pleaſed to condemn the breach of this commandment, only when the ſinner wants the excuſe of an advantage by it; yet certainly, he, that uſes to toſs God's ſacred name in his mouth without any reverence, and employs it about every trifle, will eaſily be tempted not to care much what he does with it, nor to what uſe he puts it. And therefore holy *David* makes it a ſymptom of hatred againſt God, when in a pſalm he ſays,
Pſalm cxxxix. 20. " Thine ene- " mies take thy name in vain." Theſe conſiderations may clearly teach us, what to think of thoſe uſual forms of ſpeech, ſuch as are, God forgive me, God help you; and the like of thoſe cuſtomary exclamations, ſuch as are, O God! O Jeſus! and thoſe others, that are uſually employed to proclaim our wonders, or ſupply the want of a compliment, with an exceſs of irreverence: for though theſe unregarded treſpaſſes be in moſt perſons faults venial enough, as the effects rather of ignorance and heedleſſneſs, than of deſign; yet are they faſhions of ſpeaking, which, beſides that they are always needleſs, and often ſcandalous, do but inure our mouths to a very ſaucy ſlighting of that awful name, which eternally to praiſe, ſhall be in heaven both our employment and our happineſs.

PLEA V.

NOR will it avail the oathmonger to reply, But I do not take God's name in vain; for I ſwear not by God, or by Chriſt, or other oaths of the like nature, but only by the creatures, as by this light, by this bread, by heaven, and the like; and the creatures name I hope it is no ſin to take in vain.

ANSW. For ſure if we will allow our Saviour to be the beſt interpreter of his Father's commandments, he will teach us a very differing leſſon in thoſe (already twice alleged) words of St. *Matthew*; for doubtleſs he, that forbids to ſwear by heaven, the nobleſt, or by earth, the meaneſt ingredients of this vaſt fabrick of the world, intended, that prohibition ſhould reach all other creatures; which is as clear as light in the enſuing words of the 37th verſe of the ſame chapter, where Chriſt's expreſs injunction is, " But let your commu- " nication be yea, yea; nay, nay; for what- " ſoever is more than theſe, cometh of evil."
Mat. v. 34.

BESIDES, either by the thing you ſwear by, you mean God, or no; if the former, your guilt is evident in the breach of God's commandment; and if the latter, remember what the ſpirit ſays in *Jeremy*, " How ſhall I par- " don thee for this? Thy children have for- " ſaken me, and ſworn by them that are no " gods." And in effect, it is queſtionable in divinity, whether be the greater ſin, to ſwear falſly by the Creator, or with truth by the creatures; for as the former is an act of high impiety, ſo is the latter of idolatry: becauſe ſwearing by any thing being a part of divine worſhip, (as the paſſages the margin leads to, will evidence) implies in us an acknowledgment of ſome divinity in the thing we ſwear by; which, without omniſcience, is uncapable to diſcern the inward truth or falſehood of our oaths; and without omnipotence, unable to reward the one, or puniſh the other. A conſideration ſo prevalent with many of the primitive martyrs, that they choſe rather to expire in torments, than ſwear by the genius of the emperor. Nor is an oath only an act or ſpecies of divine worſhip, *If.* xlviii. 1. and xlv. 23. but by a ſynecdoche is taken for the whole worſhip, that men pay their Maker, in the lxiiid Pſalm, and the laſt, and in *Jer.* iv. 2.
Jer. v. 7.
Deut. vi. 13. & x. 20. Iſa. lxv. 16. Joſh. xxiii. 7. Jer. xii. 16. Exod. xxiii. 13.

PLEA VI.

ALLIED to this plea is theirs, that will not flatly ſwear by God, but by certain fictitious terms and abbreviatures, as by *Dod*, &c. and by the like diſguiſing of them believe to juſtify their oaths; as if they cared not, ſo (like *Saul* to the witch of *Endor*) they may go maſked to Satan.

1 Sam. xxviii. 8.

ANSW. To theſe I ſhall only anſwer with the apoſtle, "Be not deceived, God is not "mocked; ſince (as the ſame apoſtle elſe-where ſays) "He taketh the wiſe in their "own craftineſs." Well may this childiſh evaſion cheat our own ſouls, but never him, who judgeth as well as he diſcerns intents; and regards not ſo much the preciſe ſignification of your words, as what they are meant and underſtood for; which (in ſuch caſes) is uſually an oath, ſince the ſame credit is both given and expected upon theſe mongrel oaths, that is paid to thoſe they mean, but would not ſeem. Theſe people bring into my mind the bloody perſecutors of our firſt Chriſtians, who clothed them in the ſkins of ſavage beaſts, that it might ſeem no crime to worry them; for ſo theſe hypocrites diſguiſe God's name, to give themſelves the licenſe to diſhonour it.

Gal. vi. 7.

1 Cor. iii. 19.

IT is a very pretty ſlight of theſe gentlemen, to cozen the devil to their own advantage, and to find out by-ways to damnation, and deſcend to hell by a pair of back-ſtairs; and methinks argues a cunning much about the ſize of his, that pleaded he was innocent of falſifying the king's coin, becauſe he had diſplaced ſome letters in the motto. But to hell, as to towns, theſe ſingular by-paths (though leſs frequented) may lead directlier than the broad highways: and to theſe gentlemen, and thoſe that rely upon the laſt anſwered objection, I ſhall at preſent only recommend the ſerious pondering of that paſſage of the wiſe man in the Proverbs: "All "the ways of a man are clean in his own "eyes, but the Lord weigheth the ſpirits."

Prov. xvi. 2.

PLEA VII.

IT is a uſual excuſe of ſome ſort of ſwearers, that they ſwear only ſome peculiar oath, and that one kind of oath cannot amount to ſuch a crime as the more ſcrupulous pretend.

ANSW. An apology equally excuſing with the thief's, that ſhould alledge, that he commits all his robberies upon the ſame horſe; and the drunkard, that ſhould offer to juſtify his beaſtlineſs, by affirming, that he never foxes himſelf, but with one ſort of wine, or in ſuch a peculiar unaltered bowl. Remember what an apoſtle ſomewhere ſays of ſinning, "Whoſoever ſhall keep the whole law, and "yet offend in one point, he is guilty of all." Juſt as a man, that wounds the buck in the vitals, is truly and properly ſaid to have killed the deer, although the ſhaft reached but the head or heart, leaving the legs and other parts untouched. Thus in a globe, though there be numerous parts, yet he is guilty of breaking the whole globe, that breaks it but within the arctick circle, though near the equator it have eſcaped that violence; for whereſoever you break it, you break the globe; its eſſence conſiſting in the entireneſs, that is ruined by the fraction of any part. Sin, becauſe natural to us, is ſo readily learnt by us, that as in ſhooting, by practiſing to hit wrens and ſilly ſparrows, we learn the art of killing feldifares, thruſhes, and the other ſort of birds we never aimed at; ſo by committing ſome ſmall ſin, we learn, though inſenſibly (and perhaps undeſignedly) to commit other and groſſer kinds of ſins.

James ii. 10.

ONE act may make us do diſpoſitively, what *Moſes* is recorded to have done literally (at the foot of mount *Sinai*) break all the ten commandments at once; for ſingle diſobediences, if preſumptuous, may have the power to exile that fear of God, whoſe expulſion compriſes in it the whole trade of ſin, which (conſcience once deſpiſed) is known without being learnt. If a reverence to the commandment were that, which did place limits to the variety of your oaths, it would not permit the uſe of any one, but lay an equal reſtraint in relation to them all; ſince the ſinfulneſs of ſwearing does conſiſt, not in the diverſity of our oaths, but in their forbiddenneſs. But this excuſe itſelf is often wanting to many of our gallants, who not content with the received forms of diſhonouring their Maker's name, do as much affect novelty in their oaths, as in the faſhion; and if they have a gift of ſingularity in ſwearing, are as proud of it, as of their miſtreſs's favour: ſuch people are as nice as impious in their oaths, they will never uſe any till it be ſtale and threadbare, but (ever like their clothes) leave them off before they have been worn long enough to grow old. But whilſt they are thus induſtrious in the diſcovery of new ways of provoking their Creator, it is much to be feared, that they do but (if I may ſo ſpeak) find out for themſelves a north-weſt paſſage to damnation.

Exod. xxxii. 19.

PLEA VIII.

BUT, continues the ſwearer, if I ſwear not, I ſhall not be believed.

ANSW. But (it is replied again) belief is better wanted, than purchaſed at ſo dear a rate as ſin; ſince he, that parts with heaven, makes over a bad bargain, though the whole world were the accepted price. But alas! unleſs men will conſtrue their diſobediences for arguments of your obſequiouſneſs, how unlikely is it, that (by believing you ſpeak truth, becauſe you uſe to ſwear you do not lye) they ſhould take your readineſs to tranſgreſs one of God's commands, for a proof, that you dare not break another.

Matth. xvi. 26.

How ridiculous would men eſteem that merchant, that ſhould be confident to gain credit amongſt lenders, by giving bond for every trivial ſum, for which others are truſted upon their bare word? For in oaths (as in

moſt other things) too conſtant a frequency depreciates that authority, which their rareneſs, as well as nature, gives them; that not being held a ſufficient ſecurity for the belief of a doubted or important truth, that is laviſhed to authoriſe every trivial and impertinent aſſertion; nor thought a convincing atteſtation of a queſtioned truth, that flows rather from a cuſtom of ſinning, than deſign of confirming. No, no; he needs not many oaths, that uſes few; for to be known to make a conſcience of an oath will gain your words more credit than the ſwearing of a thouſand; it being a viſible and remarkable judgment of the offended Deity upon oaths, that their number diſcredits that truth itſelf would perſuade.

SINCE then it is your habitude of ſwearing needleſsly, that alone engages you to a neceſſity (as you call it) of ſwearing to be believed, let your diſcontinuance remove that obligation cuſtom only has contracted; and believe me, that the moſt perſuading aſſeveration of all is ſo to live, as not to need to ſwear. That ſociableneſs, which you allege to extenuate your fault, but aggravates the heinouſneſs of the crime, by confeſſing cuſtomary oaths to be like jealous tyrants, whom we cannot entertain, without giving admittance to their retinue and their guard, ſince in this vice you acknowledge the act an engagement to a repetition; and that oaths, which are the ultimate and higheſt confirmations of truth in their nature, muſt yet (by this fine policy) themſelves derive an authority from their multitude; which is very unneceſſary, where the aſſertor is believed, and uſually does but create diſtruſts, where the veracity is not credited.

Heb. vi. 16.

PLEA IX.

OF kin to this is their apology, who plead, that if they do not ſwear, their words ſhall neither be feared nor obeyed by their very ſervants; men's ears being of late ſo accuſtomed unto oaths, that they are neceſſary to make them think we are in earneſt. This is the uſual objection of the French, amongſt whom this vice is grown ſo epidemical (as of blackneſs amongſt the Ethiopians) its commonneſs has removed all the deformities they would otherwiſe find in it.

ANSW. But ſure there are ways enough to make your ſervants obey your commands, without your breaking God's. Gravity and ſeverity, not uſing them to hear you ſwear, are courſes likelier far than oaths to reach that end; which if they yet ſhould fail of, they would turn this fancied inconvenience into an advantage of neceſſitating you to the election of religious ſervants. Certainly, ſince the ſole univerſality of vice has drawn upon us this ſuppoſed neceſſity, a general and unanimous deſertion of it muſt needs be the propereſt expedient for its removal. And, believe me, it is but an extravagant way of teaching our inferiors to pay us their duties, to teach them to diſobey the commands of their ſuperiors by our own example, and to lead them the way to deſpiſe the injunctions of the moſt adored powers, to whom we confeſs to owe an exquiſite obedience, upon the higheſt conſiderations.

BUT admitting (as the diſperſedneſs of this vice too often forces us) the ſuppoſal of this plea to be true, yet will the inference prove conſequent? For by the ſame reaſon the thief might juſtify the unreclaimedneſs in his robberies, by alledging, if he forſake that trade, his purſe muſt ſoon grow empty; or the Buona Roba excuſe her proſtitutions, by ſaying, that unleſs ſhe continue her former profeſſion of wantonneſs, ſhe ſhall no more be preſented with new gowns, and linen richly laced, nor be able any longer to maintain her wonted riots; her converſion (by forbidding her to be the cheriſher of her gallants looſe exceſſes) depriving her of the only fuel of her bravery. Upon how few could we with juſtice preſs religious duties, if ſuch petty inconveniences attending their performance were a warrantable diſpenſation or diſengagement from it? Surely he, that requires, that we ſhould "pull out our right eyes, and cut "off our right hands," if they oppoſe our entrance in at the ſtreight gate, will ſcarce give them admittance, that will not purchaſe it by the parting with ſuch trivial conveniencies. It is much leſs unreaſonable, that you ſhould be neither believed nor obeyed with readineſs, than that God ſhould either not be believed when he ſpeaks, or not obeyed when he commands. For take this for a truth, to which oracles are fables, that never any man commits a ſin to ſhun an inconveniency, but one way or other, ſoon or late, he plunges himſelf by that act into a far worſe inconveniency, than that he would decline.

Matt. v. 29, 30.

PLEA X.

OTHERS there are, that uſe to repreſent, that they ſwear not but when they are angry; and then (for all our clamours and exaggerations) they mean no harm at all.

ANSW. But would you take it for a juſtification of your wife's adulteries, if ſhe ſhould tell you, that ſhe never proſtitutes herſelf, but when her fits of luſt tempt her to give that ſatisfaction to her appetite? Beſides, this is but to excuſe one fault with another; and with no greater juſtice, than his, that ſhould defend a baſtard's crimes, by alledging, that his mother was a whore; ſince the nature, as well as the duty of virtue, being the moderation of our paſſions, it is evident, that their exceſſes degenerate into ſins; and therefore how that can be a good excuſe, that needs one, and how that anger, which in itſelf is ſinful, can impart an innocence to productions in their own nature culpable, let thoſe that are concerned determine.

FOR my part, when I conſider the apoſtle's command, "Be ye angry, and ſin not;" I cannot but apprehend, that when our paſſions ſwell into exceſs, they are indeed contaminated by the guiltineſs of their productions,

Eph. iv. 26.

tions; but confer not upon them a meritoriouſneſs, which themſelves want. But why, I pray, in every paſſionate mood, muſt you be tranſported to commit ſins, that are as unprofitable as impious; and to deſerve your croſſes, by a ſaucy provocation of your God, whom you then endeavour to make your enemy, when you muſt need his favour to protect you from diſquiets? Why muſt your tongue fly in your Maker's face, and vilify his ſacred name, becauſe your dice turn up ſize-ace rather than quatre-trey? For either he is the guider of thoſe ſeeming chances, or meddles not with their diſpoſal: in this laſt caſe you are palpably injurious, to make God the object of your choler, when he is not the cauſe of it; and in the former caſe your folly is not inferior, inſtead of propitiating, to incenſe that Deity, who is the ſole diſpoſer of thoſe fortunes we either wiſh or fear.

But take heed he give you not too much pretence to be ſo, by diſpleaſing you, (as diſcreet mothers whip their froward children, that cry without cauſe) and puniſh in his anger theſe raſh and culpable expreſſions of yours. As for the other branch of the excuſe, I mean the harmleſſneſs of your intent; to that I muſt reply, that our actions may as well offend as our intents, if they be ſubſequent to our knowledge of God's averſion to what we do. And uſually men take it for a ſufficient offence, to do what we are ſure will diſoblige them, though with a differing deſign. Nor do we think ourſelves leſs injured by robbers when they ſtrip us, becauſe they offer us that violence, not with intent to anger us, but only to make a booty of our purſes. It is a received maxim in divinity, which moraliſts prop with their full concurrence, that no goodneſs (much leſs bare innocence) of the intent can juſtify a formal ſinful evil. If then the committing of this ſin againſt the knowledge of the ill you act, be not crime enough to condemn you, you muſt not be denied my abſolution. But withal, I muſt acquit moſt ſinners in the world upon the ſelf-ſame ſcore; and believe the threatned flames of hell as uninhabited as inſupportable; ſince certainly ſuch ſinners (if any ſuch there be) muſt be prodigious no leſs for their unequalled rarity, than deviliſh perverſeneſs, that are ſuch monſters as to offend their Maker, merely to offend him. For in philoſophy our maſters teach us, that ill under that notion cannot be the object of our choice; (that being ever a real, or at leaſt a ſeeming good;) and though in our miſguided elections we oftentimes embrace it, yet that is ever under a contrary notion, and rather by miſtake than by deſign.

But oh! how induſtrious are ſinners to deceive themſelves; and how ſtrangely does the devil faſcinate and blind deluded mortals, when (by ſuch ſilly and impertinent excuſes) he perſuades them rather to expoſe their judgments to a certain diſcredit, than let their ſouls be ranſomed from an ignoble ſlavery, into a glorious freedom; and rather ſuffer their abilities to be believed weak, than permit their lives to be made virtuous. Certainly, ſuch people would make me as much aſtoniſhed as themſelves are faulty, if I did not conſider this gallant property, of rather making bad apologies to defend their ſins, than good reſolutions to forſake them, as entailed upon them by a kind of traduction from our firſt parents, who hoped with fig-leave aprons, and the faint ſhade of trees, to hide both their nakedneſs and their diſobedience from the omniſcient eye of God himſelf.

I will not waſte ink upon their ſucceſsleſs and impudent defence, that make their drunkenneſs an apology for their ſwearing, and make that an excuſe for their ſin, which is itſelf a ſin above excuſe; but with as little juſtice, as the keeper of the lions in the *Tower* could excuſe any particular tragedy they had acted, by alledging, that he had voluntarily let them looſe. But ſince the tempers, that moſt diſpoſe men to a flux of oaths, are drunkenneſs and choler, give me leave, by the by, to take notice of the chief midwives, that are uſually aſſiſtant to the birth of oaths; and to obſerve, that as the thunder falls not, but when heaven is overcaſt, ſo we are proneſt to ſwear, when the beaſtlineſs of our paſſions hath either blinded or depoſed our reaſon.

PLEA XI.

It is confeſt, you may allege, that ſwearing is a moſt heinous ſin, but I do never ſwear myſelf, but only to repeat thoſe oaths of another (which are therefore his ſins, not mine) whoſe omiſſion would ſpoil the jeſt.

Answ. This brings into my mind the known ſtory of that merry gentleman, who to ſhew the ſullen juſtice, how the maſtiff he had killed had firſt aſſaulted him and overthrown him, runs full but at the formal Sir's breaſt, and ſends both him and his chair to ſalute the ground: for when a ſin cannot be imitated, without being committed, then that you but repeat it only, is as ſorry an excuſe, as his muſt be, who, to illuſtrate the relation of a murder, ſhould piſtol the firſt man he meets withal. Beſides, when did tranſgreſſion by precedent turn innocence? and what was unlawful in the act, become legitimate in the repetition? It is acknowledged, that the relating of another's oaths may ſometimes be not only lawful but neceſſary; but then it muſt be either to diſcover or convert the ſwearer; or elſe when the oath is ſome material circumſtance of a ſerious narrative. But here the very end adds guiltineſs to the action, it being only to make another's vice applauded, and render his ſin both infectious and immortal. But how will you juſtify this introducing of God's name only (like a fool in a play) to make the company laugh, and to bring it into contempt, from the diſobedience to the prohibition of taking God's name in vain? Unleſs (perhaps) the conſequences of your ſin teach you a conſtruction, that may reſolve this difficulty; and the judgments your ſwearing will produce, ſhew you, in what ſenſe you have taken your Maker's

name in vain. Remember how ſad a reckoning was preſented to *Belſhazzar* by the hand-writing upon the wall, for having turned the veſſels of the temple into implements and furtherers of mirth, at his ſumptuous entertainment; and conſider betimes, that God may leſs reſent the making merry in his holy cups, than the making merry with his moſt holy name.

To this may well be added, that in this ſinning at the ſecond hand, the copied ſin is held more criminal in the tranſcript than in the original; for beſides that this ſwearer by imitation acknowledges himſelf ſo delighted with the other's ſin, that he becomes the devil's mountebank (or his zany) to have it admired by all, that hear him, (and we know, that approbation is but an after-conſent;) beſides this, I ſay, the leading ſwearer has the excuſe of an immediate applauſe; whereas the apiſh repeater wrongs and diſcredits his own piety, only to celebrate and proclaim another's wit; if that be not too partially termed wit, that appears ſuch only to our corruptions; ſince when the oath muſt make the jeſt, it is only the devil in us, that is pleaſed with it. Handſom replies are good without oaths, and dull ones will not be made good by them: to the one they are needleſs, to the other they are uſeleſs; that being juſtly enough appliable to oaths in apophthegms, which is uſually believed in painting of faces, that beauties need it not, and deformed women look but ridiculouſly for it.

Prov. xiv. 9. Fools (ſays the wiſe man) "make a mock "of ſin;" they can take pleaſure to hear him affronted, in whoſe communion conſiſts happineſs; and make that the fuel of their jollity, that ſhould be the object of their deteſtation. For my part, I do not like this doing in jeſt, what a man may be damned for in earneſt; and I much wonder, that we frail mortals, whoſe faults are more numerous than the very minutes we have lived, ſhould think our own ſins too few to condemn us, without adopting thoſe of others too! And to our crimes (too numerous already) adding theſe ſins of ſupererogation! But to reſume our theme.

PLEA XII.

There remains yet a prejudice to remove, which, though very rarely the pretence of ſwearers, is very often a prevalent motive to ſwearing, and is an evil by ſo much the more obſtructive to theſe ſinners reclaiming, by how much the more ſilently it oppoſes it. This is a fooliſh fancy, that many ſwearers cheriſh, that their oaths make them looked upon with a kind of admiration, as gentleman-like ſins; and witneſs in them ſo bold and daring a courage, that it extends to a fearleſſneſs of God himſelf.

Answ. But though their bluſhing to own ſo childiſh a pretence be a ſufficient diſproval of it; yet ſince as in war, ſo in diſputes, we conſider not ſo much the perſonal ſtrength of the adverſary we attempt, as the rank he holds among thoſe, that employ him; it will not be amiſs to remove an obſtacle, made conſiderable by being ſo great a vice's motive, and ſo great a motive to that vice: though of this ſort of ſwearers (as of ſome ſavages, that lurk in rocks and woods) it be much more difficult to obtain a battle, than to get a victory; and to draw them to the field, than to give them a defeat.

Doubtless theſe needy gentlemen will never tempt the admiration of wiſe men upon any other ſcore, than that of the greatneſs of their folly. They muſt be thought ſtrangely neceſſitous of meriting qualities, that do ſo meanly by their bad ones implore and court men's good opinion: and I know not, whether be the greater, their impudence to expect it for the recompence of vice, or their profuſeneſs, that ſhould ſquander it away on thoſe, who have no juſter title to our eſteem, than that, by which the miſerableſt of beggars pretend to our charity, the multitude of their imperfections and wants. Wiſe men will make theſe poor and empty projects the objects ſolely of their ſcorn and laughter; and only thoſe, that want eſteem for themſelves, will reward you with it; and for ſuch people's praiſes, they will but diſcommend you: ſo that that empty applauſe, you are ambitious of, will either be impoſſible to be purchaſed, or not deſerve to be purſued. But what, your oaths will make men take you for a gentleman! You are deceived, there is too little Epicuriſm and chargeableneſs in your vice, to be affected to that quality. It was ſtill ſo cheap, and now grown ſo common, that I wonder our grandees, though they deſiſt not for the ſin's ſake, renounce it not, at leaſt for the company's. Muſt then vices be arguments of the poſſeſſion of that dignity, that virtue is the ſole true means to purchaſe? I am ſure it ſhould not be ſo; but grant it were, will you pretend to nobility, by that alone, which is not the property, but the vice of gentlemen? and entitle yourſelf to that illuſtrious quality, by that, which, in God's eye, makes them unworthy, if not diveſts them, of it? At that rate your pretenſions would parallel his mirth, who boaſted a deſcent from the firſt *Cæſars*, barely upon his being (like moſt of them) almoſt deformedly hawk-noſed, deriving his intereſt in their blood, only from his ſympathy with their defects.

For my part, I muſt confeſs, I am not ambitious of thoſe badges of gentility, that Chriſtianity delivers for the ſymptoms of reprobation; nor do I find men deſirous of the gout, though the proverb have appropriated that diſeaſe to rich men.

But then (you think) your courage will be unqueſtionable: and indeed it may ſeem, that you want not probability to prop up your hopes, ſince you deſperately hazard the incurring of immortal torments, for that, for which no wiſe man would venture the ſtretching of his little finger. But ſince the kindred betwixt virtues is not ſo remote, that the want of any one ſhould conclude the poſ-

ſeſſion of any other, and your impiety convince us of your courage; experience teaches us, that no men more fear what they ſhould contemn, than thoſe, that contemn moſt what they ſhould fear. And martyrs have embraced thoſe flames with joy, that impious perſons durſt not ſo much as think of without horror.

THAT boldneſs, that men perſonate againſt their Maker (were it real) would not be the effect of their reſolution, but either of their inconſiderateneſs, or their unbelief. "The "wicked flee (ſays Solomon) when no man "purſueth; but the righteous are bold as a "lion." And indeed it is no great encouragement to deſpiſe this life, to want either hope, or at leaſt confidence of a better. Nor will all men ſo eaſily conclude, that he, that fears not to venture his ſoul, dares freely venture his body. For ſince it is not the eſſential worth of things, but the proprietary's value of them, that their dearneſs to us is to be meaſured by; that ſtandard, and moſt men's actions, will preſent us the ſoul and body in a very inverted order of precedency; the greater part of men living for the body, as if they were all body, and ſlighting their ſouls, as if they had no ſouls, or had them but to loſe. It being but too true of the very greateſt of thoſe people, that in themſelves, as in their ſtables, the employment of the man is but to ſerve the beaſt. And truly he, that conſiders, that the neglect of the ſoul proceeds from the former dotage on the body, will think, that a very unlikely conſequence, that infers a readineſs to hazard the latter, from the careleſſneſs of what becomes of the former. He, that ſhakes off the emboldening fear of God, betrays himſelf to as numerous apprehenſions, as did the weak-eyed frantick, who, to be ſecured from the offenſiveneſs of the ſun's brighter beams, by pulling out his eyes, expoſed himſelf to all thoſe dangers, and thoſe horrors, that attend on blindneſs.

Prov. xxviii. 1.

PLEA XIII.

BUT, ſay ſome ſwearers, if I renounce this vice, my repentance will procure me a deriſion I ſhall be aſhamed of.

ANSW. Muſt then that baſhfulneſs, which is both the livery and guard of virtue, oppoſe our addreſſes to it? Like ditches, when the drawbridge is cut down; which, though their uſe be to ſecure the fortreſs from enemies, forbid acceſs to them, that once have ſallyed, when they are meditating a retreat. But yours is an excuſe as receivable as the whores, who pretended baſhfulneſs for their turning honeſt. I was much taken with an Italian gentleman, who ſpying a friend of his peep out his head from behind the door of a Bordello, to ſee, if he might retire undiſcovered; "Come forth, come forth, cries he; "you need not be aſhamed to leave that ſlut-"tiſh place; but you ſhould have been a-"ſhamed to have entered it."

HAVE innocence and vice then ſo changed natures, that he, that did not bluſh to commit ſin, ſhould bluſh to forſake it? And he, that hath once framed miſhapen characters, be aſhamed afterwards to write a neater hand? The bluſhes, that do wait on our repentance, proceed from an implicit confeſſion it imports of ſome former faultineſs; and ſo if it have been ſhameful to have committed a fault, how much more ſhould we be aſhamed to continue, and how little can it diſcredit us to forſake it? And truly, he, that thinks a fault a juſt engagement to a relapſe, leſt his converſion ſhould make him laughed at, deſerves the cenſure men would paſs upon that fool, who having ſlipt one foot into a quagmire, ſhould rather proceed to be entirely bogged, than by timely ſtepping back, to confeſs a miſchance, that may provoke men's laughter. I had much rather men ſhould laugh at my retracting, than God frown upon my relapſes; and care not ſo much, who ſmiles at any action, that makes my conſcience do ſo, (not by way of deriſion, but of applauſe.)

How contradicting are the deſires of mortals! We are angry, if we are not thought virtuous, and yet we are aſhamed to appear ſo, and think it a juſt ground of quarrel, to be reported the contrary of what we bluſh to ſeem! Like ladies, who though they long to live till they grow old, fret to appear what they deſire to be. The ſinner, that is overmuch concerned in bad men's opinions of good mens actions, does as it were ſwear allegiance to the devil, and let him bore his ear through with an awl againſt the door-poſt, ſealing an engagement to perpetual bondage; for (as the ſame men that crucified our Saviour, derided him) as long as the greateſt part of men are wicked enough to injure piety, there will be found men impudent enough to mock it.

Exod. xxi. 6.

FOR ſinners knowing, that in the world's eſteem, the extent of a deformity makes it vaniſh, and that the generality of a crime does ſo diveſt it of that name, that every body's ſins are thought no body's, are by the cheapneſs of the expedient eaſily ſwayed to intruſt the protection of their reputation rather to common guilt, than to a private virtue; and to ſeek an innocence rather by adding to the number of the wicked, by their calumnies and deriſion, than by increaſing the number of the godly by their converſion. Thus being bribed by their own intereſts to diſcredit ſuch actions, as they are tied to, and yet will not practiſe; it is no wonder, if by ſcoffingly condemning what cloſely condemns them (though therein their conſciences give their tongues the lie) they cunningly endeavour to father their faults, not upon their want of piety, but ſtore of wit; and to make their ſlavery to their paſſions paſs for the ſuperiority of their judgments.

BUT ſure he is very unfit to be Chriſt's ſoldier, that bluſhes to wear his heavenly leader's colours, and wants the courage to diſobey example. He, that will take the *Canaan* above by violence, muſt imitate the conqueror of the *Canaan* below, who profeſt to

Joſh. xxiv. 15. to the world, "If it ſeem evil unto you to "ſerve the Lord, chuſe you this day whom "you will ſerve, whether the gods, *&c.* But "as for me and my houſe, we will ſerve the Matt. v. 11. "Lord." Our Saviour (who for us "endured the croſs, deſpiſing the ſhame") apportions felicity to the being reviled for his ſake: and congruouſly his apoſtles being Acts v. 14. cauſleſly miſuſed by the chief-prieſts, "departed from the preſence of the council, "rejoicing, that they were counted worthy "to endure ſhame for his name." Deriſion for virtue is a grievance as old as Job; who Job xii. 4. in his time complained, that "the juſt and "upright man is laughed to ſcorn:" and it was even Chriſt's own caſe; of whom one of the evangeliſts in ſome place records, that Matt. ix. 23. "they laughed him to ſcorn." But we may ſay of the reſolute Chriſtian, what the wiſe Prov. iii. 34. man ſays of his Maker, that he "ſcorneth the "ſcorners:" and ſurely, ſince God is ſaid to laugh divers tranſgreſſors of his law to ſcorn, it is not improbable, that he will not fail to laugh them to ſcorn, that for his glory ſcorn not to be laughed at: eſpecially, ſince ſuch perſons are deeply acceſſary to their own and piety's diſgrace, by a ſneakingneſs, which ſo implies a guilt, that where it proceeds not from a fault, it is one: and themſelves highly countenance the diſcountenancers of the profeſſion of religion, by being aſhamed to own it. Whereas the loſs of the blind world's applauſe ſhould prove as little diſſuaſive in the point of converſion, as its acquiſition ſhould be a motive. The man, that dares be good without a precedent, looks like the nobleſt precedent of good: though, to ſay truth, as horſes are not much prized, only for not refuſing to ſet forth, unleſs others lead the way, and for not leaving the track they once are in, becauſe none but reſty horſes are guilty of the contrary faults; ſo is not the gallantry of contemning the opinions and ſmiles of ſinners ſo meritorious as it is thought; ſince none but children (and they too laughed at for it) will let themſelves be frighted from what they love, by others making mouths and faces at it. Could ſingularity in goodneſs conſiſt with the innocence of others, a gallant ſpirit would look upon that ſolitude rather as a delight than a determent; ſince it is not a greater affliction to his charity, than it is a compliment to his generoſity, by aſſuring his devotion of the higheſt extraction, and reſtraining the acts of it to the nobleſt ends.

He is the welcomeſt to paradiſe, who ventures though alone, and comes unattended thither; I mean, who by ſo reſolute a bravery, as ſetting forward to heaven, without ſtaying for company, gives ſo good example, that he arrives there with much difficulty. To all this I muſt add, that when once it is noted, that the apprehenſion of being derided for retracting is the ſole obſtacle, that ſtands between your reaſon and ſo important a change as your converſion, they will juſtly eſteem your parvanimity ſo great, that you deſerve deriſion for ſo poorly fearing it; and ſo you will fall into that contempt you would decline, by your very ſhunning of it. If then laughter in this caſe cannot abſolutely on both ſides be avoided, ſure it is much better to endure that of fools at your repentance, than that of wiſe men at your timorouſneſs. Did not martyrs, through frowns, infamy, and torments, force themſelves a paſſage to the ſame heaven you aim at; and will you with ſmiles be frighted from your happineſs? I am aſhamed of it; and if you be not ſo of yourſelf, Chriſt will be ſo of you: for, "Whoſoever (ſays our Saviour, who before Pontius Pilate witneſſed a good confeſſion) "ſhall be aſhamed of me, and "of my words, in this adulterous and ſinful "generation, of him alſo ſhall the Son of "man be aſhamed, when he cometh in the "glory of his Father, with the holy angels." And truly, for my part, I had rather be laughed at by men on earth, than howl with the devils in hell. Mark viii. 33.

DIGRESSION.

[* Nor need we be (as even the beſt new converts often are) ſo ſcrupulous to own repentance, for fear of injuring humility; ſince, certainly, if the latter be a virtue, ſhe cannot enjoin a vice ſo heinous as ingratitude, by forbidding us even ſuch a retribution as acknowledgment; for ſure it is the leaſt return we owe to God for his gifts, to confeſs, that we have received them. Who would not tax him of unthankfulneſs, that, being loaded with a prince's preſents, ſhould diſclaim them, for fear of confeſſing himſelf to be rich? Although a woman, praiſed for her complexion, be bound in modeſty to gainſay thoſe praiſes; yet if the fire have given her a good colour, it is not thought pride to refrain contradicting, becauſe the effect being natural to the fire, and requiring no excellent prediſpoſitions in the object, to refer thoſe aſcriptions to their cauſe, is held to juſtify the not rejecting them: ſo though there be an eye of vanity in the publication of thoſe graces, whoſe near reſemblance (or affinity) to virtues merely moral leaves their extraction dubious; yet true repentance is a grace ſo purely foreign, that being acted in us by a principle not native or acquired, but infuſed, to own the having received it, is not to boaſt our merits, but acknowledge our debts; the vanity being rather on the other ſide, who, by pretending to diſclaim ſo ſupernatural a grace, imply, that they eſteem it to be their own inheritance or purchaſe. God's goodneſs being ſo free, that it is the only title to its ſelf; and the motives of his favours being taken from himſelf, and not from us, his

* The lines included within this parentheſis [ ], may, perhaps, paſs for one, and appear ſomewhat foreign, both to the theme and ſtile of this diſcourſe: I have yet ventured to inſert them here, to pleaſe a perſon, that I much affect; leaving to the reader a liberty to ſkip them, if he pleaſe; but if he chance to vouchſafe them a peruſal, I muſt beg for them his attention; not that they deſerve it, but becauſe they need it. It ends p. 217.

bleſſings

bleſſings argue, indeed, the bounty of the benefactor, but infer not the merit of the obliged; ſince the ſpirit's irradiations into our ſouls (like the ſun's ſhining upon ſhrubs and hemlock) are due to the diffuſiveneſs of his goodneſs, not the attractiveneſs of ours. Moral virtues may perhaps be reſembled to great men's clothes, which ſupply thoſe, that ſee them, with ſome conjectures of the quality of thoſe, that wear them: but inſpired graces (ſuch as repentance is) are like their liveries, whoſe gaudineſs evinces not the footman's deſerts, but his lord's ſplendidneſs; and in men's eſteem entitles the lacquey to nothing but a good maſter. Thoſe better qualities blood may convey, or induſtry acquire, like honours conferred by princes, ſuppoſe the party deſerving; but heavenly donatives are like alms, which ever preſume need; and where they are more liberally beſtowed, ſtronglier conclude the greatneſs of the party's wants than merits.

Upon ſuch conſiderations poſſibly as theſe, the great apoſtle (after a recital of his firſt unworthineſs) ſcruples not to write of himſelf in ſuch bold terms as theſe; "By the "grace of God I am what I am, and his "grace, which was beſtowed on me, was not "in vain; but I laboured more abundantly "than they all," (meaning the college of the holy apoſtle's) "yet not I, but the grace of "God which was with me." I might produce many reſembling paſſages of ſcripture, had I not handled this ſubject elſewhere.) But truly, ſince you are commanded in the goſpel to "let your light ſo ſhine before "men, that they may ſee your good works, "and glorify your Father which is in heaven;" you ought to conſider, whether or no your expreſſing a ſerious diſlike of others preſent, and your own former practice (in point of ſwearing) do not either proclaim your repentance, or infer you a hypocrite. And if your reaſon (as queſtionleſs it will) lead you to embrace the affirmative, believe you are then farther to be put in mind, that not only the confeſſion of our virtues is juſtifiable, when it is neceſſary to your juſtification, but (though in all other caſes our actions ſhould commend us, not we ourſelves, praiſe being a debt, which he that pays himſelf, acquits all others of) even the mention of our own praiſes is allowable, when they are produced, not to extol, but barely to vindicate us, and finds a ſufficient defence in its being neceſſary unto ours.

1 Cor. xv. 10.

In an Eſſay of miſtaken Modeſty.

Mat. v. 16.

The owning of repentance has ſo much of penance in it, that there is not any grace more indiſpoſed to a perverſion into vanity; for ſtill repentance (like the pardon it endeavours to procure) does preſuppoſe a fault, having this particular unhappineſs above other virtues, that men cannot arrive at it but through vice. And therefore in the return to the diſintereſtedneſs of action, virtue (who can ſcarce more reward our love to her, than by imparting unto us a higher degree of it) commonly recompenſeth ſo unſelfiſh a duty, by making it a powerful engagement to perſeverance againſt relapſes; and any affront or loſs ſuſtained upon that ſcore turns to a bleſſing, by producing in us, towards religion, the uſual property of ſufferers for a cauſe, more zeal and paſſion for the party men have been ſufferers for. But admit you could not own repentance without being fancied vain, muſt the fear of others ſins continue (thoſe that are immediately) yours? Will you rather let others ſin by imitation of your bad actions, than in their miſconſtruction of your good ones? And will you quench the ſpirit, and refrain from being virtuous, leſt men ſhould think you know yourſelf to be ſo? Eſpecially ſince our ignorance in good performances, though it criminate the act, degrades the agent from the title of virtuous; virtue being a habitude elective, and election pre-requiring knowledge. Which reaſon I might fortify, by aſking to what end preachers ſhould light us ſo many candles, and give us ſo many touchſtones to diſcover and examine graces with, if our being conſcious to our own repentance were a fault that deſerved it? Undoubtedly, that were (and that were ſtrange) to make it our duty to ſeek, what it were our ſin to find.

This laſt reflection I muſt recruit, by adding, that ſince our improvement of, and thankfulneſs for grace, will be expected proportionable to our ſtock of it, (as the parable of the talents, and our Saviour's declaring, that "where much is given, there alſo much "will be required," evinces) we cannot without the knowledge of our receipts, know what our returns muſt be (of gratitude and duty) to be anſwerable to them. The utmoſt, that modeſty does exact of you, is the declining of thoſe praiſes your actions do deſerve, not the refraining actions, that deſerve praiſe, for fear of being ſuſpected to affect it. But truly baſhfulneſs, though in maids thought a virtue, in virtue is a fault; for ſure it is one of the worſt compliments you can put upon the ſpirit, to lock him up in a dungeon, for ſhame to own his viſits.

The union betwixt virtues is too ſtrict, and their aſſiſtances reciprocal, that that may be concluded to be no virtue, that forbids the exerciſe of any, and does not rather facilitate than obſtruct it. Certainly it is better be accuſed of vanity, than guilty of relapſes; and if ſome reputation muſt be loſt, it is fitter that you ſhould be diſhonoured by other men's faults, than God by yours; for he is good enough to recompenſe his ſervants, not only for being good, but for their not being thought ſo for his ſake; and to make one day their diſhonour (not only the foil, but) the purchaſe of their glory. I have ſpent the more ink to carry away this obſtruction, becauſe I have obſerved it to be a block, at which the beſt natured novices in piety are the moſt prone to ſtumble; the devil, our ſubtle antagoniſt, (more ſerpent far than that he tempted our firſt parents in, when he inſinuated himſelf into our credulous mother's eaſy faith; in which ſly winding creature, he elected not a fitter inſtrument than emblem) in the ſcruple

have laboured to remove, leaving his own to aſſume the borrowed habit of an angel of light; in that diſguiſe to make virtue claſh with grace, and pervert modeſty into an obſtacle of reformation. Thus when man was once fallen from paradiſe, even cherubims intercepted his return unto the Tree of Life.] Gen. iii. 14.

The laſt Excuſe.

LASTLY, (replies the ſwearer) all this I confeſs to be very true; but what would you have me to do? Long time and cuſtom have ſo habituated me to this vice, that I find the impoſſibility of my ſubduing it as great as my willingneſs to leave it.

ANSW. Well, I am very glad we have brought you to this paſs: it is then confeſſedly a ſin, and a great one: the queſtion therefore is, whether it be fitter for God to make it no ſin, or you not to make it yours; and for him to be reconciled to the evil of its nature, or for you to deſiſt from its practice? Your apology is juſt as excuſing as the murderers would be, who ſhould alledge before his judge, that ſince he had been a murderer from his youth, he begs to be excuſed; but truly for his part he could not help it, and he muſts need continue the trade of cutting of throats, that he had ſo long practiſed. Is not yours a holy conſequence, I have been wicked long, therefore I will continue ſo ſtill? Sure it is the devil's logick, from thoſe ſins, that evidence the juſtice of our ſuddener repentance, to infer the legitimateneſs of our relapſes into crimes. The argument would have as much reaſon, and more honeſty, that concludes out of, I have been wicked but too long already, that therefore I muſt be ſo no more; and from our former want of piety, infers there needs a greater meaſure now to make amends for paſt omiſſions. You would judge him uncharitable, that ſhould tell you, that you are ſcarce ſo much as deſirous to be forgiven: but (to ſhew you how little you have for your opinion, beſides your wiſhes) conſider who would think that delinquent very ambitious of pardon, who refuſes to accept it, unleſs he may have licenſe to thieve again; and declines to purchaſe it by an engagement againſt former miſdemeanors. Certainly,

Weak is th' excuſe, that is on cuſtom built;
For th' uſe of ſinning leſſens not the guilt.

AND cuſtom in evil rather increaſes than contracts the fault; for that cuſtom, that now is the parent, was firſt the child of ſin, ſince the evil of cuſtom proceeds from the cuſtom of evil; (like ice, which though it eaſily thaw into water, was firſt produced out of that element's congelation.) And therefore our equitable and impartial laws, that in theft chaſtiſe the firſt faults only with a brand upon the hand or ſhoulder, puniſh relapſes with deſerved death.

NOR are the obſtacles, that oppoſe your cure, ſo ſtubborn as you are pleaſed to fancy them. We flatter ourſelves in augmenting the difficulty of our repentance, that we may leſſen the guilt of our neglects. The truth of it is, our baſeneſs adds dimenſions to theſe difficulties, becauſe we are really loth to forſake our ſins; and yet would fain cheat our conſciences into a belief, that our refractorineſs and impenitency do proceed, not from our unwillingneſs to mend, but from our impotence. We do not, in this caſe, like many flouriſhing orators, who out of oſtentation uſe to create monſters, afterwards to quell them; but like children in the dark, who fancy firſt horrid miſhapen bug-bears, and then are frighted by them.

AND yet when the ſlight penalty of a ſhilling is laid upon each oath, and ſtrictly exacted, we may eaſily diſcern a viſible abatement in the tale of your ſins, as long as you are true to your engagement; which were not moſt men too ſoon weary of would (probably) ſoon make them weary of offences of that nature.

IT is the opinion both of pious and of judicious perſons, that ſwearing is therefore, though not the moſt unpardonable, at leaſt the moſt inexcuſable of vices, becauſe that in it men have moſt power to refrain: and in effect this ſin is ſo deſtitute both of temptations, advantages, and apologies, that in ſubduing the cuſtom of ſwearing, we have ſcarce any thing but the cuſtom to ſubdue. Try; it is leſs eaſy to ſurmount the belief of the difficulty, than the difficulty itſelf, which nothing makes ſo much invincible, as our thinking that it is ſo.

HERE, a willingneſs to hoiſt ſail (to quit this ruinous vice) ſerves for a proſperous gale. If therefore Chriſt, by giving you a deſire to ſhake off the clogging yoke of ſin, do call you to himſelf, give me leave to ſay to you, as the people did to the blind man of *Jericho*, "Be of good comfort, riſe, he calleth thee." Mark x. 49. And to complete that comfort, I muſt tell you, that the operation of ſaving grace upon the ſickneſſes of the ſoul is like that of the pool of *Bethesda* upon the infirmities of the body; ſince without all regard either to the age or greatneſs of the diſeaſe, ſo the remedy be but duly applied, the cure is infallible. John v. 2, 3, 4.

I SHALL never deſpair of the recovery of any, that is but heartily deſirous to be reclaimed; ſince that, which God was pleaſed to make me lately inſtrumental to work upon a gentleman, whoſe nation being French, his vice little younger than himſelf, humour extremely cholerick, and his apprehenſions of the ſucceſſleſſneſs of his endeavours very great, obliged him to vanquiſh indiſpoſitions numerous and great enough to make that concurrence very frequent in one ſingle perſon; and yet before one fortnight was effluxed, he obtained ſo viſible a conqueſt over this ſtubborn vice, that he had afterwards only as many relicks of it to ſuppreſs, as might keep him from growing proud of ſo ſudden a recovery.

SO eaſy is it after having vanquiſhed the imagination of the difficulty, to overcome the

difficult itſelf; for in matter of uneaſy Chriſtian duties, we muſt not only conſider the diſproportion of our weakneſſes to the obſtacles we muſt ſurmount, but allow the diſproportion of thoſe obſtacles, to the ſupernatural aſſiſtances we ought to hope for. For God requires nothing at our hands, which his own favour (zealouſly implored by our addreſſes) will not enable us to execute. And in this, the commands of God, differ from thoſe of men, that the latter but lay on us an obligation; the former inveſt us with a power to obey them. As when our Saviour commanded the ſick man (in the goſpel) to "take up "his bed, and walk," at the ſame inſtant he ſtrengthens his ſinews to perform what he enjoined: and in the firſt creation, that powerful command, "Let there be light," gave that bright creature an exiſtence, to make it capable of paying him an obedience. Let not then taſks above the forces of our nature diſanimate thoſe, that may expect aſſiſtances from his Almightineſs, who in the ſame leaves, where he commands us to perform more than we are able, promiſes to do in us what he commands; ſince difficulties are not eſſential properties of obſtacles, but only diſproportions to the powers they are to reſiſt. But admit that your habitude of ſwearing have rendered your converſion as difficult as you pretend; ſure then that, which cuſtom of ſinning has confeſſedly made ſo uneaſy, the continuance of that cuſtom is very unlikely to facilitate: as probably may he, whom a ſurfeit of melons has caſt into a fever, hope for a cure by eating more again. No, no; remember, that bad cuſtoms, like conſumptions, admit of remedies in the beginning, but grow ſtill more incurable by delay; and vices, like young trees, the longer they are let grow, the greater difficulty there is in felling of them; each ſingle ſin being not bad only for the evil of the act, but the propenſity it gives to repetition.

Mark ii. 9, 12.

Gen. i. 3.

SECT. II.

BUT becauſe to ſhew a ſinner the danger of his diſeaſe, without preſcribing him the remedies, that may contribute to his recovery, would be but to give him a perfecter knowledge of his wretchedneſs, and prove a truth as uncomfortable to him, as an ignis fatuus to the benighted traveller, that has loſt his way, whoſe horrid light ſerves not to guide, but to affright the wanderer; I think it not amiſs in the enſuing directions to caſt the ſwearer a few cords, by which (if they be carefully laid hold on) he may happily be drawn out of that deep and dangerous pit of ſin, into which his negligence or his corruptions may have betrayed him. Nor let the coarſeneſs of theſe home-ſpun lines divert you from making them inſtruments of your reſcue; for ſilk and ſattin ribbons, you know, are not ſo proper to draw men out of pits, as homely hempen cords: nor did the impriſoned prophet refuſe to be drawn up out of the dungeon, though by the help of "old caſt "clouts and rags:" ſince in caſes of this nature, it is not the value nor the fineneſs of the inſtrument, but their fitneſs for our purpoſes, that we ought chiefly to regard. But to begin without more circumſtance.

Jer. xxviii. 11, 12, 13.

DIRECT. I.

MY firſt advice ſhall be, ſeriouſly to conſider, that ſwearing is a ſin, and ſuch a ſin too, as not its nature, but its commonneſs only, makes men count little: for if we may judge of the greatneſs of the crime, by that of the vengeance heaven inflicteth on it, certainly God has divers times ſo ſeverely puniſhed obdurate and incorrigible ſwearers, that were his judgments on them as divulged as they have been terrible, that crying ſin would (poſſibly) be almoſt as unfrequent as it ought to be. Nor will the ſeeming harmleſsneſs of that act do more than make a parallel betwixt your fate, and that fond wretches (mentioned in the book of *Numbers*) that provoked ſtoning, for gathering a few ſticks on the ſabbath-day. For though Almighty God, (whoſe will is the exacteſt rule of good and ill) ſhould forbid actions otherwiſe innocent, yet his prohibition diveſts them from that property; and (as the preceding verſes of that paſſage alledged of *Numbers* intimate) makes you liable to a juſt puniſhment, though not for the act, yet for the diſobedience. And conſonantly we find, that though the killing of ſo horrid and parricidicial a murderer as *Cain* might ſeem an act of juſtice, yet God by his prohibition having rendered it a ſin, annexes a ſeven-fold vengeance to the breach of that command.

Numb. xv. 32.

Gen. iv. 15.

NAY, though the rebuilding of a ruined city be in itſelf not only innocent, but highly conducing to the publick good; yet God (to ſhew the independency of his juſtice, having forbidden the re-edification of *Jericho*'s raiſed walls, puniſhed the tranſgreſſion of that prophetick order, in the very children of the tranſgreſſor. An example of ſeverity very obſervable, being not, that I know of, to be parallelled. Conſider not therefore ſo much (in your ſwearing) the little harm you do, as the great God you offend. Falſe coinage is as well felony in farthings, as in half crowns, or twenty ſhilling-pieces, And as careful mothers ſoundlier whip their children for eating four crabs, and ſuch green traſh, than ripe and goodly fruit; ſo often are thoſe ſins moſt ſeverely dealt with, which bring us leaſt advantage; nor is it a prodigy, to ſee men get moſt ſtripes for thoſe offences they get leaſt by.

Joſh. vi. 26.

1 Kings xvi. 34.

IT is an eaſy matter in trivial things to tranſgreſs heinouſly. What trifle could appear ſlighter than the eating of an apple? Yet this petty ſeeming peccadillo loſt *Adam* paradiſe, and us a title to it; God's interdict enabling the core of that forbidden fruit to choak his immortality, and his poſterity's hopes of it upon earth. But I purpoſely decline all inſtances of this nature, not only in purſuance of my intended brevity, but be-

cauſe it is much nobler, and more handſom for you, to owe your repentance to your reaſon, than to your apprehenſion.

DIRECT. II.

In the next place, I ſhall preſcribe, a zealous and inceſſant ſolicitation at the throne of grace, for power to ſubdue this ſtubborn vice. This ſecond advice, St. *James* ſeems to ſuggeſt to us in theſe words, "Reſiſt the "devil, and he will flee from you;" and he immediately adds theſe, "Draw nigh unto "God, and he will draw nigh unto you." And truly, men preſume too much, when they imagine thoſe treacherous natural forces of their own, are able to redeem that ſpiritual liberty, they were unable to defend; and then they loſe their beſt advantages, when their omiſſions of applying themſelves to their Maker, makes them neglect ſupplies infallibly victorious, which wait but the imploring, to advance to their reſcue. Ceaſe not then, with *Moſes*, to lift up your hands to heaven, till you have thereby diſcomfited and deſtroyed theſe ſpiritual *Amalekites*, your vices: and believe it, prayer (to uſe a term of phyſick) is a ſpecifick remedy againſt this diſeaſe, and deſerves, that, among all the weapons proper for this warfare, you ſhould ſay that of it, that *Dævid* ſaid of huge *Goliah*'s ſword, "There is none like that, give "it me."

James iv. 7, 8.

Exod. xiii. 11, &c.

1 Sam. xxi. 9.

For prayer, performed with thoſe due rites its object requires from it, gives us ſuch awful ſentiments of God's holy name, that our conſcience will not, in a ſhort while after, permit us to diſpenſe with the uſurping it in vain. And thus, this ſacred duty does not only procure, but, in a manner, give us what we pray for: as, when ſome ſqueamiſh and diſreliſhed perſon takes a long walk to the phyſician's lodging, to beg ſome remedy for his inappetence, his very walking thither does, in ſome meaſure, give him that good ſtomach, he hopes to regain by the medicines he ſhall get there.

But if, in your firſt attempts, this ſin meet with a ſucceſs more anſwerable to your fears than your deſires, be not diſcouraged at it, but make of this delay the uſe it is intended for, a riſe of greater eagerneſs and importunity in the purſuit of your addreſſes. Nor think it ſtrange, that God ſhould make you wait a while for the grant of your requeſts, that have been ſo tediouſly refractory to the motions of his ſpirit, that ſummoned your obedience to his commands. But loſe not patience, for the wiſhed ſupply will infallibly arrive at laſt, and all your expectation will but ſerve to endear it when received; for God will not be wanting with his power to aſſiſt what is undertaken only for his glory.

Nor is it leſs our duty to truſt in his promiſes, than to obey his commands; and we may confidently expect from his faithfulneſs to the one, what he will enable our endeavours to perform the other. The great apoſtle tells us, that the ſame God will give us "to will, that worketh in us to do:" and therefore you may be confident, that (as he elſewhere ſpeaks) "he, which hath begun "a good work in you, will perform it unto "the day of Jeſus Chriſt." And on this ſcore our Saviour, who entails happineſs only to the godly, does yet pronounce them "bleſſed, that hunger and thirſt after righte- "ouſneſs," promiſing, that they ſhall be ſatisfied. Thus he, that graciouſly "accepts "the will for the deed," counts good deſires but infant holineſs, as things, that differ from more perfect graces, not in their nature, but their (age and) growth.

Phil. ii. 13.

Phil. i. 6.

Matt. v. 6.

In the mean time, let this conſideration comfort you, that thoſe ſins diſpleaſe God leaſt, that diſpleaſe the doer moſt; and that, in this, our combats againſt ſins, are differenced from our battles amongſt men; that in the former the victory depends not ſo much on our ſucceſs, as our reſiſtance; ſince none are there held vanquiſhed, but ſubmitters. And, for your farther comfort, you may take each victory grace wins of your corruptions, not only for a preparative to new ones, but an earneſt of more. For the conqueſts of ſaving grace in the ſoul are not like thoſe the ſea makes upon the ſtrand, when it makes acquiſitions by the flow, but to loſe them again within few hours by the ebb; but the expeditions of the ſpirit againſt vices are like thoſe of the crowned rider of the white horſe in the *Revelation*, of whom it is ſaid, that, "he went forth conquering, "and to conquer."

Rev. vi. 2.

DIRECT. III.

In the next place, as far as conveniency will permit, it were fit to fly the converſation, or at leaſt the familiarity of profeſt ſwearers. This advice of declining infectious company, though in a general caution ever found prevalent againſt all vices, has a peculiar property againſt this; for there being very ſmall (if any) temptation to it in our natures, it is principally imitated from others, (as when one yawns, moſt of the company, though otherwiſe uninclined to that act, do uſually yawn out of ſympathy) and ſo ſubſiſts but as it is cheriſhed by example and cuſtom, (its motive and its nurſe.) And therefore, a very effectual remedy againſt ſwearing is by converſing where it is diſcountenanced; to ſtarve it by diſcontinuance, forcing that ſhame of ſingularity, that firſt begot it, to make amends for the miſchief it has occaſioned, by employing it to the ruin of its own productions. As phyſicians make ſcorpions their own antidote, by preparing out of them an oil, that is ſovereign againſt their ſtings. Lovers of the ſame ſin may (methinks) be reſembled unto firebrands, which, being laid together, kindle each other by their mutual heat; but being ſevered, and kept ſo aſunder, each ſingle brand, after a little ſmoking, does of itſelf go out.

DI-

DIRECT. IV.

For the fourth remedy, I ſhould adviſe the ſwearer to oblige himſelf to pay or ſuffer ſomewhat for every oath he ſwears; thoſe little forfeitures ſerving both as monitors and as penalties. But if the bargain tie you to pecuniary diſburſements, be ſure diſtreſſed Chriſtians be (at leaſt) ſharers in them. For if (as divines tell us) the poor be God's receivers, they ſeem to have a title, as well by juſtice as by charity, to the amerciaments, that are eſtreated upon treſpaſſes againſt their Lord. But have a care you turn not this phyſick into poiſon, by imagining, that, when you have fined for your engagements, you have done penance for your ſins; and, by your juſtice to your compacts, cancelled your diſobedience to your Maker. No, no, God requires not, that you ſhould part with your ſixpences, but with your ſins; and the repentance he accepts, conſiſts not in a paying for, but in forſaking your tranſgreſſions. Eſteem then theſe inconſiderable mulcts but as remembrancers of your faults, not ſatisfaction for them.

Allyed to this expedient is that uſeful one of procuring ſome diſcreet friend, by putting you in mind of every oath, to force you to take notice of your faults; which this courſe will very much contribute to make you both weary and aſhamed of. Provided always, that theſe reprehenſions be as well ſeaſonable as juſt; for to correct men in the firſt violent tranſports of their choler, is, by adminiſtring phyſick in the extremity of the fit, but to exaſperate inſtead of curing. Reaſon being to our paſſions, as the wind to the fires; the ſame puff, that will blow out the flames of a candle, will but kindle thoſe, that prey upon a faggot. Reprehenſions may ſuppreſs paſſions when they are weak, but do but incenſe them whilſt they are raging. It is liſted amongſt the miracles of Chriſt, that he once chid a ſtorm into a calm.

Matt. viii. 26.

DIRECT. V.

The fifth thing, that I muſt preſcribe our ſwearer, is, to reſolve, at once, to renounce that vice, by a deſertion not only ſincere, but unſuſpended and entire. Were it but one of theſe mere moral failings, whoſe unfitneſs, or miſbecomingneſs, makes all the guilt, I ſhould, poſſibly, counſel you, to wean yourſelf of it by degrees, whoſe progreſs were ſcarce diſcernible before its end; juſt as phyſicians uſe to reclaim thoſe, that have been long accuſtomed to unwholeſom diet. But, as the ſame phyſicians, when once a dangerous ſurfeit is contracted, reſtrain not by degrees, but totally and abruptly, thoſe exceſſes, that occaſioned it, and whoſe continuance would prove fatal to the patient; ſo here, where that, which is to be forſaken, is not ſo properly a fault, as a ſin, we muſt refrain, without the leaſt exception, or connivance; ſince elſe (the thing prohibited, being in itſelf a ſin) we allow ourſelves to offend God as much as ever, though not ſo often; by committing the ſame ſins in quality, however not in multitude.

Indeed, what is leſſened by the number of our oaths in this partial reformation is recompenſed by the aggravated heinouſneſs of their nature; thoſe, that ſeemed formerly but the ſlips of infirmity, being now authorized by diſpenſation. This bare abatement of the tale of our ſins is a good refuge, but a bad deſign: many times this diminution is the utmoſt our endeavours can arrive at; but, then it ought to be practiſed, and not to be intended; for true repentance, and a purpoſe of relapſing, are hugely inconſiſtent; the one not being real, without a property deſtructive to the other; ſince he but very lamely repents his crimes, that reſolves not againſt relapſes into the crimes, that he repents. No, no; this faint deſiſting from ſome acts of vice does but endear the reſt, that is unexiled, and that importunately urge for the recalling of their baniſhed companions. This mild remiſſneſs, if it do not prune a vice, at leaſt, it does but lop it; and that prohibits not its future growth; which the only way infallibly to prevent, is, to dig it up by the roots, with the ſpade of an abſolute and irrevocable reſolve, never to accord to ourſelves, ſo much as by connivance, the leaſt licenſe, that may endanger a relapſe. In this caſe, extirpation is that alone, which can ſecure our quiet; and the only way, that leads to an eſtabliſhed ſafety, is a ſeverity, that its object ſecures from all poſſibility of exceſſes. A ſinner's condition may be reſembled to a mouſe in a pail of water; if ſhe can get out at one leap, well and good; otherwiſe her toil will prove but fruitleſs, in attempting to get out by degrees.

DIRECT. VI.

Lastly, my concluding precept is, to make frequent and ſerious reflections upon the vanity and fooliſhneſs of ſwearers, who live as if they meant to remove all our wonder from the folly of our firſt parents, that loſt paradiſe for an apple. Sure, that theſe people are not quartered in *Bedlam* (where far leſs frenzies have impriſoned many) proceeds rather from the multitude of the infatuated, than any want of madneſs in their actions: but, howſoever, wiſe men build cages for them in their opinions, and, in their ſoberer thoughts, condemn them to inhabit thoſe frantick lodgings.

That uſual expreſſion of ſcripture, which ſometimes puts the word folly inſtead of the word ſin, ſeems chiefly calculated for the ſwearer's vice, to which it does ſo eminently belong, and which is ſo uncapable of being wronged by the appellation.

Gen. xxxiv. 7. Joſh. vii. 15. Judges xx. 6.

But, to what has been already delivered, to ſhew how little ſhelter our ſwearers find from all their weak apologies, (as certainly the fruitleſſneſs and inexcuſableneſs of their vice conſidered, almoſt no ſinners have more

to anſwer for, and leſs to anſwer) we muſt now add, that they want not only the temptation of an excuſe, but the very excuſe of a temptation, unleſs its being forbidden, paſs for one. For, firſt, this mungrel iſſue cannot (as other vices uſe to be) be laid at nature's door; we cannot father it upon traduction, ſince we inherit it not from our parents; nor is it born with us, but learned by us; ſo that here, before we can be ſinners, we muſt have been diſciples. But, then, all other vices have either honour, (as ambition,) or profit, (as avarice,) or delight, (as uncleanneſs,) to plead for their excuſe; ſwearing alone can plead nothing but guilty: ſo that if ever that expreſſion of the apoſtle, which mentions
Jam. i. 21. "ſuperfluity of naughtineſs," belonged to any ſin, it is certainly here to be appropriated.

THE ſilly *Indians*, that part with gold and jewels, for glaſſes, whiſtles, and ſuch trifling gugaws, are *Solomons* to ſwearers; betwixt whoſe madneſs, and the famed folly of *Lyſimachus*, who, parched with extreme thirſt, to get a little drink, became a voluntary priſoner to his (ſoon after vanquiſhed) enemies, I find no diſparity advantageous to ſwearers; it being a leſs ill bargain, to ſell away one's liberty for one's belly-full of water, than to ſell away one's ſoul for a mouthful of air. This ſwearing is a hook without a bait: and when hell employed its ſpurious brood of vices into the world to ſeduce mankind, it furniſhed every one of them with a dowry, either of fame, of pleaſure, or advantage, to entice lovers with; only poor ſwearing was left portionleſs; a miſtreſs only for thoſe generous and diſintereſted ſinners, that need no temptation; but loving wickedneſs (as they ought to do virtue) for its own ſake alone, aimed at nothing in the act of ſin, beyond the ſatisfaction of having committed it. To whom the Lord may juſtly ſay, as he did
Iſa. lii. 3. to the *Iſraelites* in the prophet, "You have "ſold yourſelves for nought." For, whereas, uſually, thoſe vices, that riſle the ſoul, do bribe the ſenſes; in ſwearing, the poor ſoul is ſtript of her graces, and robbed of her joys, without the leaſt emolument (of pleaſure or advantage) accruing to the ſenſes. This ſwearing (in my opinion) is even as fooliſh as loving a cruel miſtreſs; a man parts with his heart, and gets nothing in exchange for it. An oath is like the powder, that charges a granado; its properties are to make a momentary, diſpleaſing noiſe, to offend thoſe, that are within the reach of it, and to ſpoil that, from which it parts. Nor is that criminal blaſt unlike the prophet's deſcription of the cankerworm; of which he gives this
Nahum iii. 16. character, that "it ſpoileth, and fleeth away."

BUT the leſs advantages this vice affords, the more culpable it is; the diſobedience, as well as folly, of a forbidden act being increaſed by the want of its being beneficial; he, that treſpaſſes for leaſt, tranſgreſſes moſt; for ſure, it is rather an aggravation, than an excuſe, of having injured any body, that you get nothing by it. The ambitious, and the incontinent, are like great ladies, that ſurfeit upon apricots, nectarines, and melons: whereas the ſwearer is but too juſtly reſembled to thoſe beggars, that kill themſelves with blackberries and ſloes, and ſuch like traſh, the excrements of hedges; having appetites as ridiculouſly noxious, as thoſe of ſome of our green-ſickneſs girls, whoſe ſtomachs riſe at dainties, and long for loam and charcoal.

FOR my part, would I renounce my intereſt in virtue, it ſhould be for the attaining of a ſcepter, a fame tranſcending *Cæſar*'s; and, in a word, where the happineſs I forfeited ſhould ſeem ſo recompenſed by that I gained by loſing it, that wiſe men themſelves ſhould have occaſion rather to compaſſionate my frailty, than admire my weakneſs. For, I confeſs, it would extremely trouble me, to hang for my thirteen-pence-half-penny; and, I am confident, that many of thoſe this ſenſeleſs vice has damned, do find a vaſt acceſſion to the pains of hell itſelf, in the conſideration of the cauſe of their enduring them.

SINCE then ſwearing is a vice ſo ill qualified, that you want a temptation to it, you find no pleaſure in it, nor do derive any advantage from it; O let not your obſtinacy to doat upon an empty, fleeting ſound, that has nothing in it of a ſin, except the guilt, hinder you from ſhunning torments, that will equal your wretchedneſs to your folly, and from keeping up a title unto joys, whoſe very hope tranſcends all earthly happineſs, by oppoſing all your paſt unneceſſary oaths, by one inviolable promiſſory one, never to ſwear needleſly again.

ADVERTISEMENT.

TO prevent all miſtakes, that may ariſe from ſome apprehenſions of mine, which (ſeeming to cenſure oaths without diſtinction) may poſſibly be ſtretched beyond my meaning, I thought myſelf obliged to declare, that in no part of this diſcourſe my intention was to juſtify that plauſible error of our modern anabaptiſts, that indiſcriminately condemn all oaths as abſolutely and indiſpenſably prohibited and aboliſhed by the goſpel; my deſign being only to reſtrain the needleſs abuſe, not interdict the neceſſary uſe of ſwearing. Whoſe criminouſneſs if not in this diſcourſe I have repreſented in its moſt enlarged dimenſions, I may find an excuſe in the precedent and practice of thoſe painters, who being to draw upon the concaves of the roofs of churches, make their pictures more gigantick than the originals they are to reſemble; to recompenſe by that advantage in the dimenſions, what the eye loſes by the diſtance from the object. For every ſinner naturally beholding vice, upon which he doats, through the contracting optick of ſelf-love, muſt have the idea of his crime enlarged beyond its true proportions, to make him ſee it in its juſt quantity. I might add, that it is ſcarce poſſible to paint this ugly negro in blacker colours than his own; eſpecially ſince now this is grown ſo much in faſhion, that it ex-

pects not (as moſt other vices) ſlow time or years to ripen it; ſince in our very ſtreets we hourly hear children (who ſure offer up oaths as the firſt-fruits to the devil) ſwear, that can ſcarcely ſpeak; and ſee them perfect in their father's language, before they are old enough to ſpeak their mother-tongue.

But though in the heinous properties of this vice I might find cauſe enough to juſtify more fierceneſs, than I have expreſt againſt it; yet ſhould I be extremely loth, with many much better ſtored with zeal than charity, to doom all thoſe to hell, that through frailty or temptation ſometimes let ſlip an oath. For ſo ſevere a ſentence may perhaps concern too many, whoſe addictedneſs to other, not to greater ſins than ours, makes often all the difference of our guilts; and who in ſpite of all their ſlips and ſtumbles by the way, may by repentance arrive ſafely at the heavenly *Canaan*: and therefore I ſhall conclude what has been ſaid of ſwearing, with this ſenſe of it, that it is a ſin too heinous to excuſe neglect, and too venial (if I may ſo ſpeak) juſtly to beget deſpair.

A

DISSUASIVE

FROM

CURSING.

For Mr. *W. D.* to Sir *G. L.*

I HAVE too much paſſion for your perſon, to have any complaiſance for your faults; and ſtill have loved you at ſo high a rate, that I had rather hazard the loſs of your affection, than decline any proofs of the reality of mine. It is not, that I am not as unwilling to employ cenſure, as I am confident you will be troubled to have neceſſitated it from me; but (all conſidered) I have too much friendſhip, to have courtſhip enough to let ſlip ſo fair an opportunity as your forced converſation with *Cleander*, to ſhew you in him the deformity of a vice, from which I wiſh you were as free as from all other crimes.

Certainly, if curſes were as much the badges of a gentleman as he thinks them, men would not gueſs him to be of a lower order than that of emperors: and if the devil were to fetch all thoſe he bids him take, his water-dog would not have half ſo buſy an employment; hell would have cauſe to praiſe his liberality; and were not Satan ſtill the father of lies, he could not but acknowledge, that none of the ſeven deadly ſins, (nor perhaps all together) ſent thither half ſo many. If I thought *Cleander* would take it for a diſſuaſion, that I proved curſing to be a ſin, I could be as ready to bring prohibitions of it out of ſcripture, as he is to tranſgreſs them. The prophet *David* (imitated by the apoſtle *Paul*) makes it the character of the wicked, that "his mouth is full of curſing." And in another place, that "they curſe inwardly." And ſuitably to his own doctrine, when *Shimei* (equalling his curſes to the number of his ſteps) railed at him with as many imprecations as he deſerved bleſſings, he did not (to ſpeak St. *Peter*'s language) render "evil for evil, or "railing for railing;" but only anſwers, "Let "him curſe, it may be the Lord will look "upon mine affliction, and that the Lord "will requite me good for his curſing this "day." Our Saviour commands us to bleſs even "thoſe, that curſe us; nay, bleſs "them, that perſecute you. Bleſs (ſays St. *Paul*) and curſe not." And to ſhew you, that it was not only his precept, but his practice, "being reviled (ſays he) we bleſs; be-"ing perſecuted we ſuffer it; being defamed "we intreat." Imagine then you hear the apoſtle ſaying, as in one place he does, "Be "ye followers of me, as I alſo am of Chriſt; "who (ſays another apoſtle) when he was "reviled, reviled not again; when he ſuf-"fered, he threatned not, but committed "himſelf to him that judgeth righteouſly." And in effect, when upon the *Samaritan* clown's refuſal to receive Chriſt, the two fiery-ſpirited diſciples deſired leave to call down fire from heaven (to conſume thoſe by the fury of that active element, who refuſed entertainment to him that created it) our Saviour anſwers, but with a rebuke, and telling them, that they "knew not what manner of "ſpirit they were of."

If then, in ſpite of provocations we are enjoined to return prayers for maledictions, ſure we, that are forbidden to retribute curſes, are much more prohibited to laviſh them. And if we will take the pains to ſhrive, and to look back into their pedigree, we may diſcern in them a hereditary guiltineſs, and ſhall find them ſinful (if I may ſo ſpeak) by traduction,

1 Pet. iii. 9.
2 Sam. xvi. 11, 12.
Mat. v. 44.
Rom. xii. 14.
1 Cor. iv. 12, 13.
1 Cor. xi. 1.
1 Pet. ii. 23.
Luke ix. 54, 55.
Pſalm x. 7.
Rom. iii. 14.
Pſalm lxii. 4.
2 Sam. xvi. 5. & 13.

traduction, they being but the emanations and ſallies of a temper extremely unconſonant to Chriſtianity; of which our Saviour makes "love" the diſtinguiſhing ſignature: and St. *Paul* tells us, that "the end of the command-"ment is charity." Of which in another place he gives this character, that "charity "ſuffereth long, and is kind; doth not be-"have itſelf unſeemly, beareth all things, "is not eaſily provoked;" with many other properties of the ſame nature. Inſomuch, that St. *John* ſcruples not to affirm, that if a "man ſay, I love God, and hateth his bro-"ther, he is a liar;" (as concorporating things inconſiſtent, and uniting things diſtanter than the two poles of heaven:) and therefore when St. *James*, ſpeaking of the tongue with a certain kind of wonder, in theſe terms, "Therewith "bleſs we God, even the father; and there-"with curſe we men, that are made after the "ſimilitude of God: out of the ſame mouth "proceedeth bleſſing and curſing;" he adds, "My brethren theſe things ought not ſo to "be." And ſurely too the goſpel teaches us, that theſe aſſaſſinates and murderers of the heart, for being bloodleſs, are not therefore guiltleſs.

John xiii. 35. 1 Tim. i. 5. 1 Cor. 13. 4, &c. 1 John iv. 20. James iii. 9, 10.

BUT granting the ſin to be as venial as indeed it is heinous; (and that by uſing curſes men do not merit them) yet certainly the multitude of *Cleander*'s faults would give them that danger, that is pretended to be wanting to their nature; and he, that conſiders, that thoſe little drops of rain, which ſingle ſeem but ſo many liquid atoms, do often (united by their confluence) ſwell into torrents, nay, (ſometimes) into deluges, will eaſily believe, that curſes cannot but be extremely criminal in that *Cleander*, that curſes as if he were an inhabitant of mount *Ebal*; and who is ſo reſolved not to keep the devil's counſel, by concealing any impious ſuggeſtions, that were but his prayers as frequent as his curſes, he would ſeem to obey literally that qualified injunction of the apoſtle, of "praying with-"out ceaſing."

Deut. xi. 29. 1 Theſ. v. 17.

I MIGHT add, that in moſt of theſe imprecations, God's ſacred name being clearly taken in vain, renders theſe *Ebalites* guilty of the breach as well of the ſecond commandment of the firſt, as of the great commandment of the ſecond table, unleſs they will juſtify themſelves from that crime, by the owning of a worſe; I mean, demonſtrate, that they did not employ God's name to no purpoſe, by confeſſing they employed it to a bad one.

AND now this laſt conſideration leads me to that of the unreaſonableneſs of curſing; for it is not a fit thing, that upon every little accident, that *Cleander*'s vexed at, the creatures of God muſt inſtantly change maſters, and devolve to the devil. Were it not very juſt, that God ſhould be the executioner of all the raſh decrees his pettiſh paſſion makes; and his Creator's power ſhould have no other employment, but to run on errands (at the moody gentleman's beck) often repugnant to his juſtice, and ever to his mercy?

NAY, how often has *Cleander* in his paſſion wiſhed things, whoſe accompliſhment himſelf confeſſes would have made him miſerable? And is it then either the part of a good man to make wiſhes, that are unlawful, or for a wiſe man to frame deſires, of which he need repent the grant? One imprecation amongſt the reſt *Cleander*'s very ready in, which (with as little caution as he commonly obſerves) I would not have pronounced for as many kingdoms as he has uſed it times, and that is, "the devil "take me." For ſure God, (as we are ſure he may, and know not but that he will) give the devil leave to take him at his word, in what a caſe were he? And what curb ſhall we henceforward think ſtrong enough to bridle his corruption, when what to the wickedeſt is the greateſt terror, he makes his wiſh?

THERE was ſome years ago in *Geneva* an Italian, (both by extraction and humour) who riding a handſom mare in a ſolitary angle, was by the devil ſeduced to ſtallion her himſelf. The fact once done, the horror of a crime, that made him more a beaſt than that on which he acted it, tranſported him ſo far, as to make him give himſelf to the devil, if ever after he relapſed: but ſome while after, forgetting both his conſcience, and the condition of his vow, he was fatally tempted to repeat his former beaſtlineſs in the ſelf-ſame place; which he had ſcarce compleated, before the devil appearing to him viſibly remembers him of his forgotten promiſe, and claims the forfeiture: the trembling wretch, to avoid the being hurried away inſtantly from the hell he felt, to that he feared, compounds with the devil to reſign him his ſoul at the expiration of a limited reprieve: but before that time came to be effluxed, it pleaſed God to viſit both himſelf and the place of his reſidence with the plague; which rouzing his ſeared and lethargick conſcience, forced him to expreſſions of his anguiſh, unuſual enough to make his companions inquiſitive into the cauſe; which having fully and circumſtantially confeſt, he was after his recovery, upon that evidence, accuſed of having carnally abuſed a beaſt, and having made a compact with the devil; which latter, though upon a repentance ſuitable to his ſin, God's mercy did diſannul, yet the juſtice of the magiſtrate did for the former crime condemn him to a death he richly had deſerved, and penitently endured. This ſtory I thought not impertinent to inſtance in, to teach us how dangerous and unſafe it is to preſent that to the devil, for which Chriſt ſhed his blood; and (with more wearineſs than *Cleander* can pretend to) to offer that to one, that is greedy to ſnatch (and therefore ſurely willing to accept) that which the whole buſineſs of religion is to defend and reſcue from his attempts. The ſtory itſelf may teach us, that though we are never to deſpair of God's mercy, we are as ſeldom to provoke his juſtice. I have given it you in the very words of our friend Mr. *Boyle*, who had it upon the place from an excellent divine of that republick; to whom the delinquent himſelf confeſt it, as to him,

that

that was aſſigned to comfort and aſſiſt him at his death. And the inſtances are not unfrequent in the moſt credited authors of thoſe, whoſe imprecations God has puniſhed by granting them.

BUT I had almoſt forgot to mention one opportunity, to which the devil is indebted for a vaſt number of *Cleander*'s curſes, and that is his gaming; for the leaſt frown of chance upon him then gives fire to whole volleys of curſes againſt fortune; if at leaſt they deſerve not a more heinous title than barely that of curſes, who in ſeverer men's opinions are guilty of an (at leaſt) implicit blaſphem-
Prov. xvi. 33. ing; ſince *Solomon* does diſcreetly affirm, that all the croſs and happy lucks at play are not raſhly or deſignleſsly ſhuffled by a blind hazard, but are diſpenſed by an all-ruling providence.

I DETERMINE not here, whether theſe words of the wiſe man (according to the received opinion of divines) may be extended to an abſolute ſentence of condemnation againſt all games of hazard; but this I know, that (not to inſiſt on that injunction of God
Exod. xxiii. 13. to the *Jews*, "Be circumſpect, and make "no mention of the names of other gods, "neither let it be heard out of thy mouth;)" it is very unfit, that under the ſun-ſhine of Chriſtianity, we ſhould build or repair the ruined altars of depoſed chance, and acknowledge a blind deity; that under the abuſed name of fortune, fools anciently were pleaſed to create a goddeſs, and ſinners now diſſemble to miſtake for ſome ſuch thing, that they may unreproved controul and cenſure thoſe heavenly diſpenſations their proud and peeviſh natures are diſpleaſed with. I know, that many unforeſeen accidents, which the ignorant vulgar do impute to fortune, are by God in the ſcripture aſcribed to providence: and therefore you muſt give me leave, both to take notice of, and diſapprove that ungrateful expreſſion of our language, wherein (to juſtify our unthankfulneſs for the benefits we have received) we uſe to call God's bleſſing to a man in his outward poſſeſſions, his fortune; as if our eſtates were gifts blindly caſt on us by the raſh profuſeneſs of that fond deity, and not the emanations of God's bounty, and preſents of his promiſe. Old
Gen. xxxiii. 11, & 5. *Job*'s gratitude ſpeaketh another ſtrain, and will not mention his wealth (though never ſo juſtly the wages of his proſpered induſtry) without acknowledging it for the gift of God.

BUT ſince this much-abuſed name of fortune has preſented itſelf in my way, I dare not take leave of it, till I have expreſſed a deſire, that men would be more wary how they defame her, leſt through the ſides of fortune they affront providence. If fortune, under the common notion, had fee'd me to be her advocate, I ſhould alledge, that gameſters, of all others, have the leaſt juſtice to complain of her diſfavours, ſince the ſucceſs of the one abſolutely depending upon the loſſes of the other, they themſelves reduce fortune to a neceſſity of diſobliging ſome of them, by rendring it impoſſible for her to content them all. And I would add, that what we fondly call her inconſtancy, when ſhe ſometimes forſakes thoſe ſhe once ſmiled on, is much more properly to be aſcribed to the juſtice of her goodneſs, and the extenſiveneſs of her affection to men; ſince ſeeing ſhe is not able to make them all completely happy at once, at leaſt ſhe endeavours to make them fortunate by turns, and for ſome intervals of time.

NOR is it her fickleneſs, that in purſuance of this impartial love, ſhe ſeems to deſert her former favourites, when ſhe confers her favours on new perſons, ſince ſhe bereaves not the firſt poſſeſſors of them with intention, but only by conſequent; as being not able to lend her benefits to new neceſſities, without redemanding them of her former debtors; whom, otherwiſe, ſhe has as little deſign to offend by this tranſplacing of her bounties, as the ſun has to benight the antipodes, when to bring light into our hemiſphere, he is neceſſitated to leave them in darkneſs.

IT is not the malice or inſtability of fortune, but our miſtakes of the nature of her preſents, that occaſion our complaints; for we miſtaking thoſe benefits for abſolutely given to us, which are indeed but depoſited in our hands, repine and murmur at their reſtitution, inſtead of being thankful for their loan, and having had their uſe. And ſurely they, that pretend to be ſo perfect in her conſtancy, muſt be guilty of more madneſs in truſting her, than ſhe can be of treachery in deceiving them.

BUT were I to frame an apology to vindicate fortune under the notion of providence, I might repreſent, that what we attribute of her envious partiality, when ſhe does ſhower moſt favours on thoſe, that leaſt deſerve them, is but the effect of God's immenſer bounty, that gives even them a larger portion of pleaſures in this life, to whom he reſerves none at all in the next; and withall caſts a diſeſteem upon theſe glittering goods, fools over-value, by heaping them upon his very enemies.

I MIGHT farther alledge, that what our diſcontents call fortune's ſpitefulneſs, and her injuſtice, when ſhe ſeems to perſecute thoſe moſt, that are moſt virtuous, is in effect but God's care of his children, which by theſe afflictions both exerciſes and improves their piety, ſecures them from the allurements of proſperity, endears his aſſiſtances and his recompences by theſe difficulties; which both add luſtre to their victories, and make their virtues more exemplary and more meritorious.

AND (laſtly) I might ſay, that what we miſcall inconſtancy in fortune, when her changes invalidate the title of preſcription to her favours, and make their reſidence (when poſſeſſed) as incertain as their wiſhed ſtay is welcome, is indeed but a merciful ſtratagem of providence, to wean us from a dangerous fondneſs of theſe tranſitory goods; leſt, if the continuance of their fruition were as certain as the contentments of it are great, we

ſhould, by neglecting, forfeit all nobler joys, and loſe far greater pleaſures reſerved for us in heaven.

BUT we have too long wandered from our theme; let us return to *Cleander*, and his curſing; which, over and above thoſe other good qualities we have already obſerved in it, has that of being a ſin as uſeleſs as it is unchriſtian. All other vices have ſomething to extenuate their guilt; all other ſinners ſerve Satan for his pay; but the curſer (as the ſwearer) is the devil's voluntier, valuing his ſoul ſo cheaply, that ſome ſuſpect, that the reaſon of its ſtay in the body is, that the devil ſcarce thinks it worth the fetching: and certainly, *Eſau*'s bargain, who ſold his birthright for a meſs of pottage, becomes no more abſurd, when parallelled to this; which makes thoſe it damns, as much admired for their folly, as tormented for their ſins; and ſo caſts upon them the imputation of madneſs, that it deprives them of the privilege of madmen; for whereas frantick perſons (who innocently act all crimes) may kill men without murther, the curſer (on the other ſide) does murther without killing.

Gen. xxv. 33.

CLEANDER may, indeed, give himſelf to the devil by his curſes, but never his enemy; for if *Solomon*'s authority be credited in this point, we ſhall believe, that, "as the bird by "wandering, as the ſwallow by flying, ſo "the curſe cauſleſs ſhall not come." But the beſt of it is, that theſe intentional ſins, for being ineffectual againſt others, diveſt not the being criminal in themſelves: for the curſer is as uncharitable to himſelf, as to his enemies; he commits murders, without acting them; and contracts the guilt of his neighbour's blood, without ſhedding it; and incurs the penalty, without once taſting the ſweetneſs of revenge. For it is not only in good, that God accepts the will for the deed; he makes the ſame reception to our endeavours and deſigns of ill. And juſtly may God puniſh the ill by us intended, though by him prevented; ſince that diſappointment, in which we think to find our juſtification, is not the effect of our want of malice, but our want of power; and ſo does not excuſe our ill, but magnifies God's goodneſs. Let us therefore ceaſe to wonder, that whilſt we curſe one another, our Maker curſes us; and that the plague is ſo raging in our houſes, ſo long as it is ſo riſe in our mouths: but rather, let us tremble at that diſmal fate, that *David*, praying againſt his enemies, propheſies againſt God's. "As he loved "curſing (ſays he) ſo let it come unto him: "as he delighted not in bleſſing, ſo let it be "far from him: as he clothed himſelf with "curſing, like as with his garment; ſo let it "come into his bowels like water, and like "oil into his bones."

Prov. xxvi. 2.

Pſal. cix. 17, 18.

I MIGHT yet farther alledge, that curſes are of ſo culpable a nature, that their very apology concludes them guilty, by pleading them to be idle words: and I might add to all the paſt diſſuaſives, the ill repute, that curſes gain a man, amongſt the moſt ſcrupulous and preciſer ſort of people, who judging of the greatneſs of the vice, by the ſmallneſs of the advantage that is derivable from it, will hardly believe him to be the owner of much piety, that will ſlight it upon ſo little a temptation. And thoſe of our divines, that hold curſes to be the dialect of the reprobates in hell, will think it but an ominous piece of providence in *Cleander* to imitate travellers, who uſe to accuſtom themſelves beforehand to the language of thoſe climes they deſign to viſit. But the laſt conſiderations that I ſhall employ, to perſuade you to diveſt, with the practice of uſing curſes, the means of provoking them, and the fears of ſuffering them, is that of the ſcandal this vicious cuſtom gives to weaker Chriſtians. And as the former conſiderations relate properly to *Cleander*, ſo this I muſt more peculiarly addreſs to you, whoſe virtues have acquired you ſo high a reverence, that they have put it in your power, not only to excuſe, but almoſt to canonize the worſt actions by your example; and therefore ought to make you ſo much the more wary and ſtrict in your behaviour: ſince men believing it impoſſible to fail in imitating you, your exemplary faults will contract a deeper guilt by being precedents, than by being ſins.

Matt. xii. 36.

BUT, Sir, leſt I ſhould give you too juſt an occaſion to encreaſe the number of your curſes, by beſtowing ſome freſh ones upon my tediouſneſs, I will now put a period to your trouble, by ſaying to you, as once our Saviour did to the young man in the goſpel, (that ſo reſembled you in the poſſeſſion of ſo many virtues) "One thing thou lackeſt" (yet); and that one thing in you is, but, by ſacrificing your habitude of curſing, to make yourſelf capable of as tranſcendent bleſſings, as conſtantly are implored for you, by,

Matt. x. 21.

SIR, Your moſt affectionate,

moſt faithful, and

moſt humble ſervant,

W. D.

LETTERS

FROM AND TO

Mr. *BOYLE*,

AND

TRACTS by him,

Now firſt publiſhed from the Originals.

LETTERS

OF

Mr. *BOYLE*

TO

SEVERAL PERSONS.

SIR,

THOUGH the favours you heaped upon me at *London*, were both very numerous, and very great; yet cannot I eſteem any (not to ſay all) of them ſuperior to the welcome promiſe you were pleaſed to make me before, and confirm at our parting, of a conſtant correſpondency during our ſeparation. For not only your letters will continue to me the happineſs of your converſation, but will hinder it from becoming occaſionally a diſquiet to me; which it would certainly prove, if, having enjoyed it enough to long for more of it, your pen ſhould not gratify the deſires your tongue hath created. Since then, Sir, you are pleaſed, not only to allow, but to command me to write to you, I am too much a friend to my own inclinations, not with equal joy and readineſs to obey you: and I hope you will pardon me, if my deſire of ſeeing the Engliſh language honoured by your ſkill in it, make me willing to engage you to be more converſant with it, by employing it in my letters to you. And the ſame juſt concern for the glory of the Engliſh tongue obliges me to beſeech you, not to do it the injury to judge of it by my writing it; for it is not more true, that, being a very bad ſecretary, I cannot expreſs my thoughts otherwiſe than very dully in it, than it is, that my uneloquent expreſſions are imputable to the writer, not the tongue; for I think I may ſay, without flattering it, that though I have been a much greater ſtudier than prizer of languages, I have not learned any beſides the Greek, in which good thoughts may be expreſt with leſs diſadvantage; and that he would be ſuperior, both to *Demoſthenes* and *Cicero*, that were fruitful in as choice conceptions as may be happily expreſt in Engliſh. All this I had ſooner written to you, and had earlier paid you the duty of this letter, if I had not been withheld by the apprehenſion of diſturbing your joys. For I am told, that Hymen makes you recant the opinions you lately defended againſt the ſovereignty of Cupid: they ſay, your grand theme is now no longer the prerogatives of a free heart, and the advantages of a ſingle life, but a certain frame of mind, expreſt long ſince by

* *Omnia vincit amor, & nos cedamus amori.*

But though your late contempt of love and women, and the railleries, with which you threatened me, in caſe I did what I may now do only to imitate you, give me both cauſe and riſe enough to puniſh you, and to let you ſee, that I have not been cauſleſly thought ſufficiently ſtored with declamations againſt Cupid and Hymen; yet I ſhall willingly ſacrifice my reſentments, and this inviting opportunity of expreſſing them to your alliance with honeſt Mr. *Hartlib*. For I cannot conclude you leſs a ſervant to philoſophy, by chooſing a miſtreſs in his family; and I cannot but look upon it as an act of his grand deſign to oblige this nation, that he hath found this way to detain you amongſt us.

SINCE I began this letter, I received a peremptory information of your marriage, in which I wiſh you and your bride as much happineſs, as ever that relation afforded any. A longer letter would now, perhaps, be an unſeaſonable interrupter of your joys; and therefore, though not to violate the laws of our commerce, I dare not ſend away this paper without ſomething philoſophical in it; yet what I ſhall now encloſe you, ſhall be only a way to make wine to drink the bride's health; which (as little as I love any ſtrong drink) that I may do to you, I heartily wiſh myſelf for a few hours at *London*. Having received this proceſs from a friend as a ſecret, I ſhall beg you would not let it loſe that name: and if the inventor of this artificial wine do not flatter it, *England* may afford us as generous, though not as laſting wine as the *Canaries*. I ſhould now likewiſe ſend you the way of making wine and ſpirit of wine out of corn; but the unwelcome affairs, that diſtract me here, have at preſent put it out of my head; and the papers I have of it being in one or other of my trunks, ſome of which are already ſhipt, and the others ready to be ſent aboard, I muſt ſuſpend the ſending you

that proceſs, till the next trouble I give you of this nature; and, in the mean time, ſhall deſire you, to do me the favour to name me an humble ſervant to the fair lady, that hath freed you from the conſtant trouble of defending your heart: for though in making herſelf happy, ſhe have obliged all the ingenious perſons in *England*, by procuring them the happineſs of your preſence; yet is there none in all that numerous company, that her ſtopping you at *London* hath ſo highly and ſo ſenſibly obliged, as he, that ſtiles himſelf,

SIR,

your moſt affectionate,

Briſtol this 27th of *September*. moſt faithful, and moſt

obliged humble ſervant.

[This letter was probably written to Dr. *Clod*, who married a daughter of Mr. *Hartlib*.]

SIR,

I RECEIVED juſt now, in a letter as worthy of you, as I am unworthy of it; a of praiſes ſo unexpected, and ſo unmerited, that only its ſuperſcription alone made me think myſelf at all concerned in its contents. Nor muſt I miſtake you and myſelf ſo much, as to think it either ſhould or could be anſwered or believed: I know you write it rather to expreſs your wit, than your opinion; and I perceive, that your rhetorick being enjoined a maſterpiece, has made ſuch uſe of your civility to beguile your modeſty, that, to do herſelf right, under the notion of doing me an honour, ſhe hath drawn you unawares to ſend me your own character; which I value too much, and have too little title to, either to own or keep, and which therefore I reſend you (as a miſtaken picture to its true original) being not a little ſatisfied to find myſelf in a condition to exempt myſelf by an act of juſtice, from the neceſſity of committing one of dulneſs; of which nature any thing muſt unavoidably have appeared, that had pretended to return your compliments in any but your [their] own expreſſions, they being ſuch tranſcendent and obliging ones, that even as much eloquence as you are pleaſed to aſcribe me, would not yet anſwer that you have aſcribed it with: and you alone have wit enough to ſay, what you have merit enough to deſerve to have ſaid to you. But, truſting my obedience with the manifeſting of my gratitude, [reſentments] I ſhall proceed to tell you, that I perceive, by the obliging expreſſions you are pleaſed to convey your commands in, that *Theodora* hath been introduced into your eſteem by a ſo partial a character, that the juſt apprehenſion, that her preſence might deſtroy it, would make her unwilling to be known to you under any other notion, if ſhe were not infinitely more concerned in her felicity than her reputation [glory]. But ſhe had rather acquaint you with her imperfections, than live any longer a ſtranger to your virtues; and therefore thus readily accepts your invitation: though ſhe ſays it would be without ſome trouble, that ſhe ſees herſelf neceſſitated to make fame ſo ill a return [requital] for the ſervice ſhe has done her, in recommending to you, as the diſcrediting her introducer with you, if ſhe ignored the over-raiſing expectation to be the ſubtileſt and prejudicialleſt calumny.

SIR,

I ACKNOWLEDGE myſelf to be much beholding to fame for having procured me the honour of your letter; and I am not a little tempted to be proud, that *Carneades*'s reaſonings have brought ſo great an *Helmontian*, as you yourſelf tell me you were, to doubt with him, of ſome opinions, that chemiſts do very generally acquieſce in. But though I may, perchance juſtly enough, pretend to be ſomewhat wary in admitting, and free in examining, ſuch hypotheſes, as I judge to be of moment in philoſophy; yet in other things I readily confeſs, that fame has flattered me; and that I am far from pretending to be maſter, either of the alkahiſt, or of thoſe other great Helmontian and Paracelſian arcana, of which you ſeem to ſuſpect me to be a poſſeſſor; though as to chemical experiments of an inferior ſort (which yet may be not uſeleſs in philoſophy or in phyſick) I may poſſibly be acquainted with ſome of them, which I have not been unwilling to exchange for others of the like nature, with perſons curious of ſuch matters. But I am very ſorry, that I cannot at preſent make benefit of the litterary commerce, that is ſo civilly offered me by ſo learned a man. For I have had this great while ſo great a weakneſs in my eyes, that it is exceeding troubleſom to me, to write even ſhort letters; inſomuch that I have not theſe many months written any to my neareſt friends. And I am now ſo buſied about the publication of experiments and obſervations, that I had formerly made, and conſigned to paper, concerning cold, that that work has, ſince I received your letter, ingroſſed all the time I had to ſpare for philoſophical employments. But though I am not ſo happy, as to be in a condition of making uſe of the correſpondence you are pleaſed to invite me to; yet I am not ſo unjuſt, as not to receive ſuch a favour with the reſentments that become your, *&c.*

SIR,

I FREELY confeſs to you, that I was ſo troubled and diſcouraged by having had the number of the firſt books, that I writ, leſſened by more than one, that were ſurreptitiouſly got away from me; that I afterwards, to ſecure my ſelf againſt the like loſſes of a whole treatiſe at a time, reſolved to write in looſe and unpaged ſheets; and ſometimes (when I had only ſhort memorials, or other notes, to ſet down) even in leſſer papers. And

And though I knew it probable, that by this courſe I might loſe ſome papers, yet ſuppoſing I ſhould by that courſe keep ſome men from the temptation they had before, I preſumed, that, by the help of the remaining papers and my memory, I ſhould quickly be able to ſupply the loſs of a ſheet or two, in caſe it ſhould happen.

BUT after that I have thus confeſſed, I muſt alſo acknowledge to you, that after the weakneſs of my eyes had, by diſabling me to write myſelf, reduced me to dictate and commit my papers to others, when I came to tack the looſe ſheets together into entire treatiſes, I found, that, through the negligence at leaſt of ſome men, if not alſo the fraud of others, ſo many were miſſing, and ſome of them (that had lain the longeſt by me) ſuch as I could not retrieve out of my memory, that I thought fit to comply in great part with the advice of a friend or two, who being unwilling, that ſuch things ſhould periſh to me, as well as others, by vaniſhing out of my memory, were deſirous, that I ſhould ſet them down, as they occurred to me, in one book, to be committed to ſome truſty and friendly perſon. And accordingly I have here cauſed divers of my ſcattered memorials and notes, and other looſe papers, to be tranſcribed, without any coherence, or any other order, than that wherein they chanced to occur to me; adding, here and there, divers later obſervations and thoughts, which, upon occaſion adminiſtred by theſe tranſcribed paſſages, came into my mind: and though ſeveral of them may ſeem but bare hints, and, perhaps, ſome of them but mere ſimilies, and other kinds of expreſſion; yet I forbear not to annex them, becauſe they have ſuch relations to the diſcourſes they belong to, as to be fit to bring again to my remembrance the whole paſſage, and perhaps the ſubſtance of the whole diſcourſe, whereto they appertain.

The marginal notes, that expreſs to what book, or tract, already divulged, the paſſages are to be inſerted, or to which of the unpubliſhed papers they belong, may be, to you, that are pleaſed now and then to give your ſelf the trouble of ſurveying ſome of my writings together, not wholly unacceptable; as well as it may prove uſeful to me, by facilitating my referring them, upon occaſion, to their proper places. And ſince you have been pleaſed to encourage me, I ſhall preſume upon your pardon, if I commit this rude and undigeſted heap of materials to your cuſtody, to which I ſhould, with much more willingneſs, and no leſs confidence, intruſt, if I had them, necklaces of pearl, than ſuch heaps of oiſter-ſhells; and therefore I ſhall not fear a refuſal, when I deſire, that theſe mangled papers may, during my life, be expoſed to no other, than to ſuch favourable eyes (as well as diſcerning ones) as yours, without the expreſs conſent of,

SIR,

your moſt affectionate

and humble ſervant.

Kenſ. Dec. 12.

SIR,

IT was my unhappineſs to be obliged, by going out of town, the ſame day I ſaw you at *Greſham* college, to be deprived of the ſatisfaction of waiting on you, at your own lodgings, before you returned to *Oxford*. I ſent two ſeveral times to enquire after Mr. *Pool*'s book; but the firſt day, by a miſtake in the direction, the meſſenger miſſed of your ſon's houſe; and another day, he found the houſe, but not Mr. *Wallis* at home; ſo that, till ſome hours ago, they were not brought to my lodging; which, I hope, will procure me your pardon, for not ſooner acknowledging the favour you did me, in relation to them. The news here is neither very conſiderable, nor very certain. I was yeſterday at *White-hall*, and was informed, that his majeſty is learning ſomething of the mathematicks, and that, as they ſay, of your brother, the biſhop of *Saliſbury*. Whilſt I was there, the king ſent for Mr. *Mercator* to come to him; but he being not found in the way, I could not learn of him, as I elſe might have done, what ſervice was required of him; but was only confirmed, in the general, that his majeſty's laudable curioſity now applies itſelf to mathematical enquiries; which *Plato*'s prognoſtick about philoſophiſing monarchs will, I preſume, make no unwelcome news to you; on which account it is ſent you by,

SIR,

your moſt affectionate friend

and moſt humble ſervant.

THE permiſſion you were pleaſed to vouchſafe me, of begging in your letters ſome part of that ſatisfaction I am neceſſitated to relinquiſh with your company, is that, which gives you the trouble of this letter, and me the confidence of giving you this trouble. Which I do with the leſs ſcruple, becauſe your converſation hath aſcertained me, that what I moſt do want, you can as eaſily ſpare. For I deſire not to put you to the trouble of gadding to *White-hall*, or *Weſtminſter*, to ſend me the intelligence of what is reſolved or voted there. No; without ſtiring out of your laboratory, you may give me all the information I ſue for; ſince I beg no account of any thing but of what is done there; and ſhall deſire no Mercurius to march on any other than on Vulcan's errands. And I know your letters (as well as your diſcourſes) are as naturally more fertile in philoſophy, than news, as oiſters are in pearls, than in rattles. I need not mind you of the obſervation, that chemiſts acquaintance is of age at a day old. (As the needle and the loadſtone, at their firſt meeting, cloſe, as if they did ſo upon an age's friendſhip.) For you know, that Vulcan is a quicker mediator of amities, than even Virtue herſelf:

herſelf: And thoſe metals, that grew in (never ſo) diſtant mines, he can, in a few minutes, perfectly and exactly aſſociate and unite. Nor ſhould I regret the time and pains I have ſpent in chemiſtry, though I had never derived from them any other benefit, than their having thus early radicated my acquaintance with you; from whom I muſt now earneſtly beg the favour of that correſpondence, with whoſe promiſe you had the charity to ſweeten my unwelcome ſeparation from you. But I ſhall not only conſent, but article, that not alone all ceremony and compliment, but even all rhetorick and care of language, may be ſeverely baniſhed from our commerce; as things yet leſs conſiſtent with chemiſtry and employedneſs, than with freedom, or with truth: And for my part, ſo your letters be but as fraught as your diſcourſes with gold of Ophir, I ſhall very willingly bate you the apes and the peacocks; which I know too, that one ſo rich, in all but trifles, as you, would find as much a more unobvious, as a leſs valued freight. That, which would moſt trouble me in this philoſophical traffick, would be, that its advantages will be too entirely mine (ſince I fear my retributions will be ſo trifling, as to amount but to acknowledgments, not exchanges) but that I conſider, that in knowledge it is as much more glorious, as more bleſſed, to give than to receive; ſince where our returns cannot encreaſe your knowledge, they argue it; and in as celebrating a way, as the ſtars do the ſun's tranſcendent brightneſs, by their diſability to heighten it by all theirs. And ſince the mind's intellectual ſplendor, knowledge, both as a good and as a light, muſt doubly joy in that kind property, diffuſion, I ſhall not deſpair of making you at leaſt ſuch an acknowledgment, as the moon makes the ſun, by her reflections encreaſing light, though ſhe encreaſe not his. For I intend to court nature as eagerly as ſuch a diſaccommodated ſolitude will permit me; and give you a faithful account of my proficiency in her favour by your mediation and influence: but at preſent the unlucky and unexpected lingring of the waggon, which is to bring me all my Vulcanian implements, and my neceſſitated idleneſs, till they come, makes me wiſh it drawn by Pegaſuſſes, and think it drawn by ſnails; and makes me ſadly walk up and down in my laboratory, like an impatient lutaniſt, who has his ſong-book and his inſtrument ready, but is altogether diſprovided of ſtrings. This unſeaſonable diſaſter, by enforcing an unlooked for backwardneſs in my preparations, does alſo conſtrain me to mind you of thoſe remedies you were pleaſed to promiſe me the maidenhead of (and principally thoſe againſt the ſtone and the ſmall-pox, the former of which does now diſquiet me, and of which the latter is very rife in theſe parts) and to beg, that, as ſoon as you have made them, a proportion of them may be conveyed to him, who will not fail, at his next remove to *London*, to make your favours all the acknowledgments and the returns, that may become the gratitude and manifeſt the friendſhip of, Sir, *&c.*

Dear Mr. WORSELEY,

YOUR ſilence would extremely trouble me, if, as it denied me the happineſs to hear from you, I had alſo miſſed the contentment of hearing of you. But this laſt I received in a letter of my ſiſter *Ranelagh*, together with the welcome news, that your propoſitions had already paſſed the houſe of lords (who it ſeems are at leiſure to hear petitions, now they have little or nothing elſe left them to do) and is retarded only by the univerſal remora of handſom deſigns, the want of a little dung-coloured earth. Truly I never found in myſelf ſuch ſtrong deſires for that adored muck, as now, that I ſee what gallant projects its affluence may promote. And I am apt to believe that a very juſtifiable avarice, that wiſhes not the poſſeſſion of riches, but the employment; and not ſo much for the pleaſure they may reap by it, as for the good they may do with it. But I muſt confeſs to you, that, in my wiſhes for the proſperity of your pious powder-plot, my private intereſts would needs mingle with more publick conſiderations, I having been lately ſo vexed by thoſe undermining two-legged moles, we call ſaltpeter-men, that my purſe, as well as my affection, makes vows for your ſucceſs. My pigeon-houſe they are already digging up, (an emblem of the practice of the times, in the ruin of unarmed innocence) and would have done the like to my cellar and ſtables, if I had not ranſomed them with a richer mineral than that they contain. I hoped my retreat to this ſolitude would have made me maſter of leiſure enough to entertain my own baniſhed thoughts, and perfect ſome lame diſcourſes I brought hither with me, to that purpoſe: but the neceſſary care of ordering my own ſmall mangled fortune, the unrulineſs of the troopers, my frequent journies, the allowed incendiaries (the ſaltpeter-men) and (to complete my diſaſters) the tedious, ſenſeleſs viſits of our country gentlemen, have ſo ſhared my hours amongſt them, that I find here as great a dearth of time, as there is of corn; and have now leſs of it at my own diſpoſal, than when I was fain to trifle it away with the ladies: and the plain truth of it is, that (betwixt the injuſtice of thoſe, that hold the civil ſword, and the unrulineſs of thoſe, that draw the martial) things are carried in ſo ſtrange a way in the *Weſt*, that theſe parts can afford little content or ſafety to any man, that is not either a ſoldier, a ſequeſtrator, or a committee-man. My grand employment, in my ſpare hours, is, to catechiſe my gardner and our ploughmen, concerning the fundamentals of their profeſſion; where I have fortuned upon ſome obſervations, that have perſuaded me into a paradox in huſbandry, as new as any of the religions minted in your heretical [*Coleman*] ſtreet. The opinion itſelf, together with the reaſons that led me to it, you ſhall hear of, God willing, by the next opportunity; I being extremely mindful of my promiſe, to tranſmit to you any thoughts or experiments of mine, that I ſhall judge conducible to the furtherance of your great deſign, and the enabling you to

do for the great world, what the chairmen of the phyſicians has done for the little, publiſh a diſcourſe *de uſu partium*. But leſt the tediouſneſs of this letter ſhould fright you from the lecture of thoſe others, that are deſtined to attend it, I will haſten to a concluſion; which though cuſtom enjoin me to make with a compliment, yet I am reſolved to continue ſo obſequious to our late decrees againſt that uſeleſs ceremony, that, to be ſure to keep far enough, not only from the guilt, but from the very ſuſpicion, of that crime, I will content myſelf with as naked, as true a profeſſion of my being very really,

SIR, *&c.*

London, Saturday morning.

SIR,

THE weakneſs of my eyes forbidding me to venture them, by candlelight, upon ſo ſmall a print, as that of the French book (of the Pere *Cherubin*) that you did me the favour to leave with me yeſternight, I could not, till late this morning, peruſe what he thought fit to write againſt my experiments, about the penetrability of glaſs with ſome finer parts of flame. I am more willing to paſs by, than imitate his dogmatical way of writing; and, in compliance with my preſent haſte, ſhall only conſider the ſubſtance of what he is pleaſed to object againſt my experiments.

I EXAMINE not what he ſuppoſes, about a violent extenſion of the air included in my ſealed retort, and that this ſtretched air has a ſtrong attractive power, to draw in the neighbouring air, when the *apex* of the glaſs was broken off; becauſe, though I do not acknowledge any ſuch attractive power in the air, yet I do not ſee how the ſuppoſition of that power will diſable my argument.

I THINK I may be pardoned, if I did omit the weighing the retort, and all that was in it, before I broke it; for I did not then know, that any body was like to make the exception the P. *Cherubin* has propoſed; and I thought it would be tedious to the reader, as well as to me, to ſet down all the imaginable objections, that could poſſibly be deviſed: and though this, that is made, had been actually ſuggeſted to me, only as a poſſible doubt, though not as the grand objection of a learned man, I ſhould yet perhaps have ſaved myſelf the labour of ſolicitouſly clearing it, becauſe, the circumſtances of the experiment ſeemed ſufficient to juſtify the concluſion inferred from it, as will by and by appear. And one, that were a ſceptick, and would have propoſed all the ſuſpicions, that might have been deviſed, would perhaps have acquieſced in ſuch a trial as my cenſurer declares would have ſatisfied him, becauſe of another jealouſy, that came into my mind, when I was converſant about the experiment. For, on this occaſion, I muſt let you know, for a certain reaſon, that needs not now be told, I remember I did weigh a ſealed retort, with matter in it, and found it encreaſed in weight, but thought not fit to lay much ſtreſs on that circumſtance.

As for the authority of Sir *K. Digby*, I am glad my cenſurer has ſo much deference for it; ſince that famous knight relates, that he had made quickſilver paſs in ſmall drops through glaſs itſelf; which, if true, will quite deſtroy P. *Cherubin*'s denial of the poroſity of glaſs: but, for a reaſon I have elſewhere declared, I will lay no weight on this; but ſhall conſider, wherein the ſtrength of the cenſurer's objection lyes; namely, that by Sir *K. Digby*'s experiments it appears, that calcined bodies do notably augment in ſubſtance, by the attraction they make of the air; to which I briefly anſwer, that if the P. were as well verſed in chemiſtry, as he is in opticks, he would not probably have looked upon this objection as irrefragable; for he will give one, that is a piece of a chemiſt, leave to tell him, that calcined bodies may be of very differing kinds, and that, though many of them, eſpecially vegetables, being calcined, do in time increaſe in weight, by the inſinuation made into the pores of their more ſaline parts, not by the ſimple air, but by the moiſt vapours that rove up and down in the air, and eaſily adhere to, and penetrate lixiviate ſalts; yet there are other calcined bodies, that are of a very different condition, ſuch as are the calces of metals, at leaſt of tin and lead; in which neither taſte, or for ought I have obſerved, any other means, has yet manifeſted a lixiviate ſalt, like that of burned vegetables. And therefore it need not ſeem ſtrange, that though calcined tartar, left in a moiſt air, will in time thereby be reſolved to a liquor, yet no ſuch thing will happen to the aſhes or calces of burned tin or lead; ſo that it is very improbable, that, in a few minutes, thoſe metals, though but partly calcined in my retorts, ſhould from air gain ſo great an increaſe of weight; eſpecially conſidering, that there is another manifeſt cauſe to be aſſigned for that increment, divers experiments purpoſely made having aſſured, that either of thoſe metals, being calcined, will make a notable acquiſt of weight upon the operation of the fire. And I opportunely remember, that this very year, having had occaſion to melt together, and ſteep for a pretty while in fuſion, a mixture of tin and copper, amounting in all to a pound (I ſay juſt, becauſe, though I dreamed not I ſhould make this uſe of the experiment, yet the uſe I did deſign required all things ſhould be very carefully weighed,) I found, that though a ſmall portion of the mixture was calcined, yet the total had gained in weight no leſs than 233 grains. And now, Sir, I am ſummoned to take leave of you and this paper, and want to renew and enlarge what I have ſcribbled; but perhaps what has been ſaid may keep it from being a preſumption in me to confeſs, that in the P. *Cherubin*'s objections, I have yet ſeen no reaſon to do what perhaps few are more diſpoſed

to do, alter my former opinions, his againſt them ſeeming to me to have more of confidence than ſtrength. I am in great haſte,

SIR, *&c.*

SIR,

IF your charity be not extraordinary, my want of civility will appear ſo to you, for having ſo long delayed acknowledging a favour, for which you might expect very early, as well as very affectionate thanks. But it will, perhaps, with ſo equitable and favourable a judge, paſs for ſome excuſe of my ſilence, if not for a juſtification of it, that your learned book came to my hands, when, being to make a journey into the Weſt, without knowing how long time, that, and my affairs in the country, would coſt me, I was obliged to diſpatch thither, before me, thoſe choicer books, that, in caſe my ſtay ſhould prove long, I thought likelieſt to keep it from being tedious. So that till, in my return, I came as far as this place, I had not an opportunity to enjoy the benefit of the welcome preſent you were pleaſed to make me. And ſince my return hither, the amanuenſis, whoſe hand the weakneſs of my eyes confines me to employ, has, upon an urgent occaſion, been unexpectedly kept abſent from me for above three weeks together; were it not for theſe impediments, Sir, I had much earlier expreſſed to you my great ſenſe of the honour and ſatisfaction I received in your excellent idea, which, though the unſettledneſs, which uſually, for a while, attends removes, have kept me from going ſo far through, as to be able to take a due proſpect of the concinnity of the work, and the tendency of the reſpective parts to the main deſign of the whole diſcourſe; yet in thoſe chapters I have had opportunity to peruſe, I have already met with divers things, that I have found no where elſe, and others ſo uncommmon, even among learned men, that though I do not much doubt but your ſeverity to the Romaniſts will, notwithſtanding your apology, procure you adverſaries enough; yet I as little doubt, that more diſintereſted readers will not judge, that, in this learned piece, the author's pen has degenerated from itſelf. If you ſhould tell me, that ſuch a work as this muſt be looked upon with much diſadvantage to it by him, that, ſeeing but a a portion of it, cannot ſufficiently diſcern the ſymmetry and connexion of the parts, I ſhall not contradict the allegation. But I hope I ſhall nevertheleſs be pardoned, if, having been unhappily reduced to ſuppreſs my reſentments ſo long, I take the firſt opportunity of declaring how much your merit and civilities have made me,

SIR,

your affectionate and

humble ſervant,

ROB. BOYLE.

WORTHY SIR,

I RECEIVED with a great deal of regret the ſad and ſurpriſing news, your letter brings me, of the deceaſe of ſo worthy and uſeful a perſon as doctor *Sall*, whoſe death I look upon, eſpecially at this juncture of time, as a great loſs, not only to thoſe, that knew him, but to the church of *Ireland* in general. But, together with that unwelcome news, you ſend me what does much alleviate the unwelcomneſs of it, when you acquaint me with your pious and generous reſolution, to proſecute the good work he was engaged in with the ſame Chriſtian aim (the glory of God, and the good of ſouls) which, I am confident, made him active in it. The nature of the work conſidered, I wholly agree with you, in thinking it unfit to deſpond of ſeeing it ſucceſsfully carried on, by his bleſſing, whoſe ſervice is aimed at in it. I look upon it as an auſpicious earneſt of good ſucceſs, that you are ſo zealouſly bent to promote it. I laſt week ſent poor doctor *Sall* notice, that I had procured the church catechiſm, with doctor *Marſhal*'s texts in the margin; and I am promiſed, within a week, a conveniency of ſending it you to *Dublin*. In the mean time I have laid by ſome money for the charge of the Iriſh grammar, that the diſpatch of that may receive no impediment that I can obviate. I intend alſo to be a further contributer than I have been towards the printing of the old teſtament, if there be any neceſſary occaſion for it; but I am ſorry I cannot yet procure the forms of ſubſcription, that were ſucceſsfully made uſe of, for the edition of the Welſh bible. I am promiſed them more ways than one, and, if I receive them, ſhall, God permitting, ſpeedily diſpatch them to you. But I do not well ſee, why thoſe, that are well affected to the work you have in hand, may not begin to do ſomewhat, whatever becomes of theſe patterns. The firſt ſheet of *Geneſis*, that you deſire, is already printed off, and, I preſume, on its way to *Dublin*, by the laſt poſt; Mr. *Reyley* having brought it ſome hours before that, went away, and having undertaken to diſpatch it that night, at the earneſt inſtance of,

Worthy Sir,

your moſt affectionate

[About April or May, 1682.] and moſt humble ſervant.

To the Counteſs of *Ranelagh*.

My dear SISTER,

IF I were of thoſe ſcribblers humour, who love to put themſelves to one trouble, to put their friends to another; and who weekly break their ſilence, only to acquaint us with their unwillingneſs to keep it; I muſt confeſs I had much oftner written you letters not worth the reading. But having ever looked upon

upon ſilence and reſpect as things as near of kin as importunity and affection, I elected rather to truſt your good opinion to your good-nature, than your patience with my letters: for which to ſuppoſe a welcome, muſt have preſumed a greater kindneſs, than they could have expreſt. For I am grown ſo perfect a villager, and live ſo removed, not only from the roads, but from the very by-paths of intelligence; that to entertain you with our country diſcourſe, would have extremely puzzled me, ſince your children have not the rickets nor the meaſles; and as for news, I could not have ſent you ſo much as that of my being well. To beſeech you not to forget me, were but a bad compliment to your conſtancy; and to tell you, I remember you, were a worſe to my own judgment: and compliments of the other nature it were not eaſy for me to write from *Stalbridge*; and leſs eaſy to write to you: ſo that wanting all themes and ſtrains, that might enable me to fill my letters with any thing, that might pay the patience of reading them, I thought it pardonabler to ſay nothing by a reſpectuous ſilence, than by idle words. But the cauſes being juſt ſo many excuſes of that ſilence, I ſhould have more need to apologize for my letters, if theſe ſeemed not neceſſary to prevent the miſconſtruction of their unfrequency; and if I did not ſend up the antidote with them, in the company of my brother *Frank*; by whom it were equally incongruous and unſeaſonable to ſend you no epiſtle, and to ſend you a long one; which (latter) that this may not prove, I muſt haſten to aſſure you, that though I have not very lately written you any common letters, it is not long ſince I was writing you a dedicatory one, which may (poſſibly) have the happineſs to convey your name to poſterity; and having told you this, I ſhall next take poſt to beſeech you to believe, that whenſoever you ſhall pleaſe to vouchſafe me the honour of your commands, my glad and exact obedience ſhall convince you, that though many others may oftner renew their bonds, I can eſteem myſelf, by a ſingle note under my hand, equally engaged to you for all the ſervices, that may become the relation, and juſtify the profeſſions, that ſtile me,

My dear ſiſter,

Stalbridge, this 13th Novem. your moſt affectionate brother, and faithful humble ſervant,

R. B.

To the Earl of *Corke* at *York*.

My deareſt BROTHER,

I THOUGHT I had a very juſt reaſon to quarrel with my ſickneſs, for debarring me the happineſs of waiting upon my ſiſter; but now I am willing to conſent to a reconciliation, ſince the enjoyment of her company muſt have had ſo ſhort a date, as would have ſerved but to have taught me the greatneſs of my loſs. For a late ordinance of parliament (which it ſeems is very ambitious of the honour of your companies) depriving all thoſe of the benefit of the articles of *Oxford*, and ranking them with the greateſt enemies of the ſtate, that ſhall not come hither to proſecute their compoſitions by the firſt of Auguſt next; does ſeem to exact your very ſpeedy repair to *London*, where your preſence will be very longingly expected by, and extremely welcome to,

Deareſt brother,

your moſt faithful, and humble ſervant,

London, this 14th July, 1646.

ROBERT BOYLE.

To the Counteſs of *Ranelagh*.

My deareſt SISTER,

I RECEIVED your letter with a huge deal of ſatisfaction, not only as an effect of your kindneſs, but an evidence of your recovery; which latter property more endeared your neat lines to me, than the former did; ſince the one relates to you, the other reflects only on myſelf; who muſt ever as much prefer the bleſſing of your happineſs, before the happineſs of your affection, as I value this latter above all other goods. I perceive by your intelligence, that we owe our condeſcenſions to our brethren, rather to our fear, than hatred of a war; and am very ſorry to find by your ſtory, that the faculties of our minds ſtand in ſo inverted a relation, that it is our paſſions, that bring us to reaſon, rather than we them. It is not alone upon the ſcore of its being ſo lately happened, that I eſteem that to be news, you are pleaſed to inform me, concerning the lords rejected motion to the commons, to have the lieutenancy of the *Tower* confirmed to the general, and the truſt of the kingdom's militia conferred upon him: for I imagine, that deſire of the lords to be a piece of great (to which epithet you will, perhaps, think it needleſs to add that of unuſual) diſcretion; for if (by miracle) the motion paſt, they had got the thanks of it; and their deſign being to have it thrown out, they could not deviſe a likelier way in order to that end, than to make it their motion: ſo that deriving a double advantage from a ſingle act, they gained Sir *Thomas Fairfax*'s affection, by ruining his buſineſs. The ordinance you mention againſt hereſies and blaſphemies appears to me a greater argument of your fright at *London*, than the buildings of that new officious houſe, ſo ominouſly and foreſeeingly erected by the members at *Weſtminſter*. But concerning this point of toleration, I may poſſibly, ere long, give you the trouble of peruſing my thoughts in an Eſſay, entitled, *of Divinity*. It ſeems, by

by what you relate of the under-hand treaty at *Chelſea*, that jugling is ſtill as much in faſhion with you amongſt the men, as painting is amongſt the women: and I am confident, that if the ſtatute againſt juglers and hocus-pocus blades were extended to ſtate affairs, and ſtrictly put in execution at this inſtant, ſome (nameleſs) places of very great reſort would be as perfect hermitages, as that your ſervant lives in. What all theſe confuſions will reſolve into at laſt, God only, that diſpoſes of events, (I think) does know: and from our knowledge, that he diſpoſes of them, we ought to derive our conſolation.

Now, for my own particular, I have been in perpetual motion ever ſince I laſt ſaw you; partly to comply with the neceſſity of my little domeſtick affairs, which exact my being active; and partly, by lawful recreations, to divert, as much as may be, that drowſy melancholy, which (beſides other croſſes) the fickleneſs of my health does daily endeavour to encreaſe. But, believe not my melancholy ſhall drive me to any diverſion, that may make me deſerve it: and for the knight's company you ſo ſeverely diſadviſe, I muſt aſſure you, that for this ſummer I am very unlike to have it; and at all times think my ſelf very much above the being perverted by it. But my preſent irreſolution, what courſe to take, makes me ſpare the now giving you any further trouble, than that of deſiring you, if you can, to get the diſpoſing of thoſe chambers at St. *James*'s reſpited, till you hear from me next poſt: by which I hope to give you a full account of his intentions, who, by this day fortnight, expects (God willing) the happineſs of aſſuring you, by word of mouth, how really he is,

My ſiſter,

Stalbridge,
May 13, 1648.

your moſt faithful, and humble ſervant.

MADAM,

WHEN I found a tranſcript of my letter encloſed in your ladyſhip's, the diſparity both of their ſtiles and contents obliged me to reſemble the whole pacquet to moſt of our young gallants, and their clothes; where the covering is ſo much better than that which it enfolds: for ſeriouſly, Madam, I was extremely aſhamed to find, that I had put your ladyſhip to the trouble of a copy of my laſt dull ſcribble, ſince I deſired the return of the original, not more to ſatisfy (or rather diſabuſe) the young gentleman's curioſity, than to aboliſh ſo tedious an inſtance of my bad ſecretaryſhip. The intelligence here is both leſs and worſe, than poſſibly your ladyſhip's expectation preſumes; the Kentiſh buſineſs has hurt us no otherwiſe, than by making us fear, that it might do ſo. Victory is as obedient, as the very parliament to the army: my laſt week's aſtrology has not at all deceived me; and though ſince that time divers ſucceſſes of the Kentiſh men have extremely frowned upon my predictions; yet the event has very much conformed to my conjectures; the Kentiſh being almoſt wholly reduced to the diſcretion of the parliament; who, it is thought, will, in this nice particular, more conſult the laws of policy, than thoſe of charity.

THE Eſſex men had yeſternight granted them an act of indemnity; which is like to attempt *Bow* bridge with much better ſucceſs than they ſay our forces have had there. The Surrey men ſeem, by the fate of their companions, deterred from enterpriſing any novelty; and, after all their threatenings, and complaints, ſeem content, with putting this compliment upon their patience, to let the world know, that they ignore not the extent and the dimenſions of the wrongs, that they forgive. My lord of *Warwick* was pleaſed to give me a very full account with his own mouth, of his whole negotiation with the fleet: but the printed paper will be ſo ſure to relate, at leaſt as much as is true of that tranſaction, that I ſhall purpoſely decline it: he is now gone to *Portſmouth*, with the ſhipping he finds there, to endeavour the reducing of thoſe ſix ſhips, that ſhow themſelves refractory; of which he aſſured me ſecretly at his departure, that the officers of four were at his devotion. I ſupped laſt night at *Warwick* houſe, with my lady's daughters only; and find by their ſtory, that *Charles Rich* is the grand agitator in this Eſſex buſineſs. One of our maſters told me this afternoon at *Weſtminſter*, that they had voted the propoſitions to be treated on with the king, the ſame that were preſented him at *Hampton* court, to be ſent away immediately to the *Scots*, for their concurrence, with a deſire, that they ſend ſuch further particular addreſſes to his majeſty, as they have reſolved on, in order to their own nation's peculiar intereſt. Our brethren are not like to viſit us ſo ſoon as we expected; but our diverſion in theſe parts of the kingdom hath, as it is boaſted, given the royaliſts the liberty of a quiet, and almoſt undiſturbed encreaſe in the North. The diſobedient ſhips have choſen for their admiral, one major *Kemb*, a miniſter, and a mad witty fellow, whom I have ſometimes been very merry with; his wife being ſiſter to that honeſt red-noſed blade, that waits now upon me. But a perſon of quality, and one, that pretends to be no petty cabaliſt, gave me the honour of a viſit this morning, and aſſured me, that he knew from both parties the probability of a ſpeedy peace to be ſo great, that it is expected even by thoſe perſons, by whom it is not wiſhed for. But, Madam, ſince I began to write this letter, I had unexpectedly the happineſs of a long converſation with the fair lady, that people are pleaſed to think my miſtreſs; and truly, Madam, though I am as far from being in love, as moſt that are ſo are from being wiſe, yet my haſte makes me gladly embrace the old excuſe of,

Then

Then to ſpeak ſenſe,
Were an offence;

to extenuate my having hitherto written ſo dully, and my concluding ſo abruptly; for whilſt this amorous rapture does poſſeſs, I neither could write ſenſe without being injurious to my paſſion, nor can any longer continue to write nonſenſe, without ſome violation of that profound reſpect, which is both due to you from, and vowed you by,

Madam,

London, June 6, 1648. your ladyſhip's moſt faithful, and moſt humble ſervant.

[To Mrs. *Huſſey*.]

To the Counteſs of *Monmouth*, at *Moore-Park*.

MADAM,

IN your ladyſhip's (imparted to me by my ſiſter *Ranelagh*) I find myſelf ſo confounded with civilities, that if ſhe, that bleſſed me with the ſight of your letter, had not (for her own diſcharge) exacted of me this acknowledgment of my having ſeen it; I muſt confeſs, I ſhould ſcarce have ventured to return a verbal anſwer; deterred by the impoſſibility of writing without wronging a reſentment, which I can expreſs as little, as I deſerved the praiſes and the favours, that have produced it. To be commended by your ladyſhip, and that for ſuch a quality as that, which you are pleaſed to think my deſires give me a title to, would poſſibly both create pride in me, and (in ſome ſort) excuſe it; if I did not conſider myſelf extolled for an attribute, which owes more of its price to its rareneſs, than its value; and argues much more the degenerateneſs of thoſe young men, that want it, than any great virtue in them, that do poſſeſs it; that earlineſs of piety, which is made my merit, being ſo much my duty, that it is the faults of others, that muſt make it my commendation. As for my pamphlet, madam, had it expected the glory of entertaining you, it ſhould certainly have appeared in a leſs careleſs dreſs; but, madam, though after your ladyſhip's approbation, to doubt a general one, were to believe the latter not worth the caring for; yet my juſt ſenſe of the ſmalneſs of the acceſſion the preſs can be to the honour of your ladyſhip's peruſal, makes me decline its publication. And as that paper cannot have either a higher applauſe or nobler end, than the being liked and practiſed at *Moore-Park*; ſo if it have either any way diverted your ladyſhip, or had the leaſt influence upon my lord, I have reached my deſires, and gone beyond my hopes. However, madam, I am richly rewarded for writing ſuch a book, by being enjoined to fetch it where you are. So welcome a command is very unlikely to be diſobeyed: but my obedience, madam, muſt be payed to the order, not the motive: the fetching of my book may be one effect of my remove, but not the errand of it; for ſure, madam, your modeſty cannot be ſo injurious, both to yourſelf and me, as to perſuade you, that any inferior, (that is, other) motive, can be looked upon by me as an invitation to a journey, which will bleſs me with ſo great a happineſs, as that of your ladyſhip's converſation; and give me the opportunities of aſſuring you better than my preſent haſte and my diſorder will now permit me, in how tranſcendent a degree, I am, madam,

Your ladyſhip's humble

London, this 7th of July, 48. and obliged ſervant,

ROBERT BOYLE.

MY SISTER,

I HAVE ever counted it amongſt the higheſt infelicities of friendſhip, that it encreaſingly reflects upon us our imparted griefs; for if our friends appear unconcerned in them, that indifference offends us, and if they reſent them, ſympathy afflicts us. This conſideration concurring with my native diſpoſition, has made me ſhy of diſcloſing my afflictions, where I could not expect their redreſs; being too proud to ſeek a relief in the being thought to need it, and too good a friend to find a ſatisfaction in their griefs I love, or to admit of the ill natured conſolation of ſeeing others wretched as well as I. This humour may in part inform you of the cauſe of my ſilence, and, I hope, in part excuſe it. But I am not now at leiſure to make apologies, though I will aſſure you I decline the employment for want of time, not juſtice. Since I wrote to you laſt, I was unlikely enough ever to be in a condition to write to you again; and my danger was ſo ſudden and unexpected, that nothing could tranſcend it, except theirs, whoſe dilatory converſion makes them truſt eternity to the uncertain improvement of a future contingent minute of a life obnoxious to numerous caſualties, as impoſſible (almoſt) to be numbered as avoided. What God has decreed of me, himſelf beſt knows; for my part I ſhall ſtill pray for a perfect reſignation to his bleſſed will, and a reſembling acquieſcence in it; and I hope his ſpirit will ſo conform me to his diſpenſations, that I may cheerfully, by his aſſignment, either continue my work, or aſcend to receive my wages. And in this I muſt implore the aſſiſtance of your fervent prayers, dear ſiſter, which I am confident will both find a ſhorter way to heaven, and be better welcomed there. Theſe three or four weeks I have been troubled with the viſits of a quotidian ague, which yet had not the power to hinder me from three or four journeys to ſerve *Frank*, and

and wait upon my dear *Broghill*, nor from continuing my Vulcanian feat; and in the intervals of my fits, I both began and made ſome progreſs in the promiſed diſcourſe of *publick ſpiritedneſs*: but now truly weakneſs, and the doctor's preſcriptions, have caſt my pen into the fire; though in ſpite of their menaces, I ſometimes preſume to ſnatch it out a while, and blot ſome paper with it. My preſent employment is the reviewing ſome conſolatory thoughts on the loſs of friends, which my poor lady *Suſan*'s death obliged me to entertain myſelf with, and which I am now recruiting. If ever I finiſh them, I ſhall trouble you to read them, and if I do not, beſeech you to make uſe of them. The melancholy, which ſome have been pleaſed to miſrepreſent to you as the cauſe of my diſtempers, is certainly much more the effect of them; neither is it either of that quality, or that degree you apprehend, but much more juſt than dangerous. Yet to obey you, I ſhall endeavour a divorce; and as the propereſt means, endeavour to wait upon you: in order to which I came this night in a litter to this town, whence I intend not to diſlodge, till God's bleſſing upon the remedies enable me to do it on horſeback. The kindneſs you expreſs in the letter I received this morning, has brought me ſo high a conſolation, that I ſhould think it cheaply purchaſed by the occaſion of it, if I had ignored, that the ſole want of ſuitable opportunities reſtrained the frequency of reſembling ſtrains; and if I were not too well acquainted with the greatneſs of your goodneſs, not to derive a higher joy from your obliging proffers, as they are effects of your friendſhip than teſtimonies of it. But though I value the bleſſing of your company at the rate of having the happineſs of more than an indifferent acquaintance with you; I cannot conſent to purchaſe my felicity (if ſuch a thing could be done) by your diſquiet: for your remove will not more certainly diſcompoſe your family, than it will be uſeleſs or unneceſſary to me; the nature of my diſeaſe being ſuch, that it will either fruſtrate your viſit, or allow me to do ſo. For, if in a very ſhort time it deſtroy not, it will leave me ſtrength enough to fetch a perfecter cure of it at *London*, whither in ſpite of my preſent diſtempers, which are not ſmall, nor (I fear) very fugitive, the phyſicians would perſuade me, that by God's aſſiſtance I may be able to crawl in a ſhort time. I ſhall beſeech you therefore not to ſtir, until you hear further either from me, or of me; and to believe, that though your viſits are favours of too precious a quality to be fully receivable from your intention only, yet my concern in your quiet will make me (in the purpoſed journey) more welcomely reſent your deſign than your preſence. I hope you will pardon the diſorder of this ſcribble to that of the writer, who is not only weary of his journey, but is at preſent troubled with the fit of his ague, which yet being but a ſickneſs, cannot impair an affection, which will be ſure to keep me really and unalterably till death,

My deareſt, deareſt, deareſt ſiſter,

your moſt affectionate brother,

Bath, Aug. 2, 1649. late at night. and humble ſervant,

R. B.

MY SISTER,

I MUST confeſs, that I ſhould be as much in your debt for letters, though I had anſwered every one of yours, as he is in his creditor's, who for two angels has paid back but two ſhillings. For certainly, if any where, it is in the productions of the mind, that the quality ought to meaſure extent, and aſſign number; and equity to multiply excellency, where wit has contracted it. I could eaſily evince this truth, and the juſtneſs of the application too, did I not apprehend, that your modeſty would make you mind me, that the nature of my diſeaſe forbids all ſtrains. I am here, God be praiſed, upon the mending hand, though not yet exempted either from pain or fears; the latter of which I could wiſh (but believe not) as much enemies to my reaſon, as I find the former to my quiet. I intend notwithſtanding, by God's bleſſing, as ſoon as I have here recruited and refreſhed my purſe and ſelf, to accompliſh my deſigned removal to *London*; my hoped arrival at which, I look on with more joy, as a fruit of my recovery, than a teſtimony of it. *Sir William* and his ſon went hence this morning, having by the favour (or rather charity) of a viſit, made me ſome compenſation for the many I have lately received from perſons, whoſe viſitations (I think I may call them) in ſpite of my averſeneſs to phyſick, make me find a greater trouble in the congratulations, than the inſtruments of my recovery. You will pardon, perhaps, the bitterneſs of this expreſſion, when I have told you, that having ſpent moſt of this week in drawing (for my particular uſe) a quinteſſence of wormwood, thoſe diſturbers of my work might eaſily ſhake ſome few drops into my ink. I will not now preſume to entertain you with thoſe moral ſpeculations, with which my chemical practices have entertained me; but if this laſt ſickneſs had not diverted me, I had before this preſented you with a diſcourſe (which my vanity made me hope would not have diſpleaſed you) of the theological uſe of natural philoſophy, endeavouring to make the contemplation of the creatures contributory to the inſtruction of the prince, and to the glory of the author of them. But my blood has ſo thickned my ink, that I cannot yet make it run; and my thoughts of improving the creatures have been very much diſplaced by thoſe of leaveing them. Nor has my diſeaſe been more

guilty

guilty of my oblivion, than my employment ſince it has begun to releaſe me; for Vulcan has ſo tranſported and bewitched me, that as the delights I taſte in it, make me fancy my laboratory a kind of Elyſium; ſo as if the threſhold of it poſſeſſed the quality the poets aſcribed to that *Lethe*, their fictions made men taſte of before their entrance into thoſe ſeats of bliſs, I there forget my ſtandiſh and my books, and almoſt all things, but the unchangeable reſolution I have made of continuing till death,

Stalbr. Aug. the laſt, 1649. Siſter, your

R. B.

To Lord *Broghill.*

My deareſt Governor,

I RECEIVE in our ſeparation as much of happineſs as is conſiſtent with it, in hearing of you in ſo glorious, and from you in ſo obliging a way; and in being aſſured by your letters and your actions, how true you are to your friendſhip and your gallantry. I am not a little ſatisfied, to find, that ſince you were reduced to leave your *Partheniſſa*, your ſucceſſes have ſo happily emulated or continued the ſtory of *Artabanes*; and that you have now given romances as well credit as reputation. Nor am I moderately pleaſed, to ſee you as good at reducing towns in *Munſter*, as *Aſſyria*; and to find your eloquence as prevalent with maſters of garriſons, as miſtreſſes of hearts; for I eſteem the former both much the difficulter conqueſt, and more the uſefuller. Another may lawfully exalt your bold attempts and fortunate enterprizes; but, for my part, I think, that ſuch a celebration would extremely miſbecome a friendſhip, to which your goodneſs and my affection flatter me into a belief, that our relation has rather given the occaſion, than degree. Beſides that I have ſo great a concern in all things, wherein you have any, that the preſumption of my own modeſty does, as well as the greatneſs of yours, ſilence my praiſes. And, truly, that, which moſt endears your acquiſitions to me is that they have coſt you ſo little blood. For beſides, that the glory is much more your own to reduce places, by your own ſingle virtue, and the intereſt it has acquired you, than if you had I know not how many thouſand men to help you, and ſhare as much the honour of your ſucceſſes, as they contribute to them; beſides this conſideration, I ſay, certainly, though a laurel crown were more glorious amongſt the Romans, the myrtle coronet (that crowned bloodleſs victories) ought to be acceptabler to a Chriſtian, who is tied by the bindingeſt principles of his religion, to a peculiar charity towards thoſe that profeſs it; to uſe towards delinquents as much gentleneſs, as infringes not the juſt rights of the innocent; and to be very tender of ſpilling their blood, for whom Chriſt ſhed his. But I am leſs delighted to learn your ſucceſſes in the world, than to find (by your letter to my ſiſter *Ranelagh*) that you mean not they ſhall tie you to it; and are reſolved, as ſoon as your affairs and reputation will permit you, to diveſt your publick employment, and retire to a quiet privacy, where you may enjoy yourſelf, and have leiſure to conſider the vanity of that poſthume glory, which has nothing in it of certain, but the uſeleſneſs. That, in that hurry of buſineſſes, that diſtracts you, you could find leiſure to bleſs me with your letters, is a favour, which, though it amaze me not, does highly ſatisfy me. The kindneſs they expreſs is welcomer to me, for what it argues, than for what it promiſes; and I am much more pleaſed, to ſee you in a condition of making promiſes, than I ſhould be with their accompliſhment. I ſhall only in general deſire your countenance for thoſe, that manage my fortune in your province, whither I ſhould wait upon my deareſt lady *M.* if black *Betty* did not; and, ſeriouſly, the jade arrived very ſeaſonably, to ſave me a journey, for which I was but ſlenderly provided; for having not yet been able to put off my L. *Goring*'s ſtatute, I am kept in this town, to do penance for my tranſgreſſions of that precept, *my ſon, put money in thy purſe.* But the term aſſigned my expiation is, I hope, near expired; and I deſpair not to ſee myſelf ſhortly in a condition to make you a viſit, that ſhall prevent the ſprings. I ſhall implore, for my lady *Pegg*, the ſelf-ſame paſſage I ſhall wiſh for myſelf, and ſolemnize the firſt eaſterly gale with a

Farewel, fair ſaint, may not the ſeas and wind, &c.

But I am ſo entirely taken up with the contemplation of her and you, that I had forgot, that I have to write this night more letters than the four and twenty of the alphabet. My next ſhall give you an account of my tranſactions, my ſtudies, and my amours; of the latter of which black *Betty* will tell you as many lies as circumſtances; but hope you know too well what ſhe is, and whence ſhe comes, not to take all her ſtories for fictions, almoſt as great as is the truth, that ſtiles me,

My deareſt brother,

your moſt affectionate brother

London, this 20th of Dec. 1649. and humble ſervant,

ROBERT BOYLE.

THOUGH I count it no ſmall happineſs to enjoy the long-forbidden liberty of writing to you; yet, after almoſt ten years of ſeparation, and more than almoſt as long a ſorrow for it, to find myſelf ſtill withheld from a more ſatisfying and immediate converſation with you, than that of letters (by a detention here as tedious as neceſſary) is an affliction, that it is not eaſy, moderately to reſent. For being as confident as deſirous to be able to wait upon you, in my lady *Broghill*'s company, as ſoon as our reſidences ſhould loſe their

their antipathy, I am, both contrary to my expectation and intereſt, by unforeſeen and dilatory accidents, unhappily kept here, and condemned to renounce ſo fair an opportunity, as that, which my ſiſter *Broghill*'s remove, and invitations to attend her in it, preſent me, by a confinement ſo unwelcome, that nothing more troubles me in my ſtay here, than that it hinders me from ſtirring hence. But I deſpair not, by the diſpatch of thoſe affairs, that by an indiſpenſable neceſſity impriſon me in this place, to procure a ſudden releaſe; which yet, though it ſhould prevent my hopes, will appear ſlow to my deſires; which cannot but be more than moderately eager, to review my native country, endeared by your preſence, and my fourteen years abſence. I know *Frank* will endeavour to perſuade you, that it is the thing called love, that keeps me here: but truly I have ever kept that paſſion obſequious, not only to my reaſon, but my intereſt; beſides that I ſhould very willingly do you the injury of being kept from you by any of your ſex. The occaſional mention I have made of miſtreſſes, brings into my memory, that I have been deſired to ſay ſomething to you, concerning my L. of *Barrimore*'s late marriage. That I neither contributed to it, nor ſo much as knew of it, I think you cannot ignore; and that, if I had known of it, I ſhould not have contributed to it, my humour will, perhaps, incline you to believe. I ever paid too religious an obedience to my own parents, to perſuade or juſtify the contrary practice. And therefore, without pretending to excuſe or extenuate what is paſt, having minded you, that there is a difference betwixt ſeaſonable and juſt, I ſhall venture only to repreſent to you, that the queſtion is not now, whether or no the marriage be a thing fit to be done, but how it is to be ſuffered: and that, as the beſt gameſters have not the privilege of chuſing their own cards, but their ſkill conſiſts in well playing the game, that is dealt them; ſo the diſcreeteſt perſons are not allowed the choice of conditions and events, but their wiſdom conſiſts, in making the beſt of thoſe accidents, that providence is pleaſed to diſpenſe them. This being preſuppoſed, I ſhall beg you to conſider, whether, after ſo powerful a mediation, as that of a crowned interceſſor, very paſſionate and laſting (though never ſo juſt) reſentments may not prejudice you with that party, for which you have openly declared, and which alone you can have unflattering expectations from: and whether, or no, in things paſt remedy, it be not better, rather, by a winning gentleneſs, to improve what you diſlike, to its beſt uſes, and forgive a fault, you have already ſhewn yourſelf, and made him ſenſible of, than perſiſt in teſtifying an implacable indignation, that cannot redreſs a diſpleaſure, and may provoke one. I know you are wiſe enough to be your own counſellor, and that you want neither thoſe abilities, that fit us to diſcern reaſon, nor thoſe inclinations to diſpoſe us to acquieſce in it. Nor is it to adviſe you, that I have aſſumed this freedom, but only to ſatisfy the deſires of ſome of your neareſt friends; who, though they think the match very unhappy, think it unfit the married pair ſhould be ſo. I hope, by the end of *February*, to juſtify theſe conſiderations, or beg your pardon for them at *Caſtle-lyons*. And if, in the mean time, you will vouchſafe to let me know, in what my ſtay here may not be uſeleſs to you, I ſhall think myſelf happy in the opportunities of letting you ſee, that I am as much more willing, as more fit to ſerve you, than to counſel you; and that it is by my obedience, that I am chiefly ambitious to evince myſelf,

My dear ſiſter,

Lond. this 21ſt of Dec. 49.

your moſt affectionate, moſt faithful, and moſt humble ſervant,

ROBERT BOYLE.

THOUGH I received ſo early the ſad account of my deareſt brother's ſickneſs, accompanied with ill preſaging circumſtances, that I could not but doubt it would prove his laſt, and ſo had time to prepare myſelf for the worſt; yet now, that my fear is turned into certainty, I find, that though the warning I had kept me from being ſurpriſed, it cannot keep me from being ſo afflicted and diſcompoſed, that I am much more fit to keep you company in your ſadneſs, than endeavour to cure you of it. And therefore, knowing that I can offer you no conſolations ſo pertinent and weighty as you may ſupply yourſelf with, out of your own ſtock of reaſon and religion, I ſhall not trouble you with a long letter; but only name to you two or three of thoſe conſiderations, that my own experience moſt recommends to me, in our common loſs. Under ſo great a one, the chief thing I can pitch upon, to quiet my troubled mind, is, the conſideration of that hand, from which this heavy ſtroke comes; for God, who is infinitely wiſe and good, as well as abſolute, has a much greater right of propriety in our relations, than we ourſelves have, they being but our friends, or kindred; whereas he is their creator, preſerver, benefactor, and owner; and, upon all theſe titles, has a right to diſpoſe of them, as may beſt conduce to his purpoſes; eſpecially ſince the ſame courſe, by which he brings them to contribute to his glory, brings them to be the earlier partakers of it. Another thing, which has much impreſſion on me, is, the remembrance of thoſe great torments and bodily infirmities, that have, for divers years, made my dear brother's life very uneaſy to him. This none knows better than yourſelf, whoſe extraordinary kindneſs have made you acquainted with it, ſo much to your toil and trouble; ſo that, in a perſon, that lived in ſo much pain, and died with ſo much willingneſs,

neſs, a pious end ought not to be lamented by us, otherwiſe than upon our own account; eſpecially ſince God, by vouchſafing him ſome years of retirement from the noiſe and hurry of the world, gave him leiſure and opportunity to ſet his mind and houſe in order againſt the arrival of his great change. Theſe and the like conſiderations do much contribute to call my thoughts, under this ſharp trial, as it relates perſonally to him, ſo that much of my ſorrow does, I confeſs, proceed from my own private loſs of ſo excellent a brother and a friend; and from the ſenſe I have of the general miſs, that the poor country he lived in will find of him, and the particular loſs ſuſtained by his afflicted family, and eſpecially by you, my dear ſiſter, who, being now, in a more ſtrict ſenſe than before, the great ſupport, ornament, and comfort of it, I humbly beſeech you, to contribute all you can, to preſerve ſo great a bleſſing to it; not ſo remembring, that you were a wife, as to forget, that you are a Chriſtian and a mother; and as you have exemplarily performed the utmoſt of what the firſt relation could require of you, ſo I hope and beg you will now apply your ſelf to what the two other relations exact; both ſtrive to moderate your grief, and take great care of a health, which your kindneſs has made you too much, and, I fear, too long neglect; and for the recovery of which, a great many, beſides your own family, are not a little concerned; but none more heartily and juſtly than,

Madam, your ladyſhip's, *&c.*

I beg to be repreſented as a moſt humble ſervant to all your diſconſolate children, whoſe pardon I beg, for not being able to write to them in particular, upon ſo ſad an occaſion, which allows me not enough either of leiſure, or freedom of thoughts, for ſuch an employment. I wiſh my lord of *Orrery* much joy of his new title, and that he may ſucceed his father, as well in better things, as in that. Having been of late not well myſelf, I have made no viſits, but one to my brother *Burlington*, who kept his bed for the gout, and one to each of your daughters, whom I found (to day) as I expected, extremely troubled at their great loſs: but I hope that exceſs of ſorrow, that threatned their health, is ſo far moderated, that it will not now prove at all dangerous.

[To the Counteſs of *Orrery* on the Earl s death, in *October* 1679.]

To the Lady *Orrery*.

London, Nov. 28, 1682.

I LITTLE thought, my dear ſiſter, that ſo ſoon after I had ſent you a congratulating letter about my poor lady *Donegal*, I ſhould have occaſion to write you a condoling one, upon her account. But it is partly our fault, as well as our unhappineſs, if we ſo far forget the inſtability, that human proſperity is ſubject to, as to be much ſurpriſed, when we do not find it laſting. You have been of late years ſo accuſtomed to the loſs of friends, that it may reaſonably be ſuppoſed, that ſo much experience has not more exerciſed your patience, than confirmed it. And the ſeveral accidents of this kind, you have been ſubject to, would have put a perſon, far leſs pious and conſiderate, upon reflections, that doubtleſs would anticipate, what I could offer to you by way of conſolation; which therefore I ſhall forbear to trouble you with: only I cannot leave unmentioned this, that is a great one to your friends and ſervants here, that they find, by a letter from ſo authentick a hand as my lord primate's, that though the perſon we lament died young and early, ſhe did not die ſurpriſed, nor unprepared; his grace giving ſuch an account of her behaviour, during her ſickneſs, and eſpecially in the laſt ſad ſcene of it, as forbids us to grieve for her, but only for ourſelves, and for you; to whom a divine ſupport, and a ſanctified uſe of this affliction, is heartily wiſhed, by a ſharer with you in it, that begs the juſtice to be eſteemed,

Madam,

your ladyſhip's moſt humble,

moſt faithful and moſt

affectionate ſervant.

To Mr. *Clodius*.

SIR,

AS I could not ſupport the conſtancy of your ſilence but with a huge deal of uneaſineſs, ſo I receive not the honour of your letters, but with as much of joy. And indeed they are ſo obliging and inſtructive, that their philoſophy and their kindneſs do as well diſtract as deſerve my gratitude. I am little leſs than tranſported to find myſelf to have ſo great an intereſt in a perſon, that hath ſo great an intereſt in philoſophy; and in the ſame packet, in which I am aſſured by others of the ſublimity of your knowledge, to be aſſured by yourſelf of the conſtancy of your condeſcenſions and friendſhip. For the proceſſes you are pleaſed to ſend me of Mercurius vitæ, I return you my moſt humble thanks, and am extremely aſhamed to be able to return you little elſe; and that our commerce is ſo unequal, that I am almoſt confined but to receive what you ſo freely communicate. For alas! beſides, that though our opportunities and accommodations to improve our time were equal, the vaſt diſproportion of our intellectuals would keep me ſtill your diſciple; beſides that, I ſay, I live here in a barbarous country, where chemical ſpirits are ſo miſunderſtood, and chemical inſtruments ſo unprocurable, that it is hard to have any hermetick thoughts in it, and impoſſible to bring them to experiment: yet to ſhew at leaſt a willingneſs to acknowledge the favour

of your antimonial preparations, I here encloſe you the proceſſes of the ſulphur of ſtella Martis, which you were pleaſed to deſire of me at our parting; and of the two proceſſes (from the ſame hand) the larger is the recenter, and ſeems the better. I might tell you of ſtrange matters this ſulphur has done in agues (even in quartans) and fevers; but I confeſs I look upon it but as a trifle in compariſon of the laudanum, the cinnabar, the drif, the ens Veneris ſaccharinum, and thoſe other higher arcana, which you, have either perfected or ſet about. And give me leave to tell you, that it is no weak evincement of my paſſion for and concern in your happineſs, that I can refrain envying you, whilſt every packet almoſt brings me the news of the great things you, do and are undertaking; whilſt unhappy I am condemned to lead an uſeleſs life, in a country, where I can ſcarce get time to think of chemiſtry, much leſs opportunities to improve it. And certainly a detention here, that ſeparates me from Mr. *Clodius*, and ſo adds the pœna damni to the pœna ſenſus, would overpreſs my conſtancy, if I did not hope, that my ſtay in *Ireland* cannot be ſo long, as I know ſo great a diſtance from you will make me find it tedious; and if I did not alſo hope, that by a ſhort and neceſſary ſtay, to ſettle my affairs in this country, I may put myſelf in a condition of living out of it, and proſecute more undiſtractedly and effectually the ſtudy of real learning. You are extremely obliging in the tender ſenſe you expreſs of my yet continuing diſtempers, and no leſs my friend in the advice you give me to leave this unlucky country, and ſeek, under God, for a cure in a place, where you are pleaſed to offer me two things ſo conducive to my recovery, as your remedies and your converſation. And would to God, deareſt friend, my affairs were as ready for ſuch a journey as my inclinations: how would I fly to ſee the wonders I hear of, and enjoy that much wanted ſociety you were once pleaſed to vouchſafe, and are ſtill ſo free to offer me. But honeſt Mr. *Hartlib* can inform you of the neceſſity of my ſtay here till the 24th of June be paſt; and of my unfitneſs till then to obey thoſe inclinations, that would inceſſantly carry one towards you. But as ſoon as the 24th of June is well paſt, I intend, if God bleſs me with life and health, to be either in *England*, or waiting for the firſt conveniency of tranſportation thither. Till then, a juſt impatience will extremely diſquiet me, if you be not ſo charitable as to vouchſafe me ſome of your converſation by letters, (whoſe length and frequency will moſt endear them:) and ſince this is the ſeaſon of the year, in which my diſtempers uſe moſt to infeſt me, you would very ſenſibly oblige me, if you have already prepared any of the medicines your letter mentions, to ſend me by the very firſt ſafe conveniency, as much as you ſhall think fit for my preſent perſonal uſe, with ſome directions how to take what you ſend. For my part, that I may not live wholly uſeleſs, or altogether a ſtranger in the ſtudy of nature, ſince I want glaſſes and furnaces to make a chemical analyſis of inanimate bodies, I am exerciſing myſelf in making anatomical diſſections of living animals: wherein (being aſſiſted by your father-in-law's ingenious friend Dr. *Petty*, our general's phyſician) I have ſatisfied myſelf of the circulation of the blood, and the (freſhly diſcovered and hardly diſcoverable) receptaculum chyli, made by the confluence of the venæ lacteæ; and have ſeen (eſpecially in the diſſections of fiſhes) more of the variety and contrivances of nature, and the majeſty and wiſdom of her author, than all the books I ever read in my life could give me convincing notions of. Deſigning, whilſt I am kept priſoner in *Ireland*, to proſecute that ſtudy, as I have opportunity; if there be any thing relating to it, wherein my knives may give you any ſatisfaction, I ſhall be very proud to employ them to ſo elevated an end. I have not been all this while unmindful of the commands, wherewith you were pleaſed to honour me, when I laſt kiſſed your hands, to enquire into the mineral advantages of *Ireland*: but in this illiterate country, I found all men ſo perfect ſtrangers to matters of that nature, that my enquiries have hitherto been as fruitleſs as diligent. But ſince my coming to this town, my endeavours have procured me ſome little information, and hopes of more. Of the ludus, that Dr. *Currer* had, I can yet learn nothing, nor yet of any mine of antimony. But for iron, I may be able to give you a good account of it, and to bring you over of the ore; my eldeſt brother having upon his land an iron work, that now yields him a good revenue; and I having upon my own land an iron mine, to which before the wars belonged a (ſince ruined) work, which I have thoughts of reſetting up. I am likewiſe told (but how truly, I know not yet) of a little ſilver mine lying in ſome land of mine; and very lately in a place, which belongs to a brother of mine, they have found ſilver ore very rich; for being tried, it is eſtimated, (as he tells me, that means to deal for it) at between 30 and 40 pounds a ton: but whether or no there be a mine of proportionable value, we do not yet know. I was yeſterday with an officer of the army, who farms a ſilver mine from the ſtate, who hath promiſed me what aſſiſtance he can in my mineral enquiries, and told me, that a metalliſt and refiner, whom he extolled with ſuperlative elogies, aſſured him, that there was no country in *Europe* ſo rich in mines as *Ireland*, had but the inhabitants the induſtry to ſeek them, and the ſkill to know them. If I ſhall in relation to this matter, or to any other, wherein my ſtay here may be any ways improveable to your ſervice, be honoured with any further or more particular inſtructions, I ſhall (God willing) by my forwardneſs to obey them, endeavour to manifeſt, that I am as highly as juſtly ambitious not to utter uſeleſsly the title of Mr. *Clodius*'s

Moſt affectionate friend, and
moſt obliged humble ſervant,
ROBERT BOYLE.

MY

May 27, 1662.

MY LORD,

YOU will not, I preſume, think my ſilence ſtrange, when I ſhall have acquainted your lordſhip, that the reaſons of it have been partly, that I was informed, that the parliament of *Ireland* had adjourned itſelf for a long time, and partly becauſe an honeſt gentleman of publick employments, and very well verſed in the affairs of that country, did ſome days after your lordſhip's departure hence, undertake to procure me, with all convenient ſpeed, an account, how thoſe impropriations, which are within the grant made me by his majeſty are, or are like to be, provided of miniſters and maintenance. And though the procuring me this account would, I knew, require ſome time; yet the requiſiteneſs of it to aſſiſt me how to order myſelf on this unhappy occaſion, made me unwilling to write to your lordſhip, till I had received it, and the adjournment of the parliament made me hope I might receive it ſeaſonably enough: but being ſurpriſed ſince the laſt poſt with the news of the parliament's being met again, and of the quick progreſs, that is making in the act for the ſettlements of *Ireland*; the promiſe I made your lordſhip at our ſeparation, forbids me to delay to ſay ſomething to you about the buſineſs we then diſcourſed of, but it is now too late at night, that I muſt not till a fitter opportunity enlarge upon particulars, but muſt make haſte to inform your lordſhip, that having, as I told you I intended, applied myſelf to that excellent prelate the biſhop of *Lincoln*, for his advice on ſo nice an occaſion, I came upon the whole matter to this reſult, that the king's grant made to me having preceded both the grant made in the act to the church, and even the church's application to his majeſty for that grant, I might juſtly challenge the impropriations mentioned in my proviſo. (For as for the reference made by the king on the convention's addreſs to the lords juſtices, and council in *Ireland*, they having never made any return upon it to the king, it ſignified nothing to debar another's right.) And therefore I would not have what I intend to do reflect upon thoſe perſons of honour, that (though unknown to me) made uſe of my name to obtain the grant from the king, ſince in ſuch diſputable caſes, perſons, that act very differently from one another, may yet all ſatisfy their own judgments and conſciences in their proceedings. But in regard my intention in general was to apply an addition of revenue, if my friends procured any for me, to good uſes, though, I confeſs, I deſigned it rather for the advancement of real learning, than to any other purpoſe; yet ſince it ſo falls out, that unknown to me it is caſt upon impropriations, it is very likely, that by the account I expect of the ſtate of them, I may ſee cauſe to make the more immediate ſervice of religion, (by relieving the poor in thoſe places, and contributing, if need be, towards the maintenance of miniſters there, or elſewhere, or promoting other good works, as from time to time occaſion may require) the principal of theſe good uſes, to which I have thoughts to apply about two thirds of what will, de claro, come to me out of my ſhare of this grant, (hoping alſo, that the other perſons of honour, that are concerned in it, will have a care, that the impropriations, whoſe revenues are given them, be provided with miniſters.) And I ſhould poſſibly employ the other third part alſo the ſame way, but that his majeſty has been pleaſed, without my ſeeking, (or ſo much as knowledge) to appoint me governor to a corporation for the propagating of the goſpel among the heathen natives in *New England*, and other parts of *America*. And this corporation being at great charges for ſeveral neceſſary works, and eſpecially for the tranſlating and printing of the bible in the Indian tongue, above one half of their revenue is injuriouſly detained from them by a perſon, who had ſold it to a corporation erected for the ſame purpoſes with our's, under the late uſurping powers, and now has repoſſeſſed himſelf of his land, becauſe thoſe, that he ſold it to, were not legally qualified to have a ſale made to them. By which means ſo pious a deſign, as is purſued by this corporation, is now in danger to miſcarry for want of maintenance; ſo that the work being ſo charitable, and I having a peculiar call to promote it, I think, after having adviſed with the biſhop of *Lincoln* in the caſe, that it becomes me, on ſuch a juncture of circumſtances, to apply the other third part, or thereabouts, of what the king's grant will yield me for ſix or ſeven years at leaſt, to the carrying on of ſo unqueſtionably good a work; ſo that the main benefit I intend to derive from the king's bounty, is the opportunity of doing ſome good with what, if my friends had not obtained it, might have been begged by others, who would have otherwiſe employed it. And by this, I hope, your lordſhip will be confirmed in the belief of what I formerly aſſured you of, namely, that had I known, that any thing was aſked for me, whoſe grant would have been prejudicial or unwelcome to the church, I ſhould not have conſented to have my name made uſe of for a much greater matter, than the proviſo is like to yield me. And the ſame day your lordſhip did me the honour to inform me of the ſtate of the caſe, I offered ſome of the parties concerned to relinquiſh the grant, though it had already paſſed the king and council, ſo I nor my name might have nothing to do with it; but one of the intereſted parties being then too far off to be conſulted, the proffer was declined. From all which I hope your lordſhip will do me the right to conclude, that I was far from deſigning the prejudice of the church; and that though it cannot in reaſon be expected, that I ſhould do any thing to hinder the other perſons concerned in my proviſo to purſue the having it paſſed, and to enjoy the benefit of it; yet I do not at all deſire, that either your lordſhip, or any other perſon, that thinks the

proviſo

proviſo may be juſtly excepted againſt upon the church's behalf, ſhould, for my ſake, at all abſtain from acting and ſpeaking as his judgment and conſcience ſhall direct him: for as my partners are, and, I think, not cauſleſly, confident of being able to carry on in *Ireland* that, which has already paſſed the ſcrutiny here; ſo, for my part, all I pretend to, by this grant, is, to have the power in my own hands, to ſee, that the proceed of it be carefully employed to the good uſes, whereto I deſign it. And if in the management of this buſineſs my ignorance of the affairs of *Ireland*, to which you know how much I have been of late years a ſtranger, has in any thing miſguided me, I hope your lordſhip's goodneſs, and the fairneſs of my intentions, will incline you to make, and perſuade others to do the like, the beſt conſtruction of the actions of a perſon, that is ſo much,

My lord,

May 27, 2662. your lordſhip's moſt humble, and moſt affectionate ſervant.

SIR,

IN the ſtrange ſtory you did me the favour laſt week to entertain me with, there were ſome paſſages ſo ſingular and remarkable, that I cannot but renew the requeſt I then made you, that you would gratify me with an entire narrative of ſo memorable a tranſaction. And becauſe you were pleaſed very forwardly, and therefore very obligingly, to grant my requeſt, I may well forbear to ſolicit the performance of your promiſe; and ſhall only add ſomething about the manner, wherein I think it neceſſary to beg it may be performed; which, in the general, is, that, at leaſt, the main circumſtances of the relation may be impartially delivered, and ſufficiently verified, either upon your own knowledge, or by the judicial records, or other competent vouchers; for we live in an age, and a place, wherein all ſtories of witchcrafts, or other magical feats, are by many, even of the wiſe, ſuſpected; and by too many, that would paſs for wits, derided and exploded. And I have ſeen cauſe to think, ſo great a part of the vulgar ſtories, that have been confidently related, and greedily enough catched up, to have ill deſerved the entertainment they met with among well-meaning, but over-eaſy perſons, that I ſcarce believe one of twenty to be true, looking upon the other nineteen, as either falſe, or ſuſpicious; nor, perhaps, ſhould I have excepted the twentieth, if I had not had particular and conſiderable advantages to perſuade me, upon good grounds, that, though moſt of theſe ſtories be untrue, yet they are not all ſo, when I conſider, and am juſtly ſenſible, that to grant or deny, that there are intelligent beings, that are not ordinarily viſible, does much conduce to the reclaiming or confirming of atheiſts; I cannot but think, that thoſe men, in ſpite of their good meaning, have much diſſerved religion, and have obtruded upon the world ſo many improbable and ill-verified ſtories of witches and ſorceries, and that they took very wrong meaſures, in preſuming, that the multitude of ſuch relations would compenſate their want of credibility; whereas, on the contrary, ſome, among ſo many, being eaſily diſcovered to be falſe, or dubious, did not only make atheiſts exclaim, but even judicious Chriſtians ſuſpect, that the reſt were of the ſame kind. I hope, therefore, Sir, that your intended narration will reſume the credit of this kind of ſtories in the opinions of unbiaſſed men, by having its circumſtances warranted with teſtimonies, and authorities, which, the nature of the thing conſidered, may ſuffice to ſatisfy thoſe, that are diffident, out of cautiouſneſs, not prejudice. That this will be a good ſervice to religion, may be eaſily gueſſed by the great care, that atheiſts take to diſcredit all ſtories of this kind, as the products of impoſture, ignorance, or credulity: for if it could be proved, that moſt of them, as I fear it of too many of them, are of this ſtamp, yet any one relation of a ſupernatural phænomenon being fully proved, and duly verified, ſuffices to evince the thing contended for; and, conſequently, to invalidate ſome of the atheiſts plauſibleſt arguments: and, indeed, the foundation of them, as ſuppoſing the truth of what is aſſerted by many, as eye-witneſſes, and has been particularly affirmed to me by the illuſtrious count of *Walleſtein*, his imperial majeſty's miniſter here, that the famous frier *Wencel* has ſeveral times actually made tranſmutations of baſer metals into gold, in the preſence of the emperor, and divers noblemen, and good chemiſts; ſuppoſing the truth of this, I ſay, this one poſitive inſtance will better prove the reality of what they call the philoſopher's ſtone, than all the cheats and fictions, wherewith pretending chemiſts have deluded the unſkilful and the credulous, will prove, that there can be no ſuch thing as the elixir, nor no ſuch operation as they call projection; and upon ſuch a ſcore, I doubt not, but one circumſtantial narrative, fully verified, ſuch as I hope and deſire that yours may prove, will be preferred by the curious and judicious, to a hundred improbable, and ſlightly atteſted ones; ſince one cogent inſtance will evince, what a multitude of queſtionable ones have ſerved but to render the more ſuſpicious; I might add, that ſome of the particulars you mentioned to me, as (eſpecially) thoſe of the inſenſible marks of witches, and the way of detecting them, may ſuggeſt odd ſpeculations to a naturaliſt, and help to enlarge the ſomewhat too narrow conceptions men are wont to have of the amplitude and variety of the works of gold; ſince, if it appear, that there are intelligent agents, that are able to encreaſe

encreaſe; whereas men can but determine the motions of the parts of matter, the diſcovery of it may advantageouſly enlarge our knowledge, though not, perhaps, in phyſics, ſtrictly ſo called, yet in philoſophy; and therefore, by granting me this circumſtantial and well verified account, I requeſt, of the ſupernatural phænomena you have taken notice of, you may be ſure to oblige a great many curious perſons, beſides him, that you will in a particular manner engage to be, and to expreſs himſelf, upon all occaſions,

SIR,

September 18, 1677. your moſt affectionate and moſt humble ſervant.

[To Mr. *Joſeph Glanville.*]

To Mr. *Glanville.*

London, February 10, 1677-8.

SIR,

NOT daring yet to remove into the new built part of this houſe, the little room I am now confined to, reduces me to keep my books and papers too much huddled together. This notice, I hope, will obtain your pardon, for my not having earlier acknowledged the favour of your obliging letter, ſince I thought fit it ſhould be accompanied by one ſuch paper, as you write for, and which it coſt ſome time to find. I have heard many ſtories of things, that have happened within leſs than the memory of man, in *Ireland*, that would accommodate your deſign; but there was but one of them, which, by reaſon of ſome odd circumſtances belonging to it, and of the acquaintance I had with one or two of the chief witneſſes mentioned in it, gave me the curioſity to enquire more fully into the truth of it: to ſatisfy myſelf about which, I made uſe of the credit of ſome of my friends, that were then of great authority in that kingdom; and if I much miſremember not, a tranſaction, that paſſed years ago: it was my brother *Orrery*, who was then preſident of the province of *Munſter*, (which was the ſcene of our ſtory) that procured me, from the judge himſelf, the authentick account, that I now communicate to you. This you gave me a ſtrong invitation to put into your hands, by aſſuring me, that in the collection, where you intend it ſhall have a place, you are very careful to deliver none but well atteſted narratives; the want of which cautiouſneſs has juſtly diſcredited many relations of witches and ſorceries, and made moſt of the reſt ſuſpected; ſince in ſuch ſtories, the number of the whole can no way compenſate the want of truth, or of proof in ſome of the particulars; and a few narratives, cogently verified, will procure greater credit to the cauſe they are brought to countenance, than a far greater number of ſtories, whereof ſome, though never ſo few, are falſe; and others, though perhaps not many, ſuſpicious. But, Sir, you know too well the diſpoſition of thoſe you would convince, to need to be advertiſed, not to give any advantage to men, that are like to be very apt to ſeek, and much more to take it; which may be eaſily diſcerned by that very report, which, in anſwer to the latter part of your letter, I muſt take notice of, by telling you, that I know not who ſhould give out, that I have of late diſowned the ſtory of the demon of *Maſcon*, as a clear impoſture. For, whatever I may have thought of ſome incidental paſſages in the printed book, yet, as to the main ſtory itſelf, the converſation I had with the author, when the thing was pretty freſh in men's memories, and the notoriety of divers of the circumſtances, ſurmounted my indiſpoſition to believe ſuch things; and of late years, I remember not, that I have had occaſion to diſcourſe much of it, much leſs to diſown it; eſpecially after a learned and intelligent traveller, that ſome years ago paſſed by that town, and afterwards viſited me, informed me, that he found upon the place itſelf, juſt motives to believe the truth of it. The direction you ſend me, to addreſs my letters to you, at your houſe, in the college at *Worceſter*, makes me ſuſpect, that you have ſome preferment there, whoſe title I am a ſtranger to; and therefore I hope you will eaſily grant me your pardon, if, in the ſuperſcription, it be omitted, by,

SIR,

your moſt humble ſervant.

To Monſieur la *Marche* at *Caen.*

London, June 15, 1682.

MONSIEUR,

THIS week I received yours of the 30th of April; and having now a direction how to addreſs a letter to you, I muſt no longer delay giving you notice, that, though I ſuppoſe you may have had ſome deſign, as well to gratify me, as to advantage yourſelf, by ſending me the paper encloſed in your letter, yet, upon peruſal of it, I cannot think the proceſs probable enough to deſerve to be wrought; for it ſeems to me, (who am not altogether unacquainted with things of that nature) that the means are no way ſufficient to produce ſuch effects, as are aimed at by them; and therefore I am apt to think, that whoever gave you that proceſs, either had a mind to delude you, or was himſelf very ignorant in metalline affairs, or at leaſt intended to conceal his meaning, whilſt he uſed expreſſions, that ſeemed intelligible and clear enough. As for your deſign of getting an employment here, to inſtruct young gentlemen, the late perſecution of the poor Hugonots in *France* has brought ſo many of them into this country, who deſire the like employment, that it will not be very eaſy for you to find ſuch a condition as you wiſh. But, though I have ſome reaſon not to take it very kindly, that when I wrote to you three

or four years ago, about Mr. *Pierre des Cloſets*, and ſeemed much concerned to receive an anſwer, (and therefore, if I miſtake not, wrote more than once) you never vouchſafed me a line of anſwer: yet, if now you ſhall think fit to give monſieur who will be as ſoon as this letter in your parts, the beſt aſſiſtance you can, to recover all the papers of mine, that are to be found among thoſe of your great friend, monſieur *Pierre*, or wherever you know any of them are, (and which ought in juſtice to be reſtored to me) you will find, that you have not gratified an unthankful perſon, and, that this will be the readieſt way you could take, to engage me to ſerve you, on thoſe occaſions, that may be offered to,

SIR,

your humble ſervant,

ROB. BOYLE.

To Mr. *Chriſtopher Kirkby*.

SIR,

THOUGH I have not the vanity to think, that my opinion ought to be much conſidered, in the queſtion you have propoſed to me; yet, ſince you are pleaſed to require my thoughts about it, I ſhall, without heſitation, aſſure you, that I have long been, and ſtill am, of opinion, that the act of *Henry* the 4th has been, and, whilſt it ſhall remain in force, will be, a great diſcouragement to the induſtry of ſkilful men, which is very happily improved in this inquiſitive age. And therefore, that the repealing of a law, ſo darkly and ambiguouſly penned, will much conduce to the publick good, and be in particular advantageous to the counties of *Cornwall* and *Devonſhire*, where tin ſo much abounds, that it is (as you well know) a drug; is as well hoped, as it is heartily wiſhed, by,

SIR,

your moſt humble and

London, April 29, 1689. affectionate ſervant,

ROB. BOYLE.

To Monſieur *le Clerc*.

London, May 30, 1689.

SIR,

AFTER the many judicious extracts you have made of Engliſh books, I think I may preſume, that ſo great a linguiſt, as Monſieur *le Clerc*, is not unacquainted with the language of this country. And therefore I ſhall not ſcruple to employ it now, that I have an inviting opportunity to return you my humble and deſerved thanks for the rich preſents you have been pleaſed to ſend me, both by doctor *Abercromby*, and ſince by other hands. Theſe learned volumes are looked upon here, as deſerving the title they bear, of Univerſal Library; which I wiſh I could as eaſily contribute to, as I can readily applaud it. But, beſides the general acknowledgments I owe you, for other learned and curious pieces, I think myſelf obliged to pay you particular thanks for that, which you did me the favour to ſend me, about the poetry of the Hebrews. For though the weakneſs of my eyes has diſabled me, for ſome years, from proſecuting the ſtudy of that ſacred language, whereof I formerly was a cultivator; yet I have not ſo much forgot, what I once knew of it, but that I can diſcern your hypotheſis to be, at leaſt, a very happy and ingenious conjecture; and ſuch it has been eſteemed here by much more competent judges, than I pretend to be. The late publick revolutions, in theſe parts, have ſo buſied, and indeed engroſſed men's thoughts, diſcourſes, and pens, that very little has of late appeared from the preſs, beſides pamphlets, and other tracts, about political affairs, and oaths relating to them. And therefore I hope you will have the goodneſs to impute it to that cauſe, that this letter comes to you unattended by any philoſophical productions of this place. And, for my own particular, the want of health has, for this great while, ſo confined me to my lodgings, and ſo long expoſed me to a multitude of viſits, that rob me of all leiſure, that I have not been able to ſend any thing of that kind to the Royal Society, except a paper about a new way of ſuddenly producing flame by the bare contact of three bodies, each of them actually cold. The experiments contained in this writing are not yet made publick, nor brought back to my hands; but, as ſoon as they ſhall come abroad, either in the Philoſophical Tranſactions, or otherwiſe, I ſhall, God permitting, lay hold on the firſt conveniency of tranſmitting them to you, as a teſtimony, though but a mean one, of the reſpect and gratitude of,

SIR,

your moſt humble ſervant,

ROB. BOYLE.

London, Oct. 8, 1691.

Worthy DOCTOR,

IF you knew how very ill my ſiſter and I have been, ſince you left this place, you would not wonder, that you have not had from me an enquiry, how you bore your journey to *Saliſbury*; and whether you now enjoy the benefit of it, by the recovery of your health, wherein very many, and I moſt particularly, are concerned. Excuſe then, I beſeech you, my paſt ſilence, and give me, if you can, the contentment of an aſſurance, under your own hand, that you are well, which will be a great cordial to me. If I had known of your going ſo ſoon, I ſhould have furniſh-

ed

ed you with ſpirit of hartſhorn, and ſome other trifles, that you are pleaſed to let me provide you here. And therefore, if you want any thing now of that kind, be pleaſed to command it of me. Your conſtant kindneſs to me, and the benefits I have received from your ſkill and experience in your profeſſion, urge me to acquaint you with the diſtemper in my eyes, that did much ſurpriſe me, and does ſtill much afflict me, having continued with me for about a month. The caſe in ſhort is this; in the day time, I ſee, thanks be to God, as I uſe to do, and ſo till five o'clock in the afternoon; but then, as ſoon as candles are brought in, I find a very ſenſible decay in my ſight; ſo that, though I can ſee all the ſame groſs objects, as I did before, and could, if I durſt, read printed books, as I have often tried, yet the reflection from thoſe objects is not vivid, as it was wont to be; and if I look upon ſomewhat diſtant objects, methinks I ſee them through a thin miſt, or a little ſmoke, but when the candles are newly ſnuffed, and ſo the light increaſed, I ſee far better, for a little while, till it begin to have more ſnuff: this diſtemper continues, as long as I make uſe of candle-light, but the next morning, by God's goodneſs, I find myſelf as before, only now and then there ſeems to fall ſlowly down, ſometimes in one eye, and ſometimes in another, a faintly ſhining vapour, which immediately diſappears. I have ſuch apparitions of late, for theſe two or three years, without any bad conſequence. What this diſtemper may proceed from, I know not, though I remember I have heard you more than once take notice of the narrowneſs of my pupil. Sight is a thing ſo dear to all men, and eſpecially to ſtudious perſons, that I earneſtly beg, you would be pleaſed to conſider my caſe deliberately, and acquaint me with your thoughts of the cauſe; and more particularly, to ſend preſcriptions of the receipts you would have me employ, and your directions what elſe you would have me do towards the cure of it. I have had too much trial of your friendſhip, to doubt, that, upon ſo important an occaſion, you will refuſe me the effects of it, which will exceedingly add to your former favours, and oblige me to ſtudy the ways of ſhewing myſelf,

SIR,

your moſt affectionate

and moſt humble ſervant.

I HAVE, of your's, the water for clearing the ſight, which I much eſteem, and have more than once uſed; but I ſometimes uſe, upon your authority, a little honey diluted with ſuccory; but I much want the conſtant eye-water, to be uſed every night, or oftner, eſpecially if it may be fitted for the preſent ſtate of my eyes; and therefore beg, that you would be pleaſed to preſcribe me one, that I may make here. I forgot to tell you, that, for ſome months laſt paſt, I have been much troubled with what they call vapours, or fumes of the ſpleen, and with ſome ſcorbutick diſaffections.

[This was one of his laſt letters, and was ſent probably to Dr. *Turberville*, a famous oculiſt of *Saliſbury*, of whom mention is made by him, in a letter to Mr. *Oldenburg*, Aug. 29, 1664.]

Minutes of a letter to *Schottus*.

THAT his welcome letter, of ſuch a date, was, I know not by what accident, long detained by the way, as I preſume our learned friend, Dr. *Schroter*, may have informed him.

THAT this is the reaſon, why I did not ſooner let him know, that I thought it a great happineſs, that my poor endeavours have met with ſo much acceptance among the virtuoſi abroad, and particularly, that they ſhould procure me the honour of ſo obliging a letter, from a ſtranger, ſo famous and learned, as he, to whom I am glad of this opportunity to return my humble thanks for thoſe learned writings, wherewith he has obliged the curious; and particularly for his *Magia Mechanica*.

THAT I long to ſee his works encreaſed by the acceſſion of his *Technica curioſa*; towards which, I fear, I ſhall not contribute much, both becauſe of my being no better ſtocked with rarities, than I am, and becauſe I know not what particular ſubjects he treats of in it. But ſince he is pleaſed to expreſs a deſire of making uſe of my newmatical epiſtle therein, I ſhall freely leave it to his diſcretion, to preſerve as much of my book, as he thinks fit, in a work, that will be ſo laſting, as that he deſigns. And ſince he is pleaſed to expreſs a curioſity, which I fear they diſcern not, of honouring the reſt of my books with his peruſal, I ſhall take care to put as many of them as are tranſlated into Latin into the hands of Dr. *Schroter*, to whom *Schottus*'s recommendation, as well as his own merit, will make me a ſervant. In the mean time, I have obeyed his commands to our aſſembly (now called, the Royal Society) to which, I can aſſure him, that his great civilities have been very welcome, and that they are very thankfully reſented by it.

To Mr. *Oldenburg*.

SIR,

AS you begin your letter by a complaint of the retarding of the preſs, for want of the paper of colours, ſo I muſt begin mine by acknowledging, that you have reaſon to complain of it, and by adding, that yet it was not my fault; for I have been careful to lay aſide eight or ten ſheets, that I had peruſed, to re-deliver them to you, when I came to take leave of you, at my going out of town. But having laid them by, on the table, on purpoſe to have them in readineſs, and diſtinguiſh them from other papers, that were to be ſent to *Oxford*, they were, by the miſtake

of one of my ſervants, put up in a box, among ſome other writings, which I could not come at till now, that I am returned hither, where, that box being opened before my other things, I took out the roll of papers, which is already ſent away to Mr. *Herringman*, who is to receive the remaining ſheets, by the latter end of this week, if I can poſſibly diſpatch them ſo ſoon; at leaſt, he ſhall not fail, God willing, to have them ſent to him before the middle of the next week; which will be ſooner than the preſs will be ready for them. Your letter I found very ſeaſonably here, to refreſh me, after a wearisom journey, where I had far leſs opportunity, than I hoped for, to improve my little ſtock of knowledge, the ſeaſon being ſo far advanced, that I durſt not go viſit the mines at *Mendip*; and ſome ill accident or other having denied me the viſit I promiſed myſelf from our ingenious friend, Mr. *Beale*, to whom I ſent on purpoſe a meſſenger, that brought me back a letter, which bid me expect his coming, in caſe a diſtemper, that then detained him, ſhould not increaſe; ſo that my diſappointment being an argument of his indiſpoſition, was more unwelcome to me upon the account of its cauſe, than of itſelf. If you have heard any good news of him, you will oblige me, to acquaint me with it. I find them in *Dorſetſhire* far more ſolicitous to ſtore themſelves with fruit, than when I was laſt in thoſe parts; and my gardener has made a nurſery upon ſome land, that he rents, which furniſhes moſt of the neighbouring gentry, and lets me ſee, how much induſtry may advance at once the private and the publick good. I was viſited by the ingenious Dr. *Highmore*, from whom I had ſome odd anatomical obſervations, wherewith I may hereafter acquaint you. I ſhall rather tell you now, that he is a great floriſt, and finds by experience, which, I remember, has been likewiſe taught me by another eminently ſkilled in huſbandry, that there is ſcarce any mould comparable, for flowers, to the earth, which is digged from under old ſtacks of wood, or other places, where rotten wood has long lain. I have beſpoken ſome potato apples, againſt the ſeaſon. There has been found, not many miles from my houſe, a ſpring of purging water, and another, that works like *Tunbridge* water; but not hearing of them, till I was leaving the country, all I could do, was to deſire one to ſend after me a bottle of that, which was the moſt eaſy to come by. If I receive it, I ſhall endeavour to examine it. I was viſited at *Saliſbury* by the deſervedly famous oculiſt, Dr. *Turberville*, who has attained ſo much ſkill in the cure of diſtempers of the eyes, and performed ſuch remarkable things in thoſe caſes, that, being unable, as yet, to perſuade him to live conſtantly in *London*, I have perſuaded him to go thither, once or twice, at leaſt, every year; and that at ſet times, that men may know when to find him; and to ſtay there ſome weeks at a time, that he may be able to perfect ſome cures, before his return. The water of that town being very famous, for making better ale than can be made with other waters, I had the curioſity to weigh it with a good pair of gold ſcales; but have not yet had time to compare it with other waters, than which it ſeemed ſomewhat more clear and light. Since my return hither, viſits, and the unpacking of my books and implements, have left me ſo little time for other things, that I begin to wonder, how I have got ſo much as to trouble you with ſo long a ſcribble, which, ſince I began this laſt clauſe, I am ſummoned to releaſe you from, by forthwith ſubſcribing myſelf,

SIR,

your very affectionate friend, and very humble ſervant,

ROB. BOYLE.

Oxford, Aug. 29, 1664.

POSTSCRIPT.

I RETURN you my humble thanks for your ingenious communications, divers of which I locked not up from the virtuoſi here, and of which I cannot but deſire the continuation. What the poſtſcript of your letter mentions, in reference to ſuch matters, will not, if I can help it, be forgotten, upon an opportunity to ſerve the perſon concerned. I find not, in the tranſlated papers, that yet remain, that you have gone beyond the end of the 49th Experiment; for at the 50th there is three quarters of a ſide vacant, under the title Exp. 50; and that is the laſt page I have of your's. I have written to Mr. *Herringman*, to the purpoſe that was deſired at our parting, and I preſume he will readily comply.

IF you have heard any thing farther concerning the tranſlation of the bible into the Turkiſh tongue, I ſhall be glad to be informed of it; for, in caſe you hear nothing, that may divertiſe, Mr. *Seymore* and I reſolved, by God's permiſſion, to proceed, as ſoon as we ſhall be informed, either what farther anſwer you have received about it, or, that you have received none.

I FORGOT to tell you, that I did not forget to ſpeak to Dr. *Wallis*, who has received the commands of the Society, and will be very ready to comply with them, about the papers of Mr. *Horrox*; with which I find he is ſo much pleaſed, that he does not a little regret the untimely death of ſo hopeful an aſtronomer.

MY moſt humble ſervice to my lord *Brouncker*, Sir *Ro. Moray*, Dr. *Wilkins*, and the reſt of my Greſham friends.

To Mr. *Oldenburg*.

SIR,

THE news you were pleaſed to ſend me from *Guinea*, I do, with you, look on as very conſiderable; and I am much of your mind too, in what you conjecture about the conſequences of it. I ſhould have told you, in my laſt, that I am very glad monſieur de la *Quintenaye*'s

Quintênaye's ways of improving fruit trees have ſucceeded ſo well, and more, that he gives us hopes of communicating them to the world, or, at leaſt, to the Society. And as to what he deſires concerning an Iriſh greyhound, though the breed of them be now almoſt worn out, yet, when my ſiſter *Ranelagh* (who has, eſpecially at this time, far more correſpondence in *Ireland* than I have) ſhall be returned to *London*, you may command me to try what, by her means, may be done. I have received the papers you ſent me, concerning weather glaſſes, and have a little altered the titles, to make them more ſuitable to the Hiſtory of Cold, whereunto I deſign to prefix them, as preliminaries. One of the three diſcourſes, into which they are divided, I have already read over, and ſo can diſpatch to you, by the firſt conveniency, that the printer may forthwith fall to work; the other two I was hindered from reviewing this day, but intend to diſpatch it ſo ſoon after the former, that the preſs ſhall not ſtay for it. And though I have not, even at *Oxford*, half ſo much time at command, as you may think, and I could wiſh; yet I chuſe rather to defraud my other ſtudies, than not allow daily ſome time to the finiſhing of what I have by me of the hiſtory of cold, wherein I have made a progreſs, which, though inferior to what I intended, will yet, I hope, enable me to ſend away all that is at this time to be publiſhed, before the 10th (perhaps before the 1ſt) of November. To the learned and induſtrious Dr. *Merret* you will oblige me to preſent my humble ſervice, and to let him know, that if I had found his Chriſtian name at length in his own book, I ſhould have given it him in my letter; but though I gave him not his right name, yet, I preſume, it will not be thought I wronged him in the name I gave him. But (raillery apart) I think it were not amiſs, that his ingenious obſervations be printed in the ſame letter and volume with my hiſtory, but in an alphabet by itſelf; for by this means, theſe two differing pieces need not ſtay for one another, but the preſs may go on with them both (which will ſave time) and, in the interim, it will be eaſy to reſolve, which of the two ſhall be premiſed. The obſervations of huſbandry you were pleaſed to ſend me, I intend to add to thoſe others, that I received from the ſame hand before. And, leſt this letter ſhould be altogether barren, I will, on this occaſion, add, that, having, in ſeveral places, been inquiſitive about the phænomena of the ſenſitive plant, I learned of a very induſtrious perſon (though no ſcholar) that it may be, and has actually (and that of late too) been propagated, even in our climate, otherwiſe than by ſeed. The way is eaſy, though ſomewhat odd; and, which moſt recommends it, agreeable to his own experience. But it is ſo late at night, that I have not time to ſet it down particularly.

I OWE you many thanks for the trouble you were pleaſed to put yourſelf to, of writing ſo concernedly to *Amſterdam* about the Turkiſh bible. And though, upon the advertiſement you gave me from thence ſome weeks ago, we had thoughts of deſiſting from our endeavours here, leſt *B. Warnerus*'s labours ſhould prevent ours, or blaſt them; nevertheleſs, ſince his own friends at *Amſterdam* do not know, that that worthy man, as yet, has done any thing upon the new teſtament, and ſince they themſelves not only allow of, but wiſh for, our proceeding, we are not willing to be diſcouraged from ſo charitable a work, as that we were upon. But as we have a great reſpect for *B. Warnerus*, and his moſt laudable attempt; ſo we are willing to deal openly and candidly with his friends at *Amſterdam*; and to this end, as they will much oblige us, to ſend us over a printed ſheet of his edition, if they have any one in their hands, ſo we intend, by the next poſt, to give you the trouble of ſending to them a printed ſheet of ours, that if they, or any friend of theirs, be ſufficiently ſkilled in the Turkiſh tongue, to make a judgment of it, we may have their ſenſe upon it, and their advice touching any thing, which they think may be either corrected or amended; and ſuch reflections of theirs we ſhall receive as favours, and the rather, becauſe I find, by ſome letters, of a freſher date than yours, that when our Turkey merchants heard, that I had thoughts of deſiſting from what I was upon, ſome of them ſhewed themſelves more heartily concerned, that ſuch a work ſhould not be laid down, but be vigorouſly carried on, than I and my friends here expected. I ſent away your letter to Dr. *Wallis*, who indeed deſerves the thanks of the Society, for the great pains he took about Mr. *Horrox*'s papers. What apparatus we ſhall have, to obſerve the conjunction, I cannot yet tell; for though he and I were twice at the ſchools, to take a view of the implements of the obſervatory, yet we could not get in, the key having been, by ſome miſtake, or negligence, either loſt or carried away. But if it cannot be found, to-morrow, I mean to urge the having the door broken open; that the commands of the Society may be, as far as we are able, obeyed by him, and by,

SIR,

your very affectionate and

very humble ſervant,

ROB. BOYLE.

[This letter was wrote about the beginning of October, 1664.]

To Mr. *Oldenburg*.

Oxford, Sept. 8, 1665.

SIR,

AS I was laſt Saturday in the evening diſpoſing myſelf to write to you, I was hindred by the unexpected arrival of my lord and lady *Clifford*, and ſince that have been tied to ſo much attendance on my lord Chancellor, my lady *Clarendon*, and her new daughter-in-law, my lord Chamberlain, and others, that went away but this day, that I have been fain, though very unwillingly, to omit acknow-

ledging the favour of your letter, wherein I found, that I had cauſe to return you my thanks for your reſentment of an information, wherein you ſuppoſed me concerned, though indeed I were not at all ſo. For neither do I believe, that any ſuch thing, as our worthy friend Dr. *Beale* was told, was at all deſigned; neither if it had been propoſed, would it have been much welcomed. I did, as I promiſed you, take out my burning glaſs, which, though but of ten inches in diameter, is made of ſo good a metal and figure, that it will not only in a moment almoſt kindle an ordinary ſtick of wood, but in a trice melt laminated lead, and in a ſhort time colour bright iron or ſteel, and make it ſmoke, and will perform divers other things, of which, I remember, I have ſome where ſet down ſome memorials. I preſume I may in my next tell you the diameter of ſome of thoſe concaves, that they yet have in *Italy*, there being here ſome perſons lately come from *Rome*, that have let me know they mean to viſit me; and I confeſs, I think the making of ſuch burning glaſſes not unworthy to be encouraged, being apt to imagine, that if I had one of them, I could make it in more ſenſes than one condenſe the beams of light. If your friend be maſter of any of them, I would gladly have a few experiments (not difficult) recommended to his trial, having already collected divers obſervations of that ſort, but made with ſmaller glaſſes, in what I formerly writ about heat and flame. I was lately making ſome trials with the petrified wood I told you of, which I find to be a very odd ſubſtance wonderfully hard and fixed; and I have got alſo a parcel, that looks like iron ore, and is very heavy. If I had opportunity to reprint the Hiſtory of the Fluidity and Firmneſs, which I have often been ſolicited to do, I could add divers things about ſtones, that perhaps would not be diſliked; and I hope, if God vouchſafe me a little leiſure, to inſert ſeveral of them in fit places of that hiſtory againſt the next edition. Here is a certain ſtone, that is thought to be petrified bone, being ſhaped like a bone with the marrow taken out; but with a fit menſtruum I found, that I could eaſily diſſolve it like other ſoft ſtones, and poſſibly it may prove as fit as oſtiocolla for the ſame medicinal uſes. I am much obliged to thoſe virtuoſi in *France*, that are pleaſed to entertain ſo favourable an opinion of my poor endeavours to gratify ſuch as they; but I have not of late had any opportunity to proſecute my ſtudies vigorouſly, the perpetual reſort of Engliſh ſtrangers, and the want of glaſſes and other mechanical employments, leaving me neither leiſure nor accommodations ſuitable to my deſires and deſign: yet, if I had not forgot it, I ſhould a fortnight ago have told you, that among ſome hydroſtatical things I was once purſuing, I bethought myſelf of an eaſy ſlight inſtrument, which I called the meaſuring (or ſteriometrical) balance, whereby I can, without rule, or compaſſes, *&c.* or calculation, a meaſure with greater exactneſs, than by the geometrical ways, the magnitude of ſmaller bodies, whether regular or as irregular as you pleaſe. Of this I may hereafter tell you more, if God permit; in the mean time begging you to take notice of the date of this, I muſt, to conclude with my paper, ſubſcribe myſelf abruptly,

SIR, your's, *&c.*

R. B.

DOCTOR *Wallis* deſires, that if you have any conveniency, you would do him the favour the firſt opportunity to convey the encloſed according to the addreſs (he not knowing how otherwiſe to get it ſent) in which requeſt I join with him.

To Mr. *Oldenburg*.

March 19, 1665.

SIR,

THIS afternoon, before I had got an opportunity to acknowledge yours of the 13th, I received another of the 17th, and muſt now return you my humble thanks for both together. And to anſwer the former firſt, I wonder not there ſhould be a miſtake in the barometrical paper I ſent you, the haſte I was in having kept me from reading it over; which miſtake lying but in one word, is eaſily mended, by putting inſtead of the other, and of the varying weight, *&c.* the other cauſes of the varying weight, *&c.* But the tranſcript you are pleaſed to ſend me of this paſſage, lets me ſee, that in thoſe words, to a greater height in the air, the three laſt words, *viz.* (in the air) ſhould have been omitted. Since the obſervations came not time enough, it is poſſible I may be able to add a few more to them, before your next come abroad. I have been able to procure ſo little account, ſo much as of the country, where *Bombay* is ſeated in the *Eaſt-Indies*, that I can ſupply you with no queries about it. And as for *Dantzick*, there are only two enquiries, that now come into my mind concerning timber; the one is, whether the learned *Hevelius* or his friends have ever obſerved, what I have met with in a modern author of very good account, that lumps of amber have been taken up, within whoſe middlemoſt parts, when the hard outſide was broken, there has been found pretty ſtore of uncoagulated naphta or bitumen: and this I rather take to be a conſiderable query, becauſe of the other I am to ſubjoin, which is, whether it have been obſerved, that pieces of amber have been taken up ſticking almoſt like gum to great pieces of the barks of trees. For more than this is affirmed upon his own repeated obſervation, by one of the judicioſeſt travellers I have yet read. But now I ſpeak of queries for foreign countries, I muſt beg your pardon, that my haſte made me forget the laſt time to ſend you, as I intended, a paper of general queries. It belongs to one of the eſſays of the unpubliſhed part of the Uſefulneſs, *&c.* and therefore poſſibly may not ſo much anſwer your expectation, as if it had been written entirely for your purpoſe.

But

But perhaps too, it may ſerve your turn pretty well, eſpecially with a little addition, which if you make uſe of it, I can afford it. I have ſomewhere ſome ſpecimens of particular enquiries, ſubordinated to ſome of the more principal articles of inquiſition, which I ſhall ſcarce take the pains to look out, till I know, whether the paper I now ſend may be of uſe to you. If you have occaſion to take any publick notice of it, be pleaſed to intimate to what treatiſe it belongs. I am very much obliged to my lord *Brouncker*, for the favourable acceptance and character he has vouchſafed my hydroſtatical trifles; and I am glad his lordſhip's obſervations agree with mine about the great height of the quickſilver in droughts: but I forgot, and was ſorry I did ſo, to tell you in my haſtily written paper, that one cauſe of that height I ſuſpected may be, the elevation of ſteams from the cruſt or ſuperficial parts of the earth, which by little and little may add to the weight of the atmoſphere, being not, as in other ſeaſons, carried down from time to time by the falling rain, to which it agrees not ill, what I had ſince, namely this week, occaſion to obſerve. For whereas about this day ſennight at *Oxford*, the quickſilver was higher than for ought I know has been yet obſerved in *England*, viz. above $\frac{5}{16}$ above 30 inches, upon the firſt conſiderable ſhowers, that have interrupted our long drought, as I foretold divers hours before, that the quickſilver would be very low, a bluſtering wind concurring with the rain, ſo I found it here at *Stanton* to fall $\frac{3}{8}$ beneath 29. This you may, if you think fit, add to the other obſervations, or communicate with my humble ſervice to the worthy Dr. *Beale*, of ſome of whoſe ingenious conjectures perhaps I could already give you an account; but having not time to do it, I muſt defer it till God grant us a meeting, and then we may diſcourſe about the other buſineſs you write of, which I am very willing to defer it till that time. In the interim, if you tranſlate your Tranſactions into Latin, I ſhall gladly receive a ſeaſonable notice of it before-hand, that I may now and then be the better able to ſerve you in them. I expect to morrow ſome books of the Origin of Forms ready, and hope this week to ſend you one as you deſire; which is all, that can in this paper be told you, by,

SIR,

your very affectionate friend,

and very humble ſervant,

ROBERT BOYLE.

To Mr. *Oldenburg*.

October 17, 1667.

SIR,

I THINK you have pitched upon a good courſe about the catalogue of my writings; only if you mention it at all, you may be pleaſed to remember to add to the reference, that the two tracts of the Origin of Forms, and of Hydroſtatical Paradoxes, mentioned in the catalogue you ſpeak of, annexed at the end of the *Hiſtory of cold*, came forth ſince that hiſtory. I hinted to you in my laſt ſomething about the original of the experiments made in *Italy*, by injecting acid liquors into the blood; to explain which I ſhall now tell you, that about this time three years, I mentioned at *Greſham* college to the Society an odd experiment I had formerly made, (not by chance, but deſign) upon blood, yet warm as it came from the animal, *viz.* that by putting into it a little aqua fortis, or oil of vitriol, or ſpirit of ſalt (theſe being the moſt uſual acid menſtruums) the blood not only would preſently loſe its pure colour, and become of a dirty one, but in a trice be alſo coagulated; whereas if ſome fine urinous ſpirit abounding in volatile ſalt, ſuch as the ſpirit of ſal armoniac, were mingled with the warm blood, it would not only not curdle it, or imbaſe its colour, but make it look rather more florid than before, and both keep it fluid, and preſerve it from putrefaction for a long time. This experiment I deviſed among other things, to ſhew the amicableneſs of volatile ſpirits to the blood. And I remember it was ſo much taken notice of, that ſome very inquiſitive members of the Society came preſently to me, and deſired me to acquaint them more particularly with it, which I readily did, though afterwards I made ſome farther obſervations about the ſame experiment, that I had no occaſion to relate. This having been ſo publickly done, though I will not ſay, that ſeignoir *Fracaſſati* might not have hit as well as I upon the experiments publiſhed in his name; yet there is ſo little difference between the warm blood of an animal out of his veins and in them, that it is not very improbable, that he may have had ſome imperfect rumour of our experiment, without knowing whence it came, and ſo may without any diſingenuity have thence taken a hint to make and publiſh what you have Engliſhed for him. Perhaps you will find ſome entry made of my narrative in the journal of the Society; and if it be thought fit, that, without at all reflecting upon our Italian author, any mention be made of what I related ſo long ſince, I think I can ſend you ſome other circumſtances belonging to it. For I remember I tried it with other liquors, (as ſpirit of wine, oil of tartar, oil of turpentine) and I think I can ſend you ſome remarks upon the colour of the upper part of blood. And I ſhall on this occaſion add in reference to anatomical matters in general, that after I ſaw how favourably the Uſefulneſs of Experimental Philoſophy was received, I was invited to enlarge it in another edition, and for that I provided divers anatomical as well as other experiments, and deſigned many more; ſo that I have by me, if I have not loſt them, divers things, that would not perhaps be unwelcome to anatomiſts. But I am ſomewhat doubtful, how to diſpoſe of them, having found by experience, that if a man

man proceed not cautiouſly in ſuch matters, he may hereafter be thought to have ſtolen from others, what indeed they owe, either mediately, or immediately, to his communication. I could ſafely truſt the Society with them, as the looſe papers, that contain them, come to my hands; but, perhaps, it would not be ſo proper to put them out as my own, after they ſhall have been, not only tried, but, as no doubt they will be, improved there, unleſs the Society ſhould think fit (which yet I ſhould be loth to move) to leave their members a liberty of publiſhing the experiments, either preſented or propoſed to them, with all the additions they ſhall receive from their being made at the Society, with a ſignification (where it ſhall be thought neceſſary) that ſuch a part was the author's, or the propoſer's, and ſuch the improvements of the Society. But of this I would beg you not to diſcourſe, unleſs it be with our noble preſident, or without naming me. For, perhaps, it will not be amiſs to ſtay, till I ſhall be able, through God's permiſſion, to talk with you about it at *London*. In the mean time, I have ſent to Mr. *Herringman*, to deliver you the books you ſhall call to him for, in the name of,

SIR,

your very affectionate friend,

and very humble ſervant,

ROB. BOYLE.

THERE is a little piece come out of *Schwammerdam*, which is laid by for me, but I have not yet ſeen it. If I miſtake not, it treats of reſpiration; and therefore may be fit for your looking into. If I can find one of my old note books, that I had in my hands ſince I came laſt to *Oxford*, I expect to meet there with ſomething about that ſubject. If you try the injection of ſaline liquors into the veins, be pleaſed to try the injecting of ſpirit of ſal armoniac, or of hartſhorn alone; and alſo preſently after the injection of a corroſive liquor: for I remember I made a ſomewhat like experiment, which I have not now time to ſet down. You will oblige me to put, from time to time, in a diſtinct ſheet of paper, the dates of thoſe letters of mine, wherein I mention to you my own experiments made or propoſed.

To Mr. *Oldenburg*.

Oct. 26, 1667.

SIR,

I AM not ſorry you found the relation, which your curioſity (and perhaps your civility too) made you ſearch for in the journal of the Society. But I am ſtill of opinion, that ſignior *Fracaſſati* be tenderly dealt with. What other thing (of that nature) you ſay will ſurpriſe me, I almoſt long to know. The obſervation you mention in your Tranſactions, about the florid colour of blood, is pretty, and, in the trials I have made of it, it holds true: the reaſon alſo given by the author may, perhaps, be good. But I have tried ſome things, that may much help to determine, whether it be or no; of which, if it be deſired, I can eaſily give an intimation. I am glad Dr. *Lower* and Mr. *Collins* are elected into the Society; for I take them both to be able and induſtrious men, in their ſeveral profeſſions, and deſire to have my ſervice very particularly preſented to the former of them; as alſo to worthy Dr. *Beale*; as to whoſe obſervation about the ♀, I remember, that within a day of the time he mentions, I obſerved it to be here extraordinarily low, and ſo did Dr. *Wallis*, (in his baroſcope) whom I ſpoke with about it. I humbly thank you, for the care you have been pleaſed to take, about the diſpoſal of the books; and I ſent to Mr. *Herringman*, to deliver you thoſe, that you ſhall call to him for; among which, I muſt beg not to forget one for yourſelf, if you have it not already. You will find it ſomewhat difficult to give, in few words, an account of my Diſcourſe of Subordinate Forms, which coſt me more thinking than poſſibly thoſe, that have not attentively looked into that intricate ſubject, will imagine.

CARE will be taken for the future, that the letters I ſend you be dated. But, in caſe at any time it ſhould be forgotten, you may be pleaſed in great part to ſupply the omiſſion, by endorſing on the letter, when you received it; for by that it will appear, that, at leaſt, it was written as early, as the time mentioned in the endorſement. And I am the more ſolicitous about this matter, becauſe frequent experience ſhews us, how much our Engliſh have loſt, for want of being ſo; and (which is more conſiderable) how difficult it is, otherwiſe, to avoid the occaſions of perſonal diſputes, or reflections; which, for my part, I heartily deſire to ſhun.

IF I can conveniently (for I have been theſe two days not well) I may, in my next, impart to you an experiment, as odd as moſt I have met with, and which will, perhaps, ſet ſpeculative wits awork, as much as another. When it ſhall have received what improvements the Society will make of it, it is very like I ſhall leave you at your liberty to diſpoſe of it; but, in the mean time, I muſt deſire you not to take notice of it, and ſhall intimate, at preſent, that it is a quite new way of deſtroying and re-producing light. I have alſo lately put in practice another thing, about which I muſt earneſtly deſire your ſecrecy. For, though long ſince, perhaps, ſome years, I was ſo hopeful of a ſucceſs, that I ſet down, and have now by me, a long catalogue of experiments, that, I think, never have been made, (nor, perhaps, deſigned) that may be tried by the help of this invention; yet, for want of tools, and becauſe the nature of the experiment requires time, I have not been able as yet to perform them. But the thing I pretend to do, in ſhort, is this; to ſeal up glaſſes hermetrically, when without

without the help of heat (for it is done by the engine) they are more exhauſted of air, than an Æoli-pile has been yet brought to be, by the help of heat. And this I have actually done, and that by ſeveral ways. And if it pleaſe God to bleſs me with health, as he has in ſome meaſure in my mechanical attempts of late, I hope to make good what I lately writ you, that though the ſtudy of nature would not be courted at the old rate, yet neither will it be deſerted, by,

SIR,

your very affectionate friend,

and very humble ſervant,

ROB. BOYLE.

IF you hear any thing of the judgment made of my Eſſays and Experiments of Colours, now they are diſperſed beyond ſea, I ſhall be glad to know it. I hear nothing of your proſecuting at the ſociety the buſineſs of reſpiration; nor have I yet read *Swammerdam.*

To Mr. *Oldenburg.*

Dec. 29, 67.

SIR,

I HAVE no exceptions to the title page, which you deſign to prefix to the experiments of light, if you have good warrant for the laſt words of it, which, to me, ſeem complimental enough. I ſent you on Tueſday the concluſion of the poſtſcript, which, I hope, you have received, and to which I am not like ſuddenly to make any additions. For, without telling you now, whether I could or no, I muſt confeſs to you, that I am tired with inſiſting ſo long upon one ſubject; eſpecially ſince it hinders me from proſecuting ſome others, for which I have a ſtronger inclination. If, when thoſe experiments about light come forth in Latin, you think fit to ſay ſome little thing to the reader, either about the nature and deſign of the tranſactions, or about thoſe experiments; I ſhall neither perſuade nor oppoſe it. But I think it will be convenient to make the very firſt words of the Engliſh account itſelf, I ſent you, to be preceded by a long ſtroke in the ſame line, to intimate, that the letter did not begin there; leſt, without ſuch intimation, the beginning may appear, either too abrupt, or not ſo civil to you, as I deſire my writings ſhould be thought, as well as be. If you can conveniently do it, (and not otherwiſe) I ſhould be glad, that in the Latin edition ſome intimation were given the readers, that, whereas two ſeveral books of mine have been lately printed in *Holland*, viz. the *Phyſiological Eſſays*, and the *Book of Colours*, without any notice taken, as I am informed, either that they were ever printed in *England*, or ſo much as tranſlated out of Engliſh; whereas, I ſay, I am told this, if by the title pages of the books (whereof Mr. *Davis* tells me, ſome are come to *London*) you find it to be true, I ſhould be glad, that a ſhort intimation were given, that thoſe books were tranſlated out of Engliſh, in which language the eſſays were publiſhed in the former part of the year 1661, and the latter, before the middle of the year; which I therefore deſire to have a little notice given of, becauſe, that if they ſhould be ſuppoſed to be publiſhed but this preſent year, I may be ſuſpected to have taken divers things from others, which they, indeed, borrowed of me. The experiment of transfuſion, made upon a mad man, I ſhall look upon, if the cure hold, as a very conſiderable thing, and capable of improvements. I am glad the Florentine experiments are at length publiſhed; which I remember a learned ſtranger, that came from thoſe parts (and whom I never ſaw before nor ſince) told me, eight or nine months ago, they had been long before, if it had not been perceived, that ſome things of mine, that were already out, would, probably, keep divers of them from ſeeming new, or appearing ſo conſiderable, as was hoped. But, perhaps, this was but this gentleman's conjecture, or compliment; and, however, I cannot think, but ſuch ingenious perſons, as the excellent prince *Leopoldo*, and ſome of the other Florentine virtuoſi, muſt needs have made divers experiments, that would be very welcome, and inſtructive. What you ſay of the French book you have received, gives me a great curioſity to ſee it, and makes me deſire, that you would be pleaſed to order Mr. *Crook*, or ſome other bookſeller, to ſend for it to *Paris* for me; and if, in the mean time, when you have done with your's, you can ſpare it me for a while, it ſhall, God willing, be thankfully returned you. I ſent you on Tueſday a paper ſealed up, with a ſuperſcription, that deſires it may not be broken open, till you hear farther from me about it; which requeſt I muſt yet continue, and now give you this reaſon for it, that that packet is the ſecond part of ſome papers, whereof I cannot ſend you the firſt part, though I was made to hope, to have it tranſcribed time enough, and do expect to be able to ſend it you in a few days. The author of the book *De Viribus Percuſſionis*, I look upon as a ſubſtantial writer; but there are ſome here, (who are not wont to be vain glorious) that think, that on that ſubject he will teach them little, that they know not already. I am glad of your correſpondence with monſieur *Carcavi*; but though to gratify both you and him, I have conſulted our library-keeper (and not him only) about the catalogue of books, printed in *England* during the laſt twelve years, yet my endeavours have not proved ſucceſsful: for though there be a law, that gives this univerſity an exemplar of every book, that is printed; yet that law, for want of an annexed penalty, has been but very negligently obeyed. But thus much I have learned, which, I hope, may do you ſome ſervice, that you may find a catalogue of all the books printed at *London*, within

within the time mentioned, by getting a ſearch made in the regiſter of the Stationers-hall, of which for the two laſt years, I hope a copy may be here procured you, by,

SIR,

your very affectionate friend,

and very humble ſervant,

ROBERT BOYLE.

I AM ſorry the perſon you mention in your poſtſcript has been ſo much your enemy, as to oblige you to be his. I have obeyed you to Dr. *Wallis*, who is much your ſervant. If you had been here this week, I could have ſhewn you divers aerial experiments, which would (ſome of them at leaſt) have let you ſee, that the air, as tranſparent as it is, has not yet diſcloſed to us all, that may be diſcovered in it. I deſire to have my humble ſervice preſented to Dr. *Beale*, Mr. *Glanvill*, and Mr. *Colepreſſe*, and to the firſt of them my thanks for his kind remembrance.

To Mr. *Oldenburg*.

February 1, 166$\frac{7}{8}$.

SIR,

A VISIT made me ſince ſupper has left me ſo little time to anſwer your letter, that I am reduced to leave divers paſſages of it untouched, that I may be able to tell you, that I am very glad, that the Florentine experiments are at laſt come out, and are like to be ſhortly in ſuch good hands as yours. I ſhewed my lord *Brouncker*'s ſolution to Dr. *Wallis*, who, I ſuppoſe, will take notice of it to you; and I was this day at Dr. *Wren*'s lodging, but could not meet with him, nor conſequently diſcourſe with him about Mt. *Hooke*'s way of eſtimating the preſſure of the air. I am glad the experiment of transfuſion has at length ſucceeded ſo well at *Paris*. For I confeſs, I have good hopes it will at length prove a very conſiderable one. I thank you for the advertiſement you are pleaſed to give me according to my deſire about the collection. The fifty pound, I told you I was ready to contribute, will, I hope, be received for me at *London* within a week or ten days; and if there be, before you hear from me again, an occaſion to mention it at the council, you will oblige me to do it for me with all due expreſſions of affection and reſpect, together with ſome little apology grounded upon the great prejudice, not to ſay ruin thoſe, that belong to *Ireland*, undergo by the ſtop of their almoſt only trade, the tranſportation of cattle. When the other members of the council pay in their contributions, upon your leaſt intimation I ſhall, God willing, be ready to give order for the payment of mine, which, as I was ſaying, I doubt not would be received for me within theſe very few days. I am glad of what you tell me concerning young Mr. *Stroude*, to whom pray, if you ſee him, be pleaſed to preſent my humble ſervice, and deſire him to do it for me to his father Sir *William*; and if he have any minerals for me, as I ſuppoſe he may have, you will oblige me to perſuade him to leave them in your hands, or at my ſiſter *Ranelagh*'s. I muſt before long be a ſuitor to you for ſome letters of recommendation for the ingenious Mr. *Colepreſſe*, when he goes to travel, and where you think, that it may ſerve him to have it known, that I was one of thoſe, that requeſted you to recommend him to the acquaintance of ſome ingenious men, you are at liberty to take notice of it. We have no luck in our enquiries about the ſenſe of the modern Greek church. For the critick, I mentioned to you in my laſt, was five days ago ſuddenly hurried away to *London*; but yet when he came to take leave of me, I would not give it him, till for all his haſt he had in a ſnip of paper, that was at hand (and which I encloſe you) ſet me down the names of thoſe books, which he ſays prove the diſſent of the Greek church from the Latin in the point of the ſacrament; and he added, that one of the three authors (which I have therefore ſince marked with an aſteriſk) has a full confutation of *Baronius*'s ſtory of the reconciliation of the Greek and Latin churches. I had in my hand a liſt of a pretty number of pneumatical experiments, made in order to the continuation of the engine book, which catalogue I intended to have ſent you, but only for your own view, together with this letter; but the party, to whom I entruſted it, having not (I ſuppoſe by reaſon of the much company I have had this afternoon) thought fit to reſtore it, as I expected, it cannot be ſent you till the next opportunity I have of naming myſelf,

SIR,

Your very affectionate friend,

and very humble ſervant,

ROBERT BOYLE.

To Mr. *Oldenburg*.

Feb. 21, 1667-8.

SIR,

I AM obliged to you for ſo early diſpoſing of the ſealed paper I troubled you with. The objection, that was made you, about the ſociety's order, in reference to ſuch papers, was not altogether unreaſonable; but I think your anſwer to it was very juſt; the deſign of that order being only to ſecure thoſe, that deſire to enjoy the benefit of it, againſt the uſurpations, not the induſtry or out-doings of others; and if I had been there, I could have added, that as to what concerned my paper, in particular, the invention (if it deſerve that title) there mentioned is not only hinted, but clearly ſet down. Such a book of the Uſefulneſs, *&c.* as I could get ready bound (and your haſte made me unwilling to ſtay for the better binding of another) I have this

this morning ſent you, and ſhall beg you to accept of from me. It is my unhappineſs, more than that of your Italian virtuoſi, that I am not at *London* to converſe with them; but I am apt to think, you have rightly gueſſed at the reaſon of the preface they made you about the Florentine experiments. Dr. *Wallis* and I have been this night endeavouring to ſee the new ſtar, but were hindred by cloudy weather; which has laſted longer than I remember to have known theſe many years; ſo that I have been kept from proſecuting an experiment or two, I made about a month ſince, touching the burning of bodies in vacuo (as they call it) though what I then obſerved, together with what I tried, to almoſt the ſame purpoſe, about the line deſcribed by moving ſmoke, ſix or ſeven years ago, make me think ſuch trials worth the being purſued. If I can get it tranſcribed, I may ſend you, by this poſt, a liſt of about half a ſcore of experiments, that ſhould be added to the catalogue you laſt received; and will, I hope, be looked upon by you under the ſame notion with the former. I have enquired about the bones your poſtſcript mentions, but as yet I cannot hear ſuch matters. If, upon further inquiſition, I can, you may (God permitting) expect an account from,

SIR,

your very affectionate friend,

and very humble ſervant,

ROBERT BOYLE.

To Mr. *Oldenburg*.

April 3, 1668.

SIR,

I AM not ſorry, that the reputation of our Society encreaſes abroad, but we ſhall have cauſe to be ſorry, if nothing be done at home (by thoſe, whom it moſt concerns) to enable us to make it good. I am glad you are like to ſettle a correſpondence with *Rome*, that being the chief center of intelligence; nor is it unwelcome news to me, that you are like to receive, from time to time, an account of what will be done in the academy at *Caen*, though poſſibly, if our Society had ſuch encouragement, as you ſay monſieur *Colbert* gives that learned company, *England* would be able to give *Normandy* as good as it brings. The diſſection of a camel being that, which in theſe parts we have had no opportunity to make, may well, according to what you intimate, afford us ſomething of conſiderable. You are not at all miſtaken, in thinking, that I have had my ſhare of troubleſom viſits from ſtrangers, and that I would not invite my friends at *London*, to procure me any more of them; but I aſſure you, I except the converſation I lately had with monſieur *Paiſan*, who left me with extraordinary profeſſions of ſeveral kinds, and to whom, if he be yet at *London*, you will oblige me, to preſent my humble ſervice. I perceive I am very much beholden to monſieur *Sheutius*, for the very favourable mention he is pleaſed to make of me and my triſles. When I have the happineſs to ſee you again, I may ſuggeſt ſome queries, about the mines of his country, ſince I perceive he is both curious and intelligent in thoſe matters. What he mentions to you about the ſubſtance he lighted on, that changed conſiſtence & eaſy, I am prone to believe, both upon his word, and upon an experiment I made, though not altogether the ſame way, with fixed nitre and diſtilled vitriol. I look alſo upon what he delivers as a more general obſervation to be ingenious, but I doubt it will admit of ſome limitations, ſince I remember not to have found red integrated nitre near ſo fuſible, as his ſuppoſition requires it ſhould be. Your hint about the uſe of it in thermometers is rational; but we have other ſubſtances, that perform the ſame thing at leaſt as well. The mention of heat puts me in mind of a paſſage in your former, about the way propoſed for the hatching of eggs, which brought to my remembrance, that I once attempted an odd way of ordering eggs, whereby I brought ſome of them to animation, and one or two of them a great deal further. The way I could not then proſecute, but did deſcribe it in one of my yet unpubliſhed eſſays. I have been, before the laſt week, beginning ſome trials about the air, which, if it pleaſe God I have opportunity to complete them, will not, perchance, be unwelcome to the ſpeculative. For though, for want of accommodations, I was obliged to deſiſt from proſecuting my attempts, yet what I was able to do, will promiſe no ill ſucceſs to,

SIR,

your very affectionate friend,

and very humble ſervant,

ROBERT BOYLE.

I FORGOT to tell you in my laſt, that a gentleman, who paſſed by this way, informed me, that the French *Journal des Sçavans* is tranſlated into Latin, and printed in *Germany*, and that he had bought it. I have newly received, from Dr. *Needham*, a letter addreſſed to you, and which he deſires me to convey to you. This it were not fit for me to decline; but in regard it concerns Mr. *Hooke*, and contains objections againſt ſomething lately publiſhed by him, I preſume you will think it fit, as I do, to ſhew it him, in the firſt place. And ſince they are both ſuch ingenious men, and both members of the Royal Society, it were to be wiſhed, that, if it be poſſible, they may be brought to agree, without making their oppoſition éclater. Dr. *Needham*'s letter ſhall be ſent by the carrier.

LETTERS

FROM

SEVERAL PERSONS

TO

Mr. *BOYLE.*

Moſt honoured SIR,

I WENT yeſterday to wait upon my excellent lady, who was pleaſed to ſhew me a certain letter making mention of me, which I had no ſooner peruſed, but the expreſſions of your very great love were delivered into my hands. Sir, this gave ſuch an alarm (for we are nothing almoſt but alarms) to my affections, that I muſt needs convey the ſound of it to your ears by thoſe paper-wings, which carry alſo along with them a further diſcovery of the office of publick addreſs for accommodations. The office of communications is to follow very ſhortly, God willing, eſpecially in reference to univerſal learning. And if then the truſtees of the kingdom ſhall vouchſafe to look after ſuch ſmall and trivial by-matters, I ſhall aſſuredly be mindful of your kindneſſes, and be perhaps as well in an offering, as in a receiving condition. If they do not, I fear, that my lord *Cottington*, who, as I am certainly informed, was, with a French doctor in *London*, before thoſe troubles began, fully reſolved to have erected ſuch an office, [will] riſe once in judgment againſt them. However, I am more than reſolved to continue in this kind of folly to ſerve the good of many; and worthy Sir *Cheny* profeſſes himſelf to be one, that will join with me in running this race. For in his laſt he uſed theſe very words unto me.—"I offer, if others of our acquaintance will come in, and according as my condition in theſe tottering times ſhall prove, to allow towards the maintaining of one clerk, the ſum of 20*l. per ann.* and ſhall (as God ſhall bleſs me) be ready to encreaſe it, till we can invite the publick to take notice of its own intereſt in the buſineſs." Thus far Sir *Cheny*, which I mention the rather, that it may be ſome incentive to others by your means in your quarters, if any burn with ſuch inflammations. And that you may have the more fuel to put into the fire, I cannot but tender to your favourable hands the other writings here adjoined, eſpecially the deſign of the *Hiſtory of Trades*. The author of them is one *Petty*, of twenty four years of age, not altogether a very dear *Worſley*, but a perfect Frenchman, and good linguiſt in other vulgar languages beſides Latin and Greek, a moſt rare and exact anatomiſt, and excelling in all mathematical and mechanical learning; of a ſweet natural diſpoſition and moral comportment. As for ſolid judgment and induſtry altogether maſculine. This is the meat or banquet, to which I deſire to invite mainly all ingenious ſpirits and diſcerning palates at this time. I know not how the ſauce of it, (which muſt be at leaſt a hundred and twenty pound *per ann.*) will be reliſhed; but when he hath perfected the ſpecimen, which I have required of him, in one trade, (which alſo is near done) and ſet down all the terms and conditions, upon which he deſires that annual aſſiſtance, I ſuppoſe no right taſte will nauſeate it; nay, I am confident to your ſenſe it will be delicacy, and the beſt veniſon, that ever I could have hunted out for you in this populous wilderneſs. Sir, may I be ſo happy as to ſee again ſome lines from your hands, to continue or rather begin a correſpondence, as to the coſmetical (but to my aims truly vital) parts of it; and I ſhall ſtudy to approve myſelf in all thoſe, and all other profitable and real reſpects and obſervances,

Moſt honoured Sir,

your entirely affectionate,

and moſt willing, and obliged

friend to ſerve you,

Lond. Duke's-place, Nov. 16, 1647.

S. HARTLIB.

SIR,

I BEG the ſending of Mr. *Dury*'s Exercitation how to travel profitably in the law. You ſhall have back this money with intereſt, if you dare give me credit for ſo much.

Farewel, dear Sir.

Right worthy Sir and truly honoured,

THE encloſed from Mr. *Worſley* I received on Saturday laſt. The extracts he wrote confidingly to myſelf, but I thought it my duty not to conceal them from your eyes in the very formalia of his words. If I were not very confident, that you would take all in good part, I would never have made over thoſe adventures of my freedom unto you; but owing ſo much to the nobleneſs of your diſ-

poſition, your ſpecial ſervices, and to the moſt faithful friendſhips both of Mr. *Morian* and Mr. *Worſley*, I could truly do no leſs. Sir, I could enlarge myſelf upon many other particulars full of variety, and of a ſpring of pleaſure; but I ſuppoſe Mr. *Worſley* hath preſented to your curioſity a large field to walk in at this time: yet give me leave to preſent you with a poſy of additional lines in the following words. I thank you for your new diſcoveries in anatomy, and enquiries of other uſeful and ingenious knowledges. I ſhewed Mr. *Hobbes* your letter, who liked it ſo well, that he deſired me to lend it him, which I did. Your worthy friend and mine Mr. *Gaſſend* is reaſonable well, and hath printed a book of the life and manners of *Epicurus* ſince your going from hence. He hath now in the preſs at *Lyons* the philoſophy of *Epicurus*, in which I believe we ſhall have much of his own philoſophy, which doubtleſs will be an excellent work. There is an experiment how to ſhew, as they ſuppoſe, that there is or may be vacuum. It were too long to write all the particulars, but in brief thus. They prepare a long tube like a weather-glaſs, which is filled with quickſilver; and being ſtopped as cloſe as may be with one's finger, the tube is inverted and plunged in a veſſel half, or more, full of quickſilver. The quickſilver in the tube will force the quickſilver in the veſſel to riſe, by adding more quickſilver to it, and ſo leaves a ſpace in the top of the tube vacuum, as is ſuppoſed. But a bladder being hung in that vacuum was as perfectly ſeen as could be, ſo that there muſt be ſomebody there to convey the action of ſight to the eye, as I ſuppoſe and divers others here. That bladder was made as flat as they could, when they put it in; and when the quickſilver left it, it ſwelled in that ſuppoſed vacuum like a little foot-ball. Thus far Sir *Charles Cavendiſh* to Mr. *Petty*, who honours and loves you, but not in thoſe dimenſions, as he, who ſubſcribes himſelf always,

Right worthy Sir and truly honoured,

Lond. Duke's-place, in the great open Court, May 9, 1648.

your moſt entirely reſpective and faithfully devoted,

SAM. HARTLIB.

Right honoured Sir,

I HOPE you have received my laſt of the 26th of June, with many extracts of letters of great importance, which I would not have fall into other hands but your own. The letter was directed as this by the favour of *Sherburn*. Here are the continuation of the reſpects from *Amſterdam* and *Duke's-place*, which contain ſome particulars in them worth your trial and animadverſions. One *Evans* in *Fetter-Lane* uſed to ſell antimony cups for 40 ſhillings apiece, if not more, which perhaps coſt him no more than ten ſhillings. I am told they can no more be had, for which I am not much troubled. For I ſuppoſe the antimony cup is no other than a pure ordinary regulus antimonii caſt into the form of a cup, which cup hath no other virtues nor effects than the foreſaid regulus; for this regulus lying in any liquor doth the ſame, which the cup-holding liquor in all reſpects. As for *Vaux-hall*, there is a proviſo put into the act, that it ſhall not be ſold. My endeavours are now, how Mr. *Petty* may be ſet apart or encouraged for the advancement of experimental and mechanical knowledge in *Greſham* college at *London*, of which you ſhall have a true account alſo,

Right honoured Sir,

Duke's-place, July 24, 1649,

from your entirely faithful, and moſt humble ſervant,

S. HARTLIB.

Dear SIR,

YOUR firſt and laſt from *Ireland*, dated at *Youghall* the 10th of January, 1653-4, I received yeſternight, very late. The 30th of September anſwered your's from *Briſtol*, but do not perceive, even by this, whether the ſame packet did ever come ſafely to your hands. I ſhould not have failed to perform my promiſe of writing, as I was really reſolved to do it every week, if yourſelf had not been in fault. For my promiſe was grounded, as you remember, upon your firſt writing from *Ireland*, which was never received till now: beſides your deareſt ſiſter was ſo diſcouraged, having ſent ſeven or eight letters, to which ſhe had gotten no anſwer, that ſhe was more than inclining not to write any more unto you. I cannot alſo but remember, with what reſolvedneſs you promiſed to be back again in *February*, or ſooner; which now being paſt, you ſee, upon your intimation of a longer ſtay, how ready I am, without the interpoſal of one day, to fulfil, in ſome meaſure, all your deſires and expectations; I ſay in ſome meaſure, for there are ſome things fallen out ſince your departure, which it is not lawful to utter by writing, but are as certainly your's, as thoſe that do poſſeſs them, as ſoon as God ſhall afford a fitter and more certain opportunity. For my lady tells us, that ſhe expects ſhortly another letter from you by a ſhip, which is to let her know, how your poſture ſhall be ſtated, for coming or ſtaying; which will alſo direct us how to carry ourſelves in our communications for the future. But O! that it would pleaſe God to order your affairs in ſuch a manner, that you could be with us before ſo many months be expired as you have calculated, according to the Iriſh account! We expect every week to hear more from *Johannes Baptiſta Coen*, who hath been a great while with *Faber*, that famed pretender in *France*, but is now at *Diepe*. It is not impoſſible, but I may tell you in my next, God willing, that he is not far from the place, where once Char-

ing-croſs did ſtand. Some months ago I received a letter from Mr. *Worſley*, in theſe words, among other particulars. " I wrote to you, " a while ſince, and in it took the boldneſs " to write to monſieur *Clod*, in which you " muſt deal plainly and honeſtly with me, if " I took too much liberty or freedom in aſk- " ing his opinion, about a matter of ſo much " judgment and weight. For the truth is, " I have laid all conſiderations in chemiſtry " aſide, as things not reaching much above " common laborants, or ſtrong-water diſtillers, " unleſs we can arrive at this key, clearly and " perfectly to know, how to open, ferment, " putrify, corrupt and deſtroy (if we pleaſe) " any mineral, or metal; which being with- " al not indeed to be done, unleſs by one, that " diſcerns the nature very well, I preſume it " is therefore ſaid, it is eaſier to make ſome " metals, than to deſtroy them. Not that I ap- " prehend it is to be underſtood, the work is " eaſier, to make a metal, than to deſtroy it; " for that were impoſſible, ſeeing a natural " putrefaction and corruption is the firſt thing " in order to be done towards the making, " tranſmuting, or multiplying of any metal. " But I conceive the meaning rightly to be, " that a man once knowing how to corrupt " or deſtroy a metal, it is then nothing near " ſo difficult, for him to proceed further, and " to make a metal, as it was at firſt, or is now " generally to men, to underſtand, how they " ſhould begin to deſtroy a metal. In this " therefore, both principally and only, I con- " ceive learning, judgment, or wiſdom to " conſiſt, either as to the knowledge of true " medicine (other preparations ſhort of this " being not much to be valued) or as to the " carrying on of a higher work in nature. " And being led by ſome ſerious conſiderati- " ons to ſee the neceſſity of this (and the " ſmallneſs of moſt chemical operations be- " ſides this) the ſame hand of goodneſs did " diſpoſe my mind to comprehend both the " poſſibility, and ſomewhat of the way of " it, and nature of the courſe concerning it, " which I confeſs did provoke and occaſion " that freedom with monſieur *Clod*; as re- " ſolving not much to prefer a correſponden- " cy of any hands, in things chemical or me- " dicinal, unleſs this, as I either may be an " aſſiſtant towards it, or be aſſiſted in it. " And although I may ſay, I ſee already ſo " much in it, as to prefer it before any other " natural knowledge, or, perhaps, employ- " ment; yet I can find nothing very valuable " or very deſirable, either in myſelf, or others. " And when I have once a while conſidered " things, I find myſelf as much inclined to " fear or ſuſpect them, as I do to wiſh them." Thus far that noble and high ſoaring ſpirit, which I thought good to repreſent unto your better conſiderations, which you ſay are engaged, for the preſent, in a ſhort eſſay concerning chemiſtry, by way of a *judicium de chemia & chemicis*. As for us, poor earth-worms, we are crawling in my houſe about our quondam back-kitchen, whereof my ſon hath made a goodly laboratory; yea, ſuch a one, as men (who have had the favour and privilege to ſee, or to be admitted into it) affirm, they have never ſeen the like, for its ſeveral advantages and commodiouſneſſes. It hath been employed days and nights with no ſmall ſucceſs, God be praiſed, theſe many weeks together. But what particulars it hath hitherto produced, and what greater medicines he is taking in hand this week and the next, I ſuppoſe this my obedient and very chemical ſon will be able better to relate unto you, than myſelf. I could wiſh the like account could be given of Dr. *Stirk*, but he is altogether degenerated, and hath, in a manner, undone himſelf and his family. I know not directly how many weeks he hath lain in priſon for debt; but after he hath been delivered the ſecond time, he hath ſecretly abandoned his houſe in *London*, and is now living obſcurely, as I take it, at *Rotherhith*. He hath always concealed his rotten condition from us; nor hath there been any communication between him and my ſon, as long as you have been in *Ireland*. Mr. *Webb* doth now rail at him and curſe him, as having been moſt wretchedly ſeduced and deceived by him. Many weeks ago he promiſed me to write diligently unto you, but hath never ſent one letter ſince your going from hence. I hear there are ſecret tranſactions between him and my lord *Dover*; but I am afraid they will all vaniſh into ſmoke. When God hath brought you over again, we ſhall leave him altogether to your teſt, to try whether yet any good metal be left in him, or not. But the beſt is, that he ſtands more in need of us, than we of him. I am glad that ens Veneris hath done ſo much good in *Ireland*. My ſon, and many others, can tell you of the ſtrange vertues and effects, which his laudanum hath already produced among us here. The courſe, which you have purchaſed of your excellent ſurgeon, to cure the ſtone in the kidnies, will be very welcome, whenſoever you ſhall ſend it. After thoſe great and moſt univerſal arcana are prepared, my ſon, both for your and my ſake, will ſet himſelf on purpoſe, God bleſſing his endeavours, to perfect thoſe other Helmontian preparatives concerning the ludus with the ſal armoniack. I need not tell you again (for I hear, that you know it already) that Dr. *Boat*, when he was come as far as *Diepe* towards *England*, being let blood by thoſe common butchers of human kind, departed this world; which really is a very great loſs to the commonwealth of learning. In his laſt, of the 18th of October, 1653, he wrote unto me as followeth: " Pray preſent my humbleſt " ſervice to Mr. *Boyle* and S^r. *C. Culpepper*; " and tell the firſt, that here is newly come " forth a *Treatiſe des arbres fruitiers* (which, " God willing, I ſhall bring him, with the " reſt of that ſubject deſired by him) and the " other, that in all *Paris* there is not to be " had one grain of Lucern ſeed, not only of " this, but not ſo much as of the laſt year's " growth." Thus far that bleſſed ſoul. I make no queſtion, we ſhall find that treatiſe in *Paul*'s Church-yard; or it may eaſily be procured

procured with the reſt from *France*, if you will let me know the particulars of that commiſſion, which you imparted to the late doctor. But how to gain another treatiſe, deſigned by the foreſaid worthy man, upon my moſt earneſt ſolicitations, I am utterly at a loſs, except Dr *Child* from *Ireland* ſucceed him in the purſuit of that weighty ſubject. For having dealt much with him, about the completing his *Natural Hiſtory of Ireland*, by procuring that encouragement, which he demanded, he was pleaſed to encourage me again with another undertaking, in theſe words:

" You may encourage our friends to do as " much by me for to ſet me on work about " another (beſides the perfecting of the *Na-* " *tural Hiſtory of Ireland*) production, viz. " my intended book of the whole nature, " intrinſical qualities, preparations, and all " manner of uſes of ſaltpetre; a natural body " of too noble a nature, and too univerſal uſe, " for to be ſo much neglected, and unknown, " as hitherto it hath been. I have not ſo much " as begun that work yet, but having all the " materials ready for it, *partim in chartis & par-* " *tim intra caput*, a few months at any time " will ſerve my turn, for to give it its being."

In the mean while, receive here that ſpecial, ſecret and ingenious ſpeculation of my friend, the great experimenter, of whom I told you lately, in the very words, wherein I ſet it even from his mouth, being as followeth. " Hav- " ing been told, that one Mr. *Jurſang* and " monſieur *la Grange* here gave out, to have " found out a way to make ſaltpetre grow, " but that they would not diſcover it under " ten thouſand franks, he ſet his wits at " work, for to find out the way, and made " no doubt but it might be done thus: viz. " Taking a parcel of good ground, well dig- " ged and well manured with dung, as for " the richeſt corn, a cover is to be made over " it, for to exclude the ſun, and to hinder " the growing of any herbs (which would " hinder the growing of ſaltpetre) and then " to ſow ſaltpetre on it; which might moſt " commodiouſly be done, by diſſolving it in " water, and throwing the water on the " ground. The proportion he thinks to be a " pound of ſaltpetre for a foot ſquare of ground; " after half a year, you may pare away half a " foot deep of your ground, and half a year " after another half foot, and ſo from time to " time, and you will have an everlaſting " mine of ſaltpetre; and the deeper you " come, the better it will be; but if at firſt " you ſhould pare it too deep, and cut away " too much, you would mar all. After the " paring away of the upper cruſt, the ground " muſt ſtill be digged afreſh." Thus far my friend's invention. *Hactenus ille.* The latter paſſages of the ſecret I have added, being deſirous to have that deſcription concerning the Hamburg ſaltpetre (whereof you may inform yourſelf again from Mr. *Van Muſſig*) under your own hands. But to return to the remaining contents of your letter, I muſt now moſt ſolemnly call upon you, on the behalf of the *Natural Hiſtory of Ireland*, which, if yourſelf and Dr. *Child* do not take profeſſedly to taſk, I fear will never be perfected to any purpoſe; at leaſt, if ſo much could be done in it, as to have all the interrogatories judiciouſly anſwered (of which, God willing, I ſhall ſend you more copies) it would be a conſiderable addition to a ſecond edition of this imperfect work, which I formerly have publiſhed. I pray therefore, Sir, do not fail to give or procure me as ample an account, as poſſibly you can, concerning this affair. As ſoon as I have made an end of this letter, I purpoſe to ſend for thoſe Arminian books, which you have deſired. If they may be had, the interrogatories ſhall be ſent in the ſame packet with them, according to your direction. I am ſorry, that the tranſplantation of the Iriſh ſhould be that diſmal occaſion of your ſtay; but my comfort is, that you may get far better tenants, and that could not be ſo eaſily ſwept away, as thoſe other, if you had but ſo much faith and courage, as to adventure yourſelf amongſt us, and to let us enjoy your preſence with all convenient expedition. I confeſs, the tranſplantation of thoſe many governments have ſwept away alſo almoſt all my tenants, that I cannot do, that which otherwiſe I had more largely intended. But my hopes and confidences towards God are ſtronger than ever, that my lands ſhall not always lye waſte upon my hands. Sir, you complain of that barbarous (for the preſent) country, wherein you live; but if you would but make a right uſe of yourſelf, from the place where you live, towards Dr. *Child*, Mr. *Worſley*, Dr. *Petty*, major *Morgan* (not to mention others) they would abundantly cheriſh in you many philoſophical thoughts, and encourage you, perhaps more vigorouſly than I can do at this diſtance and uncertainties, to venture even upon divers choice chemical experiments, for the advancement both of health and wealth. And if *Stirk* ſhall continue his ungrateful obſtinacy, yet give us but more certain aſſurance, either of your ſtaying or coming, and we ſhall endeavour to fraight our letters with many Utopian intelligences, to expreſs, at leaſt, this way the very good will which we bear towards all manner of ingenuities. If Mr. *Dymock* knew, that I was writing into *Ireland*, I am confident, he would preſent his moſt humble ſervice, with his gratitude for former favours, unto you. He is forſaken, in a manner, by all, and the lower, for the preſent, becauſe I cannot any longer aſſiſt either his perſon, family, or inventions. By the laſt poſt I received an unexpected letter from the Scottiſh lord *Forbes*, in theſe very lines. " Having newly ſeen " three ſmall pieces, one called, *An Invention*; " *&c.* another, *The reformed Huſbandman*; the " third called, *An Eſſay for Advancement of* " *Huſbandry Learning*; I perceive you are ſtill " the old man, and your inceſſant endeavours " to advance a publick good is never wanting, " though ſuch be many times miſregarded, " and not rewarded. Since it is my lot to be " here, where I have been ever ſince I did

" come

" come from *England*, by that act of baniſh-
" ment, and reſolves, God willing, to ſtay
" here, till it pleaſe God to ſend better times;
" out of the acquaintance I have formerly had
" with you, I am bold to entreat you to ac-
" quaint me what effect thoſe three treatiſes
" have taken; and if they be practicable,
" communicate your knowledge with your
" old friend. But if, for lack of patrons,
" ſuch talents lye ſo long hid, if the gentle-
" man, that writes to you, or any inſtructed
" or taught by him, will do me the favour
" to come hither to *Sweden*, I will find him
" patrons, that will afford him a plentiful
" maintenance." The letter is dated at *Stockholm*, the 21ſt of Jan. 1654. I ſhould be willing to part with him into *Sweden*, or any other place, which he could fancy: as to his invention of motion, of which I am no more ſo fond as I was wont to be. Not that there is any defect in the ſaid invention, but, according to the ſaying of *Terence*, *Tædit harum quotidianarum formarum*, there appearing a far greater beauty and perfection in ſome other inventions of the ſame kind, which are going through my hands at this preſent; of which I ſhall be able to give you a more particular account ſhortly, there being already a reference made by his highneſs, for a patent for 14 years. But that other part of his publick and private uſefulneſs, as to all the parts of huſbandry (I ſpeak ſtill of Mr. *Dymock*) is now the more to be regarded, and deſerveth far better to be cheriſhed and ſupported, than hitherto it hath been. Yet I hope he ſhall not need to go into *Sweden* for patronage, if God bleſs thoſe other natural, chemical, or mechanical ingenuities, in which our confiding friends are ſo deeply engaged. The huſbandry directions about clover, here encloſed, I got from my lord *Brereton*'s eldeſt ſon, who obtained them once from colonel *Goring*, as I take it. The other experiment, or the offer of it, came from *Hamburg*, and is tranſlated into Latin; and thoſe other animadverſions, for your ſake. I hear there is one Mr. *Haughton*, a gentleman, that lives in *Norfolk*, who hath for many years ſince uſed the huſbandry of clover-graſs, and hath an eaſy way, by the help of a kind of mill, to ſhell the huſk from the ſeed, whereby his ſeed will not ſtand him in above two ſhillings per pound; which otherwiſe is ſold in *London* for eight, ten, twelve, and ſixteen ſhillings. There is alſo a Dutchman, one Mr. *Bedloe*, for the preſent at *Amſterdam*, who promiſeth to furniſh huſbandmen with a liquor, for imbibing of ſeed-corn, whereby the ſeed, being ſown in the moſt barren ground (ſo it be freſh) ſhall produce as rich a crop, as the ſame quantity of ſeed would have done in the beſt prepared land, according to the uſual courſe of huſbandry; and the land ſhall continue to yield ſuch crops for twenty years together, without any amendment or manure, than what may come from the ſeed thus imbibed. The charge of the liquor will not be above twelve ſhillings for a buſhel. A gentleman of *Wales* (Mr. *Kemeys*) is ſaid to have ſown laſt year four acres of wheat in barren land, imbibed with the ſaid liquor, of which I am promiſed a fuller relation in due time. In my late publiſhed treatiſe, which I ſent you, concerning diviſion of land, *&c.* there is an experiment, or ſecret, tranſlated into Engliſh, which runs thus in the original.

Frumentum eligatur ponderoſum & maſculum. Hoc enim ſolum in terram tanquam faminam conjectum, vim generationis habet. Hoc ita electum imponatur in aquam ſimi equini pinguem & fætidam, in qua tot libræ ſalis terræ, quot jugera ſeminanda erunt, diſſolvantur, maceretur per 24 horas. Hoc ſi fiat, media frumenti ad ſementem pars ſufficiet, aratri duntaxat unius labor, neque ulla ſtercoratio neceſſaria erit etiam in terra ſterili. Frumentum inde uno ante meſſem menſe matureſcet, & ob ſalis terræ commixtionem, decennio conſervari poterit. Te hortor, ut porro huic negotio inſiſtas ac promoveas hoc Ceriale artificium. In the forementioned treatiſe you will ſee, how highly Dr. *Child* doth eſtimate this experiment. Since I have received a further enlargement upon it thus. *Nunc de ſeminum maceratione, cui ego multum tribuo, id addo, ſummopere cavendum ne in aqua calida multo minus ad ignem, macerentur & coquantur. Retulerunt mihi harum rerum gnari omnem vim ſeminis & fertilitatem perire, ſi coquantur, vel etiam aqua calidiore macerentur. Cauſam illi ignorabant. Exiſtimo autem hanc eſſe: virtus ſeminalis in ſale conſiſtit. Hic ſal liqueſcit & reſolvitur, adeoque aquæ calidæ miſcetur, unde granum ſale caſſum moritur. Quod ſi in illa aqua, cui grana incocta ſunt, poſtquam refrixit, recentia grana macerentur, attrahent ex aqua ſalem incoctum, & virtute creſcent. Unum enim granum ſal multorum, vi magnetica, attrahet. Unde etiam patet, cur grani-voracium ſimus ad fertilitatem commendetur, ſicut tu olim recte in tuis, quod vita media vegetativa & ſeminum in ſtercoribus illis reſtitet exaltata. Unde grana aliquo aeris vitio corrupta non ſunt abjicienda, etiamſi enim non conducant ad victum, tamen excocta vim ſuam reddunt aliis granis, æque macerata multiplicant.* Thus far learned Dr. *Horne*, profeſſor at *Harderwick*, who hath been lately called to *Leyden*. Sir, I thought to have taken my leave here of you, but that ſomething extraordinary of butter and cheeſe is brought to my hands, to entertain you withall. That is, how to make a better ſort of butter, without ſetting the milk for cream, practiſed with great approbation by Mrs. *Child*, in the iſle of *Ely*. The milk, ſo ſoon as it is come from the cow, muſt be ſtrained then churned; as uſually cream is done. Alſo the cheeſe made of the butter-milk will be better than the beſt two meal cheeſes, that ever was eaten. And one pound of this butter ſhall be worth a pound and a half of your beſt butter, which is made of cream. My poor wife hath been ſick unto death, but, by God's bleſſing upon the laudanum, the ſtrength of her diſeaſe was broke within leſs than three hours after once taking of it, which none of her kindred would have believed. She remembers her humble ſervice, with the reſt of her daughters and ſons. Sir *Cheney* complains more than ever, that his father hath utterly undone him.

If

If you find no letter here from my ſon *Clodius*, you muſt lay the blame upon the ſmith's ſhop in *Martin's Lane*, where he hath been all this day, with another workman, to prepare ſomething, which is to be an ingredient in that noble medicament of the Helmontian cinnabar, which he hopes to have in readineſs, if God permit, in leſs than three weeks time. But by the next poſt you may expect a large letter, in anſwer to your kindneſs, from his hands. The printed paper, here adjoined, was preſented, without any effect, to the publick truſtees of that affair. If the adder will not hear, yet, methinks, it is ſome comfort, that the charmers have charmed wiſely. I remain now and ever,

Dear Sir,

Charing-Croſs, Feb. 28, 165$\frac{3}{4}$. your moſt entirely devoted friend and ſervant,

SAM. HARTLIB.

MY moſt humble ſervice to the earl of *Corke*, and the lord *Broghill*: alſo to Mr. *Van Muſſig*, if he will be friends with me. I have not time to read over what I have written.

Dear SIR,

I PERCEIVE, by your laſt moſt welcome letter, of the 25th of April, that all my three former letters are ſafely arrived to your hands: your intended ſtay till the 24th of June is ſuch a paſſage, as pierces my ſoul, for divers very weighty reaſons and conſiderations, which is but bootleſs to name for the preſent. Nor dare I entertain your departing again from *Dublin* with any delight or ſatisfaction, in reference to our communications, which might have been more readily exchanged, if you had continued in that central place. But we muſt quietly ſubmit to a wiſer providence, than we can ſet up by our own deſires or affections, though never ſo ardent and ſincere. I hope you have received likewiſe the great packet, with the deſired Arminian books, which could hardly be gotten at the ſecond hand. The monies, which I laid out for them, I received again, according to your appointment. If I ſhould have apprehended ſo long a ſtay as to the 24th of June, I would have added ſomething elſe to the foreſaid packet, beſides five copies of the deſired interrogatories; to divers of which I have procured a ſufficient anſwer. It would much further that deſign, if every ingenious head amongſt you would take notice of whatſoever worth the obſervation occurreth in any place, that ſo by little and little we might perfectly come to underſtand the natural hiſtory of all the parts in that country. There are ſome things worth a philoſophical pen in theſe places, *viz.* How it cometh to paſs, that there are not frogs, toads, ſnakes, neither moles nor nightingales, rarely magpies? How ſome kind of fowls and beaſts we have not in *England?* as divers hawks, cocks of the wood, pintails, wolves, foxes, greyhounds wondrous large; as alſo divers plants and fiſhes. Farther, to enquire what truth there is, concerning the generation of barnacles, which much abound there. As alſo of divers things, which the Iriſh fooliſhly report of St. *Patrick*. Alſo it were worth the while, ſtrictly to examine their petrifying fountains, which are ſaid to abound in ſeveral parts, whether they tranſmute all woods, or only holly, as is commonly reported? Whether turf doth grow here much, and how? Alſo, concerning divers iſles, in one of which it is reported, a dog will not bite, and a woman cannot have children in. Alſo of lakes, ſome of which are accounted bottomleſs; another, at certain times, caſting forth yellow amber. Alſo concerning ſtones like birds, which, they ſay, St. *Patrick* turned into ſtone, for chirping when he was preaching. I am glad to hear, that Mr. *Worſley* alſo is like to engage in the proſecution of theſe affairs, and this kind of ſurveying of lands. Concerning the clover huſbandry, I am promiſed a ſpecial account, which you ſhall have, God willing, as ſoon as it comes to my hands, either in print, or a copy in writing. There is another renowned ſeed in *Brabant* and *Flanders*, which is as little taken notice of as clover was, before my books were divulged; it is called in Latin *ſpergula*, and in Engliſh ſpurry-ſeed; of which one writes unto me, as followeth. "The ſpurry-ſeed, which you have gotten "out of the low, grew, no doubt, in light "ground: and, accordingly, if it were mine, "it ſhould again be ſown in the lighteſt "ground I had; though, for trial's ſake, I "might, perhaps, beſtow a handful or two "upon every ſort of ground near me."

THE times of ſowing it are twice in a ſummer: the firſt time is not very early. I ſhould not adventure to ſow Dutch ſeed in *England*, before the middle of May, leſt being a ſtranger, it ſhould take it unkindly to meet with cold May mornings, and diſcourage me. In June and July it will be in flower, and in Auguſt the ſeed is uſually ripe. The ſecond time of ſowing is after hay-harveſt, when the *Brabant* huſbandman preſently ploughs up his ground, and ſows it with ſpurry-ſeed, that it may grow up, and ſerve his kine after all the late graſs and rowins be eaten up, even till New-years-day: ſo that this latter ſowing yields no ſeed, but is eaten up green, and the proviſion for ſeed is made by the former ſowing.

IT will be good in this firſt trial, to ſow it in ſeveral parts of the ſame ground, in different proportions, and to mark, which thrives beſt. As alſo, in the ſame ground, and with the ſame proportion of ſeed, to try the difference of encreaſe there is between the ſeed newly threſhed out, and thrown into new-ploughed ground, and that ſeed, which is at the ſame time a year old.

IT is ordinary in *Brabant*, to ſell away their May-butter, and to make their winter proviſion for themſelves, and their more

knowing cuſtomers, in the end of the year. For many of them prefer ſpurry-butter before May-butter. I ſuppoſe, the principal reaſon is, becauſe it is not ſo apt to grow rank, with that ſummer-heat, which May-butter muſt endure in June, July and Auguſt.

I HAVE known ſome *Brabant* huſbandmen ſow Kolls, that is, ſmall round turnips, among their ſpurry, in the latter ſeed-time, as being alſo good to encreaſe the milk in their kine.

SOME *Brabant* women give ſpurry to their hens, that will catch it from one another as they do chick-weed: they believe, that it makes them lay the more eggs. Spurry is by ſome eſteemed a ſure remedy for a cut, or green wound, if it be bruiſed green, and laid to the cut. Thus far of ſpurry-ſeed. I could give you likewiſe ſeveral accounts concerning la Lucerne, and St. Foyne; but my legacy of huſbandry being to be printed the third time, you ſhall find them all in that edition with the Anſwer of the late Dr. *Child* to the animadverter, Dr. *Boate*, upon his large letter of huſbandry, wherein there are divers excellent obſervations and experiments, which, by God's bleſſing, are like to enrich theſe nations, if their induſtry be not wanting. By that, which I read concerning Dr. *Child*'s huſbandries in the work of *Ireland*, I ſee what a good foundation of life he hath laid for that honeſt country calling. But I doubt the colonel cannot ſhew us any more obſervations or directions of his in writing, beſides what is extant already from his hand; though this would have improved clover, flax and woad, upon many more lands than his own. I have heard no more from Dr. *Horne*, ſince I have ſent him a pretty bulk of all ſorts of books. I ſuppoſe, he will give his judgment upon thoſe, that treat of this ſubject, as ſoon as he is ſettled at *Leyden*, whither he is called to the profeſſorſhip of hiſtory, in *Salmaſius*'s room, as I take it. I have ſeen lately a French book, much commended unto me, called, *Le Jardinier François, qui enſeigne a cultiver les arbres & herbes potageres. Avec la maniere de conſerver les fruits, & faire toutes ſortes de confitures conſerves, & maſſepains. Dedié aux Dames. Seconde edition. A Paris* 1651. Perhaps, this alſo was amongſt the books, which Dr. *Boate* commended for his georgical catalogue. I long to hear more news of that ingenious gentleman, between *Youghall* and *Dublin*, for advancement of theſe rural ſtudies. I like ſo well his character already, which you have given him, that I am much inclined to preſent him with ſome of theſe kind of books of mine, that they may be improved and enlarged by his pen, both from his great travels in the eaſtern countries of the world, as likewiſe from his eminent huſbandries in *Ireland*. The way to have roſes twice a year, is very pleaſant and fragrant, if it be ſo practicable, as you have deſcribed. For the lord *Digby* would ſay, ſpeaking of an ancient fair lady, that a roſe in Autumn was as ſweet as a roſe in June. But better travellers and naturaliſts relate, that the planting of roſes is but a late attempt in the *Weſt-Indies*, where they never grew afore; yet ſince they have been planted there, they have proſpered exceedingly, in a moſt ſurpriſing nature, for ſight and ſmell, above all our roſes. I am ſhortly to be acquainted with Mr. *Marſhall*, the great maſter of inſects in all *England*, as likewiſe of the planting of above thirty new ſorts or kinds of roſes, which are ſo lively and accurately repreſented, that three hundred pound ſterling hath been offered for that picturary, if he would have ſold it. The performance of Dr. *Van Muſſig*'s promiſe concerning ſaltpetre will be very welcome: but, not taking notice of this, I pray remember my true love and ſervice unto him. If he have any buſineſſes or commands to honour me withall, you may aſſure him, I ſhall approve myſelf always his ancient faithful friend and ſervant. The author of *Iſagoge Phytoſcopica* is Dr. *Jungius* of *Hamburg*, one of the beſt logicians in all *Germany*. For he conceives, if that art were truly underſtood and applied, not only botanical, but all other real ſtudies whatſoever, would flouriſh more than they have done ſince the fall of *Adam*. *Leges Collegii Protonoetici* came from the ſame forementioned author: but they will ſcarcely be underſtood, without the general draught of his philoſophical undertakings, which I ſhall impart unto you hereafter, God willing. In my laſt to Mr. *Worſley*, I gave him the contents of a certain treatiſe, called, *Viridaria Varia Regia & Academica publice in uſum magnatum ac philobotanorum collecta ac recognita opera & ſtudio D. Simonis Pauli S. R. Daniæ Andrei Aulici, Hafniæ* 1653. *In quo continentur*, 1. *Catalogus plantarum horti regii Hafniæ.* 2. *Pariſienſis.* 3. *Warſavienſis regis Poloniæ.* 4. *Oxonienſis.* 5. *Gymnaſii Patavini.* 6. *Horti academici Lugduno-Batavi.* 7. *Horti Groningenſis.* 8. *Catalogus tuliparum.* 9. *Laurembergii Botanotheca. Hoc eſt, modus conficiendi herbarium vivum.* All in one thick volume, in great 12mo. There came over but two copies only from *Denmark*. But a judicious friend of mine writes his cenſure upon it in theſe following words.

—*Viridaria regia Sim. Pauli perſuadeo mihi opus eſſe ad pompam verius quam ad uſum: cui bono quæſo variarum iſtarum plantarum nomenclatio, ſi certior earum et fundatior deſcriptio abſit? Et licet ejuſmodi nobis poteſtas, quemadmodum in prolixa horti Eichſtedenſis deſcriptione atque in herbariis præprimis nonnullis (puta Matthioli ſola ſe figurarum elegantia inſinuantibus) eſt videre, quid tamen præter inanem oculorum voluptatem lectori adferunt ſolidi? Niſi forte nobis una virtutes vireſque in cibo, potu, aliiſque diſtinctius et accuratius explicent? Sed quî hoc mihi pollicear de uno homine? niſi ut quis ſcribere libros animum intendat, & nobis denuo apponat, quod cum tædio ſumptum eſt. Unam unus medicus herbam deſcribat; res difficillima in mitiorem cogetur naturam, & ſic aliquando pleniſſimum rei botanicæ ſyſtema habebimus. Imo praxis reſpondebit theoriæ quam proximè, et erit chymico bono cui fidat in poſterum. Hodie aliud nihil quam ſcribunt & exſcribunt botanici, rariſſime*

me quod docent, quod ipſi experti ſunt, ut minoris merito emolumenti ingentia noſtra herbaria ſint. Verum eſt alicubi extant certa medicamina & infallibilia, ſed illapſa ſunt multis dubiis aliis quaſi involuta, & nequit nemo docere veritatem illuſtrius, quam quem ipſa fideliter docuit. Sed de hac re eſto domini Clodii judicium. Thus far a very learned friend, which agreeth with your judgment, which you have expreſſed upon this matter. I thank you for the intelligence given me of my lord of *Leiceſter*'s inoculating practices. I ſhall take more notice, from henceforth, of that garden for theſe, and his other pleaſant and profitable civilities and cultures. If we could have a true and faithful deſcription of all theſe kind of induſtries, which have been, with very vaſt charges and exquiſite ikill, beſtowed upon the famed duke of *Holſtein*'s garden, it would teach us yet more botanical and oeconomical leſſons. If I might be ſo bold, I ſhould be glad to know, what other curioſities Mr. *Worſley* hath communicated to you, beſides the moſt unprocurable part of *Glauber*'s ſecond furnace. Mr. *Morian* writes no more of him, or his other promiſed magnalia. A great abbot in *France*, intimately correſponding with Sir *K. Digby*, is ſaid to have other kind of furnaces than any of *Glauber*'s, which will be erected, ere long, amongſt ourſelves, to proſecute really philoſophical ſtudies. For you muſt know, that a general chemical council, not far from *Charing-croſs*, ſits often, and hath ſo behaved itſelf hitherto, that things ſeem now to haſten towards ſome ſettlement; and we, poor and ſickly creatures, begin to conceive hopes of being able ſhortly to ſupport our burthens. As for Mr. *Clodius*'s philoſophical wonders, if they were in my hands, or poſſeſſion, you ſhould ſoon be an eye-witneſs of them, though you were at this diſtance. But my chemical ſon aſſures me, they are fitteſt to be reſerved to that happy converſation, which is ſo much prayed and longed for on both ſides. In the mean time, though the great medicinal arcana be not yet prepared, he hath done, with God's bleſſing upon certain ſpecificks, ſo many and ſtrange cures already, as are counted no leſs than miraculous; or, to uſe Sir *Kenelm*'s words, conjuring. They are about an univerſal laboratory, to be erected after ſuch a manner, as may redound, not only to the good of this iſland, but alſo to the health and wealth of all mankind. I ſuppoſe you have heard, how that Sir *Kenelm* is in very good favour with the lord protector; his ſequeſtration is taken off, and as ſoon as he hath gotten his lands into his own poſſeſſion, (which will be ſuddenly) he ſpeaks of engaging ſix or ſeven hundred pounds for his own part in the foreſaid laboratory, beſides ſome other friends, which he can procure. He proteſted ſeriouſly unto me, that in all his travels and converſes with the choiceſt wits, both in Italy and France, he hath not met ſo much of theoretical ſolidity, and practical dexterity, both together, as he finds in my chemical ſon; and therefore is reſolved to improve that prize accordingly, which providence hath brought to his hands. He hath many excellent ſecrets and experiments of all ſorts, yea, ſome arcana of the higheſt nature, which he hath already freely (yet *ſub fide ſilentii*) imparted into his breaſt; and is purpoſing to ſend for all his papers out of *France*, that he may put them into his cuſtody and management. Both their judgments and experiences agree mightily together, to the very amazement of each other. And there wants nothing to the perfecting of the grand deſign, but that you are not preſent with them, without whoſe intereſt we have no mind, that it ſhould be conſummated. In the mean time, he hath been inſtrumental to ingulph my ſon with the practice of phyſick into ten or twelve families of the greateſt of his acquaintance, which take up ſo much already of his time, both day and night, that he hath no leiſure to devote himſelf to your ſervice, and deſires of correſponding with you, or making out of the better ſort of phyſicks, with ſome of the much deſired and longed for arcana. He hath written for an expert ancient old laborant, which hath lived with Mr. *Morian*, who is like to be here very ſhortly, now the peace between both commonwealths hath been proclaimed ſo many days ago. The laborant alſo is very much commended for his mineral ſkill in divers reſpects. My ſon aſſures you, that he will not fail to prepare the ludus after *Helmontius*'s way, as ſoon as it is poſſible. The rare medicine for curing the gout is yet but extant in the recipe or proceſs, which Mr. *Morian* got from *Coen*, and hath ſince communicated to Mr. *Clodius*, who promiſed to ſend ſome other medicines, which are ready, by the firſt occaſion, as you have directed. The famous lithotomiſts courſe for the ſtone is very welcome, but is counted no great jewel by my ſon. Sir *Kenelm* commends hugely the medicine of the *virga aurea*, which *Barcleius*, in his *Euphormio*, hath ſo remarkably diſcovered to the world, though little taken notice of, in compariſon of thoſe few, which have uſed the ſame with admirable ſucceſs. I am now endeavouring to get the ſight of the forenamed book, and, by my next, God willing, you ſhall have a tranſcript of it. The greateſt ſecret you ever knew in ſurgery, which you mention, as imparted and encloſed in Mr. *Clodius*'s letter, was not found in it. I hope it is not otherwiſe miſcarried. That of the lithotomiſts to me, was found in the company of your deareſt ſiſter, which ſhe faithfully delivered unto me, not knowing how it was come into the letters written to herſelf. I beſeech you, Sir, do not forget to ſend in your next the forementioned ſecret, with thoſe other chirurgical rarities, which you have made a ſhift, as your phraſe is, to poſſeſs yourſelf of. The rare chirurgical ones, which I have purchaſed of late, are contained in the adjoined printed paper of Mr. *Morian*'s communication, which Mr. *Van Muſſig* can interpret. The chirurgical ſeveral oils, therein mentioned, are ſent unto me by the forenamed laborant; of which I

ſhall

ſhall give you farther notice, when they are arrived. The peace with the Hollanders doth no leſs rejoice us, than it doth thoſe nobler ſouls in *Ireland*. To further the philoſophical commerces therefore, in ſome meaſure, I am intending ſhortly to write to the poſſeſſors of the late Dr. *Boate*'s papers, to publiſh thoſe in print beyond the ſeas, which contain the Natural Hiſtory of *Ireland*, written in Low-Dutch originally, as he told me in his life-time. For I ſuppoſe, this may be one means, whereby *Ireland* may be peopled again, and get good tenants; eſpecially, if the other parts, which are wanting to that hiſtory, were more particularly diſcovered and deſcribed. *Coen* hath neither *England* nor the *Low Countries* made happy by his laſt viſits. For Mr. *Morian* hath written twice, that he is arrived at *Hamburgh*, where he hath found, that other *Faber*, which was before engaged in ſome mineral and chemical works. But ſince they have been together, the good man at *Amſterdam* complains, that both of them have been (to uſe his own words) *magis muti quam piſces*. If he knew, that my ſon hath lately gotten from ſome other hand his greateſt myſtery, I dare propheſy, he would not be ſo long ſilent and ſuſpenſe, as hitherto he hath been. I read with ſome pleaſure, that Dr. *Petty* and yourſelf have lately been making fine diſcoveries in anatomy. The ingenious doctor told me, divers months ago, of certain muſical and dialling anatomies, invented by him. But becauſe I have heard nothing more of them, a farther diſcovery from your hand will always be very welcome. There are other fine diſcoveries made by the Bohemian baron *Miſneck*, lately ſent to this commonwealth from the duke of *Courland*, whereby both watches and dials will ſuffer much, if he can make good his invention. The diſcoveries are as yet made only to a few of his moſt confiding friends. Only I have learnt in the general, that he can make a moſt exact and perfect dialling uſe, as I may ſo call it, from the knowledge of the circulation of blood in a man's body, if I have been rightly informed. If I could have gotten a copy of two pretty large volumes, lately brought over by a gentleman of ſingular quality, and who lodgeth in the beſt room of my houſe (for ſo much my chemical ſon doth love and honour him) at this preſent; I would have ſent it into *Ireland*, to put it to a trial, whether you could find any more of theſe fine diſcoveries, which you promiſe to impart at more leiſure. The titles of them are theſe. *Thomæ Bartholini Vaſa Lymphatica nuper Hafniæ in Animantibus inventa. Et Hepatis Exequiæ*, 1653. 2. *Ejuſdem Dubia Anatomica de Lacteis Thoracicis. Et, an Hepatis Funus immutet Medendi Methodum*, 1653. 3. *Ejuſdem hiſtoriarum anatomicarum centuria* I. & II. 1654.

FROM *Upſal* in *Sweden* was likewiſe ſent unto me ſomewhat, which I have not imparted to you, for ought I can remember: it is called, *Nova Exercitatis Anatomica. Exhibens Ductus Hepaticos aquoſos. Et Vaſa Glandularum ſeroſa. Nunc primum inventa aereiſque figuris delineata. Ab Olao Rudbeck Sweco, Cui acceſſere aliæ ejuſdem Obſervationes Anatomicæ.* Thus you ſee what the Daniſh and Swediſh world is attempting and tranſacting in theſe affairs of learning. I wiſh, that Dr. *Petty* would ſhew himſelf to the world by ſome rare piece or other. For ſince the non-performance or non-divulging of the invention of his double writing, his credit is mightily impaired in *England*, and other nations, which have heard of it. Thoſe, that know the way, which Mr. *Wren* doth uſe, ſay, his art of double writing is not worth a ruſh; for it can never be readily practiſed. Honeſt Mr. *Dymock* is blamed almoſt by every body, though the fault, in my judgment, be as much, if not more, in them, that blame him. The earl of *Worceſter* is buying *Vaux-hall* from Mr. *Trenchard*, to beſtow the uſe of that houſe upon *Gaſpar Calehof* and his ſon, as long as they ſhall live; for he intends to make it a college of artiſans; which, if it go forward, I ſhall get Mr. *Dymock* into it, though I had rather he ſhould ſuperintend a college of huſbandmen, whenſoever it can be founded. Yeſterday I was invited by the famous *Thomas Buſhel* (for I ſuppoſe you have ſeen his *Mineral Overtures* in print) to *Lambeth-Marſh*, to ſee part of that foundation or building, which is deſigned for the execution of my lord *Verulam*'s *New-Atlantis*. I make no queſtion, your deareſt ſiſter hath written to you of Mr. *Dury*'s going into *Germany* with Mr. *Pell*. Since his departure, I have printed a treatiſe of his, concerning a body of practical divinity, to be compiled out of Engliſh authors, which is very worth your reading, and therefore ſhall ſend you ſome copies of it. *The Political Viſion* be pleaſed to tender, with my humble ſervice, to your noble brother, the earl of *Corke*. Thus, begging your pardon, for giving you ſo tedious a trouble, with my large ſcribbling, and preſenting again the humble and faithful ſervices of my wife, ſons, and daughters, I profeſs myſelf unfeignedly,

Dear Sir,

May 8, 1654. your moſt affectionate,
and moſt obliged
humble ſervant,
SAM. HARTLIB.

Dear SIR,

MY laſt was dated the 9th of *May*, which was a very huge, if not voluminous anſwer to your laſt of the 21ſt of *April*, with a ſhort letter alſo from my chemical ſon. Yeſterday I ſent you a packet, wherein were 15 copies more of the interrogatories for *Ireland*, two copies of Mr. *Dury*'s laſt treatiſe concerning a body of practical divinity, and an Helmontian manuſcript, which Mr. *Clodius* had lent to Mr. *Morian*. I cauſed it to be tranſcribed out of the original, which is very faulty in divers places, ſo that ſcarce any ſenſe can be made of them; but I fear

the tranſcript is much more faulty, which I had not time to read over, leſt I ſhould have neglected the preſent opportunity of ſending packets. The title of the foreſaid manuſcript is, *Magna virtus verborum et rerum*, about five ſheets of paper. I ſuppoſe Mr. *Clodius* will be able to ſupply the defects, who was fully reſolved by this very occaſion to have ſent you ſome of his medicaments, but that the beſt of them, which is now preparing, could not be ready. But he hopes it will be done within ſix or eight days, God willing, and then he purpoſeth to ſend it with the firſt, with a proof of his other phyſical preparations, which he counts not ſo extraordinary. In the mean time I cannot but tranſmit this way the high reſpects, which he beareth towards your own perſon: for S^r. *K. D.* of whom I have written ſo largely in my laſt, being yeſterday morning with me at my own houſe, and preſſing moſt earneſtly the accepting of his generous offers towards my ſon (for a plentiful proviſion of himſelf and family for two years, with the furniſhing of a complete laboratory) I would give him no other anſwer, but that I would acquaint Mr. *Clodius* with his reſolves, leaving him to the freedom of his own determination. He hath not yet been with S^r. *K.* but when I related the matter unto him, before I could paſs my opinion upon it, he replied—*Timeo Danaos ſua dona ferentes*—I will determine nothing before Mr. *Boyle* be arrived. For whether his eſtate will ſuffer him to contribute little or much for the carrying on of all our phyſical and chemical affairs and deſigns, he alone is to be entruſted with a full and entire communication of them all and others, as we ſhall adviſe amongſt ourſelves. He ſaid indeed, that S^r. *K.* was as gallant a gentleman as ever he had met withal, but yet he could diſcern rather gallantry than goodneſs in the frame of his ſpirit, and of all his actions, both which he had found ſo eminently and ſuperlatively in your own converſation. For my part, I was more thoroughly gladded (if you dare believe me) with this ſolid judgment and affections of my ſon, than with any treaſure of knowledges and experiments, which he ſeems to poſſeſs or to purſue. After he hath conferred again with S^r. *K.* he will, it may be, teſtify, under his own hands, theſe very reſpects unto yourſelf. I have found that paſſage concerning the cure of the ſtone, which the gallant knight ſo highly extolled, in *Barcl. Euph.* Satyr. p. 1. of a *Leyden* or *Amſterdam* edition in theſe following words.

—*Statim notiſſimam herbam oculis meis ſubjicit Æſculapius, quæ calculo bellum indixit multo felicius, quam aut veratrum amentiæ, aut vulneribus Aſciros. Hæc lanceatis foliis piloque ita brevi, ut pene curioſos oculos fallat, crenis denique tenuibus, et ſæpe in obtuſam ſpeciem oras ſecantibus, mediocriter aſſurgit. Radix cauliſque lignea ſubtiliora ſuccam in herbam transferunt. Planta ad ingenium terræ nunc cubitalis, plerumque eminentior, inſigne faſtigium floribus ad examen turgentibus cingit; et virgæ aureæ eſt nomen, ſive quoniam aureæ ac pæne divinæ virtutis eſt, ſive quod præſtantis metalli colorem exigui floris venuſtas æmulatur. Cæterum contuſum in renibus calculum in innoxium pulverem ſolvit. Non in latere, non in veſica dolor; adeo ut tam facili remedio pudeat calculum timuiſſe. Et enim in hyemem ſiccatur æſtivis umbris planta, et ubi gravitas lateris coeuntem morbum præſagit, aureus pulvis ad drachmam mere delibutus ſumitur, ſive ovo liviſſime cocto permixtus. Sed mihi non erat ad manum tam prætioſus pulvis. Itaque recentem adhuc herbam jubeo Fibullium mandere. Nihil eo die viſum eſt ad morbum feciſſe medicamentum: ſed biduo deinde repetitum, ſupra fidem eſt, quam egregie refellerit acerbiſſimum morbum: ſordidus pulvis abunde veſicam exonerabat, cænoſumque ſaccharum pæne ſanguinis imagine pingebat. Jam ventriculo robur redierat, jam corpori toti vigor, et mihi ad perfectionem artis medicæ ſola deerat laurea et emptitii teſtimonii liber. Hactenus Berclaius.* If Mr. *Clodius*'s laborant come in time, I ſhall endeavour to get this phyſick alſo prepared after his better way. By the laſt poſt I got from a counſellor's hand of the elector of *Brandenburg* theſe lines.

—*Inviſit me heri quidam nuperrimè Ratiſbona profectus, qui ibidem ſingularem junioris Helmontii notitiam habuit. Is probitatem ac beneficentiam ejus inſigniter deprædicabat, eumque apud Cæſarem electorem Moguntiacum, alioſque principes, et in ſublimi gradu conſtitutas perſonas, magna verſari in authoritate, mihi referebat, quamvis ipſis Germanam veritatem rotunde dicere non dubitaret. Aulici vero ſtatus tædium omnino eum jam tum percepiſſe, ſolitariamque vitam agere decreviſſe. Ratiſbonæ commoratum, inſignia ſibi veſtimenta conficienda curaſſe, ut hoc ipſo eo commodior ad magnates ſibi pateret aditus. Cum vero locum mutaret, diſceſſumque pararet diſtributis aliiſque dono datis magnificis ac pretioſis iſtis veſtibus, inveteratam rubri coloris togam pelle ſeu corio ſubductam, propriaque manu ſarcinatam (cum non ſolum ſartoriæ, ſed ut reliquarum ferme artium omnium peritus ſit) induere, iterque ſuum plurimum pedibus perficere. In egenos ac neceſſitate preſſos valde eſſe munificum, ſiquidem Ratiſbonæ aliquem, qui ſolvendo non erat, ne infamiæ notam ſubiret, aliquot centum imperialibus ex diverſorio redemit, neſcientibus cæteris, unde tantæ fuit particeps pecuniæ. Curare hinc inde pauperes ancipiti et acuto morbo laborantes. Artem vero aurificam omnino eum repudiare, ludibrioque habitos chemicos hac de cauſa literis eum inviſentes auriperdas vocare.* The letter is dated the 5th of May, 54. Another counſellor of the ſaid elector, who lodgeth in my houſe (as I intimated in my former) tells me of an antimonium roſatum, which he had ſome years ago to ſmell unto, as far ſurpaſſing roſes and other curious odours. Alſo that he had been very credibly informed of another of his acquaintance in *Germany*, which has had aurum roſatum yielding a far more tranſcendent fragrancy, than that of antimony. If gold could be made thus vegetable, really I ſhould prefer it before the producing of the beſt roſes twice in a year. I fear I ſhall not be able to keep that worthy forenamed gentleman, who for my ſake (for ſo he is pleaſed to phraſe it) is come into *England* for a ſhort time, ſo

long till your happy arrival. But having begun to take the next and beſt courſe, I could have made him acquainted with your deareſt ſiſter, who perhaps will give you ſuch a character of him as he deſerves. He preſents alſo his moſt humble ſervice unto you. There is another, an Engliſhman, that hath been ſpecially recommended unto me by Sir *K. D.* His name is captain *Saunderſon*, who hath been of the king's party, but intends now to ſettle himſelf with his family in *Ireland*, where he hath purchaſed land to the value of 200*l.* a year. I have devoted him likewiſe after a ſpecial manner to your ſervice. For I find him a very pretty gentleman, full of good arts and contrivances, but his main deſign is by a new experiment or ferment to make as much ſaltpetre, as you pleaſe out of ſalt or ſea-water. When my chemical ſon ſpoke with him, he confeſſed, that he had hit right on his ferment, which was his ſecret. I long for more letters from your hands, that they may furniſh me with occaſions of enlarging myſelf, and of gratifying your more particular deſires. Here you have a rude draught of Dr. *Jungius*'s Protonoetical Philoſophy, which as it lyes in a pack bound about with ſuch coarſe expreſſions and terms as he uſeth, makes no great ſhew; but if it were fully opened, a great deal would appear to be rich cloth of Arras. This is the judgment or opinion of your,

Dear Sir,

moſt entirely aſſured

faithful friend to ſerve you,

SAM. HARTLIB.

FROM my houſe (which deſireth to have their moſt humble ſervice preſented unto you) near *Charing-croſs*, May 15, 1654.

---

* * * * * But before I ſhut theſe, I purpoſe to ſend to him for his anſwer to your laſt letter, to incloſe it in mine. Mr. *Morian* writes again of *Glauber*, that he hath had a very dangerous fall from a waggon, ſpitting much blood, and if the fever prevail upon him, he fears his life; which I pray God may be yet continued, for giving many good hints, at leaſt to the ſtudiers of nature and arts. For, *Deus varie colit hunc mundi hortum & velut per areolas*, as *Lipſius* ſpeaketh. Laſt Friday, the ſad news was brought to my lord protector, of the death of that truly gracious, learned, and incomparable primate of *Ireland*, of whom, no doubt, you will hear more particulars from others. In my laſt I ſent a wrong letter for Mr. *Auſtin*, *A Monſieur Tugontloben*, which I deſire may be returned; for the gentleman, I hear, is gone to the duke of *Holſtein*, and I am to ſend this letter after him. I ſhall count it true civility in him, if he ſhall acquaint me with the proceedings of *Coen* from thence, according to my inſtructions. For hitherto I have been able to learn nothing, but that that chemical and experimenting man hath ſpent vaſt ſums of monies out of the foreſaid duke's purſe, and that he hath brought nothing yet to perfection. But my ſon is greatly to blame for not writing to him ſo courteouſly as he is bound to do, according to that of the apoſtle's, "in honour preferring one "another, *&c. &c.*" The adjoined is the true letter to Mr. *Auſtin*, as doth appear by the ſuperſcription. Sir *Richard Napier* can bear witneſs, how I waited two ſeveral days to have ſpoken with my lord protector, but could not. That good and induſtrious ſoul will not be perſuaded of our dulneſs and untowardneſs for peopling of *England* with fruit-trees. Be pleaſed to let him know ſo much, and that Mr. *Batchelor* of *Eaton*, and Mr. *Langley* of *Pauls*, have promiſed to ſecond our applications with all their might and intereſts. When you are returned, God willing, you muſt needs make a viſit alſo into *Kent*, to colonel *Blunt*'s ſeveral plantations, which will as much delight your obſervations. For I dare believe the well-grounded relations, that have been made unto me, from time to time, of all his choice oeconomical and georgical induſtries. If we cannot help Dr. *Horne* with that true and excellent ſpirit of vitriol, for the preſent, yet I believe a good account of Sir *K. Digby*'s MS. at *Oxford* will be obliging in the mean while. There is lately a very accurate and full catalogue made of all the MSS. in the ſeveral colleges of *Cambridge*, which I wiſh might be communicated in print; for I ſuppoſe there may be ſome chemical, phyſical, medicinal, and mechanical amongſt them. I am writing to Mr. *Brereton*, for the birch-water; for I remember he told us laſt year, that he could procure a great quantity of it out of *Cheſhire*. In my great paroxyſm I uſed it very much, but found no benefit by it. Mr. *Schlezer* preſents again his moſt humble ſervice to you. He bids me to tell you, that he hath an excellent nephretical ſtone, which ſhall be at your devotion, when you pleaſe to call for it. I thought to have mentioned ſomething concerning a very conſiderable huſbandry, laſt week imparted unto me, but I dare not weary your eyes or ears too long; ſubſcribing myſelf ever,

SIR,

your entirely faithful

Charing-Croſs, March 25, 56. and moſt ready friend,

to ſerve you,

S. HARTLIB.

Honoured SIR,

YESTERDAY I received your laſt, ſignifying your return to *Oxford*. I pray God, that your health may be continued and encreaſed, that it may be inſtrumental for the good and refreſhment of many. I am ſtill extremely full of pains, and have much ado either to write or to do any thing elſe. But if the Lord would diſcover the like powerful

remedy againſt the inward piles, as he has done againſt the ſtone in the kidneys by a new medicine of my ſon *Clod* (which he is reſolved not eaſily to impart, and always to diſguiſe under ſome other name,) I ſuppoſe I ſhould draw near to a perfect cure. Above all recipes and medicines Dr. *Gliſſon* has commended to my ſon that of the lieutenant of the *Tower* againſt the piles. I expect my ſon every day, and if the aforeſaid doctor has had any of thoſe ſuppoſitories in readineſs, I hope he will bring ſome of them along with him. In the time I need not tell you, that the moſt learned famous Engliſh Æſculapius (I mean Dr. *Harvey*) is departed this world. I expect your cenſures, obſervations, and communications, upon my former letters. Here you have a vindication of the decaying clover-graſs, written and ſent unto me by Mr. *Wood* from *Dublin*. If you could furniſh me, I would ſay it were very fit, that ſome directions were publiſhed concerning clover-graſs, as proper to take off the prejudice that is of late againſt it, and to inform punctually, in what ſoil it is an improvement, and in what manner it is to be uſed.

As firſt, It may be laid down at a certainty, how deep the root deſcendeth; where it proves beſt, and where it is indifferent, and where it faileth to be an improvement, for want of due depth.

SECONDLY, How it proves in a ſtiff clay land, or wheat land; how in a hot ſandy rye land; how in a very ſtony land; and how in a chalky land, *&c.* and in which kind of ſoil it laſteth longeſt.

THIRDLY, It may be laid down, what beſt uſe may be made of the ground, when the clover decays.

FOURTHLY, It ſhould be carefully advertiſed, how it is to be uſed; for ſometimes it hath been ſeen good, and yet come to nothing, by many kinds of miſcarriages.

IF the cattle bite it the firſt year, ſome therefore will deſtroy, and ſome they will pull up by the root; and ſometimes, the ſecond year, it will be rooted up, eſpecially after moiſt weather, and after a long drought; if it be bitten, it will die; and if it be mowed in unſettled weather, it will ſoon be tainted; if it be ſuffered to be too far ſeeded, before it be mowed, it will be like hard ſticks, too coarſe for moſt kind of cattle. We want clear directions, how we may follow the cuſtom of *Flanders*, to decline all theſe inconveniencies. I long to ſee what has occurred to you in your journey. To me, of late, out of *France*, have occurred theſe following lines.

" In paſſing by *Tours*, and hearing there " of certain ſtrange engines, by which they " water the tabbies and mohairs, we went to " ſee them, and found it an excellent inven- " tion, brought out of *Italy*, from *Luca*, by " the father of him, that hath at preſent the " chief workmanſhip thereof, named, mon- " ſieur *Chauma*. I wonder the engine is no " more taken notice of, nor the uſe thereof " brought into *England*; which certainly " might eaſily be done, by ſuch as are ſkilled " in mechanicks." Thus far a travelling friend. I ſhall tell this Dr. *Kuffler* (whom I have not ſeen theſe fourteen days) of your intimations to tell ſtrange ſtories of the benefit to be made by the watering of land. I ſuppoſe you remember the great expectations I have of the Quaker of *Durham*, *Anthony Pierſon*, his promiſes of huſbandry. I have not yet obtained any thing from his hands; but major general *Lilburne* pretends to know his Univerſal Compoſt; and a friend of his was pleaſed to entruſt me with it, in theſe words. " Plough up your barren ground, " and croſs-plough it, as they uſe to do thoſe " lands, which they burn for bate or betting. " Then gather the turfs, and lay the firſt " courſe of turfs (*e. g.* of two yards ſquare, " the graſſy or heathy ſide upwards) and " ſprinkle upon it a ſmall quantity of un- " ſlacked lime. Then lay the ſecond courſe " (leſs than the firſt) with the green ſide down- " wards, upon the lime; and ſo build up " your heap. Let it lye half a year thus. " If you will ſow winter corn (as wheat or " rye) upon it, let it lye from ſpring to ſeed- " time. If you ſow barley, *&c.* let it lye " from autumn to ſeed-time. The beſt time " to turn it up is, when it is moſt moiſt; " for that will make the lime run and burn " the better. A greater quantity of lime, or " laid in any other manner on the land, burns " out the vegetable ſalt, and ſpoils it, as is " experienced in the Weſt by colonel *Monck*. " When it hath lain half a year thus, it will " be ſo mellow, that it will run like aſhes. " Then ſpread, harrow, and ſow it. If it " want depth of earth, upon the harrowing, " to cover the ſeed, plough it again." Thus I have diſcovered unto you, that magnet of huſbandry, without any reſerves; for I am very ambitious to ſhew myſelf, upon all occaſions,

Honoured Sir,

Charing-Croſs, June 30, 1657. your moſt humble and ever faithful ſervant,

S. HARTLIB.

Aug. 4, 57.

Honoured SIR,

LAST Tueſday, July 29, I wrote largely, encloſing a great packet from *Ireland*, and ſomething of weather-glaſſes, which I thought would have been very welcome unto you; but I have not had one line from you, whether they have been ſafely delivered or not. The encloſed I got yeſterday by the poſt from *Ireland*, with a letter from Mr. *Worſley*, dated at *Holy-head*, July 29. He preſents his moſt humble ſervice. I am told again —As oft as you commend heath, you may do well to put them in mind of adding ſome cordial plant, as ſage, or balm, which will add ſome help, to keep the drink the longer. And you may put them in mind of Roman wormwood, which agrees with all the months that

that have *R*, as for oiſters. We (in *Hereford-ſhire*) begin to plant it, a little of it does much towards the preſervation of the beer. But that heath begets madneſs, is againſt our long and conſtant experience; and how can it be ſo, it being apparently a releaſe to a hard ſpleen, as perfectly as tamariſk? But I inſiſt upon the neceſſity of adding ſome other cordial herbs, to prevent the drink from ſourneſs. In *Herefordſhire*, as a powerful preſerver, they bake wormwood in a loaf of coarſe bread, and break this bread very ſmall into the ale or beer. They ſay it does much pleaſe the taſte, and preſerve the drink. You may ſmile at it, but my witty neighbour, to encreaſe the ſtore of his Roman wormwood, pleached it down in the way of propagation, and it ſucceeded in great plenty. I reſt ever,

Honoured Sir,

your moſt faithful

and aſſured ſervant,

S. HARTLIB.

Honoured SIR,

ON Monday I received your laſt, of Aug. 29, but could not anſwer the ſame, (by reaſon of divers commiſſions and letters, which my lady had laid upon me) on Tueſday next, but ſent only under a covert one from Mrs. *Drury*, and another from Mr. *Worſley*, which alſo by the laſt poſt I received from *Ireland*. It ſeems, that the 26th of Aug. (which is the date of his letter) he did not yet know of the council's order, which my ſon hath ſent unto him. For, beſides that to yourſelf, he ſends another to my lord deputy, and is very earneſt, that it may be ſeconded. But, on Tueſday laſt, I told my lady, that the buſineſs was not only fully paſt the approbation of the council, but likewiſe his highneſs's conſent; ſo that what remains muſt now be diſpatched in *Ireland*. My ſon believes, that the foreſaid order will give Mr. *Worſley* ample ſatisfaction. I am more troubled at your weakneſs and diſtempers, than at my own pains, which rather, God be thanked, diminiſh, than encreaſe. The ulcerous matter is likewiſe no more ſo diſcernible, as it was for divers weeks before; but every day almoſt there comes away little pieces of ſtones, whereby my ſon *Clodius* concludes, that the ſtone is diſſolving. Mr. *Van Muſſig* ſhewed me his doctoral charter; but alas! this will cure no diſtempers nor diſeaſes. Within two or three weeks he is going for *Ireland*, preſenting his humble ſervice. As for the elixir proprietatis, he is very poſitive and peremptory, that there is no better comforting cordial in the world, for weak ſpirited, or aged people. Truly I have found it ſo hitherto, without any inconveniency at all. The publick adviſer of this work gives this following advertiſement. "Next unto "*Vaux-hall*, in *Lambeth*, liveth one *Thomas* "*Smart*, an artiſt, who, conſidering the ne- "ceſſity of the times, and alſo being moved "thereunto by divers pious and godly mini- "ſters, for the welfare of this nation, doth "hereby ſignify, that he hath one medicine, "which, by God's bleſſing, perfectly cures all "gripings of the bowels, looſeneſſes, bloody "fluxes, and their kinds. Alſo another me- "dicine, that is a ſpeedy and perfect cure for "epidemical, feveriſh, and aguiſh diſeaſes, "that now ſo much annoy. The medicines "are ſafe, not unpleaſant to take, and for one "half crown, as much as will be ſufficient for "one perſon. *Probatum eſt.*" Thus far the adviſer. Do you believe theſe medicines? Some weeks ago, Dr. *Broome* told me himſelf, what a wonderful cure he hath performed on Sir *James* (as I take it) *Cunningham*; but, poor gentleman, is brought over-againſt my houſe, where he is to be cut of the ſtone, within a day or two. Dr. *Walter*, at *Hamburg*, writes very ſubſtantial and experimental letters to my ſon. I adviſe him to entertain carefully a ſtrict and faithful correſpondence with ſo able and ſucceſsful a phyſician. I had a curſory reading of one of his letters, wherein he commends hugely eſſentium cervinum. Yeſterday I had from *Tunbridge* theſe following lines.

"It hath pleaſed God to viſit me with a "long and laſting ague, which gives little "intermiſſion for ſtudy. I have had a relapſe "or two, and, after them, ſuch immoderate "ſweats, at night, as have conſumed me to "ſkin and bones. For the ſweats, the phy- "ſician and I am not pleaſed; only the laſt "week, by God's good providence, a gentle- "woman, who came to viſit me, aſſured me, "upon her own knowledge, that two perſons, "viſited with this late ſickneſs, and by ſweats "likewiſe brought into a conſumption, "have, within a fortnight, or little more "time, recovered, and are now alſo grown "fatter and healthier than formerly, by the "only uſe of the Turkiſh drink coffee. The "one of theſe perſons thus cured was a young "gentlewoman, and the other an ancient "gentleman; and of the truth of this I doubt "nothing, the authors being all perſons of "quality and credit. Upon this, I was ear- "neſtly preſſed to ſend for a bottle; and ſo "I had one laſt week; and though I have "taken it but three mornings, yet I find my "ſtomach more clean, and ſtronger to digeſt, "my brain clearer, and my ſweats ſomewhat "abated. And I am the rather convinced "of the efficacy of it, becauſe, as my lord "*Verulam* commends it, it is the Turks wine; "and they, as I underſtand, are generally heal- "thy, ſtrong, fat, and big men. And as "their chief feeding is rice (which alſo I find "a great nouriſher, and amongſt the variety "of meats provided for me, I am weary of "them all but this) ſo their chief drink is "coffee, at which they tipple, with a fool "to make them ſport. Now, Sir, the intent "of this relation is not to inform you, either "of the drink, or berry it is made of (of "which I have taſted, and find the drink to "have its only taſte without other ingredient) "or the virtues of it; to all which I be-

"lieve

" lieve you are no ſtranger; but only give " you in this teſtimony, that you may ſpread " its benefit towards this new diſeaſe, which " I hear is with you; and not only in theſe " parts, but elſewhere, in *Oxfordſhire*, *Norfolk*, " in *Hampſhire*, *&c.* whereſoever an epide- " mical diſeaſe uſeth to rage in the inlands " and ſea-coaſts by us, *Rocheſter*, *Dover*, *Rye*, " *&c.* Another purpoſe of this paper is, to " beg of you ſome of the freſheſt berries, " which may be had of ſome Turkiſh mer- " chant, with his directions to make it drink; " which, if it may be had, I know you may " command; and this for my own recovery. " I have ſent now for another bottle, and it " will laſt me a week more; but, to ſave this " trouble, I beg yours, and hope they will " ſpare of their ſtore, and diſcover the uſe " of it to one, who intends no gain by it. " Sir, now I am upon this ſeeking for cor- " dials (which daily I take, to ſupport my " ſpirits in this weakneſs) I find in the Ara- " bian cordials in our *Pharmacopœia*, in An- " dromachus or Venice Treacle, a great quan- " tity of raw ſilk; ſome of which I deſire " of you likewiſe, if you can direct me with- " al, whether it hath any correctives, or " may be taken alone, as I find it preſcribed " by *Culpepper*. I ſhall once more trouble " you for eggs of the worm. For here we " have trees, and I intend to plant more. " But of this not at preſent." Thus far a publick-hearted learned friend. Sir, do you know whither to addreſs me for the B* berries? I have written to know what will pleaſe the ſecret-monger. Mr. *Wood* tells me of a rare one for a new kind of graffing of vines, which he hopes to attain, and to communicate to me. If you have peruſed my diſcourſe concerning *Ireland*, I deſire ſtill your impartial opinion about it. Since my laſt I have not ſeen Dr. *Kuffler*; but when I do, I ſhall acquaint him with what you have written, being upon this, or any other occaſions,

Honoured Sir,

your moſt aſſured

faithful ſervant,

S. HARTLIB.

JUST now Mr. *Dalgarno* is come to my houſe.

Sept. 8. 57.

Honoured SIR,

NOT only Mr. *Dalgarno*, Mr. *Morſtein*, Sir *Charles Culpepper*, but alſo another Polonian gentleman have kept me ſo long, that I cannot enlarge, having ſeveral things, which muſt alſo, by this very poſt, be imparted to *Ireland*. The one of the encloſed I received by the laſt poſt from thence, and the other from *Saumur*. Dr. *Van Muſſig* purpoſes to go to *Oxford* on Thurſday next. He triumphs to have lighted upon a ſpecial ſecret, or medicine (*multorum morborum curativum*) at *Amſterdam*. But I durſt not aſk the receipt of it, he prizing the ſame at ſo high a rate; or, it may be, he ſuſpects me, as if I would communicate the ſame into your boſom, and therefore reſolves rather to gratify you with it by his own hands; at which kind of charity, or ambition, I ſhall never be offended. If he make no offer, I pray uſe freedom to ſignify to him, that I have intimated ſomething unto you, concerning a ſpecial medicine, which he rejoices to have found at *Amſterdam*. I received a letter for Mr. *Oldenburg*, which ſhall be ſent by the next poſt, with all care and faithfulneſs. Mr. *Oldenburg* complains, that, beſides the two great packets, he has received no more letters. But he may thank himſelf for it, having ſent the addreſs for them but a few weeks ago. I am ſure there is no want on my part. Your laſt is dated Sept. 5. I am ſurpriſed with a kind of aſtoniſhment, that Mr. *Worſley* hath not anſwered my ſon's nor my own letters, which he might have done fourteen days ago. For I have anſwer upon my other letters from thence, which were ſent at the ſame time. By this very poſt I have written again, and my ſon promiſes to do the like, with ſending another copy of the order, with its amendments, and a report, that it is paſſed both his highneſs's and the council's conſent. If he had ſignified his ſatisfaction (for the order is fully granted and drawn up, according to all the inſtructions, which he left behind) the foreſaid order might have been ſent by this poſt to the council in *Ireland*. My ſon is now more and more contriving, how, with the beſt grace and advantage, it may be tranſmitted. For, as ſoon as he ſhall have underſtood his approbation, he intends, that the order, with the addition of ſome affectionate clauſes, ſhall be turned into a letter, written by the council here to the council in *Ireland*, under the council's own ſeal, that it may be diſtinguiſhed from the ordinary paſſing or imparting of orders from hence to *Ireland*, that it may appear a buſineſs of extraordinary import and concernment. The next poſt I hope will bring Mr. *Worſley*'s reſolves. I have alſo preſſed much upon him the performance of his other promiſe, concerning cellars and vinifications of liquors. Mr. *Brereton* propoſes thus. " I like well Mr. *Beale*'s addition of " heath, and I have not yet received the pro- " miſed account of it from the phyſician I " wrote to you of. Your friend there ſpeaks " of recovering ſour or dead beer by fermen- " tation, and that hops doth well to keep " beer long together. I am of opinion, that " if it be very well fermented and purified " at firſt, it will keep of itſelf, provided you " exclude air. And that it is really ſo, is ſeen " in the Scottiſh ale, whereof I gave you the " proceſs, which you have inſerted in your " laſt edition of your *Legacy*, page 231. " Now, to prevent that waſting, which is " there ſpoken of, I think it would be good " to put ſo much oil at the top of the veſſel, " as would cover the whole ſurface of the " drink, at the largeſt part of the veſſel; " by

" by which means, the oil ſtill lying on the " top of the drink would infallibly keep in " the ſpirits, as is known to divers merchants, " vintners, and gentlemen about *London:* for " ſo they keep in bottles, that hold about " two quarts, their rich *Italian* wines, which " will not by themſelves endure the ſea; and " I have drank of them at *London* in April, " ſo that they were above half a year old, " and very pleaſant, full of ſpirit, and no " taſte of the oil at all. But becauſe oil of " olives would be too dear, let it be conſi- " dered, whether rape oil may not be ſo cla- " rified, as to ſerve the turn. For I remem- " ber, that in *Holland* they uſe to fry their " fiſh in it; which ſurely they would not do, " if it gave any ill ſavour: and if it do not, " I do not ſee, why the ſame oil may not " ſerve again and again. For all this while " I ſuppoſe, that the drink ſo kept muſt be " firſt exceedingly well fermented, clarified, " and drawn off the lees." Thus far he. I pray give in your obſervations upon this to him, who is really,

Honoured Sir,

your entirely devoted ſervant,

S. HARTLIB.

December 8, 1657.

Honoured SIR,

LAST Thurſday I ſent divers letters, which I then received by the poſt, under my cover. This encloſed I had from *Saumur*. I got alſo a ſhort one from Dr. *Petty*, in theſe words: " The reſentment I " had of the challenge, was not ſuch, as to " need ſo formal and troubleſom an apology. " To ſhew you, that I am not angry, or vin- " dicative upon the gentleman, I will for- " bear noting ſeveral impoſſibilities in his " contrivances of the dials to all the ſenſes. " When I am got clear of Mr. *Worſley*, I " will have ſuch another bout at learning, as " ſhall both ſtrain my abilities, and demon- " ſtrate my willingneſs to advance it. In " which perſuaſion, I deſire you and my " friends to remain; for what I have been " doing here is but to prepare me thereunto. " This is the 12th letter I have written this " night; wherefore excuſe this brevity." Thus far the rich doctor. I have written to Mr. *Worſley*, that he would unriddle his meaning in that one paſſage. I have the dial, with moſt of the ſenſes, in my poſſeſſion, and therefore cannot but ſmile at his threatened impoſſibilities. Mr. *Worſley* is expecting ſtill ſome engagement upon his phyſico-aſtrological letter: but except I have an account from *Oxford*, upon the foreſaid letter, I am forbidden farther communications. Mr. *Mercator* writes ſomething, which I know will not diſpleaſe him: his words are theſe. *Impoſitum eſt mihi judicium Genethliacon ex hora Nativitatis Domini mei junioris proferre, et credo aliquid veri ſubeſſe quoad temperamentum & conſtitutionem humorum; ſed invenio anteceſſores aſtrologos rem pulcherrimam vaniſſimis commentis obſcuraſſe, ideoque difficultate laboro ubique. Nam aſſeverare nihil volo, quod ratione certa ſtabilire nequeam & tuo ſocordiam priorum. Nam omnia hic (ut fere in cæteris artibus) ex fundamentis denuo ſunt extruenda. Ego vero mallem etiam meum in aliis prius captis ponere, quæ interea delitescunt in pulvere. Atque hoc male me habet.* I received a ſpecial commiſſion from Sir *Charles Culpepper*, who, preſenting his humble ſervice, entreated me moſt paſſionately to put you in mind of the promiſe you were pleaſed to make unto him, about the new invented plough of Dr. *Wilkins*. He bids me to aſſure you; that if you can procure one for him, that you will lay a very great obligation upon him. I humbly beg, for my own uſe, the ſpirit of vegetables againſt fevers. Here you have a copy of Dr. *Horne*'s letter, which contains many conſiderable paſſages in it; on which if you would enlarge your's, the exchequer of the commonwealth of learning would be the richer. Divers weeks ago I preſented you with ſome demands of Mr. *Beale*'s concerning inſects, which were principally intended for Dr. *Starkey*. I have obtained an anſwer from ſome other good hand, which I thought fit not only to tender to Mr. *Beale*, but alſo to yourſelf, as you will find by one of the papers here adjoined. I ſhould be glad to ſee, how you entertain either the divinity, or the philoſophy of it. My pains are very tedious unto me, and much work lyes yet upon my hands; but nothing ſhall hinder me from ſubſcribing myſelf,

Honoured Sir,

your ever faithful, and

moſt obliged ſervant,

S. HARTLIB.

SIR, Mr. *Dury* told me this morning, that he believes my lord *Broghill* is landed before this time in *England*.

January 7, 1657-8.

Honoured SIR,

THE poſts not coming regularly, as they were wont to do, I did not get your laſt of January 2, till yeſterday. The foregoing to this, and which I have already anſwered, was dated December 28. I am hugely therefore troubled, that to this hour I have not yet ſeen your large letter, to which you refer yourſelf. The poſtage of letters are already paid by your laſt diſburſements. I am glad, that at *Oxford* they are ſenſible of any reformation in learning. The former king of *Denmark* took the ſame courſe with the lectures of his publick profeſſors, as you write hath been ordered of late at *Oxford*. Laſt week I received a letter from the vice-chancellor of *Cambridge*; who was pleaſed to ſend me alſo the adjoined printed paper.

The

The laſt Iriſh poſt brought a letter from Mr. *Worſley* to my ſon in theſe words. " I take " very kindly your laſt to me, and that " clear aſſurance you have given me of your " mindfulneſs and care in that buſineſs. This " I do aſſure you, that the thing intended is " ſo real, that if the council here do but " pleaſe to give equal countenance to that, " which they have done to others lately in " their private concerns; the propoſition will " be made to (I judge at the leaſt) ten thou- " ſand pound. For I have in my hand al- " ready a conſiderable ſtock aſſigned by the " donors, and a probability of ſecuring near " the whole ſum within leſs than a month's " time, the council giving the donors encou- " ragement to go on. I took the freedom " to write at large to you the laſt week, and " to give you ſeveral arguments for its diſ- " patch. But all theſe now need not at all " to be enforced, the thing being ſo near to " be ſent; one thing only, as you ſee a juſt " occaſion for, I do think not inconvenient " to take notice of, and that is, that Dr. " *Clarges* is actually ſatisfied his ten thou- " ſand pounds, and captain *Arthur* his at ſix " years purchaſe preſent value, being the ut- " moſt favour deſired by the donors. And " I hope our friends on the other ſide will " not be unmindful to ſuggeſt it here, by " way of allowance of the juſtneſs and rea- " ſonableneſs of our propoſal." The letter is dated December 29. I think I told you already, that my ſon hath ſent him copies of all, which was as this week to be tranſmitted in the originals. Since Monday, my ſon hath been ſo buſy, that I have not been able to have a further account of him concerning this affair. Mr. ſecretary continuing ill, and not meddling with buſineſſes, my lord *Fleetwood* had undertaken to get the letter to be ſigned by his highneſs to the council in *Ireland*, which was the only thing remaining to be done. What Mr. *Worſley* writes unto me, you will find in the encloſed paper. He concludes thoſe real paſſages, with a complaint, as followeth. " I have had a great mind to " entertain you with a diſcourſe or two upon " ſome other ſubjects; but providence hath " hitherto juſtled me out of theſe ſedate pur- " poſes, by bringing in, and throwing ſome " other exerciſes upon me; and ſuch at pre- " ſent is his bleſſed will, to which I therefore " deſire willingly to ſubmit." Thus far Mr. *Worſley*. Some days ago, Mr. *Smethwick* told me, that he had gotten at laſt Dr. *Lake*'s new invented water hour-glaſs. He ſaid, that he had tried it already above fourteen days, and found it ſo accurate, that it excels all the watches or clocks whatſoever. In a word, he counted it an exceeding great rarity, the like never hath been yet brought to perfection in that kind. I am acquainted with the doctor himſelf, (a civilian) who is now going for *Ireland*, to exerciſe huſbandry; being entruſted by the lord of *Strafford* with his lands and poſſeſſions there. He told another friend of mine, that he would willingly beſtow one of his clepſydras upon me, but that he counted it no better than a trifle. But for all this, I do not deſpair of getting one of them, either ſooner or later. Mr. *Beale* was the firſt man, that diſcovered *Norden* of *Briſtol* unto me, with his invention of clepſydras; but ſince he hath advertiſed, that it will require ſome time to get one from thence. It may be, Sir, you have a greater intereſt there than any of us. I remember alſo, that in former years, Dr. *Gauden* was very buſy about meaſuring of time this way. I long to hear more particulars of Dr. *Wilkins*'s philoſophical character. Mr. *Comenius* hath ſent lately to Mr. *Dalgarno* his idea of it; but it is ſo ſhort and general, that it is not worth the imparting. Sir *Charles Culpepper*, though he be out of town, yet I know no ploughman can be ſo greedy of his meat, as he is after that invention. He begged not ſo much a ſcheme, as a mechanical model of it, or the thing itſelf, promiſing moſt willingly to pay for it. You ſpeak ſtill of the German vacuum, as of no ordinary beauty; but the poet ſays, *Uritque videndo fœmina.* Juſt now I received another from you, dated January 4, referring me again to your large letter; but I having never gotten any ſuch letter, (as I told you alſo in the beginning) my mind is not a little tormented with the miſcarriage, or ſo long a delay of it. Hath it not been left behind at *Oxford?* I cannot remember, that any of mine, or of my friends, have thus been dealt withal by our inland poſts. It muſt certainly be ſome miſtake, or other. The amorous perſon is gone into *Cheſhire*, for two or three weeks: his father ſeems now to be more willing to condeſcend to his deſires. But, I ſay again, I have not received the recipe of the wound-drink. Monſieur *Kratſhmer*'s (that is the German's name, of whom I ſpake in my former) medicine againſt the ſtone is certainly moſt excellent, and abſolutely the beſt, that ever I have uſed. But I have already ſpent all, ſo that a few drops more are only left. He hath revealed the recipe to *Clodius*, and offers to aſſiſt and diſpatch the preparation of it. But, to my very great perplexity, *Clodius* is again in ſuch a labyrinth, that he will be forced to break his ovens, and to remove to another houſe, which alſo is a new kind of undoing of him. I have obliged the gentleman thus far, that if you were in town, I could prevail with him to ſhew you all along the making of that moſt ſingular medicine, which *Clodius* alſo, from the authority of it, muſt confeſs to be truly tranſcendent. However, I do here engage myſelf, that you ſhall be made partaker of the true and full recipe of it in due time. For I have a very great and cordial reſpect to prevent, by the bleſſing of God, thoſe torments in yourſelf, which I have endured theſe many months, for want of ſo powerful and bleſſed a medicine, handed over by an extraordinary providence. My lord *B* * and my lord *Barrimore* are expected in town this day, but I can learn nothing more of my lord *Broghill*. I remain ever,

SIR, your humble ſervant,

S. HARTLIB.

February 2, 1657-8.

Honoured SIR,

THE extremity of the froſty weather doth greatly increaſe my wonted torments. But having ſome little intermiſſions, I cannot beſtow them better for the preſent, than by acknowledging the receipt of your laſt *January* 30, with the encloſed to Dr. Secretary, which I ſhall ſuperſcribe and ſend away by the poſt this night. Mr. *Worſley* ſent me a big packet yeſterday, but when it was opened, there was not a word unto myſelf, but another packet within addreſſed to my ſon *Hartlib*, with whom I have not been able to ſpeak this day. It may be he hath been informed, how near I have been to the land of forgetfulneſs; yet I received another letter from him laſt week, dated *January* 20, wherein he entertains me with a large theological diſcourſe concerning Prophecies, but concludes as followeth. "For that of the "malt-drying here, they do ſteep it about "24 hours, they ſpread it thin in the dry-"ing of it, having upper floors to lay it up-"on, through which the wind freely paſſeth, "if there be any ſtirring. They dry it in-"differently at any ſeaſon, though in the "moſt temperate ſeaſon they can dry moſt "at a time; but they do it well enough all "the winter. The other friend, that is like "to give you a viſit, would think a man "much a fool, that would ſerve any man be-"ſides himſelf, or otherwiſe, than in order "to himſelf, being a wiſdom common to "this world. [And that honeſt man he means "him, to whom your letter is to be ſent] you "have ſo often taken occaſion to mention and "deſire my reſolution of, is doubtleſs ſuch a "wiſe man, and ſo as in that wiſdom all "his whole ſecurity is placed. And to all "ſuch it is as real a goſpel-ſaying, as it is a "law-ſaying, *De non apparentibus, et non ex-"iſtentibus, eadem eſt ratio.* But the apoſtle "tells us a better rule, faith is the evidence "of things not ſeen. Pray preſent my ſer-"vice to Mr. *Boyle*, and tell him, I am truly "his ſervant, yet I have not writ to him, partly "in expectation weekly, that I ſhould re-"ceive thoſe papers from *White-hall*, which "are not yet come; partly by reaſon of a "criſis ſome affairs of mine here are under, "which hath lately engaged, and will for a "while take up more of my time." Thus far he: monſieur *D.* was pleaſed to tell me (but this muſt not be known abroad) that though he be diſpleaſed, yet that he is to enjoy, if not all, yet ſome of the benefits of it, at leaſt two hundred a year. And if this ſhould not be ſo, yet I ſhall never change my judgment to count him far more happy in ſerving that more general ſurvey of all God's glory, and the God of human kind. For this is the honeſty of that buſineſs, which will not be without ſignal providences, and ſpecial acquiſitions and enjoyments better than *Dublin* or *Ireland* can afford. I ſhall not be wanting to obtain that ſecret, which hath been imparted to Mr. *Milton*. It may be the publick gentleman, that ſent it unto him, will let me have a copy, in caſe the other ſhould not come off readily with the communication of it. But if yours would aſk it from Mr. *Milton*, I am confident he would not deny it. My ſon *Clodius* tells me, the German phyſician, of whom I wrote before (*Kratſhmar*) is a rare man for chemiſtry and phyſical knowledge and experience. And though he is not very willing, that I ſhould be admitted to any of his arcana, yet I believe the gentleman himſelf will hardly conceal any thing from the crazy and afflicted creature. Mr. *Morian* did promiſe me not long ago a few doſes of *Glauber*'s univerſal medicine, but that he put too high a price upon it, at leaſt his purſe could reach unto it. I dare not crave it from Mr. *Morian* for a ſecret reaſon. For having ſhot an arrow of charity at random towards *Zurich*, it lighted upon our reſident there Mr. *Pell*, who hearing of his very low condition, and to have been aſſiſted with 3 *l.* ſterling, by Dr. *Van Muſſig*, ordered, that the ſum of 10 *l.* ſterling, ſhould be made over to that worthy man out of the penſion, which the ſtate doth pay him quarterly. But this being ſubject to many delays, Mr. *Haak* undertook in the mean time the paying of him by bill of exchange, which laſt week he acknowledged to have received. Now if I ſhould beg a few doſes of the Glauberian medicine, Mr. *Morian* might happily think, that I deſired to be gratified this way; which truly is far from my ſpirit and intentions. But I am confident, if I ſhould venture ſuch a requeſt upon him, he would certainly pay for the medicine whatever it ſhould coſt, out of thoſe ſupplies, which have been procured, by the bleſſing of God upon my hearty recommendations. Therefore I ſhall a little defer this matter, and wait for ſome other opportunity. As for Dr. *Bonet* I have his expreſs engagement and promiſe, that as ſoon as his *omnium morborum curativum* is brought to perfection (which he hopes will be done within a few weeks,) I ſhall have many doſes of it, which I ſhall inſtantly certify you of as ſoon as I have received them. Any thing, that can be imparted for general good, for keeping of poultry, or the artificial diſcoveries of hatching of chickens, will be very welcome to my hands. Mr. Vice-chancellor of *Cambridge* (Dr. *Worthington*) pleaſes me not a little by writing in his laſt.— "We have divers fellows of colleges, who "have made excellent progreſſes in anatomy "of ſeveral kind of creatures, and have "ſome obſervations peculiar. They have "alſo much travelled in botanicks, and have "got together many hundreds of plants in "ſeveral gardens here. Some, that are rare, "and for which they have been ſent to from "thoſe, that profeſs great knowledge. They "intend to publiſh a Phytologia of ſuch herbs "as are within ten miles of *Cambridge*, which "they have often travelled, and found ſome "not mentioned in other herbals. And for "the names of herbs in the Phytologia Bri-"tannica, and other herbals, they have found "many errors, which have been propagated "from one book to another; and they judge

it

" it a good ſervice to reſtore them to their " own true names." Thus far of experimental learning at *Cambridge*. By the adjoined narrative of the life and death of that late incomparable univerſal ſcholar at *Hamburg*, you will oblige, it may be, divers of the *Oxford* worthies, Dr. *Ward*, Dr. *Wallis*, if not alſo your whole philoſophical club. The other paper is worthy to be taken into their ſerious conſideration. But I beg, that the moſt intimate and friendly paſſages (which are only poured into my boſom) may be concealed. I have received, and almoſt diſtributed your packet with Mr. *Auſtin*'s books, and ſhall ſtudy the like real thankfulneſs. Mr. *Brereton* writes in his laſt, *January* 30.—" If Mr. *Boyle* be " come to *London*, I pray you preſent my " moſt humble ſervice to him, and let him " know, that I hope ſpeedily to have ſome- " thing for him worthy his knowledge, but " as yet I have not; which is the cauſe he " hath not heard from me."—My ſon *Clodius* is removing this very day to another houſe in *Axe-yard*. Mr. *Stroud* is come up to *London*. My lord Protector ſent him a horſe worth 150*l*. My ſon excuſes himſelf, that he cannot come at me. My lord Protector's ſpeech is ſo full of high and particular reflections, that the printing of it is denied, though the parliament has deſired the ſame. A copy of it was ſent by Mr. Secretary to the Swediſh miniſters here. The houſes cannot yet agree, but are in great diſorder. If they continue ſo, it is apprehended they will ſhortly be diſſolved. Juſt now my ſon comes to ſhew me Mr. *Worſley*'s laſt letter, whereof you ſhall find an extract here adjoined. By it you will ſee, more ſeconding letters of recommendation being called upon, how ſeaſonably yours will come to Mr. Secretary. Thus I reſt ever,

Honoured Sir,
your moſt willing faithful ſervant,
S. HARTLIB.

April. 8, 58.

Honoured SIR,

HOPING you are ſafely arrived at *Oxford*, I preſent theſe encloſed, which came yeſterday to my hands, without a word to myſelf. I beſeech you, if there be any better (or worſer) news concerning our common friend, or the honeſt buſineſs, to give me notice of it by the next return of the poſt. It ſeems, you forgot to deliver thoſe papers, or extracts out of authors, concerning an artificial way of hatching of chickens, which you more than once promiſed unto me. Our reſident from *Zurich* writes as followeth. " Here you have what I wrote upon occaſion " of that of Mr. *Beale* from *Hereford*, Jan. 18. " I long to ſee that diſcourſe concerning " Engliſh crabs and wild pears, and the way " of ordering thoſe deſpiſed fruits, that their " juice may be raiſed to excel the wines of " *France*. Some parts of *Helvetia* are full of " vineyards, yielding great ſtore of unpleaſant " white-wine, or claret. In other parts of " the country, the vines are killed by froſts " and nipping blaſts from the ſnowy moun- " tains. There they drink water, or whey, " or milk; which makes them larger limbed " and taller than their neighbours. Many " places are full of wild cherry-trees. One " ſort, which is ſmall, black and ſweet, is " dried and kept in great cheſts, in every " country houſe, for the uſe of the table, all " the year. Some gather more than their fami- " ly can eat in a year, becauſe they can diſtil " a ſtrong aqua-vitæ out of them, which they " ſell in the market towns and cities. In the " landgravate of *Turgow* they make great " ſtore of perry, of a ſort of very ſmall pears, " which, as I have heard, are hard and full " of very unpleaſant juice, ſo that no man " will eat one of them raw. But ſome boil " them, and, with I know not what cookery, " make a diſh, to help furniſh a table. Some " tell me, that the Turgow-perry is of two " ſorts. The one boiled to the height of a " ſyrup, ſo that it becomes almoſt as thick " and as ſweet as honey. The other ſort un- " boiled, and pretty clear. In other places " of *Helvetia*, the boors make drink of the " wildeſt apples, as well as of wild pears, " calling them by the name of muſt; perhaps " becauſe it always keeps a ſweet taſte, ſome- " what like to that of new preſſed wine. But " thoſe boors ſeldom ſell any of this muſt, " keeping it for their own palate, being con- " tent, that the citizens ſhould deſpiſe it, as " drink for clowns; though ſome think, that " now and then it proves better drink, than " can be made of the beſt grapes in that " country. Alſo *Glauber* hath told us, what " winy drink he hath made of hips and haws, " *&c.* But I fear his chemical fermentations, " joined with all the experience of *Helvetia* " and *Normandy*, would not be able to make " drink of crabs and wild pears, that ſhall de- " ſerve to be compared with Rheniſh, Bac- " charac, Canary, or Greek wines; which " your friend ſeems to ſay he can do, and " therefore I deſire to read more of his writ- " ings on that argument." Thus far Mr. *Pell*. I ſent away on Tueſday the letter I received for Mr. *Worſley*, remaining ever,

Honoured Sir,
your moſt humble devoted ſervant
S. HARTLIB.

April. 27, 1658.

Honoured SIR,

I MAY truly ſay, even in an outward ſenſe, " I die daily." Theſe three days, every night I have been near unto death, ſo exceedingly vehement have the pains, eſpecially of the ulcer and piles, encreaſed upon me. For want of Mr. *Kratſhmer*'s medicine, I have been forced to uſe that, which Dr. *Bonet*, out of ſingular love, did ſend my ſon *Clodius*, conceiving it the preparation of the ludus, which

he doth prefer above all other medicines in this kind. It wrought notably upon the ſtone, and brought away divers pieces of it, with abundance of ugly gravel. But my ſon forbad the continuance at laſt, perceiving it to do hurt to the ulcer. Now he hath made Mr. *Kratſhmer*'s medicine (but not yet by his own better preparation) which I am to take to morrow, God willing, as the moſt ſuitable found by experience as yet to all my three moſt tormenting diſeaſes. This night my poor wife roared out as much as I did; but behold, though my pains continue very ſharp, yet I am enabled to preſent my reſpects, in acknowledging the receipt of your laſt, which not before this morning was delivered unto me, being dated April 22. I ſee alſo, the like miſcarriage has befallen the delivery of mine; which is not ſo juſt and fair for them, that have the ordering of this affair, and who have been offered, not long ago, to manage that office, the ſum of ſeven thouſand pounds to them. I believe really, that my lord *Broghill* was very ill when our friends came to wait upon him. Mr. *Kratſhmer* hath been ſince very ſick and forced to keep his bed and chamber. But Mr. *Marvel* did ſend again another expreſs unto him, that his buſineſs was laid ſeriouſly to heart. Mr. *Dury* doth beſtir himſelf daily for him. Yeſterday he went to *Hackney* to ſpeak with Sir *Thomas Winor*, about the contents of his highneſs's letter for advancing of four or five hundred pounds, for the relief of the twenty families. But the poor man excuſed himſelf, that he had no money, and becauſe the other treaſurer was abſent, that ſhould concur with him. The collection is begun to be made in ſeveral churches in *London*; but what farther expedient they will find out for the advance-monies, I cannot tell. I will ſhew Mr. *D.* what you write in your laſt, concerning my lord *Broghill*'s concurrence. I perceive they will engage him to give intelligence of thoſe quarters of *Germany*, where he lives; which will the more oblige them, as I conclude, not to diſmiſs him, without a good viaticum. Mr. *Kratſhmer* hath preſented a printed paper of anagrams (which I was diſſuading him to do) but you cannot believe what acceptance they have found, both with his highneſs, and the whole court. For my part, I care not ſo he be holpen, with anagrams, or without anagrams, and diſpatched to go in the company of the other gentleman you know of. For he begins to be almoſt impatient of the long delays. My ſon *Clodius* is well again, God be thanked. The poſtage of your letters is already paid. My ſon came to me, three days ago, very much rejoicing, for obtaining, very ſtrangely and providentially, a ſecret of a very great importance, and which his deceaſed brother-in-law's ſon hath denied to Dr. *Kuffler* theſe twenty years. When his brother-in-law was a dying, he ſent for Dr. *Kuffler*, with an intention to reveal and confide it into his breaſt; but he was dead before he could come at him. How far my ſon is bound not to reveal it, I cannot ſtate the caſe; but by expreſs covenant he is bound up not to do it to Dr. *Kuffler*, who ſeems to prize it above any other thing he knows; and fancies himſelf to be made for ever, as they call it, if he might but know that very ſecret, which now is fallen, as it were by the bye, into my ſon's hands. All this in very great faithfulneſs to yourſelf alone. In my former, as I remember, I ſpoke ſomething of a ſick-bed. Whatever it may prove, I count it more worthy to be taken notice of, than any French bed of ſtate. The account, which I received ſince of it, runs thus. "If this, that appears "in the model of Mr. *Owefield*'s dwelling, in "the *Strand*, near the *Savoy*, ſick bed ſhall "be found to hold in the great as well; then "I ſay, that I very well like that part, or "joint, that is made to raiſe the head; for it "is done more eaſily and equally, than can "be done by hand, and that without diſturbance to the ſick, without waking him, if "aſleep, without ſtraining him (if extreme "weak, ſore, or wounded) to riſe and ſit up, "as the manner is, whilſt they raiſe and alter "his pillows; by which means alſo, many "times, the ſick, being in a ſweat, takes much "cold, which is this way prevented. The "like device ſerves for the like purpoſes, ſo "far as is neceſſary, at the bed's feet.

"As for that contrivance at the ſide, to "raiſe or let fall either ſide, I do not perceive "ſo much uſe thereof: for no well man can "endure to lye on the ſide of a hill, in a "poſture always ready to tumble down. And "if it be intended only to help him to turn, "it will badly do that, without two or three "more to help, and then the uſe (viz. the "ſaving that charge) is loſt. And, without "ſome care, one alone, ſtanding on one ſide "the bed, and turning the ſame ſide up, may "poſſibly throw the ſick perſon out of the "bed, or againſt the bed's-poſt, to his terror "or hurt. But this can do no hurt, if let "alone. In the whole matter, I find conſi-"derable eaſe and advantage to the ſick, "and charge ſaved, one perſon being, by "this means (ordinarily) enough to look to "one, though very weak." Thus far one of my learned ſurveyors. What the inventor will be able to alledge, in vindication of all the parts, I ſhall learn very ſhortly, I do not remember, whether I have told you ought of a weatherwiſe toad, diſcovered unto me from *Zurich*, March 21, 58, in theſe words. "It was obſerved in the court, that *A. M.* "(which, I hear, was *Adrian May*) was wont to "foretel the change of weather confidently "and infallibly; wherefore the king would "needs know of him, what it was that en-"abled him to out-do all other mens con-"jectures in that ſort of predictions only. He "replied, that he had a familiar, which he "durſt not ſhew to others, for fear they "ſhould ſay it was a devil; but he knew his "majeſty would not miſtake ſo groſly, nor "diſcover the myſtery to others, that were "not worthy to know it. Hereupon he led "the king into an odd corner of the garden, "where, in a blind place, he had ſo ſhut up a

"great

" great toad, that ſhe could not get out. Hi-
" ther, ſaid he, do I come two or three times
" every day, to ſee how her colours change,
" having long obſerved great variety in them,
" according to the different alterations of the
" weather at hand, *&c.* And theſe are the
" only aſpects, that I conſider for my prog-
" noſticks of the weather." Thus far of this pretty natural weather-glaſs. But I have written back to our learned reſident, there, to reſolve me, if he can, theſe farther queries; for his relation ſeems to me ſomewhat ſhort, and would be more largely explained; as 1. What thoſe colours and varieties of appearances were. 2. What alterations they did portend; whether rain, ſtorms of wind, change of heat and cold: all theſe, or only ſome one of them. 3. How the toad was maintained, fed, or kept alive in that cell. By ſome of the adjoined papers you will ſee what my Hereford philoſopher hath returned to theſe and ſome other particulars, worth your knowledge and improvement. In the extract of Mr. *Worſley*'s letter, imparted in my laſt, he ſaith, " The council retracted their former
" order, and made me another, in all things
" ſuitable to what they had promiſed, and
" made me expect." (The following words, which ſhould have been added, were left out.)
" A copy of which I ſent to Mr. *Boyle* that
" week." This copy I beg from your kindneſs; for I ſuppoſe he hath ſignified this on purpoſe, not mentioning any thing of his private condition, that I ſhould receive information and ſatisfaction from that order. And having reſolved, for time to come, to look upon me no more as a private friend, but as a father, it is fit I ſhould be acquainted with whatever hath, or ſhall befal this my ſon. In that letter, of the 14th of April (which is the laſt I had from him) there are ſome other lines alſo, which deſerve to be communicated, and which then I could not tranſcribe. For he writes moreover, " For honeſt affectionate
" Mr. *Potter*, I have returned an anſwer to
" his letter, which I think will very well ſa-
" tisfy [I conjecture about the ſkin before
" the bear or P. M. be had.] That well
" mentioned in *Herefordſhire* to yield bones
" deſerves to be more accurately ſearched,
" and to try, whether thoſe bones have not
" ſome ſingular faculty in broken bones like
" to the lapis oſtocolla of *Germany*. About
" the preſagous nature of ſtones, I cannot ſay
" any thing rare or very ſingular hath fallen
" within my obſervation at any time, and
" therefore I would be the more glad to hear
" any thing of it from our friends. For
" weather-glaſſes, to ſhew you, that I have
" not been wholly idle, nor, that I did ſet
" another a taſk, harder than I would follow
" myſelf; before I came over, I had ſeveral
" made for me, and ſeveral ways tried for the
" making both of their heads and cylinders
" exact and even. And I muſt, by the way,
" tell you, no man muſt expect another will
" ever be accurate in mechanical matters, up-
" on a bare direction, without we take pains,
" ſtand by, put to our hands, and help to
" contrive ourſelves. This I did, and had at
" length ſuch neat glaſſes made, as did very
" much pleaſe me; the cylinders being very
" even, and of a convenient proportion, both
" in their lengths and diameters, to their
" heads. Being come over hither, I had one
" exactly graduated into five hundred parts,
" and the length and heat were ſo proportion-
" ed, that in extremity of cold this winter,
" the water did riſe to 180. I have made
" many obſervations, which do confirm my
" former conceptions; *viz.* that, to be in-
" deed exact, doth require ſeveral glaſſes to
" be ſet in ſeveral places, and ſo conſtant-
" ly obſerved together. You will much oblige
" me, by letting me ſee our friend's diſcourſe
" of wines, with the whole contrivances of
" them; which I beg with the very firſt."
Thus far my philoſophical ſon. And having written thus far, my ſon *Hartlib* ſends me your laſt to me, dated April 24; which the blind poſt brought to his houſe, miſtaking *Axe-yard* for *Charing-croſs*. The letter to Mr. *Worſley* ſhall be ſent this night, encloſed in mine, who have written very largely to him. I wonder I do not hear yet of the arrival of Mr. *Wood* to *Dublin*. My ſon *Clodius* was juſt with me, bringing me ſomething of Mr. *Kratſhmer*'s phyſick, which he hath prepared, but the pipe burſting, he could ſave but a very little, promiſing to make a great quantity, as ſoon as the other pipes come from *Lambeth*, which are promiſed next week. He is pretty well again, God be thanked, and ſent you another packet on Saturdy laſt, of which I can bear witneſs. Mr. *Brereton*'s father will have him to come down again; but he is now fully reſolved to marry before he go down. If he knew of my writing to you, he would certainly preſent you his unfeigned ſervice. How much Mr. *Beale* is your trueſt ſervant, you will ſee again in the adjoined papers. There is not the like man in the whole iſland, nor in the continent beyond the ſeas, ſo far as I know it; I mean, that could be made more univerſally uſe of, to do good to all, as I in ſome meaſure know, and could direct. That glaſs, with whatever was in it, I did deliver very carefully to Mrs. *Dury*, according to my lady's direction. But Mrs. *D.* I remember told me at that time, that ſhe was half reſolved to come over. But hearing afterwards, that ſhe could not come, ſhe ſent both it and many other packets of mine and others into *Ireland*; although I cannot hear to this day, that any of them is arrived. I ſent likewiſe a large writing of Mr. *Beale*'s upon *Caſaubon*, which my lady does very much deſire to ſee, to Mr. *Worſley*, by him to be conveyed to her. But Mr. *Worſley* ſays, in his laſt, of the firſt of April, ' For thoſe
' papers and books you mention to have for-
' merly ſent by Mrs *Dury*'s conveyance, and
' thoſe animadverſions of our worthy friend
' on *Caſaubon*'s Enthuſiaſm, I have not as yet
' received any of them." But O! what a ſad and ugly note do I receive from *Zurich*, in theſe expreſſions! " This week I heard,
" that your count of *Hohenloe* is certainly
" married,

" married, and goes ordinarily to maſs with " his counteſs, profeſſing himſelf an unfeigned " papiſt." He, that told me this, was the count's great friend heretofore. He ſays, the young couple will ſpend his nothing and her portion in three years, and then they may go a begging together. Some ſay, that he, by falling from Calviniſm for a popiſh wife, hath but followed the ſteps of his father, who turned from Lutheraniſm for a Calviniſh wife; and thereby came to be hated by all his kindred, who were all Lutherans, and ſo continue. I doubt his ghoſtly father will tell him, that he is not now bound in conſcience to pay his heretical creditors. Thus far our reſident, April the 11th. Though I be like to loſe thirty pounds ſterling of my own, ſtanding engaged to others for fifty pounds more, yet this doth not ſo much affect; but the other part of the information is really ſuch, as doth fill continually my heart with ſpiritual horrors and ſorrows, that it is ready to burſt into tears (yea of blood, if it be poſſible) when I have occaſion either to write or to ſpeak of it. I beſeech you to oblige monſieur *du Moulin* to gratify my lady's and mine own deſires, according to one of the papers here encloſed. Concerning the ſtory of my lord *Middleſex*, my worthy correſpondent anſwers thus: " I " have requeſted my nephew to enquire of " Sir *W. Pye*, the truth of the famed ſtory. " He is a near neighbour, kinſman, and very " much reſpected by Sir *Walter*. But by the " like thing, which I heard from colonel " *Harley*, as related by the ſaid lord to colonel " *Harley*'s ſiſter, I ſuſpect it will be but a " drunken ſtory. It is not like to have better " teſtimony, than of drunkards." I have procured a copy of the ſame by lord *. * * for my lady, and am watching every opportunity to ſend them away, with ſome other books, for *Ireland*. The cavaliering party is not only to be ſecured in their perſons and horſes, but ſome of them to be tranſplanted from one county into another. Yeſterday my lord *Skippon* told my ſon *Clodius*, that the lord *Rich*, now earl of *Warwick*, was ſick unto death. There is no more ſpeech of a parliament, but believed there may be one about the beginning of September next. Mr. *Jeſſop* hath been very ſick, but is upon recovering. I cannot more at preſent, but remain ever,

Honoured Sir,

your moſt faithful,

humble ſervant,

SAM. HARTLIB.

May 29, 1658.

Honoured Sir,

ON Tueſday laſt I wrote largely, though under extremity of pains. On Thurſday I ſent a letter from Mr. *Worſley*, with a few words of mine upon the ſuperſcription, and by your ſervant a large packet from my lord *Broghill* yeſterday morning. I had not written at this time, but that I am bound to perform an extraordinary duty towards my worthy correſpondent Mr. *Beale*, he deſiring this very favour from my hands. Your excellent ſiſter did write April 24, as followeth, " By this poſt I receive from my brother " *Broghill* an aſſurance of his being ready to " ſerve your excellent Hereford correſpondent, " and therefore pray put him to the trial, by " offering him ſome opportunity of being ſo " nobly imployed." And in another letter of May 8. " Mr. *Beale*'s promiſe of ſeveral " ſheets of his I look upon as a great one, " and worthy of much more than thanks " from me, who muſt confeſs to read what I " have already ſeen of his with much ſatiſ- " faction." The Lord grant it may be alſo " with much edification; if not, I am ſure " the fault is not in the matter, but in " my heart. My ſervice and acknowledg- " ments to him, I beſeech you. I would fain " know how he is got free of his committee." But by Mr. *Beale*'s extract of a letter of May 21, you will ſee what opportunity he hath diſcovered, that may redound to his advantage. May it therefore pleaſe you, Sir, by the firſt occaſion of writing to preſent this caſe and opportunity to the moſt ſerious conſideration and real aſſiſtance of my lord *Broghill*, according to the adjoined paper. And though he be abſent for the preſent, yet I make no queſtion, that by an affectionate letter he may work powerfully upon my lord *Jones*. Mr. *Beale*'s caſe ſeems ſomewhat like that of *Daniel*'s, when he was caſt, without a cauſe, into the den of lions. But if my lord *Broghill* will but do as *Darius*, there is no doubt but he may be delivered. If you would alſo recommend the ſame perſon and caſe to Dr. *Wilkins*, he might alſo be very inſtrumental to ſecond my lord *Broghill*'s affections to my lord *Jones*, and ſome others. Mr. *Beale* hath written in his laſt very learnedly and largely of colours; which, being but begun to be tranſcribed, my amanuenſis falling ſick this afternoon, I muſt defer the ſending to another poſt. In the mean while, and ever (having been tired by my wonted pains, and large letter to Mr. *Beale* by this very poſt) I reſt,

Honoured Sir,

your moſt obliged,

faithful ſervant,

SAM. HARTLIB.

THE electoral college hath written to the king of *Sweden*, promiſing not to proceed to the imperial election, till the Auſtrians and Poland have firſt made their peace with him. This may reflect alſo not a little upon the affairs of *C. S.* and of *Spain*. There appears as yet no poſſibility of relieving of *Dunkirk*.

Honoured

May 13, 1658.

Honoured SIR,

I HAVE not yet heard whether you received mine of May 4, wherein one was encloſed from the excellent lady. The 8th of May I wrote very largely, adjoining many conſiderable papers. I hope, that both are come ſafe to your hands. Yeſterday I had another letter from Mr. *Worſley*, of the 5th of May, of which you have the principal extract here adjoined. For in a poſtſcript he adds, " I ſhall deſire, if you pleaſe, [but why " ſhould I not pleaſe?] that a copy of this " may be ſent to Mr. *Boyle*, (to whom I can- " not at preſent write) that he may know " how the better to write or ſpeak to the " ſaid Mr. ſecretary about this buſineſs." He introduces the extract thus. " I was, yeſterday " exceedingly refreſhed with our friend Mr. " *Beale*'s papers, containing ſo many things " ſpiritual, and worthy of obſervation, upon " the learned *Caſaubon*'s tract of enthuſiaſm. " Truly, when I read it, I found ſo ſtrong a " leaven in it, that I knew not how to give " over my meditation upon it, till very late " at night, intending, as this day, to write " you a large anſwer, of my thoughts about " it. But being, through a ſudden change " and alteration in the air, taken with a ſud- " den indiſpoſition, I muſt be forced to de- " ſire your excuſe, until the next poſt; at " which time, if the Lord pleaſe to afford " me health, with other opportunities, I " ſhall endeavour to give you ſome reaſona- " ble and full ſatisfaction. And for your " large letter alſo, of the 22d of April, with " the ſeveral ingenious papers encloſed, I " muſt be forced to reſpite my thanks for " them till the next." The letter is dated not at *Dublin*, (for I believe my writers do not love to write hard names) but at *Clantarffe*; which I mention, becauſe I would fain be informed myſelf, for certain reaſons, how far that place is diſtant from *Dublin*. Yeſterday I had alſo a letter from *Youghall*, in theſe words. " Our friend from " *Dublin* writes, that his propoſitions for " learning have lain theſe two months before " the council, but not yet advanced. I now " intend to write to *Broghill*, to quicken my " lord deputy therein. I have received all " your packets, and, in ſome of them, Mr. " *Auſtin* upon my lord *Bacon*'s Natural Hi- " ſtory. I have this week been taught a ve- " ry plain medicine againſt the piles, which " the perſon, that taught it me, recommend- " ed upon her own experience. Take the " white part of the dung of hens, and hogs- " lard, beat them well together, and put " ſome of that upon a warm ſcarlet, very " warm to the place; repeat it, as there is " occaſion. This may eaſily be tried, and " will no leſs be bleſſed, for its cheapneſs " and meanneſs. For the Lord made the " poor as well as the rich, and provides for " the one as well as the other; nay, more " for the poor, becauſe they are more im- " mediately caſt upon him for proviſion, the " rich taking their own proviſion upon " themſelves, and ſeldom looking ſo low as " the common things, which God has filled " with virtue, or ſo high as his bleſſing for " their cure. I juſt now heard, that Mr. " *Wood* is landed, and has brought me your " preſent. The letter is dated April 24. In " the adjoined extract, you will ſee how care- " fully ſhe is proſecuting the obſervations " relating to the deſign for regiſtering of il- " luſtrious providences." Thus far that great and moſt illuſtrious ſoul. I have a number of her other moſt excellent relations on this argument, but I ſpare you. I pray let not my pretty creatures be ſlighted in your Oxonian walks, as here they are repreſented unto you from *Hereford*. I pray you take notice of a certain tract come forth lately under the name of, *Hydriotaphia, Urne-burial; or a diſcourſe of the ſepulchral urns, lately found in* Norfolk: *Together with the garden of* Cyrus: *Or the Quincuncial Lozenge, or Network Plantations of the Ancients, artificially, naturally, myſtically conſidered. With ſundry obſervations. By Thomas Browne, doctor of phyſick.* To be had at the ſign of the gun in *Ivy-lane*. It ſeems to be no ordinary book. The loſs upon *Oſtend* is very conſiderable. Mr. *Cotton*, (ſon to Sir *Thomas Cotton*) who ſtabbed himſelf, is ſince dead of his wounds. Doth not the famous library fall by this means to my lord protector? My lord *Northumberland* preſented his highneſs this week with two moſt gallant and ſtately horſes. But the miniſter of *Petworth*, Dr. *Cheynel*, is not ſhot, as was reported; but too true, that he is fallen quite diſtracted, and (if it be not miſreported) ſent to *Bedlam*. The court of juſtice have met twice in one day, and that is all that they have done as yet. Mr. *Morian* tells me, from *Arnhiem*, that Dr. *K.* was ſhortly to give a proof of his firework to my lord protector. And this morning (for the doctor never or ſeldom comes more at me) Mr. *Brereton* was telling me, that he intended to be at *Woolwich* about five a clock in the afternoon, being the time appointed by his highneſs to ſee the undertaking performed himſelf, being to be there in perſon. The foreſaid good man wiſhes, that he may not blow up a good conſcience to get riches by ſuch means. My ſon *Clodius* wrote, that he would be at home as yeſterday, Mr. *Stroud* continuing very ill; but he is not come this evening for aught I know, your five ordered favours are not yet delivered. You would pardon this piece of imprudency, if you were acquainted with the particulars of my very great ſtraits, to ſay nothing of the continual (almoſt daily) diſburſements for others, and the gratitude and juſtice of account, which is due, upon all ſuch occaſions to me given, from,

Honoured Sir,

your unfeignedly faithful,

and moſt obliged ſervant,

S. HARTLIB.

Honoured SIR, May 25, 1658.

THE lord is ſtill exerciſing your poor ſervant by his various diſpenſations in ſome doubtful way. For the horrid pains of the ulcer being ſo extremely upon me, it put my ſon *Clodius* to a great deal of fear in point of life. But ſince my laſt the fury of my pains are very much, God be thanked, abated, and a great deal of ſtuff with 30 or 40 little ſtones are come away from me, ſo that I cannot tell what the lord means to do with me. For, as I told you once already; as ſometimes he perſuades my heart, that I ſhall not die, but live to declare his works, ſo always he doth temper my will with a great deal of cheerfulneſs to be ſubmiſſive to his pleaſure, whatever it ſhall be, for life or for death. There is a German at *London*, who will not be known by any name, but counted a ſecret (I mean Cainitical) philoſopher, now going for *France*, who is ſaid to have a moſt admirable medicine for curing of ulcers in the bladder, or any other part moſt perfectly. But I am afraid he is over-run with a worſe kind of ulcer than myſelf, being obſtinately reſolved never to impart this ſecret. Whether he can be prevailed withal upon any reaſonable terms to part with the medicine, I cannot yet determine. He letting fall ſome words, that the medicine was made out of minerals, my ſon *Clodius* begins to conceit, that it may perhaps be that very medicine of mercury, which he is now preparing for me. He is aſtoniſhed at the operations of the other medicine in me againſt the ſtone, and confeſſes never to have ſeen the like; conceiting withal, that I may yet be a healthier creature than I have been all the days of my life, when all the tartarious matter ſhall be thus purged out of my body. But theſe are mainly to acknowledge your ſingular condoling affections in your laſt of May 22. *Caneparius*'s book cannot be in a better cuſtody than my own, and I ſhall not fail, God willing, to give notice of it to Mr. *Worſley* himſelf. My ſon *Clodius* is reading of it for the preſent, commending it in many reſpects. The ſame author hath written another book, which is as it were a whole body of philoſophy, as Mr. *Kratſhmar* told me. But if I hear of more, I ſhall give notice of it. Dr. *K.* comes never at me, but I hear my lord Protector is reconciled again, and hath promiſed to be preſent at another proof, which he is to make again either this or next week. Mr. *Kratſhmar* is at *Stratford Bow*; and when I ſee him, I ſhall aſk him what paſſages he moſt approves in the deſigned treatiſe *De Atramentis*. My ſon commends very much young *Kuffler* unto me as a very inventive wit. He doth now make exactly the ſtopples of glaſs to ſtop bottles withal inſtead of corks, which I ſuppoſe may prove a very ſpecial kind of accommodation for preſerving of wine, ale, and all other kind of liquors. My ſon *Clodius* hath alſo received a letter from Sir *K. Digby* with many obſervable things in it. He tells me, that Sir *K.* hath alſo publiſhed of late the treatiſe of the ſympathetical Powder, and, if I be not miſtaken, that he hath gotten or is ſhortly to get a copy of it. The adjoined copy of Mr. *Worſley*'s letter ſeems to have many regular things in it. And I am glad I have gotten a letter again from Dr. *Horne* with thoſe pretty obſervations, occaſioned by my communications of *Martindale*'s new carriages or coaches. The doctor alſo hath ſent me a ſcheme or picture of new invented coaches, which have been in uſe at *Leyden* for ſome years, but only for pleaſure. But *Martindale*'s motion, the like never as yet hath been practiſed, will be not only for recreations, but likewiſe for real profit and accommodations in many reſpects. Juſt now I have given an acquittance upon the receipt of your five favours, to Mr. *Thomas Alſteyn*, which put a new obligation upon me to ſubſcribe myſelf,

Honoured Sir,

your ever faithful, and

moſt obliged ſervant,

SAM. HARTLIB.

SIR *H. Slingſby* was only this day tried before the high court of juſtice, and my lord *Falconbridge* is gone with a very magnificent train to the king of *France* at *Mardyke*.

June 1, 1658.

Honoured Sir,

HAVING written largely on Tueſday laſt, and having ſent ſome other letters on Thurſday, Friday by your man and Saturday by the poſts, theſe are only to ſignify, that I had none from your hands by the poſt, that arrived yeſterday. My ſon *Hartlib* has had a very large conference with Mr. Secretary about the buſineſs of learning; and finding him full of frivolous ſuſpicions and allegations, he hath notably pleaded for the juſtice of that affair, and doth not mean to give it over, till he be convinced into better reſolutions. To this purpoſe he hath referred him to Mr. *Jeſſop* (who is a very great and real friend to that deſign) that he may receive ſatisfaction to any of his pretended ſcruples, though they be ſuch, that my ſon can diſcern the weakneſs of them, to ſpeak the beſt of them. Yeſterday the ſecretary went to confer with my lord *Fleetwood* about it, but he will not be able to cope with his cunning ſubtilities. But not a word of all this to any other. By the encloſed you will ſee what Mr. *Worſley* hath written to Mr. *Dury*. To me he writes as followeth. " Your laſt hath " confirmed me in that, which I had only " before a probable but grounded gueſs " of, *viz.* that upon other pretences the " doctor had a mind to divert that revenue " from both thoſe perſons, and thoſe upright, " honeſt, and ſincere aims, for which it was in- " tended, and under the notion of the ſtates care " to put himſelf into the management of it. " But if this revenue may not be managed " entirely

" entirely amongſt ourſelves, who underſtand " the aims, hearts, lives, principles, and ſpirits, " one of another, I mean Mr. *Boyle*, yours, " Mr. *Dury*, Mr. *Sadler*, myſelf, or Mr. *Beale*, " (whoſe piety, integrity, and worth I have " a confidence of) it ſhall never be raiſed to " ſerve the outward glory or luſt of another " man. If the ſtate have a mind to ſet up " ſuch an inſtitution, let them do it of their " own, and diſpoſe it to their own miniſters. " If other men are willing to lay a founda- " tion of ſo much good, let not the ſtate " hinder them by interpoſing amongſt them. " For in theſe things every man is free, nei- " ther can any man be obliged but according " to his own pleaſure and through his own " ſatisfaction. But if the ſtate have a mind " to try or compare themſelves with the do- " nors, let them give us but a ſmall revenue, " and leave it to us. Let them take a " greater, and let the emulation of doing " moſt good, and being moſt faithful to the " publick grow between them and us. And " conſider, who can loſe by ſuch an honeſt ſtrife " as this is. And let this be propounded as " an expedient between us, all which I ſhall " deſire you to communicate both to Mr. *B.* " and Mr. *D.* And for as much as Mr. *D.* " may have an opportunity to ſpeak with my " lord Protector, my lord *Fleetwood*, and others " about it, as alſo with Mr. Secretary himſelf, " I have given him the trouble of a few lines " in it, that as you have well hinted, there " may be a joint harmony and concurrence " of opinion and judgment between you, " when you ſhall either of you ſpeak with " him or any other about it. But if this " ſhould be croſſed, I ſhall then expect and " truly be in hope of ſome thing elſe (which " perhaps I have ſome diſcernings and con- " jectures) that the lord will raiſe, wherein no " man ſhall have any glory to take to him- " ſelf, nor any power or ſubtilty given him " to hinder it, and which particular I think " plainly to be very poſſible. But this, as " alſo his whole work to be brought forth " in his own time, and by his own means, " is to be left to the Lord." The letter is dated May 26. But what is that ſomething elſe, which the diſcerning man is in expectation of? Can you, Sir, reſolve it out of your former letters? I had by this very poſt a letter alſo from Mr. *Wood*. And though I thought I had ſo fully engaged both his honeſty and intereſt to help to diſpatch this buſineſs, yet now he writes. " For the buſi- " neſs of advancement of learning, I ſhall " wholly refer you to Mr. Secretary, who " can much more exactly inform you of the " true ſtate thereof, than I write, had I ne- " ver ſo much leiſure." Really I had expected a more generous anſwer from Mr. *Wood*. Sir *Robert Honywood*, lately arrived out of the *Low Countries*, tells of a ſingular invention found out there, of a clock, that goes moſt exactly true without a balance, which needs not to be wound up but once in eight days, the price of it being 7 *l.* ſterl. Mr. *Palmer*, who hath a ſhop as it were of all manner of inventions, is to have one ſhortly. And *Fromantile* having heard of it, gives out confidently, that he is able to make the like, or rather to exceed it. I am wonderfully troubled at Mr. *Brereton*'s deſerted condition. I fear the next news you will hear, will be, that he is in priſon, there being four judgments out againſt him. I ſuppoſe you have heard of the launching of the gallant ſhip laſt week, which was called the *Richard*. There had like a very ſad thing here fallen out at that time; the wildneſs of the horſes running away with my lord *Richard*'s coach, and breaking it altogether into pieces. My lord Protector was in it with major *Beake* and Mr. *Pierpoint*, as I take it, but none had any hurt, God be praiſed, but major *Beake*, who received ſome wounds. I am perſuaded the good angels had a ſpecial care of my lord Protector. The approaches are come to the walls of *Dunkirk*, whither my lord *Barrimore* and Mr. *Henry Laurence* are gone with a great number of other Engliſh gallants, as likewiſe out of *France*, to ſee the ſiege of that neſt or den of pirates. And though the chief witneſs againſt Dr. *Hewet* be eſcaped, yet there are ſo many other evidences againſt him, that it will go very hard with him. Thus preſenting you the promiſed learned papers, which could not be ſent on Saturday laſt, I reſt,

Honoured Sir,

your ever faithful obliged ſervant,

SAM. HARTLIB.

June 8, 58.

Honoured SIR,

I AM ſo out of love with my tormenting pains, that I have never a good will to mention them, but when they may be an occaſion of uſhering in ſome good communication or other; for the eaſe and health of many. This made me ſilent in my laſt, to complain of my wonted pains. But having gotten ſome new diſcovery from our common friend at *Dublin*, I can pardon myſelf, if I continue to ſay, that my body is ſtill full of pains, though not ſo violent, God be praiſed, as heretofore, I voiding ſtill abundance of little ſtones and gravel. But the diſcovery is preſented in theſe words: " Near *Lambeth*, or " at the farther end of it, is a houſe, where " they make braſs of copper and lapis cala- " minaris. The pots of which metal do, in " the melting, ſend forth ſtore of white " flowers, or flores. Theſe are without any " thing of corroſiveneſs, and a moſt precious " medicine for your ulcer, if the Lord pleaſe " to ſucceed it, and that you can apply them." Thus far the diſcovery, which I muſt confeſs I like far better than thoſe ſalivations you were pleaſed to ſpeak of in your former. I received your civilities on Mr. *Beale*'s behalf, who wrote, before I got that letter, as fol-

loweth. " I ever pray for the right honoura-
" ble lady; ſhe pleads for favour and coun-
" tenance towards me; I cry out for common
" juſtice, that our enemies may not glory in
" our injuſtice againſt ourſelves. Without
" vanity I may ſay it, that I think I am the
" only man, that has ſo perſonally and cor-
" dially ſerved, and by my education am
" fitted to be ſerviceable, with ſome credit,
" in many relations, in moſt of the chief parts
" of *England*; and yet, that am ſo caſt off from
" favour, juſtice, or common mercy. But
" I thank God, who hath given me a heart
" above theſe things; and I think I ſee his
" providence in it, that, to puniſh my old
" pride, in the very flaſhes of falſe learning,
" he hath now placed me under the feet of
" them, that hate and abhor holy induſtry
" and true learning. If I could diſcern my
" preſent guilt, I hope I ſhould rather en-
" deavour to reform myſelf, than be willing
" to dwell in this furnace. Here I am ſick
" of a parochial labyrinth. But *thy will be*
" *done in earth as it is in heaven.* The holy
" angels, at thy command, muſt wait upon
" us poor mortals; and what am I, ſinful
" wretch, that I ſhould diſdain, at thy plea-
" ſure, to lye under the feet of the worſt
" of mankind!" The letter is dated May 27. Thus I was going to have anſwered to the other paſſages of your laſt of June 5, but that Mr. *Brereton*, Mr. *Dury*, and Mr. *Hack* have taken ſome hours from me in relating and repeating, or collating, the particulars of the great news, as they have been brought by ſeveral meſſengers, which alſo will be printed againſt Thurſday next. The ſum of all is, that the whole Spaniſh army, coming to raiſe the ſiege of Dunkirk, is totally routed, and the foot wholly overthrown. Some thouſands taken priſoners and ſlain. Very few on the Engliſh or French ſide. The marſhal *Hocquincourt*, that lately delivered *Heſdin*, killed; P. *de Condé* taken, but let go again; the general *Caracene* taken, with a number of other grandees. Some of the *Stuarts* were preſent in the battle. But the courage of the Engliſh ſoldiers was moſt inſtrumental in the victory; inſomuch, that marſhal *Turenne* gives an account to the king in no other words, but that the Engliſh had carried themſelves above men. We now do expect to hear daily of the taking or ſurrender of that piratical den of thieves. The court of *France* hath taken ſo kindly the viſit of his highneſs, in his ſon-in-law, the lord *Falconbridge*, that they are reſolved to ſend no leſs than four ambaſſadors to requite the ſame civility; one from the king, another from the queen, the third from their brother, the duke of *Anjou*, and the laſt from *Mazarin*. My lord *Falconbridge* is returned, and cannot ſufficiently expreſs the great reſpect and entertainments he hath found at that court. But he could not prevail with his highneſs here for a longer reprieve of his uncle, Sir *H. Slingsby*, who was beheaded this day upon *Tower-hill* (with Dr. *Hewet*) which was all the favour ſhewn them, who were ſentenced by the high court of juſtice to be hanged, drawn and quartered. They offered, when it was too late, confeſſing their own guilt, to diſcover the bottom of the whole plot. Laſt Friday his highneſs and council, apprehending no ſmall danger, even unto *England*, in caſe the foreſaid ſiege ſhould be raiſed by the reſolved formidable Spaniſh army, kept a private faſt; and on Saturday night they had a return of their prayers, which hath filled *White-hall* (and more places alſo) with triumphant joys. The imperial election, if it be not paſt before this time, will be farther off than ever. Mr. *Brereton*'s father hath at laſt condeſcended to ſupply him with three hundred pound, being fallen very ſick. Thus I am conſtrained to haſten and to conclude, but remain profeſſedly ever,

Honoured Sir,

your truly faithful

and aſſured ſervant,

S. HARTLIB.

Aug. 10, 58.

Honoured SIR,

I HOPE you are ſafely arrived at *Oxford*. Theſe two or three days my pains have been very much decreaſed, God be praiſed. But Dr. *Petty* hath taken away above two hours from me, which ſhould have been devoted to your ſervice. The Dr. ſeemed mightily to be ſurpriſed, when he underſtood you were gone out of town, with ſome kind of jealous intimations, becauſe I did not direct him to your lodging. But I anſwered, that, when that queſtion was made unto me, I really did not know your lodging. I had lately received a letter from Mr. *Oldenburg*, amongſt other particulars, in theſe words: " In our paſſing through *Mentz*, we met with
" a rare artiſt, called *Becker*, a young man,
" who hath found, he ſaith, the perpetual
" motion, the poſſibility whereof hath been
" hitherto ſo much diſputed by philoſophers.
" He hath almoſt finiſhed a work, wherein he
" doth demonſtrate his invention, which we
" have ſeen, and the deſign and way where-
" of the maſter told me himſelf, he would,
" within a very few weeks, put in print here
" at *Francfort*; which being done, I ſhall
" ſend you a copy of it. I am told here, that
" Dr. *Petty* hath a commodious way of print-
" ing, called, *inſtrumentum Pettii*, very con-
" venient to carry about, and to print in tra-
" velling ſome few ſheets of paper, if occaſion
" preſent itſelf. If you have or know it, I
" entreat you to communicate it unto me.
" July 18, 58." The doctor laughed at the invention of the perpetual motion, and denied to have any ſuch inſtrument of commodious printing. Moſt of the time was ſpent in telling the contrivance of his great deſign, upon which he was reſolved to ſpend two thouſand pounds, not doubting but that he would be a

good gainer in the concluſion of it. The deſign aims at the founding of a college or colony, of twenty able learned men, very good Latiniſts, of ſeveral nations, that ſhould teach the Latin tongue (as other vulgar languages are learnt) merely by uſe and cuſtom. This, with the hiſtory of trades, he looks upon as the great pillars of reformation of the world. I wiſh you could handſomly preſent unto him, how he hath defeated me of two hundred and fifty pounds a year (for which I have to ſhew ſome of the donors own hands) by undermining that more univerſal deſign of learning, upon which I have been made to hope theſe two years. Mr. *Brereton* writes, " My ague " hath almoſt left me (thanks be to God) and " my ſtrength begins to return, though ſlow- " ly." The letter is dated Aug. 7. No poſts this week out of *Ireland*; but ſome unexpected lines from Mr. *Pell*, in theſe words. " I pray " you, give ſpeedy notice to Mr. *Moreland*, " that I am here. There was once a reſolution " of ſending a ſhip for me. I fear I ſhall not " here find a fit ſhip before one may be ſent " hither." *Fluſhing* in *Zealand*, Aug. $\frac{3}{13}$. The vice-chancellor of *Cambridge* was with me laſt week, entreating me to ſound him, whether he would be willing to lay the foundation of a mathematical profeſſorſhip in that univerſity. If I find him to be, the univerſity is as good as reſolved to petition his highneſs about him, as ſoon as he is arrived. My lord *Montague* ſent orders yeſternight for a ſhip to fetch him from *Fluſhing*. Doctor *Kuffler* was with me on Monday, telling in what words you had congratulated the ſucceſs of his terrible deſtroying invention. He thinks it not fit to preſent himſelf to his highneſs, till the funeral of my lady *Claypole* be over. Her corps was to be brought as this day by water from *Hampton-court*. My ſon *Clodius* promiſed to write by this poſt. I would fain have the particulars from your own relation, which you were pleaſed to tell him of divers curious inventions, ſhewn you lately by a certain Walloon. Here you have, beſides the promiſed papers of the glaſs ſtopples, a notable anſwer from *Hereford* to Mr. *Worſley*'s olfactiques, which I imparted unto you at *Marſton*. Mr. *Beale* writes in his laſt, " We " had here about eleven of the clock, on " Wedneſday night, one great crack of thun- " der, that hath turned all the beer and ale of " this neighbourhood into giddineſs. I did not " think, that ſo much hurt could be done to " drink by ſuch a ſhort crack. Can any ſtopples " preſerve the liquor from this annoyance?" Thus far he. This day Mrs. *Dury* with her huſband went from hence to conduct Mrs. *Worſley* to *Cheſter*; from whence they intend to give a viſit to Sir *Richard Saltonſtall* at *Wrexam*. Within three weeks, God willing, they hope to be back at *London*. I remain ever,

Honoured Sir,

your faithful ſervant,

S. HARTLIB.

Sept. 14, 1658.

Honoured SIR,

MY laſt was on Tueſday. I forgot then to add one of the beſt remedies, that my ſon *Clodius* knows againſt the Eryſipelas, which I tranſmitted to Mr. *Beale*, in theſe words. *Cape Rob. baccarum ſambuci & ejus unciam unam in aquæ florum ſambuci unciis ſex diſſolve, & hac mixtura aſſumta tegatur æger ſtragulis, quam diligentiſſime, ut largiter ſudet. Hoc ſecunda quoque & tertia repetatur vice, ſi prima non cedat malum.*

THUS far I began to expreſs my reſpects laſt Thurſday, but was forbidden to proceed by the extremity of moſt violent torments, which caſt me into my bed, as into a grave. And though I be riſen this day again, yet I conflict with inexpreſſible torments, and which will ſuffer me only to ſignify the receipt of your laſt of the 11th of September. Nor is there much to anſwer to the contents thereof. Only I am mightily tormented alſo at the loſs of your excellent meditations (of the Uſefulneſs of Natural Philoſophy) which will now be more ſeaſonable than ever, for that I ſuppoſe, that his Highneſs, that now is, will perhaps more favour deſigns of ſuch a nature, than his deceaſed father, otherwiſe of very glorious memory. I have received the *Maſcon* books, and do return you my moſt humble thanks for them. I ſhould be glad to hear your account of Mr. *Beale*'s papers, concerning cyder as a winy liquor. But I believe Mr. *Auſtin* did not impart unto you a copy of his own letter, as his judgment upon them, which I have done here by ſome of the adjoined papers. But you need not to let him know any thing of the exerciſe of this my well-meant charity. My ſon *Clodius* is under new trials, his wife being brought to bed this night of a child, that died ſoon after, the mother remaining very weak. He wrote to you laſt Saturday. His chemical college or laboratory will not be ſo much proſtituted as you fear. But there was an abſolute neceſſity to reſolve upon ſuch a courſe amongſt a few confiding friends. There are near three furnaces finiſhed, but five more muſt be added unto them. And having theſe, they ſhall be able to command any kind of operation whatſoever. I know not how he will be able to diſpoſe of his buſineſs, ſo as to give you now a viſit at *Oxford*. But I ſuppoſe, that ſome occaſion or other, in theſe changes of publick affairs, may invite you to *London* ſooner, it may be, than you had reſolved. If you come, if the Lord ſpare my life, we ſhall be able to ſpeak more freely about thoſe ſecret papers and paſſages, by me imparted. My lord *Broghill* is written unto from *White-hall*, to come away with all poſſible expedition. But my lord deputy of *Ireland*, I hear, is not now likely to come, being to look the better to the publiſhing of the new ſucceſſion. I do not remember to have told you of the like charitable deſign to be founded at *Durham*; I mean of a charitable phyſician, or laboratory, for the poor. I have

but one copy of it in print, being only diſperſed by private communications. But yeſterday I received a letter, wherein I am promiſed to have ſhortly more copies. As for my ſon's charitable deſign, though the reaſons, which are alledged againſt it, ſeem to be weighty, yet thoſe other conſiderations, which the propoſer can ſhew for it, are not to be ſlighted. When you meet, God willing, they may both be laid into juſt balances. The more particular account of Mr. *Stahl*'s way of ſtudy, and of his opinions, will be fitter for a diſcourſe than writing. Mr. *Brereton* reſolves to be in *London* about the 25th of this month. He writes ſadly. "A ſhip was "caſt away about three weeks ſince, going "for *Ireland*, about four leagues off *Holy-head*. "They ſay here, it was by a ſpout, or fall-"ing of a cloud, and that divers perſons of "quality (others ſay ſixty in number) were "there loſt: not one man, and but two "dogs (one whereof upon a plank) were ſav-"ed." The letter is dated, September 11. I hear nothing yet of the arrival of Mr. *Worſley*, nor of Sir *George Wentworth*, our neighbour, who, they ſay, was in it, with all his family, expecting his eldeſt daughter, who could not be perſuaded to go into *Ireland*. I hope it is not true. But thus much is certain, that he carried two dogs along with him. There is alſo a ſecret whiſper, as if my lord *Bradſhaw* was departed this world in *Cheſhire*, which, if true, is one of the ſaddeſt and moſt piercing news, that can befal,

Honoured Sir,

your faithfully devoted,

SAM. HARTLIB.

I HAVE not time to read over what I have written.

December 16, 1658.

Honoured SIR,

HAVING written laſt week two letters, and ſent alſo a great packet with letters from *Ireland*, I did not write on Tueſday, not hearing of the receipt of any of them. But yeſterday I received the acknowledgment in your laſt of December 14, with the three books of Dr. *Willis*'s fermentation, for which I would have you returned, not only my humble thanks, but likewiſe thoſe books, which I have enquired after, in *Paul*'s *Church-yard*, if I could have gotten them. I am wondrous glad, that you have written of the preſent protector's intentions for countenancing and advancing of univerſal uſeful learning in due time. I had, by the laſt poſt out of *Germany*, in my learned letters, ſome paſſages of ſpecial importance, tending that way. I mean, about the care of magiſtrates, for ordering and improving of learning, and a purpoſe for drawing up a ſolid and handſom diſcourſe, for a ſtanding council of learning, how it may be rightly conſtituted to work out, without any noiſe and diſturbance, a real reformation and advancement in all manner of literature. I ſhall now ſtir up the gentleman to elaborate ſuch a diſcourſe, he being of vaſt and excellent parts; and if I ſhould tell his name, perhaps, not unknown to Dr. *Wilkins*, when he travelled beyond the ſeas. My humble and faithful ſervice to the doctor, who ſtands ſo nearly related to his highneſs, letting him know, that I hope to ſee him not only made provoſt of *Eaton* college, (though my lord preſident had obtained the grant of it from his late highneſs, after the deceaſe of my lord *Rous*) but likewiſe preſident of the forementioned ſtanding council of univerſal learning. I hope likewiſe, that the Lord will make your worthy ſelf eminently inſtrumental for carrying on that deſign, upon that, or any other the like favourable either publick or private occaſions. Mr. *Dury* told me, on Monday laſt, how that captain *Shaine* would have ſhortly a meeting of Mr. *D.* Dr. *Petty*, and himſelf, at my new houſe, to contrive and determine the way of promoting this very buſineſs as to the hopefulneſs from *Ireland*, the adventurers being bound, by the act of parliament, to allow, and ſet out, the ſum of ten thouſand pounds for ſchooling and learning in that country; of which I ſhall not fail to give you a farther account in due time. But *Anthony Pearſon*, the Quaker, is gone away per poſt laſt Saturday, not having performed his promiſes towards me. I am ſending to *Calvert* the ſtationer, to enquire, whether he have left any papers of huſbandry with him for me, or promiſes to ſend them up with enlargements, of which he ſpoke likewiſe unto me. As ſoon as I have heard, one way or other from him, you ſhall be ſure to be acquainted with it. In the mean time, I beg the communication of the promiſed great myſtery of huſbandry, if you become maſter of it. I ſhall carry myſelf, in the concealing or ſpreading of it, as you ſhall pleaſe to preſcribe. My chemical ſon's head and hands are much taken up with animadverſions on Dr. *Willis*'s book, he having very great and clear reaſon and experiences to diſlike very many particulars in it. But, no doubt, of this he will write himſelf; I ſhall carefully ſend the books to Mr. *B.* and Mr. *Worſley*. But I ſhall impart, what he ſo triumphantly and confidently writes to a confiding friend of his in theſe words. "My dear friend, raiſe up yourſelf, be cheer-"ful, comfort yourſelf indeed, and comfort "all our friends in the faith and expectation "they have of the glory to be revealed, and "of the faithfulneſs of the making good the "rich promiſes of God to his people, even "forthwith. For, believe me, and believe "alſo, I would not knowingly abuſe you: "and if you may receive any thing certain "from me, then I can, I dare, I do aſſure "you, I have ſeen, or heard, or been in-"formed of that, yea ſo much of that glory "now to be revealed, as I am not in fancy, "not in imagination, but in ſobriety and "judgment, well aſſured, that when the "Lord

" Lord ſhall really uſher it into the world, " (and that he may do, for any thing I know, " in a few, it may be very few months) all " the force that can be made in the world, " will not be able to reſiſt it. But it ſhall " root, and it ſhall prevail, until darkneſs be " wholly tumbled down, and confuſion itſelf " ſhall be wholly confounded and brought " to nothing. And believe it, my true friend, " this word is certain: for that muſt of " neceſſity work powerfully and ſtrongly, that " hath the counſel and decrees of God to go " along with it. And there is not the leaſt " part of that faith and hope I now declare " to you, that is built upon man, but upon " God, and upon the certain counſel, wiſ- " dom, and faithfulneſs of him, who perhaps " will, before we are aware, cut his work ſhort, " and will put an end to all gainſayers." The letter is dated Nov. 20, 1658. But of his *Tractatus Tractatuum* I cannot learn as yet any thing. My humble thanks for your continued care to Mr. *Haughton* on my behalf. Yeſterday the writs (upon new conſiderations) of parliament were ſent by a meſſenger into *Ireland*. Some fear there is of a breach between us and *France*; but my lord *Lockhart* is haſtening thither. Mr. *Dury* is fallen very ill. Mr. *Needham* told my ſon, that my lord *Broghill* was at *London*; but upon ſending thither, there was no ſuch matter.

ONE of his highneſs's daughters died lately in the country.

N. B. By this very poſt I have ſent a big packet with letters from *Ireland*.

April 5, 1659.

Honoured SIR,

YESTERDAY I received ſome part of your anſwers to my ſeveral letters, which were very welcome, but that I am extremely troubled at the ground of hindrance, that would not ſuffer you to enlarge yours upon the other particulars. My ſon's maid fell ſick laſt week of an ague, but by God's bleſſing upon the uſe of that powder, which he got from his new acquaintance, ſhe is in a very hopeful way of a perfect recovery. No doubt himſelf will write concerning ſalt cornu cervi, or that other medicine; at leaſt I have done my duty in obeying your commands. When theſe holy-days are over, I ſhall cauſe very diligently to acquaint myſelf about *Mary Rant* and her writings; for I have not only now, but very often, been importuned heretofore on her behalf. Dr. *Horne* owes me a large anſwer to a letter accompanied with many communications, ſo that I do not intend to write to him again, till he hath given me an account of them. Both *Voſſius* and *Horne* are two notable learned men, ſo that we may juſtly expect ſome extraordinary performances in their extraordinary undertakings or encounters. I beſeech you to favor me with the firſt notice, when thoſe ſo much deſired chronological labours of the late worthy biſhop of *Armagh* are come out of the preſs, that I may ſend a copy of them to the learned doctor at *Leyden*. I ſhall endeavour to inform myſelf the beſt I can, concerning the way of making ſaltpetre out of ſea-ſalt. I wonder, that Mr. *Worſley*, that was one ſo hot upon this ſubject, both for writing and acting, hath been ſo much cooled in both reſpects. I wonder alſo not a little at his perverſe and obſtinate ſilence. Mr. *Wood* gives no other account but " Dr. *Worſley* is not yet " returned out of the country, but is well " there, for ought I can hear." Thus far he, the letter being dated March 21. Concerning the inſtrument of catching and condenſing the ſun-beams, I have a promiſe of a large account from Mr. *Morian*. But whether he ſhall get leave to reveal the way, which the adeptus, who is with him, doth uſe in the philoſophical work, he cannot yet aſſure me of. The anſwer of Mr. *Pocock* to the Turkiſh queries (which are very ſeriouſly made) will be very acceptable, if it can be procured. I thank you heartily for the printed paper of coffee, which will be guſtful no doubt to your coffee drinkers, and who perhaps may add as many more good obſervations from their own experience, as the Arabian phyſician hath done. Is the philoſophical figment under the preſs? Dr. *Worthington* told me huge commendations of it. I ſhall not be unmindful of your commands to Mr. *Oldenburg*. In my laſt on Saturday I ſhould have added the following lines, wherein he has anſwered to ſome of my former deſires. " At preſent " I have nothing elſe to ſend you, than what " I promiſed to ſome of my former, *viz.* " Mr. *Becker*'s Argonautick invention, which, " if practicable, as well at ſea as in a model, " would certainly excel moſt inventions that " ever were deviſed. There are many con- " ſiderable things in it, which if he be able " to put in practice (as in the end he ſaith " he hath done heretofore already, blaming " withal that famous and raſh undertaker at " *Rotterdam*) he were worthy to be crowned. " In the interim ſuch kind of men ſhould " be ſome long time converſed with, and " ſome expences hazarded by liberal enter- " tainments, to get their familiarity and affec- " tion; after which they will more eaſily be " induced to diſcover themſelves and the " depth of their knowledge." The queſtions, which he propoſes to me, are theſe. I pray give yours the trouble to aſk, whether the book called *vulgar Errors* of Dr. *Brown* be tranſlated into French or Latin, or any other language, and acquaint me, with it by the next. Laſtly he adds a word or two concerning the French publick affairs. Here is a ſtrong rumour of a peace between France and Spain, though I think it nothing but a trick of policy, for to daſh the plottings of diſcontented people here, and to give them hopes of that quiet, which they deſire after ſo long and exhauſting a war as this hath been. Of our parliament publick affairs I have no mind to write. The debates for ſome days have been only about the act of a ſolemn faſt, that it may be publiſhed in the name of his highneſs

highneſs and the parliament, but not of both houſes of parliament. For there are new debates riſen about not tranſacting with the other houſe of parliament, till their bounds be firſt ſtated and determined. The army is coming to deliver their petition about indemnity. Juſt now my ſon *Clodius* ſends the encloſed. When he was with me this afternoon, he was admiring the great ſtones, that were come away this night from me; but though I remain ſtill in woful torments, yet I muſt ſubſcribe myſelf ever,

Honoured Sir,

your entirely devoted,

S. HARTLIB.

SIR, the Argonautick invention cannot be written out, but muſt be deferred till the next occaſion.

April 12, 1659.

Honoured SIR,

THESE are to return my humble thanks for your laſt having no date, but I ſuppoſe written on Saturday laſt. I did not write ſince my laſt of April 5, having very much overloaden you as I feared, and being very deſirous to have an anſwer to divers particulars in thoſe learned communications, which now alſo for the moſt you have given. As for Mr. *Pocock*, I dare not reiterate my former requeſt, leſt it may prove, as you alledge, a prejudice to better and greater occaſions. Here you have ſome extracts more of Mr. *Beale*'s on the optical argument. He will be very glad to hear, that the ingenious gentleman of *Greſham* college is engaged by you to make particular enquiries into that ſubject (which I ſhall carefully certify our Herefordian friend;) but I ſhould be more glad, if you could obtain copies of what he ſhall deliver (concerning the commendation and perfection of teleſcopes) in his publick lectures. At *Copenhagen* the former king had impoſed the printing of all the profeſſors lectures in that univerſity. I am heartily glad that your ague deals ſo civilly with you, but you do not tell, whether my ſon *Clodius* has ſent you ſome dozes of his new adeptus's powder, as I earneſtly begged of him. Our maid is perfectly cured, by God's bleſſing upon the uſe of that medicine. The packet with books, which I have ſo long expected out of *Holland*, hath been twice at ſea, as I was adverti ſed the laſt week, and that it was now again on the way the third time. As ſoon as it is arrived, you ſhall preſently have all your deſires. Laſt Friday I did write to Dr. *Horne* about the experiment of making ſaltpetre out of ſea-water. Mr. *Beale* has been pleaſed to ſend me his ſuggeſtions for Dr. *Horne* in dealing with *Voſſius*'s new chronology. By the next occaſion (if my torments put it not out of my mind) you ſhall have a tranſcript of it. In the mean while here I preſent you with the promiſed Argonautick invention of that *Becker*, with whom Mr. *Oldenburg* is come acquainted in his travels. But I am ſorry the Latinity of it is ſo imperfect and mechanick. The foreſaid gentleman writes in his very laſt as followeth. " I have had ſome " diſcourſe with an able but ſomewhat cloſe " phyſician here, that ſpoke to me of a " way, though without particulariſing all, to " draw a liquor of the beams of the ſun, " which peradventure ſome perſon, that is " knowing and experienced (as noble Mr. " *Boyle*) may better beat out, than we can, " who want experience in theſe matters. The " proceſs, as far as I could underſtand him, is " this. You muſt put a couple of pounds " of good mercury into an alembick, luting " the head thereof as well as is poſſible, to " the end that nothing exhale, and expoſe " the ſaid alembick into the ſun againſt a " wall of reverberation in the hotteſt time " of the year; upon which he ſaid the mer- " cury would after ſome time draw the ce- " leſtial ſpirit, and coagulate it into a yel- " lowiſh liquor, that would be a conſiderable " diſſolvent. So much he ſpoke in groſs, " which I pray communicate with Mr. *Boyle*. " At the firſt I would not have it go farther " than to Mr. *Boyle*, and according as he ſhall " judge of it, we may proceed farther." Thus far the very formalia of his letter. Alas! good gentleman! *Pauperis eſt numerare pecus*. I ſhall be able ere long to communicate other kind of proceſſes on that argument. I long to ſee your ſecret of univerſal (as I take it) huſbandry. Dr. *Kuffler* is moſt confident of his ſecret for improving of ſandy or any other barren land. He is ſo much in love with it, in reſpect of the promiſing or rather certain gain, that will moſt abundantly redound to him, that if he could get any partners, or any other encouragement or aſſiſtant for it, he would willingly deſiſt from all eager purſuits about his dreadful and deſtroying invention. I humbly beg, that you would not leave him, till he have diſcovered that ſecret of huſbandry, at leaſt into your boſom. He is very poſitive, that many thouſands may be gained by it. He ſays, the means are altogether natural, being a very ſlight thing, and that it is continually obvious to every body, but yet obſerved or improved by no body. I ſhall not fail to be mindful of your commiſſion to Mr. *Lynner*, by the next occaſion I write unto *Ireland*. I alſo purpoſe to look out thoſe papers (as ſoon as the extremity of my torments will give leave) which have anſwered my interrogatories for *Ireland*, in reference to barnacles. I pray be pleaſed ſo to mind that excellent little treatiſe, you mention, of the propagation of all ſorts of plants, that I may have the firſt notice of it, before it be flown abroad. If you have a mind (ſays my ingenious correſpondent) to oblige Mr. *Pitt* and Sir *Thomas Hanmer* of *Flintſhire*, and Mr. *Rea* of *Shropſhire*, all three exquiſite floriſts, and Mr. *Rea* ſhortly to furniſh the preſs with a treatiſe of note on that argument, you may with

" with the ſame arrow hit the mark to all " three." And again, " For though Mr. " *Pitt* ſends me his rarities of ſeeds and " plants, yet I fail not to gratify him. Mr. " *Rea* brought up his hortulan labours to " *London.* It required many coſtly cuts, " which ſo affrighted the Stationers, that " they offered him but thirty pounds for " his pains. This diſpleaſed him ſo much, " that he brought home his manuſcripts. I " told Mr. *Pitt*, that I had no vote for any " man, that demanded a patent or a price for " his merit towards the publick." I ſuppoſe you have ſeen the Petition of the army, which is no ways liked. But they are more reſolved and daring in their meetings, conſultations, and orders, which cannot be hindred. But clouds begin to gather apace, and the chiefeſt amongſt them have no other apprehenſions, but that it muſt come again to blood. My lord *Craven* is permitted to come over. I had forgot to ſignify, that Dr. *K.* deſires earneſtly my lord *Broghill*'s protection, under the notion of being phyſician to his family; for he ſays, that ſuch protections are, during parliaments, ordinary and precedential; which, if it may be obtained in time, will be a huge benefit unto him. For now he dares not go upon the ſtreets to follow his buſineſs, for fear of being arreſted. But ſuch a protection would ſave him from all his creditors, for a time, in which he hopes he may be put into a better condition. I ſhall not fail to ſpeak to your truly compaſſionate and noble ſiſter, begging your ſeconds, as remaining ever,

Honoured Sir,

your moſt faithfully devoted,

S. HARTLIB.

Axe-yard, April 16, 1659.

Honoured SIR,

I WROTE largely on Tueſday laſt. Since I have been moſt grievouſly tormented, both days and nights. I had many things to enlarge upon, but the pains are ſtill ſo great, that I have much to do to write a very few lines. Mr. *Beale* wrote ten days ago, that he was ſorely afflicted with a moſt terrible cold. But having not written to me all this while, I fear his diſtempers are encreaſed upon him. I ſaw an excellent book yeſterday, coming piping hot out of the preſs from *Cambridge*, called, *The Immortality of the Soul, ſo far forth as is demonſtrable from the Knowledge of Nature and the light of Reaſon. By Henry Moore, Fellow of Chriſt's College in Cambridge.* Mr. *Tompſon*, at the White-horſe, hath part of the books. I had a few lines again from Mr. *Wood* at *Dublin-caſtle*, who writes, " We have tried " your experiment upon one or two ſick " horſes, with good effect. I thank you for " it, as alſo for your ingenious Herefordian pa- " pers." Dr. *Petty* writes to my ſon, " Keep " all your friends from prejudice, until I be " heard, and make them mine, till the leaſt " guilt appear in me." My ſon went down with the orders of the houſe for my lord *Craven* to come over, giving him protection for ſix months. He hath ſtayed out ſo many days, that we begin to apprehend he is gone over into the Low-countries, which alſo is no ſmall trouble unto me for the preſent. The officers of the army have ſtill their meeting, and will not be controlled. They are reſolved to juſtify the execution of *Charles Stuart*, but not the government by a ſingle perſon, but rather a commonwealth. They are reſolved againſt Preſbyterianiſm, and will have allowed an univerſal liberty of conſcience. They ſay they have ſent to the trained-bands of *London*, to know, whether they will ſtand by them or not. They are for a commonwealth, or for eſtabliſhing a military great council, *&c. &c.* Next week it is feared their declaration will come abroad. This day a great multitude of Quakers were admitted to the houſe; but they would not obey their orders nor commands, ſo that Mr. ſpeaker told them at laſt, they were a company of people, that were againſt magiſtracy and miniſtry; and ſo they were diſmiſſed. The houſes have begun very reſpectfully to tranſact with each other, by members of their own, in their reſpective houſes. It is ſtill more and more confirmed, that the match and peace between *France* and *Spain* will ſuddenly be concluded. There is an expreſs come, that our fleet is ſafely arrived in the *Sound*. The Holland fleet is not yet at ſea. Thus, praying heartily and inceſſantly for your health, as a moſt publick bleſſing, I reſt ever,

Honoured Sir,

Your moſt aſſuredly devoted

S. H.

THE adjoined paper is worth your beſt peruſal.

Axe-yard, April 19, 59.

Honoured SIR,

MY laſt was on Saturday. Theſe are to acknowledge the reſpect to your laſt of April 16. I humbly thank you for the imparting of the ſecret of huſbandry. But by the adjoined paper you will ſee it is no ſecret to me. I did a year ago impart a copy of it to our Herefordian friend. But methought he was not much taken with it, though it coſt me, for the gaining of it, above fifteen pounds ſterling. My ingenious friend concluded (as far as I remember) that the poſſeſſor of it, from whom I had it, had but little ſkill in huſbandry. He made alſo many other obſervations and animadverſions upon it, which I thought to have given you, but that I cannot find Mr. *Beale*'s letter, written upon that occaſion. Sir *Charles Culpepper* had it from my communications above a year ago. He ſeemed to approve more of it than Mr. *Beale*, and I believe has made ſome trial, of

which I ſhall deſire his account, when I ſee him. I remember, that I imparted this huſbandry to Mr. *Worſley* alſo, who judged it, if by experience it ſhould be found true, a particular good menſtruum, but falling very much ſhort of advancing thereby univerſal huſbandry. I beg again, you would endeavour to intereſt yourſelf in that way, which Dr. *Kuffler* ſo highly boaſts of. I could eaſily obtain the deſired protection for him from many parliament-men; but I would willingly improve this occaſion for your greater intereſt in him, by making my lord *Broghill* his protector. I have ſufficiently inſtructed your moſt noble ſiſter in that affair, and make no queſtion, I ſhall have a favourable account from her within a day or two. My ſon *Clodius* promiſed this forenoon, in the preſence of Mr. *Brereton*, to ſend you forthwith, beſides the promiſed things, ſome doſes of the adeptus's powder againſt agues. I am not a little troubled, what is become of my ſon *H.* I ſhall not be unmindful of your commiſſion towards him. The following lines from my dear Herefordian go very near my heart. "Your "two laſt are yet unanſwered. Nor now can "I do more than abbreviate an acknowledg- "ment of your's, without peril of loſing my "ſight totally. I can neither write nor read "without a flux of rheum upon my eyes, "which glues them together, as oft as I ſleep. "I think it no danger, and towards healing, "if I forbear ſtudies one week longer, and "then I will endeavour to anſwer all yours. "I am troubled at Mr. *Boyle*'s ague; but it "is here ſo epidemical, or indeed the leaſt of "maladies, that are amongſt us. I have "lately ſeen ſo many ſmitten with dead- "palſies, apoplexies, and giddineſs, that I "take my own malady for a proof of a ſpe- "cial deliverance. I noted the time, when "I took it, by a very malignant wind in my "neck, through a window, in time of my "duty in the miniſtry. But who can com- "plain of perſonal maladies, when the pub- "lick is ſo much diſtempered?" Thus far he, the letter being dated April 13. Yeſterday I had a letter again from Mr. *Oldenburg*, in theſe words. "Having been more than "ordinary employed in buſineſs laſt week, "and being ſtill ſo at preſent, in changing "lodgings, and putting ourſelves into an "academy, I know you have the goodneſs of "excuſing my omiſſion of not giving you "thanks for your laſt, which I hope to do "amply next week, if God will." The letter is dated April 23. Dr. *Kuffler* has promiſed me the diſcovery of the arcanum of the celeſtial liquor, which, as ſoon as I get, I ſhall not need to be called upon for to let you have a true copy of it. You do not determine the time of your coming up to *London*. I beg your promiſed communications about hatching of chickens. The encloſed paper on that argument I had from Mr. *Pell*. It is pretty to obſerve, that this ſubject is counted worthy of academical conſiderations and trials. Sir *William Paſton*'s ſon endeavoured to make a ſolemn experiment of late, but did not proſper in it. I am fully of your opinion, concerning the Argonautick invention, or the wonderful ſhip. I ſuppoſe you know, that Dr. *Chamberlain* (the man-midwife) is returned into *England*. He boaſts to have the invention of ſailing againſt wind and tide, or with all winds. The invention was divers years ago experimentally demonſtrated by one Mr. *Brewer*, a Scotiſh ſilenced miniſter, who receiving many favours from Mr. *Dury*, when he was impriſoned by the epiſcopal perſecution, then raging, he was pleaſed, by way of gratitude, to reveal the whole myſtery of ſailing with all winds, or againſt wind and tide, unto Mr. *Dury*'s boſom, but not to diſcover it as long as the inventor was alive. He hath ſince been dead theſe many years; therefore let me earneſtly beſeech you, the next opportunity you ſhall have to ſpeak with Mr. *Dury*, to deſire the revelation of the ſaid invention to be made out and improved by yourſelf, and the better ſort of your mechanical relations, that ſo uſeful an accommodation to mankind may not be loſt. I do not care, if you tell him I did encourage you to this freedom, and I am perſuaded he will not deny it unto you. Here you have the votes of the commons, that paſſed yeſterday. My lord *Broghill* was highly commended, that he had ſo effectually dealt with the officers of the army, in their meeting laſt week, that it was apprehended he had broken their deſign, eſpecially the city refuſing alſo to join with them, and Sir *H. Vane* utterly diſowning their proceedings, as moſt deſtructive to the publick peace, and of bringing in of *C. S. &c. &c.* The houſe of commons thought good, as you ſee, to ſecond the hopeful work thus far begun. My lord protector himſelf has ſpoken alſo with our officers, as likewiſe the lord *Fleetwood* and lord *Diſbrowe*; but they are again very daring and high; and the other houſe hath refuſed this day to paſs the 1ſt and 2d reſolves of the commons, *&c. &c.* ſo that all ſeems to threaten a farther confuſion. There is alſo a very ſtrict enquiry made after *C. S.* he being ſuppoſed to be in or near the city. But my pains are too great, and I muſt conclude, remaining ever,

Honoured Sir,

your moſt faithfully devoted

S. HARTLIB.

SIR,

MY amanuenſis hath diſappointed me, that I cannot ſend the ſecret of huſbandry, as it was imparted unto me. By the next occaſion it ſhall be ſent, God willing.

Honoured SIR,

YOUR laſt is dated April 23, forbidding to ſend by the poſt. I am but lately riſen, having been moſt grievouſly tormented all night long, and voided, beſides many little ſtones,

ſtones, a very great one, the like I have not done of late. But I am hugely perplexed about that excellent ſpirit of ſalt, which I ſtill uſe daily, and which certainly works ſo mightily upon the ſtone, having broken and ſplit a glaſs with three ounces of it; the ſpirit, which is ſtrange, having made the glaſs ſo thin, or brittle, that it broke with the leaſt touch in the opening of it. I had a letter from him who made it, I mean Mr. *Stahl*, expreſſing a reſolution to come over ſhortly into *England*. I forgot to write to him about thoſe retorts, in which the ſpirit of ſalt is made, and which cannot be had in *England*, to bring them over with him. My ſon *H.* is returned from *Holland*, with my lord *Craven*; but my ſon *Clodius* is gone to *Graveſend*, to confer ſecretly with monſieur *Schlezer*, who hides himſelf there, to be gone with the firſt fair wind to the king of *Sweden*. I know no more of the powder, which my phyſical ſon ſent, but that it hath cured all thoſe, that have taken it. Mr. *Stroud* hath written to my ſon a confirmation of a ſilver mine, which now he is moſt certain of. After the expiration of ten or twelve months, it will yield him for certain yearly about two or three thouſand pounds a year. I heartily wiſh you may be bleſſed with the like mines. I beg the continuation of as many extracts, *&c.* out of ancient or modern authors, as you can procure on that ſubject of hatching of eggs. My ſon might have prepared ludus Helmontii for me before this time, but he wants bowels. I have not heard this week neither from Mr. *Beale*, which encreaſeth my torments. I ſhould be glad, that the ſecret of huſbandry were ſucceſsfully experimented. I ſhall take ſpecial notice of the new edition of *Hoornbeck's ſumma controverſiarum*. Mr. *Worſley* hath written to you a letter of two or three ſheets long. Will you not pleaſe to acquaint me with the communicable contents of it? Laſt Saturday I imparted the remainder of Dr. *Horne*'s letter, wherein were many obſervable matters. I alſo acquainted you fully with the ſtate of publick affairs; ſince which time, all is kept very cloſe and ſecret. It is obſerved, that my lord *Lambert* hath been with his highneſs alone about two or three hours together. There is an evil eye againſt my lord *Broghill*, for adviſing (as ſome whiſper) to clap up *Fleetwood*, *Diſbrowe*, *&c.* into the Tower. Sir *A. Haſlerig* and Sir *H. V.* came on Monday, notwithſtanding the proclamation, offering to go into the houſe of commons, but the ſoldiers watching them would not permit it, the proclamation being affixed to the doors. The officers and common ſoldiers do not agree. The latter have choſen to themſelves new agitators; ſo that all remains in ſuſpence, and under expectations. Only at eleven o'clock yeſternight I was told, that the army is agreed upon a declaration and engagement, which is forthwith to be printed. Laſt Lord's day his highneſs was obſerved to weep in ſermon-time, which cauſed many ſheddings of tears in others; but yeſterday he was obſerved to be very chearful and merry. Dr. *Petty* made a moſt notable ſpeech before the parliament was diſſolved. I reſt ever,

Honoured Sir,

your moſt faithfully devoted

S. HARTLIB.

A PEACE or truce for fourteen years between *France* and *Spain* will certainly be concluded and publiſhed. Young *Clodius* being now at my chamber, preſents his moſt humble ſervice, ſignifying, that he is near an end of the tranſlation of the two choice chemical treatiſes, called, *The Bawer*.

Incloſed in the preceding.

Hereford, April 13, 1659.

DEBUERAM in noviſſimis meis advertere, quod in ſupputatione Gregorii & Fiſheri toties à me memorati (qui niſi Uſſerianis mihi nondum perceptis cedant plurimam habent accurationis ſpeciem) à mundo condito ad paſſionem Chriſti, quam 34 ætatis anno contigiſſe probabilius videtur, 4000 ſunt annorum, quod monet Fiſherus pag. 31. hiſce verbis: The full time from the creation of *Adam* unto the death and paſſion of our Lord and Saviour *Jeſus Chriſt* is 4000 years and 10 days. *De* 10 *diebus (ſi de iis lis eſſet) ratio myſtica et monitoria facilè occurret, è quibus* 6. *ab Adamo ad creationis primordia*, 4. *ad millenorum cenſum, ubi (ut ait apoſtolus) in oculis Domini una dies pro mille annis cenſenda eſt, & cum* 400. *cub. SIR,

your moſt affectionate ſervant.

May 10, 1659.

Honoured SIR,

I WAS in good hope we ſhould have ſeen you before this time: but as long as you are abſent, nothing can be more welcome, than your letters, of which the laſt is dated May 7. On Saturday I ſent you a full repreſentation of our publick affairs. I have not thoſe two German tracts, which young *Clodius* is tranſlating; ſo that I cannot tell the particular themes or contents of them. Only in the general I can inform, that they deſcribe the whole philoſophical work with ſuch rationality and candor, as few other books of the ſame nature can be compared with it. The author, it is certainly known, had the philoſopher's ſtone. Young *Clodius* is returned again into the country. Your engagement for Mr. *Pocock* will be very acceptable to Dr. *Worthington*. I wiſh you would alſo improve the foreſaid learned gentleman's ſkill in Arabick to a more conſiderable uſe. The French gentleman ſhould have been characteriſed alſo by his name. I thought a treatiſe of *Des Cartes de Animalibus* had been publiſhed long ago; but Mr. *Oldenburg* ſpeaks of it as a new matter, in theſe words. "I ſuppoſe "you have heard, that there is another vo- "lume of *Des Cartes*'s letters under the "preſs, which will be ſhortly finiſhed; and "after that, a treatiſe of the ſame author *De* "*Animalibus*, wherein he endeavours more "particularly to prove, than in his other "writings, that all their actions are merely "mechanical. They are advanced by an "admirer of his, called monſieur *Cherſelier*, "who is here at *Paris*, and of our acquaint- "ance, by whom we ſaw the other day *Des* "*Cartes*'s own hand concerning that ſubject, "and amongſt other particulars, a compari- "ſon of his between the operations of the "body of animals, and the harmony of or- "gans; affirming, that as the ſaid harmony "depends from three things, *viz.* the air, "that comes from the bellows; the pipes, "that give the ſound; and the diſtribution "of that air into theſe pipes; that juſt ſo "the functions of an animal; that is to ſay, "the motions of its members depend only "from the animal ſpirits proceeding from "the heart, that are like to the air coming "from the bellows. 2. From the pores of "the brain, through which thoſe ſpirits paſs; "and the nerves and muſcles, into which "they paſs, reſembling the pipes, that give "the ſound. And, 3. From the manner in "which they are diſtributed into them; in- "ſomuch, that as our church-organs, *&c.* "are thus diſpoſed, that from the agitation "and diſtribution of the wind into the pipes, "there follows neceſſarily a ſound and har- "mony, which we hear; even ſo an animal "is compoſed, that whereas the animal ſpi- "rits are preſſed into the cavities of the "brain, and thence conveyed through the "nerves into the muſcles, there muſt of ne- "ceſſity follow thoſe motions in the mem- "bers, which we ſee." Thus far he; the letter being dated April laſt. But it ſeems, that that *De Homine* will be a treatiſe apart. I wonder, that Mr. *Oldenburg* hath not written concerning the weekly learned aſſembly at *Paris*. My books from *Holland* are at laſt arrived. I humbly deſire to know, whether I ſhould keep them here till you come up to *London*; or whether you will have them ſent to *Oxford*. Yeſterday I had a letter from Mr. *Beale*, beginning with theſe words. "And becauſe you are ſo tender of my "health, I muſt give you account, that the "flux and bloodineſs of mine * * * *

May 17, 1659.

Honoured SIR,

MY laſt was on Saturday, preſenting the continuation of our publick affairs. Since I received your laſt of May 14. I humbly thank you, for naming the gentleman of the French club. The reſt of your letter I ſhall certify alſo to Mr. *Oldenburg*. The names of the books lately come over are, *Lucerna Salis Philoſophorum. Hoc eſt, Delineatio nuda deſiderati illius principii. Tertii Mineralium Sendivegiani, in* 8 *pag.* 167. II. *Ejuſdem Authoris Tr. Germanicus de Principio Tertio Mineralium, ſive Sale Philoſophico, in* 8*vo, pag.* 44. III. *Joh. Iſaaci Hollandi Opus Vegetabile*. All in high Dutch, in 8vo, pag. 144. by which you may ſee, that it is but a little piece of *Hollandus*'s greater work. IV. *Novum Lumen Chemicum, ſive Medicum Polmanni*, in ſmall 8vo, all in high Dutch, of a very fine and ſmall character, pag. 82. opening the myſtery of the *Sulphura Philoſophor*. My ſon hath read it, and commends it as a moſt excellent piece for advancement and amendment of all medicinal knowledge: he counts alſo the whole treatiſe moſt worthy to be tranſlated. There is alſo ſent unto me another book, which I did not write for, being all the *Opera Paracelſi* in Latin folio in one volume, with his *Opus Chirurgicum*, which was never extant in Latin before, and yet his maſterpiece. The price unbound is thirty-three ſhillings, or one pound thirteen ſhillings; whereas, in *Paul*'s *Church-yard*, I am told it is rated at one pound fifteen ſhillings. I pray let me know your mind, if you will have that alſo. The other two treatiſes, tranſlating by *Clodius*, though they profeſſed-

ly

ly treat of the philoſopher's ſtone, yet it ſeems they have divers collateral good things, as an inſtance has been given unto me in the culture of vines. The continuation of the papers concerning artificial hatching is very welcome. I have lately obliged Mr. *Oldenburg*'s gentleman in *Languedoc*; ſo that he hath obtained from him that precious and wonderful oil, which he lighted upon in ſearching after *Butler*'s ſtone. And Mr. *Oldenburg* having imparted this ſecret in his laſt, I cannot but confide the ſame unto you by way of recital, the recipe of it being as followeth.

RECIPE.

Oleum melioris notæ. Hoc diſtilla eo quo decet modo magnus V. Helmont. Diſtillati ☉ calcina ut ibidem dictum. Calcinatum miſce cum ana ☽ & ♎ bis aut ter. Habebis ♎ rubicundiſſimum in frigido ſolubile in oleum pretioſum, cujus aliquot guttulæ aliquamdiu cum oleo communi maceratæ, illud colore rubicundiſſimo tingunt. Quod hoc modo debite præparatum eadem, quæ multoties expertus ſum, & vobis narravi, effecta præſtabit, ſi Deo omnis boni largitori placuerit.

" Theſe effects, as he told us, were the " virtues of curing head-aches, palſies, and " all ricketing diſeaſes." Thus far Mr. *Oldenburg*, forbidding the communication of it to my chemical ſon, except he will gratify the ſaid gentleman with a copy of the Helmontian manuſcript, which he hath in his poſſeſſion. Mr. *Oldenburg* adds: " The ſame " Languedocian gentleman hath ſent me the " title and abridgment of a ſtrange book, " found out ſome years ago in *Provence*, " which I may communicate alſo to your ſon " in law, according as I find his anſwer to " my former deſires. To give him a taſte " of it, I ſhall ſay only thus much at preſent, " that it is called, *Hebdomas Hebdomadum*, " *Cabaliſtarum, Magorum, Brachmannarum, an-* " *tiquorumque omnia Sapientum Myſteria conti-* " *nens.*" Thus far Mr. *Oldenburg*. As ſoon as I hear any thing again from Dr. *Horne*, you ſhall be ſure to know it. I wrote largely, and ſent ſome conſiderable preſents unto him, of books and manuſcripts, to oblige him the more to the performance of his promiſes concerning ſalts, and ſome other uſeful experiments. Here I ſend you Mr. *Auſtin*'s anſwer, to requite your kindneſs of having put you to the trouble to impart that extract unto him out of Mr. *Beale*'s letter, concerning raiſin wine. Mr. *Brereton* is extremely melancholy and ſad, not only in reſpect of his private, but much more of the publick affairs; but the particulars are of that nature, that they muſt not be written, but referred to your meeting. Here you have the liſt of the members of the council of ſtate, which is likely to ſit in the lords houſe: for yeſterday the parliament hath voted the ſelling of *White-hall*, *Somerſet-houſe*, *Hampton-court*, and *Greenwich*. They talk of a petition to be brought in againſt lords *Fleetwood* and *Diſbrowe*, and a dictatorian power to be ſettled in the army. I cannot learn the certainty of a new report, ſpread with great confidence, of my lord deputy of *Ireland* taking the field for the defence of his late highneſs: he is willing, they ſay, to allow of the diſſolution of parliament, but by no means of diſſolving the protectorate. In a word, there is a general conſternation over the hearts of men amongſt us; the like, I confeſs, I have never obſerved. I muſt needs very heartily acknowledge your now coming favour, which, inſtead of making uſe of for other good purpoſes, I am conſtrained to ſupply my own neceſſities, into which I am alſo reduced by the preſent change, my penſions of two hundred pounds a year being founded upon his highneſs's and council's orders, and privy ſeals, now utterly made null. Laſt our lady-day I ſhould have received ſeventy-five pounds out of the exchequer; but it being delayed till this change of government, there is no hope to get one penny of it. I reſt ever,

Honoured Sir,

your moſt faithfully, and

thankfully devoted,

S. HARTLIB.

P. S. The bad news out of *Ireland* is too true. My ſon *Clodius* ſpoke with one, that came from thence eight days ago. I have entreated him to give his relation by this poſt.

Thurſday May 19.

THIS day the parliament paſt an act for conſtituting *John Sadler*, *John Sparrow*, and *Samuel Moyer*, judges for probate of wills. They alſo referred to a committee to conſider, how the proving of wills may be diſtributed into the ſeveral counties of *England*, and of what was formerly done upon the bill for regiſters in the ſeveral counties. They alſo paſt an act for conſtituting *John Godolphin*, and *Charles Georges Cock*, Eſqs; judges of the admiralty. They referred it to a committee to inform themſelves of the yearly value of the regiſter's office for probate of wills; and what part of it will be fit to be reſerved for the uſe of the commonwealth. They referred it to the ſaid committee, to take conſideration of all other offices, that are or ſhall be in the diſpoſal of the ſtate; to the end it may be reſolved, what will be fit to be allowed the officers, and the reſt to be applied to the publick ſervice; and to conſider of any claims as ſhall be made to any ſuch offices, and to offer their opinion to the houſe, what will be fit to be done therein. They referred it to the council of ſtate, to conſider how far this nation is, or is like to be, engaged in war or peace, with other nations; and to prevent this nation being engaged in war, without conſent of parliament. They referred it to a committee, to bring in a bill for repealing the act to *H. Scobell*, Eſq; for being clerk of the parliament; and for conſtituting the ſaid office upon Mr. *St. Nicholas*. They

They paſt the act and inſtructions for a council of ſtate, who are like to ſit to morrow at *White-hall*. Upon a petition of the inhabitants of the bay of *South-hold* in *Suffolk*, where by a ſudden fire two hundred thirty-eight manſion houſes were ſuddenly burnt, they ordered the ſpeaker to ſign divers patents, for collecting the charity of the people throughout all *England*, towards their great loſs.

Honoured SIR,

ON Thurſday I communicated largely our publick affairs. Yeſterday I had a letter from Mr. *Wood*, in theſe words. "Your "recipe for the curing the preſent plague in "horſes has proved very effectual, as well in "my lord's ſtable, as elſewhere; divers of "our horſes, that took it, have been cured; "and, indeed, all of them, to which it hath "been carefully applied; and though ſome "of them have relapſed, yet the ſame means "has reſtored them; and the recovered hor-"ſes are now moſt of them at ſoil with clo-"ver-graſs; two acres of which we have "hired this ſummer, from May to Michael-"mas, at ten pound rent, and that in *Ireland* "too, which I mention, that you may ſee it "is profitable ſomewhere, notwithſtanding "the diſcouragement your friend mentions "he received. God, in his mercy, grant a "good iſſue to the preſent revolutions in "*England*. I hope we ſhall continue quiet "here. Dr. *Petty* is newly landed, but I "have not ſeen him yet. This evening my "lord of *Corke* came to town, and brings "news, that my lord *Broghill* arrived ſafe at "*Waterford*, yeſterday morning. Pray let "my lady *Ranelagh* know this." Thus far Mr. *Wood*, the letter being dated May 11. Mr. ſecretary came two days ago to the committee of ſafety, intimating, that though he was laid by, and ſeveral affronts put upon him, yet, that he was reſolved to ſerve the commonwealth with all faithfulneſs; and therefore came to give them certain intelligence, which he had received, that forty Holland men of war were upon our Engliſh coaſts, plying to and fro, and that had *Charles Stuart* amongſt them, who happily with his men might be landed in *Ireland*. They ſay, he was not much thanked for it, being told, that they had their own intelligence, and needed none of his informations. Lord *Fleetwood* profeſſed lately, that he was in ſuch ſtraits, that he could not tell which way to turn himſelf. The ſeveral differences are not yet compoſed; and the agitators, with the common ſoldiers, are worſt of all. Thurſday night were obſerved ſome affrighting ſigns in the air, about ten a clock at night a blazing ſtar, with a great tail in the form of a rod, and afterwards of a ſword, appearing over *White-hall*, and towards *Weſtminſter*. I can ſay no more, but reſt ever,

Honoured Sir,

your moſt ready and faithful,

May 21, 1659. *Manus Nota.*

May 31, 59.

Honoured SIR,

ON Saturday laſt I ſignified the arrival (amongſt other particulars) of Mr. *Worſley*. Your laſt is dated May 28. Ludus Helmontii is not yet prepared, though my torments need a remedy more than ever. I believe you could prepare as good an oil, as that of the Languedocian gentleman ſeems to be. Your new teleſcope will be extremely welcome to Mr. *Worſley*. When you return to *London*, I hope you will not leave it at *Oxford*. I had large letters of late from worthy Mr. *Beale*, but they are on an argument concerning the reformation of Engliſh laws and lawyers, wherein your excellent ſifter deſired his beſt aſſiſtance. The balſam of ſulphur I had from my phyſical ſon, who aſſured me, that though it was not the beſt, which he could make, yet is was very good. He is of your opinion, that the ſpirit of man's blood, and the ſpirit of hartſhorn, are a far more powerful and effectual medicine for an aſthmatical cough, than the foreſaid balſam. We long to ſee you at *London*, that you may be alſo more freely acquainted with our publick affairs, which muſt not be committed to paper. I ſuppoſe you will hear from ſome other hands, that the earl of *Warwick* is departed this world. Since my laſt, the houſe hath been reſolved into a grand committee; ſo that they are not yet come to any votes in parliament. Reſident *Bradſhaw* (for ſo he was for ſome time in that quality at *Hamburgh*) is to go within a day or two to the *Sound in viam* with new inſtructions; ſo that I apprehend Sir *Philip Meadows*, our reſident there, is, or will be, called home. The like courſe, it may be, will be taken with Mr. *Downing*, our reſident at the *Hague*, where *Holland*, *France* and *England* are now fully agreed about the articles, according to which the two Northern kings might make their peace. There is a ſyndicus arrived from the city of *Lubeck*, to preſent to this commonwealth the conveniency of that place, and that they are willing to allow of a ſociety or corporation of Engliſh merchants, to improve the trade of *England*, if they will accept of it. There are alſo great overtures on foot, to make a firm alliance between *England*, *Holland*, and *Sweden*, which would certainly be a threefold cord, that could not eaſily be broken. There is a vote paſſed, that the late protector ſhall not diſpoſe of the deer in *James*'s park. The new fleet, which is ſuddenly to be ſet out, is to conſiſt of threeſcore men of war. The fear of an univerſal inſurrection is no more ſo great, as it was ſome days ago. The remaining heads or articles of the army's petition are ſtill under debate. This day a letter was read from general *Monck*, wherein he informs of *Charles Stuart* being lately at the *Hague*, and of the deſigns, which are apprehended to be contriving to diſturb the peace of the nation of *Scotland*; which letter was referred to the council of ſtate. Upon report made from the council

council of ſtate, the houſe took up the conſideration of the intereſt of this commonwealth, in reference to the ſame, and have reſolved, that there be appointed plenipotentiaries by the ſtate, for obtaining a good peace between the two Northern kings, and to adjuſt and ſecure the intereſt of this commonwealth and its allies in the *Sound*, and, with the aſſiſtance of the fleet of this commonwealth and other fleets of its allies, to endeavour the ſame. They reſolved, that the perſons to be appointed ſhould be five, who, or any three of them, ſhould be impowered to tranſact in this affair, and to act by ſuch inſtructions, as the council of ſtate ſhould give. The names of the ſaid commiſſioners are firſt to be approved by the parliament. The reſt is in the adjoined paper. Lilium convallium is ſaid to augment very much the natural fragrancy of rheniſh wine. Whole barrels full are fetched by the *Dutch* from *Norway*, being dried. For the wine-merchants there, by putting ſtore of this lilium convallium into French wines, they turn them into Rheniſh wine. I pray tell, in your next, where lilium convallium is growing moſt plentifully in *England*. I cannot learn but that it is very ſcarce. I reſt ever,

Honoured Sir,

your moſt readily devoted

SAM. HARTLIB.

Octob. 22, 59.

Honoured SIR,

MY laſt was dated Octob. 18, wherein I gave you thanks for tranſmitting *Bill*'s anatomical papers: ſince I received a box from the carrier, with the ludus humanus without any letter. Nor have I received any line from your hands, in anſwer to my three former letters. Theſe are to preſent unto you my moſt humble thanks for the foreſaid ludus, which I ſhall urge my ſon to make out of hand. This week Mr. *Jones* hath ſaluted me with a very kind letter, containing a very ſingular obſervation, in theſe words. "Concerning the generation of pearls, I am of "opinion, that they are engendered in the "cockel-fiſhes (I pray, Sir, give me the "Latin word of it in your next) of the ſame "manner as the ſtone in our body, which I "endeavour fully to ſhew, in a diſcourſe of "mine, about the generation of pearls; which, "when I ſhall have done it, ſhall wait upon "you for my part in revenge of your obſervations. I heard lately a very remarkable "ſtory, about margarites, from a perſon of "quality and honour in this town, which "you will be glad, I believe, to hear. A "certain German baron of about twenty four "years old, being in priſon here at *Paris*, in "the ſame chamber with a Frenchman (who "told this, as having been eye-witneſs of it, "to him that told it me) they having both "need of money, the baron ſent his man to "a goldſmith, to buy ſeven or eight ordinary pearls, of about twenty-pence a piece, "which he put a diſſolving in a glaſs of vinegar, and being well diſſolved, he took "the paſte, and put it together with a powder (which I ſhould be glad to know) into a "golden mould, which he had in his pocket, and "ſo put it a warming for ſome time upon the "fire; after which, opening the mould, they "found a very great and lovely oriental pearl "in it, which they ſold for about two hundred crowns, although it was a great deal "more worth. The ſame baron throwing a "little powder he had with him into a "pitcher of water, and letting it ſtand about "four hours, made the beſt wine, that a man "can drink." Thus far the truly hopeful young gentleman, whereby he hath hugely obliged me. I wiſh he had the forementioned powder, that we might try, whether we could make the like pearls and wine. The great ſociety, which is ſaid to have far greater matters, is like to break forth next week. For this week the concluſion was, *cum fine hujus ſeptimanæ finis erit miſeriarum veſtrarum*. As ſoon as their declaration is out, I ſhall not fail to ſend you a copy, with what elſe I may. In the mean while, I humbly beg your ſilence concerning the forementioned concluſion. Mr. *Woodnot*, my ſtationer, hath the anatomical papers, with Mr. *Pell*'s deſired explanation; for I know he will get it as cheap as any ſtationer, with whom you are acquainted. You will let me know how many copies ſhall be ſent unto you, with your other promiſed directions for the diſtributions of them. Nothing is ſince my laſt paſſed in the publick affairs of any extraordinary conſequence. *Monck*'s letter to the parliament is now in print, wherein he declares againſt the petition and propoſals of the army; but colonel *Cobbet* is diſpatched with new inſtructions into *Scotland*, and colonel *Barrow* to *Ireland*, to inform them what is paſſed between the parliament and army, with the reaſons of their proceedings. The council of ſtate have in a manner diſſolved themſelves of their own accord, ſome adhering to the parliament, ſome to the army, of which number are Sir *H. Vane*, major *Salaway*, Sir *J. Harrington*, lord *Wareſton*, colonel *Sydenham*, lord *Whitelocke*. Sir *A. Haſlerig* is going into the country, if he be not gone already. On Wedneſday the general council of officers held a faſt in *Whitehall* chappel. Lord *Fleetwood* is declared and owned commander in chief over all the land forces; *Lambert*, major general of the forces in *England* and *Scotland*; *Diſbrowe*, commiſſary general of the horſe; lieutenant general *Ludlow* is made one of the committee to nominate all ſuch perſons, who hereafter ſhall be admitted officers of the army. Lord *Bradſhaw* is fallen ſo ill, that they begin to deſpair of his life. Some of the ſemi-council of ſtate, and of the general council of officers, were ſent to offer the keeping of the great ſeal of *England* to Mr. Speaker; but he would not accept of it. Both the foreſaid councils

are

are daily conſulting about the drawing up a declaration to the three nations, and what government to introduce and ſettle; but nothing as yet concluded. Yeſterday an expreſs was diſpatched into the *Sound*. Mr. *Worſley* never comes at me, yet I heard he confeſſed to lord *Frieſendorf*, that if the parliament had ſat four days longer, his head would have gone off. Lord *Lambert* received a letter with high promiſes from *C. S.* but he ſhewed it to Sir *H. Vane*, and others of the council. I can hold out ſcarce any longer, but ſubſcribe myſelf,

Honoured Sir,

your ever faithfully devoted

S. HARTLIB.

P. S. THERE is a council of ſtate conſtituted, conſiſting of twenty three perſons, of whom I have named ſome already; the reſt are, *Hewſon*, *Steele*, *Tichbourne*, *Ireton*, the late preſident *Lawrence*. The reſt I cannot call to mind. Theſe are to make up the government for the preſent. Commiſſioner *Liſle*, lord *Whitelocke*, and one more, are the keepers of the great ſeal of *England*.

Nov. 1, 59.

Honoured SIR,

I HAVE ſent by a Bohemian divine, that hath been commended to *Oxford* by Mr. *Comenius*, and lived lately as chaplain with Mr. *Thurloe* (his name is *Paulus Hartmannus*) the deſired twenty five copies of *Bill*'s *Anatomy*, together with the army's declaration. If I do not ſend the account at this time, it ſhall be incloſed in my next, under Mr. *Woodnott* the ſtationer's own hand. By him I have ſent the forty copies to Dr. *Cox* (for you need not queſtion, but they will be acceptable) in your name. And I am diſtributing to the reſt of the gentlemen, whom you have named, as faſt as I can meet with them. I mean alſo to ſend one to monſieur *Bill* himſelf, to let him know, what honour hath been done unto him by a young nobleman in theſe parts; and many more to friends in the *Low Countries*. Really you have done an excellent work, for ſpreading this anatomical magnale upon the honeſt learned world. I have received no letters from you ſince the 24th of October, which ſomewhat troubles me, becauſe I cannot tell, whether any of my letters, which have been ſent theſe two weeks, have come to your hands. I ſhould be very much troubled, if they are miſcarried. Amongſt other particulars, I wrote ſomething concerning the ſecret ſociety ſuddenly to break forth. I ſuppoſe I ſhall ſhortly be acquainted with ſome of the members; nor ſhall I ſhrink to propoſe unto them that ſame, which monſieur *Bill* doth require for carrying on of that noble work. For if all be true what I hear, though it ſeem great, yet is but a trifle to them. And truly if I had any ſuch ſtock, I ſhould ſuffer no body to ſhare with me in the glory of that publick charity. The very laſt poſt I received the following lines. "Monſieur *Bill* lives at "preſent at *Rotterdam* in the Engliſh Court "(ſo is the name of the houſe, where he "lives in *Rotterdam*.) He is a Frenchman; "ſpeaks French, Low-Dutch, and Latin. "He hath four bodies, two men and two "women, ſo anatomiſed, that he can ſhew "the inward ſtate of a man's body. For all "the parts of the body are in the body, ex"cept the guts and brains, which lye by. "He aſketh above 100000 Dutch guilders, "and then he will teach the anatomy out of "them to ſcholars, ſurgeons, *&c.* He ſaith, "this coſt him not only infinite pains and "head-breakings, but that, of his own patri"mony, he ſpent to this work 60000 guilders. "He affirms, that *Paris* hath preſented him "about 20000 francs, and *Amſterdam* about "3000 francs, for 2 corpora; but he will "not ſell them apart, but in that manner as "I mentioned. It ſeems it is very rare, that "he anatomiſed, in ſuch a manner, thoſe "bodies, and prepared alſo, that they can be "clearly ſeen, every thing in his proper "place. The like is yet never done in this "world!" The letter is dated October 31. From another confiding friend, Mr. *Dury* was lately acquanted after this manner. *Ecce afferuntur generoſo domino de Geere Conſtantinopoli literæ a domino Warnero, quem ille ante triennium jam & prece atque pretio requiſiverat, vellet; tranſlationem biblici codicis in linguam Turcicam ſibi cordi curæque eſſe. Dictum factum. Bonus ille & domui de Geerianæ ob promota pridem juventutis ſuæ ſtudia obſtrictus atque deditiſſimus, laborem iſtum hujus commendatione, & lauti ſubſidii ſubminiſtratione, alacriter ſuſcepit, atque quod jam ſcribit, eouſque promovit & peregit, ut pauca reſtent, quin brevi diem univerſa biblia lingua Turcica loqui conſtet. Promittit enim exemplar MS. ad typos promovendum intra ſemeſtre hoc circiter ſe poſſe & velle, huc ad gen. dominum de Geere curare.* This is as welcome and refreſhing, as that of *Bill*'s, ſave that he hath no *de Geere* appearing for him. Mr. *Beale* returns his thanks in theſe words. "I have taſted of Seraphic Love. It "is like a deep river, carrying more ſtrength "than noiſe. The Jeſuit *Euſebius* of *Nurem*"*burg de Ingenio Amoris* hath broken the "myſtery of divine love into fragments of "ſhort wit; as if one would cut hair ſhort, "to make it ſtrong." Thus far he. I am mightily perplexed for the preſent, being likely to loſe, by carrier, a manuſcript of above twenty ſheets of his *De Re Hortulana*. Mr. *Oldenburg* begs moſt earneſtly to be gratified, acording to his deſires, in the incloſed paper. If you would vouchſafe alſo to ſend it to Mr. *Auſten*, to know his anſwer upon it, the kindneſs would be very obliging to us both. Lord *Bradſhaw* died yeſterday in the afternoon, having left behind him lands worth ſix thouſand pounds, beſides a great perſonal eſtate. *Monck* is ſaid to be on his march. Our forces are to march alſo, having received two months pay. *Monck* doth declare not for a free parliament, but for this laſt diſſolved. And it is confidently reported by ſome, that

the old diſſolved parliament, within a very few days will ſit again. The hearts of men are filled with ſadneſs and apprehenſions of all manner of confuſions, more than ever. Thus, earneſtly longing for your letters, I reſt,

SIR,

your trueſt votary,

SAM. HARTLIB.

Nov. 15, 1659.

Honoured SIR,

LAST Saturday I ſent a very bulky packet coming from *Ireland*, with a copy of *Dalgarno*'s letter, and a few lines of my cure. Yeſterday I received again one of your deſirable letters without any date, but ſuppoſe to be written on Saturday laſt. For that trick again I ſhall ſend no more packets by friends; for ſo they have ſerved me for the moſt part upon the like occaſions. Mr. *Pell* deſired to have the correcting of the print, as thinking himſelf far more nice and critical than your humble ſervant. He had it, but it ſeems the porter did not find him at home, when he brought to him the firſt ſheet, nor could I ſpeak with him, till the ſecond ſheet alſo was printed off. I can aſſure you, the written copy was no other than that, which is printed, but I was forgetful to ſend back thoſe lines, it only concerning myſelf (who in truth is nothing elſe but a lump of worſer faults) and being greedy to have it printed off with all expedition. I have received letters lately out of *New England*, whither I purpoſe, God willing, to ſend a packet of ten or twenty copies, and as many to *Jamaica*, to my ſpecial good friend there Dr. *Browne*, that from both thoſe places they may diſperſe them to other Engliſh plantations. I humbly beg to enlarge or explain yours in what particulars you apprehend the *Madagaſcar* way or practice may be made more uſe of, than the natives are aware of. If you anſwer, I ſhall add it to the heap of your other obligations. The queries, which you farther make about the Turkiſh bible, I cannot reſolve, but ſhall write, God willing, to have them anſwered by monſieur *de Geere* himſelf. As I did laſt week let him know, what aſpect was caſt from yours and *Oxford* towards him, and ſuch kind of endeavours; and how far you were advanced towards the ſame deſign. I ſhall alſo enquire of Mr. *Hottenger* about a catechiſm, but do not put Mr. *Pocock* upon any ſuch tranſlation, till I ſhall have imparted unto you ſome few lines about the method of propagating or inſinuating of religion by catechiſms. Mr. *Pell* tells me, that *Warnerus* is a moſt accompliſhed man, and that for his great abilities and ſkill in Arabick and other oriental languages, he was counted worthy to be ſent to be reſident for the States at the Ottoman court. He added withall, that many years ago *Warnerus* had publiſhed his Collectanea of all the paſſages concerning Chriſt out of the Alcoran. I have written for it to *Warnerus*'s friends laſt Friday; for I know it will mightily pleaſe our Herefordian friend. Mr. *Oldenburg* ſays, that more experiments de vacuo are greatly longed for by your French philoſophers. Yeſterday I received the ſum of 5 *l.* by your appointment. The title of Mr. *Beale*'s manuſcript is called, *A free diſcovery of the true, lawful, holy, and divine expedient for the propagation of the goſpel, and eſtabliſhment of an univerſal peace all over the world.* It is above twenty ſix ſheets, beſides many other ſheets formerly written on the ſame argument, which I am to add, whenſoever it is printed, and then it will come to I know not how many more; ſo that I fear it will be too big and hazardous for your undertaking in theſe unſettled times. Mr. *Brereton* was ſtark wild after it, having read but a few pages. He does not legally own it, becauſe of the many paradoxes, or rather free truths in it, as I do judge them. But writing to him how providentially he had met with the ſaid manuſcript (for he meeting with the carrier, ſeeing ſo great a bulk, and knowing Mr. *B.*'s hand, paid the carrier, and returned with it to my ſtudy,) and how I was conſtrained to open the packet in his preſence, liking it ſo highly, obtained leave to tranſcribe a copy. The truth is, I deſign all ſuch and the like works or tracts be printed upon the charges of *Macaria*, whoſe ſcope it is moſt profeſſedly to propagate religion, and to endeavour the reformation of the whole world. But it is ſcarce one day (or hour in the day) or night being brim full with all manner of objects of that publick and moſt univerſal nature, but my ſoul is crying out,

Phoſphore! redde diem, quid gaudia noſtra moraris? Phoſphore, redde diem!

Perhaps within a few days longer I may for an interim preſent your goodneſs another ſubject of worth and uſefulneſs, upon which you may ſpend that ſum, which now you have depoſited in my hands; and by doing ſo you relieve in the mean while very great extremities. For yet I am overwhelmed with all manner of ſmaller and greater debts or engagements. Nor dare I for the preſent diſrobe myſelf of all the occaſions and advantages I have of continuing in my ways of well doing. For this would be—*Devorato bove in cauda deficere*; yet a little while, and deliverance will come. I told Mr. *B.* out of your former, that you were too much an orator. He anſwers—*De re Chriſtiana optime meruit eruditiſſimus Pococius, quod argumenta Grotiana Arabice reddidit recte: ait Bovillus (Boylius) noſter preclariſſimus, ſatis eſſe, ſi Chriſtiani ex vero ſimus. Nil opus alio charactere, neque nomenclatoris additamento. Verum quid ille me oratorem nominabat! Mallem virum bonum, bonum, agricolam, colonum bonum Catonis aut Varronis ſuffragio. Nemo niſi vir bonus poteſt eſſe orator, ut ait Cicero, ipſe oratorum princeps. Ego, ſi eſſem orator, non tam ingrato forem animo, ut in redhibitione tum diu obmuteſcerim. Illud inſuper addo, ecquem novimus oratorem evadere, qui in pulvere ſcholaſtico integram juventu-*

tem diſperdere neceſſe habuit, quod mihi miſero fatis importunis obvenit. Obſecro meo nomine ſummo viro plurimam ſalutem impertire non dedigeris, et in operibus Dei reſerandis bono publico et poſteris operam tam ſero navantem auſpiciis divinis proſequamur. That which follows written by the ſame good hand is no ways ſo pleaſing. " That you miſtake not, the hor-
" tulan paradoxes were ſent above ſix weeks
" ago, and I conclude they are loſt from us.
" That of tranſmutation of flowers is ſurely
" in the warehouſe at *London*. If it ſhould
" be loſt, it is not in my power to repeat it
" or to recover it; for it is the firſt draught,
" and as ſoon as I have engroſſed, I am wont
" to diſcharge my memory. And my me-
" mory holds me to that covenant of immu-
" nity; and as the beaſt will not feed on
" blown fodder, ſo doth my ſpirit love freſh
" air and free perambulations. *Nempe ut*

" *Avia Pieridum peragrem loca, nullius ante*
" *Trita ſolo, juvat integros accidere fontes.*"

The letter is dated Nov. 24. The packet to my great grief is not found in the *London* warehouſe. I have begged ſearch to be made at *Hereford*. I have called upon *Clodius* to write to you, and to ſend you the deſired Dutch books. As I am called upon to pay for them, which as yet my ſon hath not done to me, it encreaſes my preſent burdens. I ſuppoſe you have heard, that *Canaparius de Atramentis* is lately reprinted at *London*. Worthy Mr. *Pocock* will not willingly hear of the death of Mr. *Gouland*, once library-keeper of the biſhop of *Lincoln*'s library at *Weſtminſter*. Lord *Bradſhaw* left no laſt will at all. Yeſterday came forth a very notable diſcourſe called the lord general *Fleetwood*'s anſwer to the humble repreſentation of colonel *Morley* and ſome other late officers of the army, wherein he declares his judgment and conſcience, what is the good old cauſe, and for a free parliament as the only expedient for *England*'s ſettlement. Sir *H. V.* is ſaid to ſeparate himſelf from the councils of *Wallingford* houſe, profeſſing his reſolvedneſs to retire to his country-houſe. The commiſſioners have agreed to lay by the old parliament, and that the armies ſhall proceed no further. I reſt, *&c. &c.*

Nov. 26, 1659.

Honoured SIR,

I HOPE you have received my letter on Tueſday by the Daniſh maſter of arts *Petreus*. You may pleaſe to impart unto Mr. *Pocock* and to him the following lines. " I
" had yeſterday a letter out of *Germany* from
" monſieur *Ludolf*, governor of the young
" princes of *Gothe*, whom I find very ſtudious
" and ſkilful in the Æthiopian tongue and
" religion. He hath begun a new Æthio-
" pian dictionary, which he communicateth
" to monſieur *Bochart*, the great miniſter at
" *Caen*, who came to ſee us here in his paſ-
" ſage to the national ſynod at *London*. Be-
" ſides the ſaid dictionary, he is publiſhing a
" new deſcription of *Æthiopia*, aſſuring, that
" what *Alvarez* and others have done there-
" about, are very imperfect pieces, leaving
" the moſt important things behind; and
" not having well known that tongue, which
" this *Ludolf* underſtands to perfection. He
" giveth me notice alſo, that at *Helmſtad* is
" printing *deſcriptio Malthæſi novæ, et antiquæ*,
" by the governor of the baron *de Blumethal*,
" ſon of a miniſter of ſtate to the elector of
" *Brandenburgh*. As alſo that one Dr. *Lutke-*
" *man* hath publiſhed two treatiſes, one *de mun-*
" *do intelligibili*, the other *de Paradiſo primi ho-*
" *minis habitaculo primo*." Thus far Mr. *Oldenburg*, Nov. 29. he adds, " *Bill*'s *Narrative*
" I am putting into French for to communi-
" cate it to your meeting at Mr. *Monmor*'s. I
" hear, that the anatomiſts at *Padua* have uſed
" an invention, whereby they have made a
" certain liquor to eat all what lyeth about the
" inner parts of man's body, and ſo have
" cleared the way to make an exact inſpection
" of all what may be conſiderable. But I
" doubt not this ſkill of *Bill*'s ſurpaſſeth all
" what hath been hitherto found out for ana-
" tomical knowledge. Our French aſtrono-
" mers have not yet given their judgment
" upon *Huygens*'s *Syſtema Saturni*. *Warnerus*
" hath been my condiſcipulus at *Bremen*, found
" always a very honeſt and ſtudious man, and
" a ſingular lover of the oriental tongues.
" As to the tranſlation of *Grotius*, I could wiſh,
" that the able tranſlator thereof would pleaſe
" to add here and there as much perſpicuity
" and force as is poſſible; for I think the rea-
" ſons of that author may receive an addition
" in both reſpects. From *Caſtres* one writeth
" me word, that there is a book printed in
" Engliſh, *de arte volandi*; and that an Engliſh
" gentlewoman living here at *Paris* called
" Mrs. *Verger* hath it in her cabinet, being
" a curious and learned woman, which will oc-
" caſion us to wait on her as ſoon as we can;
" and ſhall in the mean time beg your favour
" of enquiring after the ſaid book, if you
" do not know it already. Though I have
" lately written at large to our noble philo-
" ſopher at *Oxford*, yet am I in doubt, whe-
" ther I have given him thanks for what he
" hath been pleaſed to procure for a friend of
" mine here out of the Bodleian library. Hav-
" ing delivered the ſame here, the perſon
" wondreth much, that *Pizibran de profeſſione*
" *fidei catholicæ et errorum revocatione*, printed
" *Moguntiæ* 1449. ſhould not be in the ſame
" library, whereas he aſſureth me to have found
" it in the catalogue thereof; as alſo the *ora-*
" *tio funebris Caroli Aretini habita à Loenhardo*
" *Aretino*. Wherefore I muſt entreat you once
" more to requeſt Mr. *Boyle*, that he would
" pleaſe to make Mr. *Stubbs* look once more
" for the ſaid *Pizibran*, as alſo to haſten the
" copy of the ſaid *Oratio funebris*, the pains
" whereof ſhall be fully recompenſed by me,
" God willing." Thus far Mr. *Oldenburg*.
Sir, I received lately, from an ancient friend, a water againſt the ſtone, which he ſent me out of *Norway*, out of his ſingular love. He ſpeaks thus of it. " I found this water,
" which here I ſend you, very efficacious *in*
" *fran-*

" *frangendo calculo renum & veſicæ ſæpe in utro-*
" *que ſexu* both by high and low. *Uſus ejus*
" *talis eſt, ſumenda ſunt 4. vel 5. cochlearia hujus*
" *aquæ manè & totidem veſperi. Inſigne levamen*
" *inde percipiet ægrotus accedente benedictione*
" *divina.*" Really, Sir, I muſt confeſs I have found it ſo, having uſed of the ſaid water near a quart. It is no ways nauſeous, but rather pleaſant. But having ſpent all, I heavily complained to the gentleman, that brought it me, who ſaid, he had no conveniency to make it, confirmed the excellency of it, and was ſo kind as to give me the recipe of it, which here I offer into your hands, wiſhing, that Mr. *Stahl* would make a good quantity for yourſelf and the poor, and to let me alſo be partaker of it. Really, Sir, next to the ludus Helmontii, I have found it the beſt medicine. There is no truſting to *Clodius* for it. And beſides, they demand no leſs than ten ſhillings for a live hare, which is the chief ingredient in it. I underſtand it not ſo perfectly, being in Low-Dutch, as Mr. *Stahl*. Our publick affairs grow worſe and worſe, there being no certain news yet, whether *Monck* will accept of the agreement, or not. Mr. *Oldenburg* concludes his forenamed letter, " This very evening *C. S.* is " expected here, but his deſign kept very ſe- " cret." My ſon is ſtill mighty confident of Dr. *Jones*'s work; and if the froſt had not delayed it, he is confident, they ſhould have had the univerſal medicine within three or four weeks. Thus, entreating you to accept of the adjoined paper (which alſo is a very noble undertaking) I reſt ever,

Honoured Sir,

your truly obliged and

devoted ſervant,

S. HARTLIB.

November 29, 1659.

Honoured SIR,

LAST Saturday I acquainted you with ſeveral matters of ſpecial importance: I beg again your anſwer to ſome particulars, now I am to impart what Mr. *Figulus* writes, in anſwer to your deſires, as followeth. " Con- " cerning Mr. *Warnerus*'s tranſlation of the " Turkiſh bible, we are the next poſt to " write to him upon monſieur *de Geere*'s or- " der, and with his letters joined, to ſend it " over hither as ſoon as he can. And then " monſieur *de Geere* is reſolved to make no " delay to have it printed. As for the other " queſtions the noble Mr. *Boyle* makes, " what the intellectual abilities of this *War-* " *nerus* are to perform ſuch a work, you " may pleaſe to believe ſo much of his ſkill " and experience, as I hear, both from mon- " ſieur *de Geere*, Mr. *Rulice* the miniſter, and " others, that he is a very learned and able " man; and in the Arabick and Turkiſh, as " much verſed and perfect as any may be, " that ever hath learned thoſe tongues. Be- " ſides, *P. Golius*, and many others, who are " able there to judge of the work, he hath " choſen for his cenſors, whereof *Golius* " wrote an ample relation to his brother " profeſſor at *Leyden* now of late. It re- " joiced us much to hear of the like forward " intentions and labour of thoſe gentlemen " in *England*, to ſet out in Arabick the book " of *Grotius*. Verily it may be of much uſe " for thoſe nations, it being ſhort, and very " ſubſtantial. This makes monſieur *de Geere* " to long the more for the copy of the tranſ- " lated bible, to the advantage of the ſame " deſign; which God grant. But of *Warne-* " *rus*'s book, (wherein all the paſſages con- " cerning Chriſt are collected out of the Al- " coran) no body knows: I have aſked them " all. Yet I will enquire amongſt the ſtati- " oners of this town, and, if it be to be had, " I ſhall have it by the next occaſion of ſhip- " ing. The other day I came occaſionally " to one, that makes all kind of letters, a " great artiſt in it, an High-German; and " there I found an Arminian prieſt, with two " other, and learned thus much of them, " that they have brought huge bills of ex- " change, to advance here, in this town, the " printing of their Arminian bible. He, " that makes the letters, ſhewed me all ſorts " of their characters, which he hath made " already; they are very curious, and this " work will likewiſe be advanced with all " ſpeed. Thus we ſee God works on all " ſides towards ſome great change, and for " the call of foreigners into the church. O " that *England* were at concord and union! " they could more help this deſign, than any " nation in the world, by aſſiſting the Swedes, " and ſo to diſſipate the kingdom of dark- " neſs and tyrannical power over conſciences. " And thus the courſe of the Goſpel would " be ſet on a free foot." Thus far one of my honeſt correſpondents. Here you have a true repreſentation in print of the ſtate of the proteſtant churches in Europe. This is as ſad as the other promiſing. *Warnerus*'s book, which Mr. *Figulus* writes is ſcarce extant, Mr. *Pell* has had in his hands many years ago: but becauſe Sir *W. Boſwel* had many copies of them, he would buy none, hoping, that Sir *William* would have beſtowed one of them upon him, which he never did. Having written thus far, I received your laſt of November 26, and am amazed to underſtand, that you had not then received my large one of November 22, which I gave to one *Petreus*, to give him an addreſs unto yourſelf. But I hope your next will bring me better news; as likewiſe of the receipt of that written on Saturday. The adjoined from Mr. *Jones* will give ſome account of *Breſſieux*'s engines, or machines. The lines, which I ſent you formerly, out of Mr. *Oldenburg*'s letter, were theſe. " *Breſſieux* intended to begin his " work, and deſireth to have ſome pieces of " good glaſs, clear and fine, which is known " by this, that if put upon white paper, the

" paper

" paper changeth little or nothing its colour " ſeen thorow it. I believe, if you could " gratify him with this, he would anſwer " your deſires, to ſend you ſome of thoſe " ſpherical glaſſes, ſerving in windows for a " fair proſpect. He hath in a manner ready " ſeven machines, for both hyperbolical and " ſpherical glaſſes; and he carried us, ſince " my laſt, to his lodging, for to ſee them; " where he ſhewed us three machines for " concave hyperbolical, three others for con- " vex hyperbolical, and one more for to " work the ſpherical glaſſes with more ex- " actneſs than hitherto. If ſome pieces of " good glaſs could be ſent to him out of " *England*, to work upon, (ſeeing he com- " plaineth of the difficulty of getting good " ſtuff, and that at *Venice* they degenerate " very much in that art,) it would, I believe, " oblige him to permit us ſometimes to look " on his workmanſhip, which he is very ſhy " to do. Thus I have repeated again, what " I have written formerly. I have told Mr. " *Jones* alſo, that this *Breſſieux* is the very " workman, that did work for *Des Cartes* for " two whole years; and therefore I would ſo " willingly (if it might be) pleaſure him with " the beſt glaſſes, that could be gotten in " *England*." Mr. *Beale* anſwers to my beg- ging thus. " I know, that bright cryſtal " glaſs is glary; and to avoid that glarineſs, " our artificers run into the other extreme; " but I know no workmen, whom I can " commend for your truſt, in a better choice. " I have ſcattered *Bill*'s account in *Here-* " *ford*, *Worceſter*, &c. Whatever I ſhall re- " ceive, or hear more of Sir *K. Digby*, ſhall " be preſently yours. I hear very ſad news " from Mr. *Poleman*; for he begins to de- " ſpair of making his medicine, though he " yet continues to try, what poſſibly he " would, but could not, with all his ſkill " and induſtry, make calx and ſpirit of wine " join together." *Clodius* ſays, it may be the fault lyes in the calx, which is made in the *Low Countries* of muſcles, gathered on the ſea-ſhore. Yourſelf hath told me, that you had made that experiment ſucceſsfully. Theſe therefore are moſt humbly to entreat you, to favour Mr. *Poleman* with your direc- tions which you have obſerved. I hope Sir *Kenelm* hath written truth, and not rhodomon- tados. And I cannot have a more faithful, careful, and otherwiſe more knowing man, than Mr. *Poleman*, who, I am confident, doth love me as his own ſoul. One of the papers I ſent by way of requital to Mr. *Jones*. If he could get that experiment of making one great out of many little pearls, I ſhould count it a lucriferous ſecret. I pray put him alſo upon it, when you write to him next. I have called again upon my phyſical ſon for the Dutch books, and what he owes for them. His anſwer is, it ſhall be done, which I do not believe, I confeſs, till it be done. Dr. *Jones*'s work is going on again, and he is fill- ed afreſh with very great expectations. His ſecret friend tells him, if the account of the particular operations, which he hath given him from time to time, be true, it will cer- tainly yield both the univerſal medicine, and the tincture: if it ſhould fail, I am aſſured from others, that *Macaria* is a real poſſeſſor of both theſe great bleſſings, but will own neither of them profeſſedly. But this only amongſt ourſelves. Lord *Lambert* writes good news, having ſent the agreement to general *Monck*, who ſeemed to receive it joyfully, giving order, that the forces ſhould preſently withdraw, &c. But for the final anſwer, he deſires to take ten days deliberati- on. Men conclude the news muſt be hope- ful, becauſe Sir *H. Vane*, who was fully re- ſolved to go out of town, has altered his re- ſolution, appearing again at *White-hall*. Juſt now my ſon *Clodius* was with me, telling that Mr. *Dury* had ſpoken with him, relating out of your letter to your moſt noble ſiſter, that you hoped within three or four days to be at *London*. The like hopes Mr. *Evelyn* cheriſhes of your coming, who hath lately printed a book *of Education*. The copies are not yet abroad; but I am confident he will preſent you with one of them, no leſs than to him, who is not only in reſpect of books, but in all manner of other obſervances,

Honoured Sir,

your very faithfully devoted

S. HARTLIB.

Letters from Sir *William Petty*.

SIR,

MEN dedicate their books to the patrons of the ſubjects, whereof they write, and I dedicate an uſeful and new invention to you, who (ſcorning the airy vanities, wherewith the greater part of men are as yet delighted) do not only profeſs yourſelf a Mæcenas of ſuch things, but can deſcend (or rather aſcend) to the practice of them yourſelf.

IT is not to tickle your fancy with a fine, curious, or intricate conceit or notion, nor to puzzle you with the ſight of a complexure of almoſt an infinite number of various me- chaniments cunningly ſet together, that I have preſented you this diſcovery; for I have always profeſſed to the whole world, that I feared, that only the meanneſs of the means, whereby I performed this unheard of effect, would make it contemptible.

NEITHER is it, that I think hereby to have given you a preſent of great value (as to yourſelf) for had you paid me but 5*s*. you might (as well as others) within ſome few months have been partaker of the benefit; nor do I believe, that you uſe copying ſo much, as that in thoſe few months of con- cealment, it ſhould be worth you ten ſhillings more; only, if in matters of privacy it may ſave ſome hours of your own time, I ſhall think the world obliged to the invention.

IT is not to give you the means of ingra- tiating yourſelf with other great perſonages by the communication of this rarity unto them, before it come to vulgar hands; for you

you are pleaſed to promiſe upon your honour a deep and abſolute ſilence to all enquiries after it.

NEITHER is it to engage you to be earneſt in ſtirring up men to contribute towards my reward; for I conſider, that your fortune and dignity have placed you above the condition of ſoliciting merchants, ſcriveners, lawyers clerks, and ſuch other your inferiors, from whom I muſt expect my recompence.

LASTLY, I do not reveal this ſecret, becauſe I know not what elſe to do with it, nor (like thoſe, who give away their meat not before it ſtinks) employ it to buy your favour, when it will ſerve for nothing elſe: for now it is, that men begin to put off the apprehenſion of a cheat, and to hear generally of it, and conſequently, that the impoſſibility of raiſing ſome conſiderable benefit by it begins to diſappear.

BUT why then, ſince it is not in your way to do me much good in promoting the deſign of raiſing a reward, do I diſcover unto you the art itſelf, thereby giving you power to do me much more harm? It is only, becauſe I hope hereby to oblige your noble and ingenuous ſpirit ſo much the faſter to continue your love and aſſiſtance to inventions, and other real fruits of learning and arts. For if the world embrace the uſe of this invention, you may, by God's ordinary providence, live to ſee a thing, whereof you have the very maidenhead and patronage, to be of daily and almoſt hourly uſe to moſt men in moſt countries of the whole earth, and that to perpetuity; and conſequently your own name made equally univerſal and known, although bright and glorious by your own better deſerving actions.

AND this is the reaſon, why I both dedicate and intruſt the invention unto you, a mere dedication unto real men (as yourſelf) being little better than a mere and that a begging compliment. There is yet another, why I have entruſted you with it, which is, becauſe I, having concredited unto you all my treaſure of this nature, may hope for ſome of your experiments to be entruſted unto me. For my ſtudy and ends being enquiries into nature, and uſeful arts, and finding how ill my abilities to make experiments anſwer my inclinations thereto, I knew no readier way to become fat in that kind of knowledge, than by being fed with the crumbs, that fall from your table: which happineſs and honour if I may obtain, I ſhall labour to merit them, by the moſt ſerious and hearty endeavours within the power of me,

SIR,

your moſt humble, and
affectionate ſervant,

Lond. June 21, 1648. WILLIAM PETTY.

Dublin, April 15, 1653.

SIR,

BEING not able to write you any ſuch compliments, as may delight you, nor to inform you of any ſuch more real matter, as might profit you, I deſire, that thoſe my deficiencies, together with my uſual rudeneſs, may be taken for the cauſe of this long ſilence. Now, indeed, I am forced to communicate with you, even to keep up the face of the viſible church of philoſophers; for, by Mr. *Worſley*'s going for *England*, and major *Morgan*'s abſence in the North, there is no ſuch thing now left at the head thereof. If there be any other reaſon of theſe lines, beſides this, and to beg my continuance in the number of your affectionate ſervants, it is to diſſuade you from ſome things, which my lord of *Corke*, my lord of *Broghill*, and ſome other of your friends, think prejudicial unto you; one whereof is your continual reading. Here, like a quackſalver, I might tell you, how it weakens the brain, how that weakneſs cauſeth defluxions, and how thoſe defluxions hurt the lungs, and the like. But I had rather tell you, that although you read twelve hours per diem, or more, that you ſhall really profit by no more of what you read, than by what you remember; nor by what you remember, but by ſo much as you underſtand and digeſt; nor by that, but by ſo much as is new unto you, and pertinently ſet down. But in twelve hours, how little (according to theſe rules) can you, who know ſo much already, advantage yourſelf by this laborious way? How little of true hiſtory do our books contain? How ſhy is every man to publiſh any thing, either rare or uſeful? How few opinions do they deliver rationally deduced, but from their own principles? And laſtly, How few do begin their tedious ſyſtems from principles poſſible, intelligible, and eaſy to be admitted?

On the other ſide, what a ſtock of experience have you already in moſt things? What a faculty have you, of making every thing you ſee an argument of ſome uſeful concluſion or other! How much are you practiſed in the method of clear and ſcientifical reaſoning! How well do you underſtand the true uſe and ſignification of words, whereby to regiſter and compute your own conceptions! So well are you accompliſhed in all theſe particulars, that I ſafely perſuade myſelf, but, that you modeſtly think every ſcribler wiſer than yourſelf, that you can draw more knowledge and ſatisfaction from two hours of your own meditation, than from twelve hours endurance of other men's loquacity. For when you meditate, it is always upon ſomething, that you are not yet clear in (and a little armour will ſerve, being put upon the right place.) But when you read, you muſt take the chance, and perhaps be corrupted with lies, diſguſted with abſurdities, and tired with impertinences, or made ready to vomit, at the *bis (imò centies) recocta crambe* offered unto you. Beſides what a difference is there between walking with our natural legs and crutches! or between a cloth, whoſe ſubtegmen is the ſame from end to end, and another pieced up, out of a thouſand gaudy rags! But the proverb (*verbum ſapienti*) forbids me to be more tedious. The next diſeaſe you labour under, is, your apprehenſion of many diſeaſes, and a continual

fear, that you are always inclining or falling into one or other. Here I might tell you, the vanity of life; or, that to fear any evil long, is more intolerable, than the evil itſelf ſuffered, *&c.*

BUT I had rather put you in mind, that this diſtemper is incident to all, that begin the ſtudy of diſeaſes. Now it is poſſible, that it hangs yet upon you, according to the opinion you may have of yourſelf, rather than according to the knowledge, that others have of your greater maturity in the faculty. But *ad rem:* Few terrible diſeaſes have their pathognomonical ſigns; few know thoſe ſigns, without repeated experience of them, and that in others, rather than themſelves. Moreover, the ſame inward cauſes produce different outward ſigns; and, *vice verſa*, the ſame outward ſigns may proceed from different inward cauſes; and therefore thoſe little rules of prognoſtication, found in our books, need not always be ſo religiouſly believed. Again, a thouſand accidents may prevent a growing diſeaſe itſelf, and as many can blow away any ſuſpicious ſign thereof; for the viciſſitude, whereunto all things are ſubject, ſuffers nothing to reſt long in the ſame condition; and it being no farther from *Dublin* to *Corke*, than from *Corke* to *Dublin*, why may not a man as eaſily recover of a diſeaſe, without much care, as fall into it? My couſin *Highmore*'s curious hand hath ſhewn you ſo much of the fabrick of man's body, that you cannot think, but that ſo complete a piece as yourſelf will be always at ſome little fault or other. But you ought no more to take every ſuch little ſtruggling of nature for a ſign of a formidable diſeaſe, than to fear, that every little cloud portends a cataract or hurricane. To conclude, this kind of vexation hath been much my portion; but experience, and theſe conſiderations, have well eaſed me of it.

THE laſt indictment, that I bring againſt you, is, practiſing upon yourſelf with medicaments (though ſpecificks) not ſufficiently tried by thoſe, that adminiſter or adviſe them.

IT is true, that there is a conceit current in the world, that a medicament may be phyſick and phyſician both, and may cure diſeaſes *à quacunque cauſâ*. But, for my part, I find the beſt medicament to be but a tool or inſtrument. Now what are *Vandyke*'s pencils and pallet, in the hands of a bungling painter, to the imitation of his pieces? Recommendations of medicaments do not make them uſeful to me, but do only excite me to make them ſo, by endeavouring experimentally to find out the vertues and application of them. There be few medicaments, that can be more and more really praiſed, than diapalma and baſilicon; for they have been carried up and down in all ſurgeons ſalvatories, for theſe many hundred years: yet how few can perform any excellent cures by them, or ſuch others! How hard it is to find out the true vertues of medicaments! As I weep to conſider, ſo I dread to uſe them, without my utmoſt endeavours firſt employed to that purpoſe.

THOUGH none of theſe arguments prevail with you, yet I ſhall pray, that nothing of evil conſequent to the things, from which I have diſſuaded you, prevail upon you. The deſire of your encreaſe in knowledge, and (in order thereunto) of your health, hath made me thus troubleſom; for if what I have ſaid, came from any other principle, I ſhould be aſhamed to write myſelf thus confidently,

SIR,

your obliged ſervant,

W. PETTY.

Feb. 17, 57.

SIR,

WHAT you heard of my being ſecretary to his Excellency and clerk of the council, is too true; for I never lived a more miſerable life than now. I hope the meaning is, to try the ethics I diſcourſed of ſo at random in a former letter. I have not, amongſt all my intelligence, heard better news, than that the club is reſtored at *Oxford*. I hear likewiſe, that infuſio croci metal. has been injected into a live animal's blood, without any notable alteration. It were good to try the ſame with opiate liquors, and other of notable and ſenſible vertues. When I deſire the club to try theſe things, I do not excuſe myſelf; but would be glad they ſhould undertake it, that it might be thoroughly done. I received your commands (concerning a deſign, which colonel *Zankey* only appears in here, and in which only Mr. *James Rand* and Mr. *Eccleſton* are named) which I ſhall obey, upon your account; for, until you had written, I underſtood little of the thing; and therefore for me (who ought *non niſi pauca & benè cognita coram principibus loqui*) to appear much, before I had a better warrant, was not ſo ſuitable to my way. I had letters from Mr. *Hartlib* not long before, but without any mention of this affair; nor could I gueſs, but by his ſuperſcribing your letter, that he had any hand in it. For it is poſſible, ſome plagiary might have made uſe of the paper, which nine years ſince I left with him comprehending this whole deſign; for I could not believe he would think me diſaffected to what I formerly ſo much tendered. But I fear ſome enemy hath ſown tares. However, as for what lyes in me, I ſhall be induſtrious to get the allowance ſettled, and no leſs vigorous, that it be duly employed, both as to the main end, and to the encouragement of the beſt particular deſervers; for the riches of one man (who drinks but as he hath brewed) ſhall not ſtir me againſt any publick good, although, ſince I have been in this nation, I have ſtudied thoſe definitions of publick, *&c.* and have obſerved the nature of their non-miraculous degenerations. Dear Sir, I wiſh I had the opportunity to make you underſtand the ſtate of ſome things; till when, ſuſpend your judgment of me. I think I can demonſtrate the

cauſes

cauſes and neceſſity of the moſt malign action I am taxed with; wherefore I beg you to let me be (as we ſay, though but *de bene eſſe*) reckoned amongſt your true and faithful ſervants, for ſuch is

W. PETTY.

Letters from Mr. *Henry Oldenburg*.

Oxford, April 15, 1657.

SIR,

THOUGH I am much obliged to you for the favour of your ſpeedy diſpatch hither of what came to your hands from *Ireland*, yet I am little beholding, I think, to the poſt, which hath been crawling rather than poſting; yours being dated the 11th, which was Saturday, not coming to me till this wedneſday night, whereas, if it had not ſtuck ſomewhere, it might very well have been here on Monday. But thanks to you, Sir, are not a whit the leſs for that and other teſtimonies of your goodneſs and affection towards me, which I can give no retribution for, unleſs you will pleaſe to accept of my real eſteem of your deſerts, and make uſe of my readineſs to ſerve you with what my little power can compaſs.

THE non-reſolution of the buſineſs written about by my lady *Ranelagh*, though it be ſomewhat uneaſy to me, becauſe I cannot well delight to be in a place, where people think me to ſtand in their way; yet do I purpoſe, if God will, to defer our remove, till I receive one letter more from *Ireland*, and if that bring no reſolution with it, after a whole winter's debate, I muſt, I think, take the liberty of chooſing another place, where yet I ſhall have care, that your nephew may not more loſe his time, than he doth now here. Only his and my loſs will then be, Sir, our abſence from you, which I reckon a very great one, and ſhould never chooſe, if the forementioned conſideration did not compel me to it. Yet, before we part to a greater diſtance, it would trouble me exceedingly, if I ſhould miſs the advantage of conferring with you, Sir, about ſome things, which are concernful to your nephew and me. Wherefore, leſt we ſhould fall at one and the ſame time upon a croſs journey to and from *Oxford*, I beſeech you, you would give yourſelf ſo much trouble, as to acquaint me by a line or two with the time of your ſetting out again for *Oxford*; till the reception of which news he is very unwilling to ſtir, that is cordially,

SIR,

your obliged and
very humble ſervant,
HENRY OLDENBURG.

Mr. *Jones* is your moſt humble ſervant.

Saumur, Sept. 8. 1657. ſt. n.

SIR,

I THINK myſelf obliged to you, that, after the troubleſom journey, you mention in your letter, you would give yourſelf the trouble of excuſing your ſilence to my former; though I confeſs, I was glad to ſee it broken, and withal to find an intention in you of being larger, when your academical hurry ſhould be over. As for us here, we are, through the goodneſs of God, in perfect health; and your nephew having ſpent theſe two or three months, we have been here, very well, and in more than ordinary diligence, I cannot but give him ſome relaxation in taking a view of this province of *Anjou*, during this time of vintage; which, though it be a very tempting one to a young appetite, yet ſhall, I hope, by a careful watchfulneſs, prove unprejudicial to his health. I am perſuaded, Sir, if you were here, and would pleaſe to make with us ſuch a little, but very pleaſant tour, as this is to my knowledge, who have made it heretofore, it would conduce very much to your health. But, I doubt, your deſire of knowing and of advancing knowledge, and the opportunities of doing that much better where you are, than here (the way you take) will deprive us ſtill from the happineſs of enjoying your company here. Well, if the publick do but thrive, we ought to bear private loſſes with patience. In the interim, give me leave, Sir, to acquaint you with an obſervation I made the other day in reading a piece of *Thuanus*, which made me reflect upon your diſcourſe about the nature of poiſons, wherein, if I remember well, you ſeem to incline to the opinion, that the poiſon of vipers conſiſts rather in the rage, wherewith they bite, than in any part of their body, which hath always a deadly poiſon in it; confirming it with inſtances, from the madneſs of a dog making his teeth poiſonous, which before were not ſo; and from an inraged cock, killing a man by a ſlight hurt. The author I named gives another inſtance, which, if true, may, in my opinion, juſtly claim a place among the reſt. He relateth (Lib. IV. ad ann. 1548.) that the Scots then beſieging a town, which he calls *Hadma*, taken from them by the Engliſh, and having both French and Highlanders in their army, one of the latter, ſeeing the French fighting ſtoutly, and then ſtirred up to emulation, ſoon ruſhed into the thick of the enemy, ſallying out, and his fury laying hold on one of the Engliſh ſoldiers, threw him, being a luſty fellow, upon his ſhoulders, and running away with him into the camp of his general, was by the way ſo bit in his ſhoulder (he going half naked) by the enraged teeth of the Engliſhman, that he failed very little, as the author ſaith, of being killed by that wound. The ſtory ſeems at leaſt as credible, as that of the cock, unleſs you will ſay, a cock can be chafed to greater rage, than an Engliſh ſoldier carried away by a naked Scotſman on his ſhoulders into the camp of the enemy. To this ſtory I ſhall add another, and then, Sir, end your trouble; but the author I had it from, is not ſo authentick as famous monſieur *de Thou*. It was an Italian, who told me but the

the other week, that pope *Urban* VIII. never did eat any pullets or other tame fowl, but ſuch as had been fed and fatned by the fleſh of vipers, and that his long popedom was aſcribed (*humanitus loquendo*) to the virtue of ſuch food. The thing itſelf, I believe, Sir, you will think very credible, ſeeing men ordinarily enough eat broth, wherein viper-fleſh hath been boiled for to fortify or recruit nature. I wiſh cordially you alſo may find means powerful to preſerve and ſtrengthen yours, for the good of the learned commonwealth; in which preſervation would be particularly involved much joy and advantage to him, who as long as he liveth deſireth to be,

SIR,

your faithful,

and humble ſervant,

H. OLDENBURG.

YOUR nephew and ſelf entreat your favour of preſenting our humble ſervices to all our noble and learned friends at *Oxford*.

SIR,

YOURS from the 2d of *September* (received by us the laſt of the ſame) intimating, that you had not heard from us a very long while, obliged me ſoon after the receipt thereof to acquaint you, that we have taken the freedom to viſit you twice, by our letters in our journey from *London* to *Saumur*, and as often, ſince we have been at *Saumur*; but been ſo unhappy, as never to hear from you, but once before this, which we now humbly thank you for. I hope, ſince our letters have once found the way to and fro, they will not miſs hereafter; and I rejoice to hear you ſpeak of your indiſpoſition in præterito, adding my hearty wiſhes and prayers, that the goodneſs of God would pleaſe to confirm your health, and to keep from you all ſickneſs in time to come, but that uſeful one, which, as you ſay, maketh men fond of charcoal and loam; with which I find none in this place to be troubled at all, having made ſo little ſtay in the other towns, which we have paſſed through, that other occaſions did not permit me to make enquiry after the lovers of that knowledge. In making our tour hereafter, I flatter myſelf with the hopes of finding ſome ſuch at *Montpellier* and *Marſeilles*, and if I could meet with a Peireſkius in thoſe parts, or any where, that is not too far out of our way, I ſhould exceedingly rejoice. Making uſe here of an Italian, to teach your nephew ſomething of practical geometry and fortification, I found, he had a way of writing to others very ſecretly, which, though he would not exchange with me for another, I have by your favour, yet he did it at laſt for that, which, as the lyrick poet ſaith, *perrumpit omnia potentius ictu fulmineo*. And thinking you have it not this way, I did venture to ſend it here incloſed, being tried by me, and doing very well. It may be of great uſe, amongſt others, for beſieged towns, to encourage them with unſeen promiſe of ſuccours, unſuſpected by the beſiegers, the white characters being wrltten over by black ones, of quite another ſenſe, which may be ſuch, as that the beſiegers, if the meſſenger ſhould fall into their hands, would not ſtop, but rather be glad to let paſs; which yet the beſieged will, by a water, mentioned in the receipt, blot out and make appear what concerneth them and their relief.

I AM hugely pleaſed, that the council hath granted your deſires for the promotion of knowledge; which I ſuppoſe to be thoſe, that were couched in a certain petition, you were pleaſed to impart unto me at *Oxford*; wherein, if I remember well, a matter of twelve thouſand pounds ſterling was offered to purchaſe confiſcated lands and houſes with in *Ireland*, and to commit the profit thereof into the hands of certain truſtees, for to employ it in the entertainment of an agent, ſecretary, tranſlators, for keeping intelligence, diſtributing rewards, *&c.* in order to the end aforeſaid. I beſeech you, Sir, to favour me with acquainting me with the progreſs of this buſineſs, and, if it diſcommode you not too much, with what elſe occurreth notable in *England*: half a word, or a word uſed *per antiphraſin* (ſince you muſt uſe the pen of a ſervant) will be enough to make me underſtand your meaning, eſpecially if you ſhall pleaſe to add but a N. B. to ſuch matters, as you ſhall not think fit to ſpeak freely and plainly of to ſuch kind of perſons. Whereby you will very much encreaſe your obligations upon,

SIR,

your moſt faithful

and humble ſervant,

H. OLDENBURG.

RECEIPT.

Prenez 1 *ou* 2 *onces de vinaigre diſtillé, &* ½ *once de lithargyron en pierre, & ayant pulverisé ceſtuy-cy, mettez-le dans le vinaigre, & avec cela eſcrivez en lettres blanches tout ce que vous voudrez enſeigner ſecrettement à voſtre amy. Apres, bruſlez un morceau de liege* (cork) *juſques à ce qu'il ſoit tout charbonné & ne bruſle plus: alors eſteignez le avec un peu d'eau de vie. Mettez ce charbonné en poudre, & y ayant mis un peu d'eau de gumme, faitez en de l'encre, avec lequel vous eſcrirez tout une autre choſe ſur les predites lettres blanches. En fin, prenez* 1 *once d'orpiment, & l'ayant auſſi pulverisé, mettez le avec* 2 *onces de la chaux vive, qui ſoit bonne & vigoreuſe, & apres mettez les enſemble dans une phiole de verre ou d'eſtain, tenant une chopine* (an Engliſh pint) *& l'ayant remplie de l'eau commune, agitez le par* ¼ *d'heure: & ceſt eau ſervira à merveille pour effacer les lettres eſcrites de l'encre, & pour faire apparoiſtre à votre amy tout ce que vous aurez eſcrit en lettres blanches.*

* * * * your

Saumur, March 29, 1658.

* * * * your nephew having alſo waited on you ſince with another letter, and being, together with myſelf, extremely coveting to receive ſome good news of your health and welfare; which, if you ſhall pleaſe to gratify us with, we entreat you to ſend it only, as formerly, to Mr. *Hartlib*, who hath order to direct henceforth thoſe letters, that concern us, to *Geneva*; where I have a friend, that will not fail to diſpatch them to me, whereſoever I ſhall be in *Germany*, which, I think, will be the country for our ſummer ſtation, becauſe likely to be the theatre, as of a great ſolemnity, ſo of other conſiderable tranſactions. But no appearance, I think, to make afterwards an excurſion into *Italy*, and thence to bring you news of the induſtrious *Kircher*'s ſubterraneous world, his ſtrange *grotta de' ſerpi*, his ſtory of the growth of pulveriſed and ſown cockles, irrigated by ſea-water; his thermometer by a wild oat's-beard; his vegetable phœnix's reſurrection out of its own duſt by the warmth of the ſun; his pretended ocular confutation of *Kepler*'s magnetical motions of the planets about the ſun; and of *Gilbert*'s magnetical motion of the earth, and of twenty other remarkable things, one might yet have the ſatisfaction to be punctually informed about, if our friends did not think to have reaſon to diſſuade us from that voyage, wherein we ought to acquieſce, if they ſtill judge them important enough to hinder it. In the interim, what particular enquiries you think in *Germany* may be made of us about philoſophical experiments, I entreat you be pleaſed to give in your next a hint at: and, to conclude, do not think it a trouble to advertiſe us, what ſucceſs that promotion of learning hath, for which the council did formerly grant your deſires, if he miſtake not, who is,

Sir,

your obliged, and

very humble ſervant,

H. OLDENBURG.

Paris, May 17, 1659.

SIR,

AS I find the favour of the good opinion you are pleaſed to have of me, as upon other occaſions, ſo in the late addreſs of Mr. *Robert Southwell*, to my advice in order to his travels, very advantageous to me; ſo I doubt very much of my capacity in anſwering the ſame as it deſerveth: yet wherein I come ſhort here, I ſhall, by the aſſiſtance of God, ſtudy to make up by a ready faithfulneſs to aſſiſt and ſerve him, in whatſoever I can. I find this perſon very ingenious, and well inclined, apt to make good uſe of travelling; but yet, for ſome conſiderations, do doubt very much, whether one may adviſe him to go into *Italy* thus alone, as he hath no ordinary deſire to do. It is a very peſtiferous climate, and vice hath a fermenting quality; unleſs a man be well antidoted and armed, he will hardly eſcape ſound and uninfected from thence. Wherefore I am alſo apt to believe, that my lord *Dungarvan*'s friends will very well conſider, before they counſel or permit him to make that voyage. You know, Sir, how few there are, that in the ſtrength of him, in whom we can do all, take up a reſolution againſt vice, and the ſatisfaction of their ſenſes; as alſo, how few there be of ſuch guides, that are ſolicitous and watchful to warn thoſe, whom they guide, againſt thoſe moral dangers, which every where, though in ſome places more than in others, do attend us.

I HOPE, Sir, my letter from the 21ſt of April, that did acknowledge your bounty, and gave you ſome account of what you demanded, is come to your hands. I have ſince received from a gentleman, that liveth in the extremities of *Languedoc*, on the ſhore of the Mediterranean, the receipt of an oil, which he told us, when we viſited him, had done great cures. Methinks, the ground of it anſwereth your *Ens Veneris*. I thought myſelf obliged to impart it unto you, and to deſire you to examine it, whether it is capable to produce ſuch effects, as the ſaid perſon (who found it in ſeeking after, and working for *Butler*'s ſtone, according as Mr. *V. Helmont* hath written thereof) did relate unto us, which are, the curing of megrims, palſies, lameneſſes, crookedneſſes, and all ricketing diſeaſes. I ſend it juſt as the author ſent it me, without deciphering his characters, as knowing, you need no ſuch thing. I add hereunto ſome few ſeeds of the ſenſitive plant, which I was preſented with here, and you may try, how they will ſpeed at *Oxford*; as alſo ſome grains of bama muſcata, which come from the iſles of St. *Chriſtofle*, growing upon a tree of three or four feet high, bearing yellow flowers, which the negroes uſe in their potage, juſt as the Engliſh do marigold-flowers. He, that gave them me, ſaid, that having put ſome of theſe grains into good ſpirit of wine, and left them there infuſed three or four days upon ſome little warmth, till the ſpirit had drawn the ſcent thereof, he had taken out the grains, calcined them, and drawn a ſalt from them, which being infuſed into *l'eau de vie foible*, and having poured upon it ſome of the former ſpirit, endowed with the ſcent of them, had made him urine much: inſomuch, that he hath a belief, theſe grains duly prepared may prove good for the gravel: if you view the figure of them well, you will find it like to that of the reins. I had ſome other things in my thoughts to extend this letter with, but company comes in, and obligeth me to free you from further trouble. Only be pleaſed to receive the aſſurance, that I am,

Sir,

your moſt humble,

and obliged ſervant,

OLDENBURG.

Oleum Vitriolinum.

Paris, March 20, 1660.

SIR,

AS I am much obliged to you for your liberality of preſenting me with thoſe two deſired treatiſes of plants and manners, and of ſending them to my lady *Ranelagh* for me, ſo I am altogether aſſured of her ladyſhip's care in tranſmitting you hither, if a good occaſion had preſented itſelf ere this. The explication of the Arabick inſcription was very welcome to thoſe concerned therein, and they return, together with my ſelf, their humble thanks for it, and tell me, that it agreeth with the ſenſe of what a Frenchman, moſt ſkilful in the oriental tongues, hath ſaid of it; which confirmeth very much the owner of the jaſper in the interpretation of Mr. *Potock*, and derogateth nothing from the eſteem he is in. Sir *K. Digby* will himſelf aſſure you, by the annexed, of his reſpects to you. We met lately at the houſe of a chemiſt, where the queſtion was agitated about the diſſolvent of gold, whether the univerſal ſpirit of the world in its undetermined nature, or as it is ſpecified and contracted to a mineral, be the menſtruum of that noble metal? The diſcuſſion hereof being rather made by authority, than reaſon, gave ſmall ſatisfaction to the auditors; whereof the learned knight being the chief, did moderate the action, but not determine the queſtion; interlacing the diſcourſes of others with the ſeveral conſiderable relations, whereof two did raviſh the hearers to admiration. The one was of a king's houſe in England, which having ſtood covered with lead for five or ſix ages, and being ſold after that time, was found to contain $\frac{1}{4}$ of ſilver in the lead thereof. The other was of a fixed ſalt, drawn out of a certain potter's earth here in *France*, at a place called *Arcueil*; which ſalt being for ſome time expoſed to the ſun-beams, became ſaltpetre, then vitriol, then lead, tin, copper, ſilver, and, at the end of fourteen months, gold; which he aſſured to have experienced himſelf, and another able naturaliſt beſides him. I muſt confeſs, I had rather ſee this, than believe it, though the author be a very authentic gentleman.

THE name of the Carteſian author, that hath written of the cauſe of purgation, is one monſieur *Nicholas Lienard:* the treatiſe is a very ſmall one in French, containing but twenty leaves in quarto; which yet is too big to be ſent by the poſt, or elſe you ſhould not be long without it. I am confident, your experiments about this purging vertue of medicines will prove more convincing, than his ratiocinations, though they be very plain and intelligible, yet not unmixed with ſome juvenile ſcholarſhip.

I CAN learn nothing of any new books, treating of the Epicurean or Carteſian principles; and I am perſuaded, that, if there be any new ones come lately abroad, the news thereof will ſooner come from *Holland*, than theſe parts. We long much, Sir, to ſee your epiſtle, which giveth an account of certain experiments made about a pneumatical engine; but I doubt, we ſhall not ſee it, till we have the happineſs to ſee you; which is much wiſhed for by,

SIR,

your faithful and

very humble ſervant,

OLDENBURG.

London, June 10, 1663.

SIR,

I COULD not forbear by this occaſion to give you notice of ſome particulars, imparted to me ſince your leaving *London*, eſpecially ſuch, wherein yourſelf and the other Engliſh virtuoſi are concerned. My correſpondent in his laſt from *Paris* ſaith, with a great deal of frankneſs: *Il faut avoüer, que les Anglois l'emportent, & ont l'avantage par deſſus les autres peuples de l'Europe, nous ayans donné quantité de choſes curieuſes & particulieres, outre les grands ouvrages, qu'ils ont donné au public. Au contraire, les livres, qui s'inpriment à Paris, ne meritent pas d'eſtre leus, au moins la plus part, ny ayant que des redites ou des allegations; mais rien de particulier, qui contente l'eſprit.* Then he paſſeth on to a gentleman, called Mr. *Boyle*, and ſaith; *On l'admire plus que jamais, & monſieur Ozou* (that is, one of the conſiderableſt members of the Monmorian academy, and a very mathematical head) *à une eſtime tres particuliere pour luy. Le meſme eſt grand admirateur de voſtre ſocieté, & ne ſe peut laſſer de loüer le genie des Anglois, pour avoir fait grande quantité de belles choſes. Nous ſerions bien aiſes de ſcavoir, ſi on continue dans la meſme curioſité.* In the end of his letter, he mentions, that he hopeth to get the obſervations, made by *Borelli* upon your *Chemiſta Scepticus*, which being obtained, he promiſeth to ſend me ſpeedily.

THIS afternoon we had no ordinary meeting: there were no leſs than four ſtrangers, two French, and two Dutch gentleman; the French were, monſieur *de Sorbiere* and monſieur *Monconis*; the Dutch, both the *Zulichem's*, father and ſon: all four inquiſitive after you. They were entertained firſt with ſome experiments, which the bearer hereof will give you a good account of; and afterwards with good ſtore of occaſional obſervations, diſcourſed of promiſcuouſly, *pro re nata*; which the ſtrangers (as well as our company) ſeemed to be much

more pleaſed with, than with ſet and formal diſcourſes: they were, 1. Of various petrifications, even of children in the womb; item in the lungs, in the plexus choroides, and in all the parts of human bodies. 2. Of perſons altogether moveleſs, but that they could ſpeak, and eat and drink; whereof one was alledged by Sir *R. Moray*, ſeen by himſelf at the *Spaw*; out of whoſe fingers, and cheeks alſo, he had obſerved a chalky matter to iſſue. Another was mentioned by Mr. *Beale*, in a letter to me, of his own kinſwoman, that lived ſome years as unmoveable as a ſtone, unable to move finger or toe; yet her mouth ſhe could move, and had a good ſtomach, and was recovered at laſt by baths. I doubt, Sir, here is matter for an occaſional meditation.

NEXT, there were very odd relations made of women voiding bones, together with their menſtrua, every month; of others bringing away bones of children (they had been ſeveral years before big of) by ſiege, or out of their ſides.

THEN there was occaſion given, by a petition made to the king, for a patent to practiſe a ſecret for the improving of any barren ground, and of flowers, plants and young trees, and among them, of vines and orange-trees, to make thoſe grow as plentifully as in *France*, and theſe, as in *Portugal:* by this, I ſay, occaſion was given to ſpeak of the ſmutting of corn, with the deſcription of it; its differences from other vices in corn; with the conjectures of the cauſe of it, and the probable means to avoid it. Concerning all which, Mr. *Long* brought in a handſom diſcourſe; which I have by me, for your ſervice, when you pleaſe.

MUCH alſo was ſpoken of the advantage of ſowing corn with the huſks; and of planting fruit-ſtones with ſome pulp about them.

MONSIEUR *Monconis* was ſo obliging, upon the ſociety's deſire, to leave them in writing his way of knowing the difference of the weight of liquors; as alſo, the manner of ordering ſilkworms in *France* and *Italy*; where are contained ſome very pretty and not obvious obſervations.

BUT, Sir, I forget to whom I write, and by whom. I ſhould have told you ſome news, and I would write more, but that I have written too much. Yet this I muſt add, that the treaty with *Rome* advanceth not; that the conſiderabler ſort of French proteſtants are tempted to apoſtaſy; that *Spain* hath had ſome ſucceſs upon *Portugal*; and that *Sweden* is grown jealous of *France*, becauſe of the French kindneſs to, and alliance with *Denmark*.

IT is after midnight, Sir, that I write this; which will, I hope, the more prevail with you to pardon this undigeſted ſcribble to,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

SEEING the abovementioned ſtrangers are like to continue here yet a while, at the leaſt ſome of them, the ſociety ſhall much ſtand in need of a curator of experiments; which, I hope, Sir, will the ſooner procure from your obligingneſs a diſpenſing with Mr. *Hook* for ſuch a publick uſe.

London, June 22, 1663.

SIR,

YOUR receipt for monſieur *Monconis* came, after he had taken his leave from us; but I ſhall not fail, God permitting, to ſend it after him by the firſt conveniency. On Wedneſday laſt there were admitted into the ſociety my lord *Craufurd Lindſey*, meſſieurs *Huygens*, and *Sorbiere*. An experiment was tried in the compreſſing engine, but again without ſucceſs; the force of the air, thruſt in, breaking the cement, that faſtned the glaſs. In the experiment of the precedent meeting (whereof, no doubt, you had an account from Mr. *Hook*) the air, put into the place of the bubble, remaining in one bolthead, was vaniſhed, as well as the bubble, that was left in the other bolthead. After this, petrifications were again diſcourſed of; and the colours of inſects: there were alſo a couple of letters read, ſent to me, one from *de la Quintinye*, containing a farther account of melons; the other from Mr. *Beale*, relating his obſervations of the ſmut of corn. I had a third letter from *Paris*, written by the ſame gentleman, that is the author of the diſcourſe *de calore*, and hath ſo particular an eſteem for you, as I mentioned formerly. He tells me now, that the king of *France* hath beſtowed a largeſſe of eighty thouſand livres upon ſeveral learned men, but moſt poets and romancers, except *Huygenius* and *Hevelius*, and *la Chambre*, having neglected *Roberval*, *Fermat*, *Frenicle*, *Rohault*, *Ozou*, and ſuch like, *qui colunt muſas ſeveriores*.

THIS friend ſheweth himſelf ſo much concerned for you, that he writeth thus: *Il faut plus attendre de monſieur Boyle, à mon advis, que de tous les autres enſemble: c'eſt pourquoy je ſuis fort affligé de ce qui le menace. Exhortez le puiſſamment à avoir ſoin de ſa ſanté: je ſuis perſuadé, que s'il s'y applique, il fortifiera ſa conſtitution, & ſe garentira d'une maladie lente. Un de mes amis, avec qui je plaignois ce malheur, m'a aſſuré, qu'un ſeigneur Anglois, menacé de meſme, fut conſeillé de paſſer en France, ou l'air ſeul reſtablit ſi bien ſa ſanté apres quelque ſejour, qu'il retourna en Angleterre, ſans qu'il retombat de ſa vie en aucun peril de ſa premiere maladie. Propoſez luy la choſe: il pourra philoſopher par tout, & faire proviſion de ſanté pour philoſopher plus long temps.*

YOU ſee, Sir, his kindneſs for the advantage of your health, though ſuch abſence would turn to the diſadvantage of your friends here, *pro tempore*.

HE prayeth me, to entreat you to communicate unto him, if it may be, the way, which Dr. *Willis* mentions in his treatiſe *de Fermentatione*, p. 64. (ſuppoſing, your curioſity hath prompted you to get it from the ſaid author)

viz.

viz. to draw without any corroſive, *ſolo calore lento*, the tinctures of bodies with all their vertue. I dare engage for him, as well as for myſelf, that it ſhall remain a ſecret, if it be one.

THERE is going for *France* a friend of mine, by whom I could ſend a good packet, with ſafety; if you ſhould think fit to preſent monſieur *Thevenot*, the author of the late voyages in French, with one of your books, of the Uſefulneſs of natural philoſophy, he underſtanding Engliſh pretty well; I intend alſo, God willing, to ſend him one of your Latin reply to *Linus*, and another to monſieur *Martel*, the writer of the forementioned diſcourſe of heat. For this cauſe, have I taken two or three exemplars of this latter piece from Mr. *Crook*, ſuppoſing your leave to do ſo; that I might not neglect ſo fair an opportunity of ſending, as is now offered to,

SIR,

your very humble

and faithful ſervant,

H. OLDENBURG.

THE friend, that is going for France, purpoſeth to go hence on Friday next.

London, July 2, 1663.

SIR,

THOUGH I hope this will meet you on your way *London*-wards, the eight or ten days, which you allowed yourſelf in your letter for the reſidue of your ſtay at *Lees* being now elapſed; yet the mixture of my fear, leſt the influence of that conſtellation you then named, ſhould arreſt you longer where you are, I thought I would try, whether the operation of the ſtars (ſince they are held but to incline) might not be diverted by the power of a Royal Society, who are now freſhly ſet upon it, to give their royal founder and patron a philoſophical entertainment, as ſoon as poſſibly they can make one ready fit for him. In order to which, their council have ſet apart an extraordinary day, which is Monday next, the 6th of July, to agree upon the experiments and diſcourſes proper for his majeſty's reception: at which meeting they will be very glad to have your preſence and contributions, as highly valuable to this purpoſe.

THE book of the Uſefulneſs of experimental philoſophy was preſented according to your deſires, and received with applauſe and thanks, but to be returned, not to an anonymous, but to Mr. *Boyle*, whom I alſo intreat to accept of my humble thanks for the preſent of one of the books to me. I have let my friend paſs to *Paris* without an exemplar thereof to Mr. *Thevenot*, upon the conſideration ſuggeſted in your letter.

WHAT was done yeſterday at our meeting, I ſuppoſe Mr. *Hook* giveth you an account of by this ſame carrier. The ſurpriſing victory of the Portugals is ſo great, that the king of *Spain* acknowledgeth, in a letter written by his own hand to the queen-mother of *France*, that his army of 18,000 men is reduced to 6,000. This will give a *tanto de naſo* to his holineſs, whoſe heart did ſo ſwell upon the ſucceſs of the *Spaniards* in the taking of *Evora*, that he diſpatched away new orders to *Raſponi*, which did ſo diſguſt the French, that the treaty thereupon is broke off *pro tempore*, which certainly cannot be reſumed, but with great diſadvantage to the pope, who now runs the hazard of ſeeing a patriarch ſet up not only in *Portugal*, in caſe he refuſe any longer to confirm their biſhops, but alſo in *France*; which if it happen, I ſhall then look upon the pope, as little better than the king of *Spain*'s chaplain.

AND I will let any conſcientious man judge, whether he deſerveth not to be covered with confuſion, who offers, as the pope doth, (if my information be true) *charta bianca* to all thoſe, that will only agree, 1. not to diſpute his ſuperiority; 2. not to give ſcandal, leaving you for the reſt to believe and do what they liſt. If the chriſtian church had no other head, but ſuch an one, who would be a Chriſtian? Certainly not he, that is,

SIR,

your faithful humble ſervant,

H. O.

IF peradventure the ſtars ſhould prove ſo powerful, as to keep you beyond the mentioned time, the council will take it extreme kindly, to receive your ſymbolum of experiments in writing, as ſpeedily as may be, ſince they would go about the trial of them immediately.

London, Aug. 25, 1664.

SIR,

I AM forced to begin this letter, with complaining about the retardment of the work of the preſs, for want of thoſe Latin ſheets I looked for by the return of the coach, that carried you to *Oxford*. If they ſhould be loſt, I know not how that loſs could be well repaired; and the printer is already impatient for ſtopping his preſs, which attendeth this book. I hope, Sir, you will take all poſſible care to ſilence theſe clamours, and to direct me what to do in this caſe, eſpecially if the papers ſhould not be found.

WE have conſiderable news here from *Holland*, *viz.* that they have made very ill uſe of the king's engaging himſelf to their embaſſador, that he would attempt nothing upon their *Eaſt India* fleet, ſeeing they have ſent order to *Van Trump*, whom they had diſpatched with fifteen frigats to ſafeguard home the ſaid fleet, that they being ſecured by his majeſty's parole of the ſafety of the fleet, he ſhould quit you and paſs to *Guinea*, and ſeek

his advantage there againſt the Engliſh. This action hath ſo exaſperated the court, that it is thought, a war cannot now be avoided. In the mean time, there are eighteen ſhips of ours, partly ready, partly making ready to go for *Guinea*, and there to maintain the Engliſh intereſt. The plague increaſeth ſtill in *Holland*, there dying the laſt week about a whole thouſand, whereof there were not above 150, that died of other diſeaſes. This maketh them, it ſeems, more reſolute for a war, ſeeing they have no trade, and ſo think themſelves fit for nothing but fighting. What they will do with all theſe *Eaſt Indian* commodities, and other wares, that lye in abundance upon their hands, ſince they are almoſt excluded from all ports, I cannot imagine.

IT is confirmed from thence, that there is a company in *Holland*, that have great hopes to paſs into *China* and *Cataya* by the north, and that they earneſtly demand an octroy for it. What paſſage this ſhould be, differing from that, which was attempted at the latter end of the laſt age by three ſhips, that endured incredible hardſhips, I have not ſkill enough to gueſs.

FROM *Paris* my correſpondent diſcourſeth thus; *Par voſtre procedé on voit bien, que vous voulez la guerre, en refuſant de rendre Cabo Verde, qui a eſté pris ſans juſtice. Les plaintes, que fait Downing à la Haye, ſont imaginaires & ſans fondement, ce qui fait croire à tout le monde, qu'il en faut venir à la derniere extremité. Sans la peſte on ne vous craindroit point, et ſi on vouloit ager comme il faut, on vois donneroit bien des affaires et bien de l'occupation. On ſouhaite icy, ſi la paix ne ſe fait pas, que les Hollandois ſoyent victorieux, n'eſtans pas ſi criminels, comme on les fait en Angleterre. Ils ont voulu rendre l'iſle de Poleron à vos gens, qui n'en ont point voulu, parce qu'ils n'avoient point d'hommes pour le garder. Meſſieurs les eſtats ont montré à Downing leurs cahiers de plaintes, qui ſont mieux fondées, que les voſtres aſſurent. Ne vous eſtonnez pas de ce que je vous dis, eſtans tous Hollandois icy.*

UPON this I have ſuggeſted to this gentleman, that I doubted very much, whether the Hollanders were as good French as they are Dutch, remitting him to his former letter, wherein he intimated, that upon the death of the king of *Spain* (who by the laſt poſt was agoniſing again) the king of *France* would do his utmoſt endeavours to poſſeſs himſelf of *Flanders* and *Brabant*, or at leaſt to enable *Antwerp* to regain their old trade by opening the Schelde, which muſt needs ruin *Amſterdam* in a ſhort time, and cannot but beget at the preſent great jealouſies in the United Provinces of the king of *France*.

I SHALL ſay little of the victory againſt the *Turks*, it being ſo notorious, though not ſo great as it was made in the beginning. I ſhall only give this touch, that comes from *Paris* concerning the ſenſe, that *France* hath of the importance of what they did in that action, *viz. nos François* (ſaith the letter) *paſſent pour les reſtaurateurs de l'empire, & veritablement ils on fait tout ce qui ſe pouvoit faire.*

FROM *Amſterdam* they write me word, that *Kircher*'s *mundus ſubterraneus* is advanced unto Lib. XII. and will be finiſhed within ſix weeks. There lye ready ſeveral books for me at *Paris*, and amongſt them ſome anſwer to *Paſcal*'s little book; but for want of a conveniency of ſending them ſafely, I muſt want them ſtill.

WE had yeſterday a terrible ſtory read at *Greſham*, ſent out of *Italy* by Dr. *Pope*, of a moſt dreadful tempeſt of thunder, lightning, rain, and hail, the like had not been in thoſe parts in the memory of the living. The hail was ſome of it as big as a tennis-ball, ſome as a Turkey egg, both for bigneſs and ſhape, ſtriking in eight ſeveral places thorough the top of the coach, wherein Dr. *Pope* and his company were travelling about *Padua*, and bruiſing ſome of the travellers, and beating others black and blue, as if they had been ſoundly cudgelled. The horſes were ſo ſcared, that they broke looſe, and run away; one of the horſes of another coach running into a river, and being drowned there. In ſum, the ſtory was thought ſo remarkable, that it was ordered to be kept upon our records.

HAVING found the top of *Paul*'s ſteeple a convenient place for ſome experiments, order was given yeſterday to try there the deſcent of falling bodies, the Torricellian experiment, and the vibrations of a pendulum of the length of the top to the floor of the church: the perpendicular height is about two hundred foot. Order was alſo given, that an inſtrument ſhould be made for diſcovering a ſecond of time by a ſun dial or the ſtars, which was looked upon as very conducive to the ſtating of an univerſal meaſure, though it was alſo judged very requiſite thereunto, to have a certain way to meaſure the preſent temperature of the air.

THE engine for meaſuring refractions was well examined, and at laſt approved of; with which many good experiments will now be made.

THERE was read a paper brought in by Mr. *Packer* concerning mine-damps, which will admit of no more but two kinds of them, which are there called fire-damps, and earth-damps, alledging, that that kind, which they call the water-damp, is nothing elſe but a vapour, that in ſome wet-damps will lye upon the water, even as a miſt eſpecially follows the rivers. He affirms, that the earth-damp is a vapour not at all viſible, though this kind be the moſt dangerous and deſtructive, it being far ſharper and of longer continuance commonly than the other. He adds a particular ſomewhat ſtrange, *viz.* that a workman aſſured him, that he being at *Chevin* cole-pits, and the damp being in the work, they hung a fire, as they uſe to do to get the damp out of the earth in the pit's mouth, which was made of at leaſt half a horſe load of coals, burning very fiercely; and notwithſtanding,

when it had drawn the damp up the ſhaft or pit, the fire was quite extinguiſhed, and put out as dead, as if caſt into a river; and being kindled two or three times again, was preſently ſtruck out, though no vapour or fume at all appeared, that could be called the damp, but the ſmoke of the fire only. He concludeth with the fire-damp, and ſaith, that when that is ſeen, it is like the ſmelting miln-ſmoke, and ſometimes it is ſo much, that it fills the whole work, at other times it is reduced to a little compaſs, and gets into a corner of the grove, and may lye there for ſome years, if not ſtirred into; and in other places the workmen may do their work, and not at all ſuſpect it, though working in the ſame grove: it may lye (ſaith he) in the compaſs of a diſh; but, if it happen to be touched by the workmen unawares, may deſtroy their lives, which it doth, (ſo he goeth on) by cauſing them to be ſo weak, that they are not able to aſcend the pit, and if not timely prevented, ſtriketh to the heart, and then there is little or no cure.

SIR, if you are not yet tired, I ſhall go on to tell you, that upon the ſuggeſtion of monſieur *Zulichem*, to try the vibrations of hard bodies ſounding, it was moved by Sir *R. Moray*, to make, inſtead of a bell, a flat round plate of bell metal, with a hole drilled in the middle, through which a cord may be drawn to hang it by; as alſo to have ſeveral of theſe round plates made of differing ſizes, to ſee what difference of ſounds they would produce, their edges being ſtruck upon.

MR. *Wylde* being preſent at the Society, promiſed them not only to ſhew them the experiment of ſoftning ſteel without fire, and hardning it again, but alſo of giving them the receipt how to do it; which the company was very well pleaſed with.

MR. *Howard* affirms to have the way of fixing log-wood, and offers to ſhew the Society an experiment of it; and it was committed to him, yourſelf, and Dr. *Merret*, to conſider of a way of fixing all ſorts of colours, which they hope you will do your ſhare in.

ON Friday laſt our committee for correſpondence met the firſt time at Mr. *Povey*'s, where we were ſorry to be without you, and without your queries for *Guinea*. In the mean time general enquiries were drawn up, ſerving for all the parts of the world; and authors were diſtributed amongſt the members of this committee, to be peruſed for the collecting thence particular enquiries for particular countries. This was our entertainment above ground: I leave you to gueſs what our correſpondence and entertainment was under ground, in the grotto, and near the well, that is, the conſervatory of ſo many dozen of wine bottles of all kinds.

BUT I muſt now eaſe you, after I have intreated your favour to enquire of Dr. *Wallis*, with my humble ſervice to him, whether he hath received that packet of Mr. *Horrox*'s letters, I did, by order of the Society, ſend to him for his peruſal, by the *Oxford* coach, Auguſt 13. You will pardon this trouble to,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

SIR, give me leave to entreat you, that in caſe you ſhould meet with any curious perſons, that would be willing to receive weekly intelligence, both of ſtate and literary news, you would do me the favour of engaging them to me for it. The expences cannot be conſiderable to perſons, that have but a mediocrity; 10*l.* a year will be the moſt, that will be expected; 8 or 6*l.* will alſo do the buſineſs.

London, Sept. 1. 1664.

SIR,

A THURSDAY laſt I ſent my letter to wait on you at *Oxford*, and to receive your commands for the ordering of the preſs about the Latin tranſlation; but I have not heard a word upon it, and thereby am left in much perplexity, what to do with the printer.

BEFORE I communicate philoſophical matters, I muſt let you know, what comes juſt now to me of ſtate-affairs, *viz.* that prince *Rupert* is declared general for *Guinea*, to command a fleet of twenty ſhips, almoſt ready to go thither, and to do what execution he can upon the Dutch there; which is a plain beginning of the war. The Dutch are likewiſe diſpatching thither, what ſtrength conveniently they can, to maintain what right they think they have there. They judge themſelves at the preſent, conſidering the rage of the contagion amongſt them, by which they are beat out of trade, fitteſt to go to war; and in all appearance they are like to have enough of it. We are about to forbid them all commerce with *England*, as *France*, *Italy*, *Scotland*, &c. have done already; whereby all their commodities will lye upon their hands, eſpecially thoſe, that came lately home from the *Eaſt-Indies*; which hath occaſioned the *Eaſt-India* company here to ſell their commodities, returned from thoſe parts, at an extraordinary rate, they having ſold within theſe three days for about four hundred thouſand pounds ſterling of wares, and, as I am informed, ſome of them at fifty *per cent.* gain.

THE news from *Amſterdam* holds, that ſome merchants there have found a north-eaſt paſſage to *Cataya* and *China*; but we are here ſo dull, that we cannot imagine, how they will or can make their way thither in that climate, unleſs they have found the ſea, by reaſon of its vaſtneſs, open beyond *Nova Zembla*, which, perhaps, continuing ſo for a great ſpace eaſtward, and ſo down again ſouthward, may bring them to their journey's end; which time will diſcover.

HIS

His majeſty intends to begin his progreſs next week, and expects to hear news of prince *Rupert*'s expedition at his return; and, accordingly, reſolve farther upon the war.

The French letters ſay this to me; *Le roy d'Eſpagne eſt tousjours fort incommodé, & ne peut vivre que fort peu de temps. Marcin a entevé deux regimens Francois aux Portugais. Le roy prend fort à cœur ſes pretenſions ſur la Flandre, qu'on ne laiſſera jamais à l'Empereur, & non obſtant qu'on lui l'a donnée par ſon contract de mariage, il aura de la penie à s'en mettre en poſſeſſion, ou au moins à en jouer paiſiblement. Le roy à plus de paſſion que jamais pour l'eſtabliſſement de la compaigne des Indes orientales, où il veut que tout le monde contribue. Mais pluſieurs doubtent forts qu'elle reuſſiſſe. La compagnie d' Hollande eſt trop bien eſtablie pour la pouvoir ruïner, principalement depuis qu'elle à obtenu la liberté de pouvoir trafiquer dans la Chine.*

On eſpere que les Turcs ſe retireront, & qu'ils laiſſeront les Chreſtiens en repos cette campagne. S'ils avoient des chefs, qui entendiſſent la guerre, ils nous donneroient bien de la peine, leurs ſoldats eſtans braves, & allans au feu vigoureuſement & aſſurement. Monſieur de Souches a le Danube entre luy & les Turcs, & eſt maiſtre de la campagne, où il eſt. La riviere de Raab eſt entre l'armee de l'Empereur & celle des Turcs, & ainſi les Chreſtiens ne courent à preſent aucun riſque; ce qui obligera les ennemis à ſe retirer.

Having tired you with news of ſtate, I will try whether I can do ſo too with news from *Greſham*. There was made an experiment for finding the velocity of a bullet, by the means of the inſtrument for meaſuring the time of deſcending bodies; which was ſo contrived, that the pendulum was ſet on moving by the bullet's paſſing out of the mouth of the gun, and a board was ſet up for a mark at a determinate diſtance, and a ſtring extended from that board to the pendulum, which was fixed juſt by the gun. It was thought, that by means of that ſtring, which was ſtretched pretty ſtiff, and ſo contrived, that a ſmall thruſt againſt the board would ſtop the pendulum, the impulſe of the bullet againſt the board would be preſently communicated back to the pendulum, by which means, that vibrating body being ſtopt at the very inſtant, would have ſhewn the time, that the bullet was paſſing from the mouth of the piece to the board or mark; but it was found upon ſeveral trials, that the bullet pierced through the board, which was three inches thick, and did not break a ſmall ſlender piece of white thread, which was to have ſtopt the pendulum. Order was given, to think upon a better way of making this experiment.

We have alſo begun to try experiments for meaſuring the time of falling bodies in water, and found yeſterday, that ſhot, let fall in a glaſs tube of 81 inches long, came to the bottom in about 2″. This is to be proſecuted in a larger veſſel, with bigger balls, and of ſeveral materials.

We made alſo a beginning with the experiments of meaſuring the refraction of common water, and found it about 14°.

On Monday laſt a club of our philoſophers went to *Paul*'s, to make experiments of falling bodies, and of pendulums: there were Sir *R. Moray*, Dr. *Wilkins*, Dr. *Goddard*, Mr. *Palmer*, Mr. *Hill*, Mr. *Hook*; and ſome of them went to the top of the ſteeple, and let down a pendulum of 200 foot long, with an appendant weight of ℔, and found 2 vibrations thereof made in 15″. Time would not then give leave to proceed to the other experiments, that were deſigned; among which will alſo be the Torricellian: but they will be ſet upon within two or three days.

I believe, Sir *Robert Moray* will himſelf let you know the news he received from Mr. *Zulichem*, concerning ſome new obſervations, lately made by one at *Rome*, of Saturn, confirming his ſyſtem, by the means of a glaſs, far better, by relation, than any of thoſe of *Divini*, wrought after a new way, without any mould at all. From the ſame hand you may alſo expect a farther relation concerning the poſt-chariot in *France*, how they now practiſe it all over that country, running with it from *Paris* to *Bourdeaux* in $4\frac{1}{2}$ days, which is no leſs, I think, than 300 miles. There is alſo more news about monſieur *Zulichem*'s new pendulum for longitudes; but that I am not at all able to give you any tolerable account of; but leave it altogether to the hand, that was entruſted with it, which is the ſame knight I lately named.

But yet, I have not done; I muſt add, and recommend to you, the liſt of georgical enquiries, which the committee for agriculture have pitched upon, as to arable and meadows; deſiring all their members, that have intereſt in the country, and acquaintance with experienced huſbandmen, to procure a good account and anſwer upon them; and not doubting, Sir, but that you will ſo effectually recommend them, and ſuch others, as you yourſelf ſhall deviſe and add, that a ſatisfactory return will be made to them. They are ſuch, as follow: * * *

London, Sept. 22, 1664.

SIR,

Having now received all the Latin papers, you had in your hands concerning the book of Colours, the impreſſion will be finiſhed, I think, within two or three weeks; and it may be ſooner, becauſe the Latin of the diamond obſervations were diſpatched before the return of the ſaid ſheets, the importunity of the printer extorting from me whatſoever I had of it; nor do I apprehend any conſiderable miſtake in that part (though it wanted your review) becauſe there is uſed more than ordinary care in the tranſlation of it. Mr. *Crook* is ready to begin the printing of the book of Cold, and doubts not to finiſh it within the time deſired, if he may be preſently and uninterruptedly furniſhed with copy. Mr. *Whitaker* telling me, he ſhould go to *Oxford* this week, and promiſing, that he would call upon me before his going,

I have

I have kept the weather-glaſs papers by me, to ſend them by him; which it will be neceſſary to return with ſpeed, to expedite the impreſſion the ſooner. Dr. *Merret* is willing to have his experiments of that ſubject annexed: he deſireth only, that if there ſhould be occaſion to name him, he may have his true name given him, which is not *Charles* (as the book of Colours hath it) but *Chriſtopher*; which, I ſuppoſe, will eaſily be granted him. You will pleaſe, Sir, to conſider, where it will be fitteſt to place them. The undertaker of the impreſſion will certainly obey you in the number of copies; but he is ſomewhat troubled, that he had not the additions, he looked for, for the reprinting of the *Scept. Chemiſt.*

I DID very lately receive the following lines about the Turkiſh bible: "As for the tran-"ſlation of the bible, I went" (ſaith my friend at *Amſterdam*) "to monſieur *de Geer* "myſelf, and deſired to know more eſpecially, "if any thing were done in the new teſtament. "He, to ſatisfy me, as much as he could, "carried me into his cloſet, where he ſhewed "me ſome letters of doctor *Warnerus*, even "of this year; but we could not find, that "yet he had done any thing in the new teſta-"ment; and therefore we would wiſh" (ſo he goes on) "that the perſon in *England*, that "hath done already an evangeliſt, and the "acts of the apoſtles, would go on, and make "an end of that moſt laudable work. What "matter" (ſaith he farther) "if we had two "tranſlations, to confront them together? "or, if you in *England* ſhould promote the "new, and we here the old teſtament unto "the Turkiſh people? Sure it is, that the "time is at hand, in which new evangeliſts "will break forth, to ſay unto *Sion*, thy "God reigneth." So far he.

Two days ſince, I received alſo an anſwer from Mr. *Hevelius*, to the packet I ſent him from the Society (wherein was contained the diploma of his election amongſt the reſt.) The anſwer is full of gratitude to his electors, and runs over with expreſſions of reſpect of their merit and deſign. The incloſed for Dr. *Wallis* came in company with that, which was addreſſed to me, which I could neither ſpare itſelf, nor make a copy of, for the preſent, to give you a full view of its contents. Yet I cannot but extract two or three particulars, which are indeed the chief things, mentioned by him, except his civilities to the Society. 1. *Nihil potius ducam* (ſaith he) *quàm ut quantocyus meas circa fixarum loca obſervationes deproperem; dummodò prius Cometographici noſtri labores penitus ad umbilicum fuerant perducti; id quod proximâ æſtate fieri poſſe ſpero.* 2. *Ad congreſſum ſolis & mercurii omni diligentiâ quocunque loco attendendum eſſe omnino judico; quantum in me erit, ſi Deus vitam ſereniratemque cæli concedat, omnem operam meam ea in obſervatione polliceor, tum quicquid ex ipſo cælo depromere licebit, lubens vobis communicabo.* 3. *Eclipſin ſolarem hujus anni de* 28. *Jan. ſt. nov.* (this is that eclipſe, which Dr. *Pell* ſent word of to the ſociety, that *Eichſtadius* himſelf, and almoſt all calendographers, had ſkipped over) *etiamſi, quantum ſciam, vix quiſquam in ephemeridibus vel calendariis mentionem ejus fecerit; tamen cùm mihi jam antea conſtaret, certò fore futuram, omni diligentiâ ad eam attendi, cæloque ſereno eam quoque obſervavi; de quo mihi valde gratulor; cùm pauci admodum illam deprehenderint. Num pariter à vobis in Anglia conſpecta & debitè annotata fuerit, ſcire geſtio. Sol cùm oriretur hîc Gedani, horâ ſcil.* 7. 50'. *fere, jam conſpicuâ parte obſcuratus erat: horâ* 7. 53'. *jam ad* $2\frac{3}{4}$ *dig. defecerat. Quæ obſcuratio magis magiſque poſtmodum increvit ad hor.* 8. 22'. *uſque ubi maximæ obſcuratio* $4\frac{1}{4}$ *dig. extitit. Deinde rurſus ſenſim lumen ſuum recuperavit. Phaſes ejuſdem eclipſeos* 22. *obſervavi ad ultimum uſque digitum hor. ſc.* 9æ. 15'. *Ab hoc tempore nubes intervenerunt, ut nihil prorſus amplius de ipſo fine animadverterimus.*

THIS I entreat you, Sir, be pleaſed to communicate, with my humble ſervice, to Dr. *Wallis*. I name not Dr. *Wren*, becauſe he was preſent, when the letter itſelf was read to the Society. I ſhall be very glad (and ſo will our vertuoſi) to receive from Dr. *Wallis* what philoſophical particulars may be contained in *Hevelius*'s letter to him. It may be, I ſhall by my next have leiſure to ſend to you both the obſervations of this Dantiſcan aſtronomer concerning two late moon-eclipſes, one of A. 1663. Aug. 18, the other, of A. 1664. Aug. 6. which latter was little obſerved of here, by reaſon of the cloudy weather.

YESTERDAY we had at our meeting the company of a Pariſian academiſt, recommended to Sir *R. Moray* and me. I have known him to frequent the meetings of monſieur *de Montmor*: his name is monſieur *Bley*, no unlearned, though here unknown, man. He was much pleaſed with our experimental method (though we had not any conſiderable experiments then ready) and with our ſedate and friendly way of conference, as alſo with the gravity and majeſtickneſs of our order. We had no other experiments, but that of breaking the ſteel cylinder with *P. Rupert*'s powder, and the deſcent of leaden, wooden, and wax balls in water. In the mean time, we ſupplied what was wanting here, by the reading of *Hevelius*'s letter, and ſome reflections thereon; as alſo with letting him ſee our contrivances for fetching up water from the bottom of the ſea, and the ſounding balls without a line; both which he was hugely taken with; as alſo with the ſtories of compreſſing a hollow leaden veſſel, by the preſſure of the ſea in the bay of *Biſcay*, and the æolipile by the ambient air, after the included air had been extremely rarified. I dare ſay, he will extoll our inſtitution and proceedings to the ſky, whereſoever he comes; though I muſt needs ſay, we grow more remiſs and careleſs, than I am willing to expatiate upon. Yet this I muſt ſay to a perſon, that I am ſure hath a concern for our proſperity, that nothing is done with the king for us; that our meetings are very thin; and that our committees fall to the ground, becauſe it is not poſſible to bring people together; though I ſolicit, to the making my ſelf troubleſom to others, not to ſay much

of the trouble, which I create to myſelf good ſtore.

BUT *manum de tabula*, after I ſhall have ſaid two or three words of ſtate news. The war like to go on; the king of *France* not like to intereſt himſelf much in it, but deſirous to let us engage together, as far and as deep as we pleaſe. The Turks ſeem to have recruited their courage. The French Eaſt-Indian company carried on with reſolution. The king intendeth to go to *Hampton-court* on Tueſday next; and then prince *Rupert* to embark. And here I leave news to haſten to aſſure you, that I am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London, Sept. 29, 1664.

SIR,

I HOPE you received your manuſcript of weatherglaſſes by Mr. *Hartlib*, and that they will be returned with all poſſible ſpeed. The ſociety took your ſuggeſtions of ſeveral experiments very kindly, and laid their commands upon me, to thank you for them. They were all looked upon as conſiderable, though the magnetical ones were judged not practicable at *Paul*'s, by reaſon of the abundance of iron, almoſt every where found in that place. That with a glaſs ball hermetrically ſealed in weighing of bodies on the top of the ſteeple and below, was preſently order given for, as a very proper one to diſcover, whether the difference of the weight of bodies above and below proceeds from the different degrees of the thickneſs of the air; which by this means will be done to a notable diſparity.

WE ſpent a great part of our yeſterday's meeting in proſecuting of the experiments of the deſcent of bodies in water. We had ready a body of wood almoſt cubical, another of the ſame matter double conical, one end tapering 3 inches; the other, 2; another cone, tapering 2 inches, with a flat baſis; another cone, tapering 1 inch; and then, a pyramid of 1 inch, and another of 2 inches, all theſe 3 with flat baſes's: laſtly, a cylinder and a globe: all of the ſame wood, and of the ſame weight, with an appendant leaden weight of 2 ounces. The firſt came to the bottom, in a ſquare veſſel filled with water, of about 8 foot high, in $12''\frac{1}{2}$; the ſecond, tapering 3 inches downwards, in $9''\frac{1}{2}$, and with the 2 inches downwards, in the ſame time, as to ſenſe; the third, in $7'''\frac{3}{4}$ circiter; the fourth, in $11''\frac{1}{2}$; the fifth, in 10"; the ſixth, in 8"; the ſeventh, in 12", and a little better; the laſt, which was the globe, in $9''\frac{1}{4}$, circiter. Theſe experiments will be repeated and carried on, the next meeting. The reſt of our time was ſpent partly in reading Dr. *Wallis*'s letter, in commending his care of digeſting *Horrox*'s papers, and in ordering him thanks; whereof the incloſed ſpeaketh more particularly; partly in taking notice of ſome experiments and obſervations, lately made abroad, and written to me, concerning refractions and the belts of Jupiter.

CONCERNING refractions, the Pariſian letler ſaith, *qu'elles ſuivent les raiſons des ſinus, & que celle de l'eſprit de vin eſt plus grande que celle qui ſe fait dans l'eau.* The latter part hereof our company underſtood not.

AS to the obſervations of Jupiter's belts, another letter from *Paris* to me mentions, that there having been a challenge for the excellency of optick glaſſes betwixt *Euſtachio* and *Campani*, thoſe of the latter were found better, than thoſe of the former; and that the firſt of July N. S. 1664, there were diſcovered in *Rome*, four belts in Jupiter, more obſcure, and two in the ſame, more clear, than the reſt of his diſcus. So that inſtead of two or three, we have now ſix belts in Jupiter. I am alſo deſired by that virtuoſo, who imparted me theſe things, to enquire here, how our obſervers ſaw Jupiter that day (vid. July 1, N. S.) and how they ſaw the ſatellites on the 25th of this month, N. S. But I can meet with none, that can ſatisfy this query.

CASATI, having been written unto by one of my Pariſian correſpondents, about the odd phænomenon of the liquor of biſmutum ſealed up hermetically, anſwers thus in his own language:

Quanto à quella eſperienza, di cui parlo nel libro, Terra machinis mota, *pag.* 143. *io ſteſſo non l'ho praticata, ſe bene per la forma del dialogo s'introduce Guldino, che ne parla, come ſe egli ſteſſo l'haveſſe fatta. Ella fu fatta da un tal giovane Boemo (il cui nome non mi recordo, ma ha ſcritto un libro di fontane & ſpiritali, ſtampato in Ferrara, come mi pare) il quale, con il ſignior don Innocenzo Conti ſtava generale delli armi in Ferrara, & puoi in Roma: detto ſignior al ſuo ritorno mi moſtrà, & in quel libro ancho ſta notata, la ſudetta eſperienza: ſe però ſe leggera bene cio chi io dico, ſi trovara, che quel liquore non creſce & cala ſecundo i periodi de fluſſi & rifluſſi marini, ma creſce né plenilunii & cala ne novilunii; & di quà ſi vede, come la luna può caggionare tali incrementi & decrementi; & ſi come gli caggiona in queſto liquore né plenilunii & novilunii, coſi ponno trovarſi nel mare altri corpi, che al ſalire della luna ſi gonfino, & al deſcendere ſi ſgonfino, & nulla più ho io preteſo di dire in tal luogo.*

Che coſa poi ſia il Biſmuto; cio è, una ſpecie di piombo cinerie, cio, mi recordo aver letto in G. Agricola, & nel muſæo metallico dell' Aldrovandi; ma io qui non havendo tali libri, non poſſo darne maggior notitia circa i luoghi della minera. Quanto poi al modo di eſtrahere quel liquore, non ſaprei più chiaramente dirlo di quello, che in poche parole ho detto nel libro.

THIS account maketh us not wiſer, than we were before; but as good as I had it, I would not omit to ſend it, remembring your concern in having it enquired after.

I HAD lately a letter out of *New England*, from Mr. *Winthorp*, but almoſt eleven months old, which I much wondered at. It refers to another

another letter, which I never received, and mentions only two or three not very conſiderable particulars; whereof one is about a mineral, that an Indian brought him, which is a kind of marcaſite, but differing from the ordinary ſort, being whiter and clearer; but Mr. *Winthorp* deferred trial, till he might have more, there being then brought to him but very little of it. He is alſo enquiring after another place, which, by the Indian's relation, gives ſigns of copper; of which he promiſeth to give me further notice of hereafter. He concludes, that he is neceſſitated to be up in the country far from the ſea, and fears, he ſhall not have opportunity, in that reſpect, to make trial about the ſalt-work ſo ſoon, as he intended; though he ſaith, he hath had men at work about it, ſince he arrived there. He preſents his humble ſervice to the whole Society, and particularly to the lord *Brounker*, Mr. *Boyle*, Sir *R. Moray*.

WE have received very conſiderable news from *Guinea*, by a ſmall frigat, that came yeſterday into the river from thence: it is, that major *Homes*, and ſome other ſhips, ſent thither to reinforce him, have not only taken four well laden Dutch ſhips, in thoſe parts, but alſo *Cape-Corſa*, and are now preparing to make an attempt upon the only remaining conſiderable place of the Dutch there, which is the *Caſtel della Mina*; unto which enterpriſe they are ſaid to have the readineſs of the aſſiſtance of 30000 natives, who are affirmed to hate the griping genius and ſevere government of the *Dutch*.

THIS I look upon as the foundation of an implacable war: and what can be the next, but that the *Dutch* will make it their whole buſineſs in the *Eaſt-Indies*, to expel the Engliſh thence? for which purpoſe, it is ſtrongly ſurmiſed, that they have already diſpatched orders over land thither, to put ſuch a work in execution, ſeeing they find *England* diſpoſed (ſo they ſay) to ruin them every where.

THE plague is now decreaſing, God be bleſſed, at *Amſterdam*, and the number of the dead is diminiſhed from 1050, to 800 a week; and amongſt theſe are ſeveral hundreds, that die of other maladies; it being obſerved, as I am informed, by the phyſicians of the United Provinces, that, whereas in the former plague, that reigned amongſt them, all diſeaſes turned to the plague (which they aſcribe to an univerſal putrifaction of the air) at this time it is otherwiſe, there being ſtill many other diſeaſes on foot, whence they conclude it to be no ſuch corruption of the air, but an infection brought thither from *Algier*, eaſy to be traced, ſtep by ſtep. I am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

SIR, *London*, Oct. 6, 1664.

WHEN I came home yeſternight from *Greſham*, I found your preliminary papers, which I was very glad of, and doubt not, but that according to the tenor of your laſt letter, the whole will be diſpatched with ſo much ſpeed, that the preſs ſhall not ſtay for it. I intend, God willing, to morrow to deliver to Mr. *Crook* what I have received, and to offer, by the way, what you propoſe to Dr. *Merret* concerning his appendix. It may be, he may think *Chriſtophorus* to be a better name than *Carolus*: however, I ſhall laugh with him, when I read to him your lines about it. I humbly thank you, Sir, for the note you were pleaſed to impart to me concerning the ſenſitive plant; and I ſhall double my acknowledgments, when you ſhall do me the favour of communicating the other way of propagating it. I was lately at young Mr. *Walker*'s, who carried me into his Virginian garden, and there ſhewed me a good number of the plants of that country, and, among them, the true ſnake-weed (as he aſſured it to me) thriving well. Being ſome weeks ſince put, by our committee of correſpondence, meeting at Mr. *Povey*'s, upon the peruſing the hiſtory of the articles, to draw up enquiries out of it, I met there with a whole wood, ſaid to be in the paſſage of the Iſthmus from *Nombre de Dios* to *Panama*, full of ſuch ſenſitive trees, which, as ſoon as they are touched, move all over, and make with their branches and leaves a rattling noiſe, winding themſelves alſo together into the figure of a globe. But, why do I take up your time in relating things, which you cannot but have taken notice of already, being ſo well acquainted with that author? I ſhould rather have told you, what was our buſineſs yeſterday at *Greſham*, where we examined, whether the experiment lately made at *Paris*, and communicated to me, concerning the exceſs of the refraction of ſpirit of wine above that of common water, did hold with us alſo, and found it did; that of water, when the angle of inclination was 30°. having an angle of refraction of 41°. 35′. whereas that of well rectified ſpirit of wine, at the ſame angle of inclination, had 42°. 45′. for its angle of refraction. Some body of the company, that hath too ſlender thoughts of all what comes from abroad of a philoſophical nature, or is done by ſtrangers, offered, before the experiment was made, to lay ten to one, that it would not be found ſo.

THE experiments of deſcending bodies in water ſucceeded not, becauſe of the leaking of the long ſquare veſſel with windows, in which they were to be made. Dr. *Charleton*, upon occaſion, mentioned to the company, that having killed a buzzard, and opened him, had found three ſtones in him, lying in a triangular way, but one of them being leſs than the other two. He was deſired to ſhoot another, and to make the diſſection thereof before the company. The phyſicians of the Society are to meet on Monday next at Dr. *Ent*'s, to conſider of what is to be particularly enquired after in the anatomical adminiſtrations this winter. Sir, you being of that committee, they will think themſelves not a little obliged to you, if you would pleaſe to

ſuggeſt ſome things, that may be worthy of further inveſtigation. If I had not been afraid of *Hudibras*, I had ſeconded Dr. *Charleton* with the relation of a certain apothecary in *Ireland*, who, as I was aſſured by a phyſician, that employed him there, has alſo three teſticles, being exceſſively given to venery. There is certainly ſomething as well in the conformation of the parts, as in the temper of animals, that neceſſitateth them (if I may ſay ſo) to ſuch and ſuch operations.

BEING yeſterday, before our philoſophical meeting, at a coffee-club, we had not only ſtate news, as that of prince *Rupert*'s being gone down to the *Hope*, to embark preſently in a fleet of eighteen men of war, and of the reſolution of the Dutch to paſs thorough the Channel with eighty ſail (whereof twenty are deſigned for *Guinea*, ten for the *Eaſt Indies*, and the reſt to convoy thoſe two parties a good way) but alſo of philoſophy, whereof I muſt ſend you one or two particulars, which were new to me, and, it may be, will not be unwelcome to you, eſpecially at this time, when you are reviewing your experimental hiſtory of Cold, if you have not met with ſuch relations already. One was, that in the northern countries, they have their French wines (for of theſe the relator ſpake only) frozen in the caſk, by putting them into water, whereby being thawed, the water encompaſſing the caſk with wine, freezeth all about it. The other was, that their fiſh being heaped up together in baſkets, and frozen, and covered over with ice and ſnow, inſomuch that you may ſnap them in pieces; yet when they come to be thawed thoroughly, they are often found alive. This latter ſtory agreeth with the Dantiſcan, of ſwallows frozen up, and reviving when thawed: *fides ſit penes authorem*, yet theſe relations deſerve farther enquiries.

To morrow, God permitting, I ſhall obey your commands in writing to *Amſterdam* for ſending you over a printed ſheet of *Warnerus*'s edition of the Turkiſh Bible. I rejoice hugely, that you have reſolved to carry on the tranſlation of the New Teſtament; and I hope, the tranſlator will publiſh with it his Turkiſh Dictionary, as it is much deſired by Dr. *Caſtel* and many others, although ſomething hath been already done of that kind in *Rome*; but that intelligent men think it not at all equal to what Mr. *Seaman* is able to perform therein. Sir, your intereſt in him may eaſily prevail with him to ſatisfy the learned and pious in this particular alſo. I confeſs, it will be troubleſom and dangerous to ſpread ſuch a book as the bible in *Turkey*; but yet it ought to be attempted, and much may be done in times of war with that nation, to inſinuate it to Turkiſh priſoners, and by their means to leaven the lump; and having done what is in our power, commit the ſucceſs to the wiſe and almighty author thereof, unto whoſe protection I commend you heartily, being,

Sir, your faithful humble ſervant,

H. O.

MR. *Southwell* is choſen clerk of his majeſty's council, in the place of Sir *George Lane*, who reſigned it, as I hear.

London, Oct. 13, 1664.

SIR,

THE reſt of your thermometrical diſcourſe is ſafely come to my hands; only I muſt give you a little advertiſement concerning the carrier, from whom, when it was ſent to my houſe, there was not only demanded by the porter his due for the pains of bringing it (which was ſatisfied by me, as formerly) but alſo for the carriage from *Oxford* to *London*: but when I looked upon the roll, I found a piece of the cover torn out, juſt where the words, *carrier paid*, are wont to be written: which making me ſuſpect a cheat, I refuſed to pay that part of the demand, ſhewing the ground of my ſuſpicion to the ſhe porter, that brought it me, who would put it upon the being rubbed off in the ſack among other things. But it was too artificially done, to be laid upon ſuch an accident; which made me perſiſt in my denial, and add, that I did intend by poſt to acquaint my correſpondent at *Oxford* with it; and in caſe it had not been paid there, I ſhould be ſo juſt as to pay it here.

THE firſt ſheet of this diſcourſe is printed, and I ſee Mr. *Crook* will make quick diſpatch, if there want not copy. Mr. *Merret* returns his humble ſervice to you, and ſaith, that the place for an appendix is ſoon found. Only, I pray, Sir, be pleaſed to intimate unto me, whether you would have it joined by any tranſition, and, if ſo, in what manner, or by none at all.

PART of our yeſterday's entertainment at *Greſham* was the hearing of ſome conſorts upon a revived muſical inſtrument, called Archiviole, invented by a Frenchman, twenty one years ago, and then notified here to Mr. *Haak*. There was about that time made one of them, to be preſented to the late king; the troubles intervening diverted the muſick, and left the inſtrument imperfect; which now is brought again to light, and by my lord *Brereton*'s care and expences made perfect, comprehending both an organ and a concert of five or ſix viols in one, giving an excellent harmony, very ſolemn and moſt fit for religious muſick; but only that the multitude of ſtrings maketh it ſomewhat longſom and tedious to tune, the alteration of the air putting them out of tune in a little time. *Merſennus* gave firſt notice of it hither, ſaying in a letter of his, which I have ſeen, *qu'un Ange, à ce qu'il luy ſembloit, ne pouvoit proceder plus ſimplement et gentiment*. I muſt confeſs, it tranſports me, and cannot but exceedingly pleaſe him, who plays upon it, hearing himſelf alone perform a whole concert of viols. The reſt of the time we ſpent in proſecuting the experiment of the velocity of bodies deſcending in water, where nothing occurred very

conſi-

conſiderable; 2. in appointing certain experiments to be made in the next anatomical adminiſtration; and 3. in giving order for ſeveral liquors, as wines, oils, lixiviums, ſea-water, to try their refractions. Since my laſt, I met with the perſon, that yearly goes to *Greenland* to the whale-fiſhing, who though he told me but ſad news of this ſummer voyage of theirs, as being rather a loſs than gain to them, yet he refreſhed me again, by telling me, that the ſhip, ſome ſeven or eight months ſince gone to the *Bermudas*, to fiſh whales there, hath had better luck, by killing ſeveral whales of a peculiar kind, that have no fins, but great teeth, and (which ſeems incredible) yielding an oil, which, though boiling, yet ſcaldeth not the hand, but feels only blood-warm: at which when I ſmiled as a fable, he would aſſure the truth thereof with all earneſtneſs, that can be deſired, proteſting to me, that two of the engagers had written it hither, and that he had read it in both the letters.

FROM *Paris* my friend ſaith, that he hath a relation for me at *Rome* of a woman, that hath been with child for an extraordinary length of time, without being delivered: and that he will ſend me ſome obſervations of one *Caſſini*, an aſtronomer, upon Saturn, made with the new glaſſes of *Campani*.

A TRUCE is certainly concluded betwixt the Emperor and the Turks; the ſuddenneſs whereof amazeth moſt people. The Emperor hath been very politick in this matter, making preſent uſe of the late advantage over the enemy, and offering to the grand viſier ſuch terms, as was wiſdom for him to accept, and not diſhonourable for the Emperor to grant; eſpecially conſidering the neceſſity he now lieth under, of conſummating his marriage, of providing for the defence of *Flanders*, and of maintaining the intereſt of the houſe of *Spain*, which in all probability would be ruined, if this peace were not made, the king of *Spain* being generally thought dead, though it be not owned by that nation, nor will be, till they have put things into ſome poſture of ſafety.

SIR *John Lawſon* is come home, but brings news, that beget a ſtrong ſuſpicion in us, that *de Ruyter*, having now victualled his Mediterranean fleet, and ſheathed it, is gone to relieve and fortify his countrymen in *Guinea*; which, if it prove true, will anger us very much, and put things to extremity.

THE Pariſian letter to me hath this note: *Le pape nous refuſe tout à Rome. On craint icy, qu'il ne ſe forme une ligue contre la France, dont la puiſſance donne de la jalouſie: quelques uns veulent, que voſtre roy y doive entrer, à quoy je voy peu de vrayſemblance, la bonne intelligence, qu'il y à entre les deux couronnes, ne faiſant croire le contraire. Le card. de Retz pourra bien aller à Rome, ou nous avons beſoin d'un homme, qui ait autant de lumieres, que luy, et autant de vigueur pour ſouſenir les intereſts de la France, et pour rompre les deſſeins, qu'on pourroit former contre elle.* But I am called away, and can ſay no more at preſent, than that I am,

SIR,

your very humble,

and faithful ſervant,

H. O.

IF Dr. *Wallis* intends to write to Mr. *Hevelius*, and pleaſe to entruſt me with it, I ſhall ſend it with mine, which I am to diſpatch away ſhortly.

London, Oct. 20, 1664.

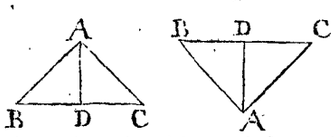
SIR,

YOU will hardly diſpatch faſter for the preſs, than the preſs, by what I ſee, will perform. Three ſheets are already printed off, and I look for the fourth this day; Mr. *Crook* being reſolved not to be behindhand, to whom alſo are already delivered Dr. *Merret*'s experiments, to be forthwith printed in an alphabet apart. I ſend you here encloſed, thoſe enquiries and anſwers concerning *Greenland*, which were formerly preſented to the Society; and they being a part of their ſupellex, I entreat your care for their ſafety. The account given therein, is ſo plain and downright, that it needs poliſhing very much; but as to the matter of fact, I hope it ſuffers nothing by the plainneſs of the deliverer. I owe you many thanks for the medicine againſt violent fluxes; but give me leave to aſk, whether the hot cinnamon and nutmeg may not claim as great a ſhare in the effect, as the cold dead man's *ſkull*? The obſervations recommended by you to the virtuoſi, and read to them at our meeting yeſterday, were very acceptable; and my lord *Brounker* intimated, to have found (and that, as he thought, on the ſame day you did) the mercury in the baroſcope, beneath 29 inches too. I ſuppoſe, Mr. *Hook* will himſelf anſwer your quere, which I acquainted him with, concerning the ſame; as alſo give you notice of the purſued experiments concerning the acceleration of the deſcent of bodies in water. I muſt proceed to let you know the main contents of a letter of Mr. *Zulichem* to Sir *R. Moray*, which was not a little applauded in our aſſembly yeſterday. Theſe are his own words: *Depuis peu l'on m'a envoyé une figure imprimée, qui repreſente une fort belle obſervation de Jupiter, dans le diſque du quel ils ont vû paſſer les ombres de deux de ſes ſatellites, qui paſſoient entre luy & nos yeux, & peu apres ſe deſgagerent du dit diſque. Je n'avois jamais penſé, que cette obſervation ſe pût faire, vû la petiteſſe de ces compagnons, & il faut aſſurement, que leur verres ſoient d'une perfection extraordinaire. Si celui de Reeves de 60 pieds eſt aucunement bon, il ne ſcauroit manquer de deſcouvrir les dites ombres, lorſque ces eclipſes arrivent. J'attends encore le diametre de ce verre, et celuy de ſon ouverture.*

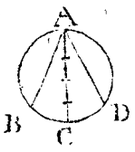
AGAIN:

AGAIN, *Je ne ſcay, ſi* my lord *Brounker aura depuis ſongé à la determination des vibrations de la chorde, eſgales à celles du pendule, que ſcavez; mais je trouvay ſa promeſſe bien hardiè. Cés jours paſſez jè ſuis tombè dans une ſpeculation pas fort ſloignée de celle là. J'ay cerché des pendules ſimples iſochrones à des triangles & autres figures & corps diverſement ſuſpendus; où j'ay rencontrê des propoſitions aſſez plaiſantes, & qui peuvent meſme ſervir à eſtablir commodement la meſure univerſelle, à quoy le dit* my lord *s'eſt eſtudié.*

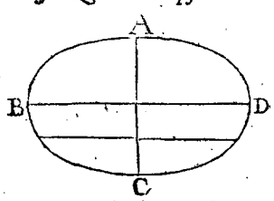
Par exemple, 1. *Je trouve, qu'un triangle rectangle & iſoſcele, come B A C, eſtant ſuſpendu par le ſommet A, ou par le milieu de ſa baſe D, & agité de coſté, eſt iſochrone au pendule ſimple de ſa hauteur A D.*



2. *Qu'un cercle ſuſpendu par un point dans ſa circonference comme A, & agité de coſté, eſt iſochrone au pendule de ¾ de ſon diametre, & de meſme toute portion, comme A B C D, ayant les coſtez A B, A D, eſgaux.*



3. *Qu'une ellipſe A B C D, dont le grand axe a ſon quarré triple de celuy du petit, ſuſpendu par l'extremité du petit axe A, & agité du coſté, eſt iſochrone au pendule A C, & de meſme toute portion coupée par une ou deux paralleles à l'axe B D.*



Si my lord *Brounker goute ces ſpeculations, je vous en envoyeray d'avantage, car j'ay la determination generale pour tous triangles & rectangles, ſuſpendus par un des angles, ou par le milieu des coſtez. Item des cercles ſuſpendus par des filets, comme eſt le cercle B en A: & ce qui a eſté le plus difficile à trouver, la longueur des pendules iſochrones à une ſphere ſuſpendue de meſme par un filet, ce qui ſert principalement à la meſure univerſelle. Car notez, qu'une ſphere grande n'eſt pas iſochrone à une petite, qui auroit le centre egalement diſtant du point de ſuſpenſion. Les mathematiciens en France ont autrefois cherché ces choſes ſans en pouvoir venir à bout, à ce que je voy par des lettres, que j'ay du P. Merſenne, &c.*

THESE particulars I muſt entreat you to communicate to Dr. *Wallis* & Dr. *Wren*, with my hearty ſervice; to the former of which two virtuoſi I am to recommend, from the Society, ſome more papers of Mr. *Horrox*'s, by the carrier to morrow, God willing.

OUR motto being *Nullius in verba*, we intend to examine theſe propoſitions, by making trials ourſelves of the matters aſſerted therein: and the author of them is to be urged to explicate, how he infers his univerſal meaſure from what he affirms here.

SIR, to divert you and myſelf a little, *poſt muſas has ſeveriores*, I ſhall draw to an end, with annexing ſome lines out of the penitential letter of monſieur *Sorbiere*, written to the biſhop of *Laon*, to make him employ my lord *Aubigny* for prevailing with our king, to interpoſe by the king of *France*, that *Sorbiere* may be reſtored from his baniſhment. As much as he depreſſed the chancellor in his printed pamphlet, ſo much does he now extol him in this unprinted letter. For he ſaith—*Facilè alias ſubjungerem litteras, ſi opus eſſet expugnandæ ſummi viri* (meaning the chancellor) *indignationi teli & machinis pluribus, quod de inſigni ipſius clementia ſperare non auſim. Audit enim in patria ſua hominum mitiſſimus; & ſanè unus ille homo Anglis cunctando & parcendo reſtituit rem. Quam laudem minimè conſecutus eſſet, niſi à ſapientiſſimo rege primarium regni munus difficillimis temporibus, exul, cùm de ſalute unuſquiſque deſperaret, nec ambiens, obtinuiſſet. Nimirum ad id operis aptiſſimum oſtendebunt ſuaviſſimi mores, ingenium perſpicax, inſignis facundia, eruditio multiplex, & civilis præſertim doctrinæ uſus & contemplatio. Ad quæ potiſſimum in illo ſpectanda ne ſatis attenderem, leviorum ſtudiorum pulvis, & ſortis meæ tenuitas veluti nubem oculis noſtris objecere. Eram enim, ut verum fatear, totus in admirationem regiæ phyſicorum Londinenſium academiæ defixus; ſcilicet, quod medicorum erat tractabam medicus, & fabrilia faber, in interiora & ſocietatis ſagaciſſimæ arcana nuper admiſſus. Ad alia autem planè cæcutiebam, & ſi quid in diario, quod majoris eſſet ponderis, forte fortuna irrepſit, ab inquinatis fontibus, procul dubio, nec ſatis advertens, hauriebam. Condonabit itaque vir in illo honorum faſtigio poſitus, & cujus fama totum orbem terrarum pervolitat, homini in litterulas ſuas bene affecto, ad phyſicas tantùm auſcultatiores idoneo, ſed* Ἀνθρωπομετρίας, *& ſublimiorum ſcientiarum, ac politices imprimis rudi & ignaro, &c.*

SIR, I want an amanuenſis exceedingly: elſe you ſhould have received the whole letter; which argues as much an abject ſpirit, as can well be, and whereby the writer hath now made himſelf hateful by all perſons of honour; whereas, by his printed book, he appeared only guilty of imprudence and partiality.

IF I could have got any more leiſure, I would have added ſome ſtate news, about our taking of the *Monados*, as is affirmed upon the *Exchange*; but of the danger we are in of loſing *Guinea* by *Du Ruyter*'s fleet, which Sir *J. Lawſon* ſuppoſeth to be gone thither, though many will lay wagers to the contrary; and ſome of thoſe, that grant their being gone thither, are perſuaded, that our people there, by the aſſiſtance and kindneſs of the Blacks, will be able enough to maintain their acqueſt. In the mean time, the Dutch will not now make any haſte to come abroad, but have wit enough to let our victuals and money be conſumed, without action; knowing we come ſhort both of their frugality, and ſupplies of money.

I HAD almoſt forgot to intimate to you, that, meeting yeſterday Mr. *Worſley* upon the *Exchange*, I was deſired by him, to let you know, upon occaſion, that ſome three or four weeks he ſent you a letter of buſineſs, but knows not whether it came to your hands; which puts him, to uſe his own word, to

ſome diſconſolation. But I muſt run away to the agriculture committee, being,

Sir,

your very humble,

faithful ſervant,

H. O.

I CANNOT poſſibly review.

London, Octob. 22, 1664.

SIR,

THE printer calling with inſtances upon me for more copy, maketh me importune you with theſe lines ſo ſoon after my laſt, eſpecially ſince I promiſed him, that he ſhould not ſtay for ſupply. I have this day corrected *G*, and muſt hear, that this ſheet being printed off, they muſt reſt, if no more copy be ſent in the interim.

WE have had an anatome at *Greſham* this day, but my occaſions, that were urgent, pulled me away from the aſſiduity, I intended. In the mean time, I received from Mr. *Beale* an anatomical relation about the manner of cutting the bladder out of the heads of cattle; which, if it be ſo new to you, as it is to me, will perhaps ſurpriſe you. It ſeems, cattle are ſometimes afflicted with a bladder in the brains, cauſing a vertigo in them; and in the taking it out my author ſaith, that the artiſt firſt opens the ſkull in that ſide of the forehead, in which, by a peculiar ſoftneſs, he perceives the bladder to lye, about four fingers breadth, and with a penknife, after he hath cut open the films, which incloſe the brain, ſcrapes off the brain, until the bladder appear; then plucks forth the bladder, with a ſtring, which feeds it, and with an inſtrument for that purpoſe divides the brain at that place, where nature hath made a partition, that is, where the ſpinalis medulla ſhuts to it, and then taketh forth all that half of the brain, in which the bladder grew, leaving the other half as much uncovered and unviolate as poſſibly he can. Which done, he turns the bullock's head ſo upon the horns, that all the water and blood, that was gathered together in the brain-pan, may run forth, and then, with a fine handkerchief on the top of an inſtrument, wipes the brain-pan as clean and dry as he can, and ſo cloſes up the ſkull again. The beaſts uſually (he adds) in a few hours fall to their meat, and recover perfectly.

MR. *Beale* ſaith, that the perſon, from whom he had this account, is an anatomiſt, and in particular perfectly read in Dr. *Willis*'s *Anatome Cerebri*, and that he hath promiſed him more exactneſs and fulneſs of the operation, which he relateth to be by divers diverſely performed, but moſt ſucceſsfully by thoſe, who, in taking away the bladder, do carefully alſo take away the whole lobus, or part of the brain, wherein the bladder lyeth. He obſerveth withal, that the part of the brain taken out hath been, upon ſearch, when the beaſt was ſlaughtered, found regenerate, only of ſomewhat a ſofter and looſer conſiſtence, than the reſt. This, if you pleaſe, with my humble ſervice to Dr. *Willis*. Yeſterday I ſent to Dr. *Wallis*, by the coach, that packet of *Horox*'s, which I threatned him with in my laſt Thurſday's letter. I am called to ſupper, which obligeth me to conclude abruptly,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

THE agriculture committee hath added, upon Dr. *Merret*'s ſuggeſtion, one enquiry more, *viz.* What plants ſeveral grounds produce naturally?

London, Oct. 27, 1664.

SIR,

I FEAR very much, that you, as well as we, have taken pains in vain about the Mercurial conjunction. Our virtuoſi did obſerve, both at *Greſham* and Mr. *Reeves*'s, but found nothing of what they looked for. I hope ſome of our ingenious friends in the American plantations, to whom I ſent notice of it above ſix months ago, have made good obſervations, the conjunction falling out there, about two or three o'clock in the afternoon, if authors have calculated aright.

MORE copy will be extremely welcome to the printer, who will quickly diſpatch Dr. *Merret*'s appendix, which is not above two ſheets. What you mention about the title-page, ought to be ſo; and what you require concerning the conveyance of the ſheets to you, as ſoon as they are printed, you will be readily obeyed in; and I ſhall, God willing, take care of diſtinguiſhing each title into paragraphs, *&c.* And I do not only review the corrected proofs, before they are printed off, but look alſo over the printed copy itſelf, to collect the errata, as the preſs goes on with the book. I did enquire at *Greſham* about the ſtation of the barometer, and was informed, that on Monday laſt it was lower, than the operator had ever ſeen it, the weather of that day being here lowring and in part rainy. The ſaid operator of the Society, by their command, doth keep a diary of the ſtations of that mercury, together with the ſtate of the winds and weather, and hath done ſo ever ſince the beginning of this year, whereof he will be called to an account at the end of it.

THE yeſterday's ſpectacle at *Woolwich* keeping me from attending the Society's meeting, will keep you alſo for once from hearing of their experiments and debates. The chief of the court, and ſome of our chiefs, went to ſee the St. Catharine (ſo they have named the new frigat) launched, and I had curioſity enough to be among the ſpectators, and in the veſſel itſelf, going out of the dock. It is a very gal-

gallant ſhip, of about eighty guns, marked for nineteen foot draught of water, when ſhe hath her full load; of about forty foot over, and an hundred and twenty foot long; ſtanding the king in ſome nine thouſand pounds, as ſhe is now, and being like to coſt him eleven or twelve thouſand pounds more, to rigg her out completely with cables, ſails, anchors, and guns. Sir *John Lawſon* is ſaid to be appointed her commander; the king, queen, duke, and all the great ones, were there, and innumerable people; and the ſubject deſerved ſuch ſpectators. In going down, our company went aſhore by the way, to ſee Sir *William Petty*'s ſhip, which advanceth very well, and will be launched, as they judge, ſix weeks hence.

SIR *R. Moray* and Sir *William* laid a wager about her drawing of water, when ſhe is launched, the latter maintaining, ſhe ſhall not draw above ſix foot eight inches, the other being for more. There is already ſpent upon her an hundred and thirty load of wood, the ſhipwrights making reckoning for twenty more, before ſhe be finiſhed. Her breadth is thirty two foot, whereof fourteen is the ſpace between the two bodies; and her length by the keel is eighty; and the height of the platform from the ſurface of the water is fourteen foot; of which ſhe will draw eleven, when ſhe is fully loaden. I find Sir *William* very chearful, and all his undertakers; and all thoſe, I think, that are well-wiſhers to the improvement of naval architecture, wiſh good ſucceſs to this brave attempt.

OF ſtate news I have little to impart to you this week; yet this I have to ſay, that moſt men think, the war with *Holland* to be unavoidable, and that it will be ſuch an one, as they never yet had. We hear, that the *Dutch* will ſhortly publiſh a manifeſto, to juſtify their proceedings; and we think, we have matter enough, to anſwer them. In the mean time, a Pariſian letter of this week ſaith, *La France n'eſt point ſachée de vous voir animés les une contre les autres, eſperant qu'elle profitera de cette animoſité, & que pendant ce temps là elle eſtablira ſon commerce.* He addeth, *Meſſieurs les Eſtats ne peuvent nullement ſouffrir les actes d'hoſtilité, que Holmes a faits, & qu'il fait tous les jours en Guinee. Et quoy que les vaiſſeaux d'Angleterre ſoyent dans la manche, & que voſtre roy ait dit, que les Hollandois ne pouvoient là paſſer contre ſon gré, ſans choquer les droits de ſa couronne, la flotte Hollandoiſe ne laiſſera pas de tenter le paſſage.*

OF *Germany*, the ſame author ſaith, *La ville d'Erfurt s'eſt rendue à l'electeur de Mayence à compoſition; la lenteur des princes d'Allemagne eſt cauſe de ſa perte. Le parti proteſtant eſt foible, & n'a plus de zele ny de vigueur. La France avec ſon argent & ſes hommes fait trembler tout le monde. Le roy fait faire aſtheur de grandes levees: la conjecture eſt aiſée touchant le deſſein, auquel elles ſont deſtinées.*

BEFORE I conclude, I muſt not omit acquainting you what Dr. *Charlton* affirmed to me of the laſt anatome, that the veins on the right and left ſide of the heart were tranſpoſed; ſo that the vena arterioſa was where the arteria venoſa uſeth to be, and viciſſim; as alſo, that Dr. *Scarborough* had aſſured him, that in the body, diſſected by him at the ſame time, there had been wanting the muſculus pectoralis. He added, that when he and Dr. *Ent* told Dr. *Scarborough* of the ſaid tranſpoſition of the veins, he urged, that the body, already buried, might be unburied again, to give him the ſight of ſo unuſual a ſtructure; which, whether it be done, or not, I cannot yet inform you.

I SHALL endeavour to procure *Peirere's Greenlandia* for you, with all poſſible ſpeed; and I remain,

SIR,

your very humble

and faithful ſervant,

H. OLDENBURG.

THERE was, at our late committee at Mr. *Howard*'s, ſuggeſted by Dr. *Merret* this enquiry more to be added to the reſt: What plants the ſeveral grounds produce naturally? This he thought might not a little conduce to diſcover the nature of the ſoil.

Letters relating to the monſter born at Fiſherton, *referred to in the following Letters of Mr.* Oldenburg.

Sarum, Thurſday Nov. 3, 64.

SIR,

IN my laſt I ſent your honour a brief deſcription of a ſtrange miſhapen birth. I am now enabled to give you a larger account of it, having ſeen it alive, and being preſent and aſſiſtant at its diſſection after death. I have here incloſed ſent your honour the deſcription and delineation of it, and can aſſure you (if I may believe my own eyes) I have written the truth, and ſhall leave it to your honour's judgment, whether you think fit to have it expoſed to the publick view, either in this or any other dreſs. I confeſs the delineation is not ſo accurate, as I could have wiſhed. We are now uſing our endeavours to preſerve the body.

SIR, I am in haſte, and can only at preſent acquaint your honour, that I have received your kind letter, with the box you ſent me, and do at preſent (with the return of my hearty thanks) take leave, remaining,

SIR,

your honour's affectionate friend,

and moſt humble ſervant,

WILL. HANN.

I PRAY, Sir, if this comes to your hand, do me the favour to let me know it.

A Letter

From Mr. Denny *apothecary at* Saliſbury.

Sarum, Nov. 18, 1664.

SIR,

I WAS commanded by Dr. *Turberville* to give you account of the manner of preſerving that ſtrange birth, that was born here with us, this time three weeks; the anatomical obſervations whereof are ſent you in Dr. *Turberville*'s letter (literal miſtakes being to be excuſed, as being copied by a child.) After the bowels were taken out, and the body made clean with ſpunges, I made a ſtrong lixivium with brine, bay ſalt, colocynthides, wormwood, and centaury, with which having well waſhed (and often) the body, for two days ſpace; then in a latten veſſel, framed purpoſely, I put about four gallons of ſpirit of wine, drawn upon myrrh, olibanum, and terebinth, and laid the corps in that, pouring upon it of oil of ſpike and turpentine about ſix pounds of each, having firſt filled the hollowneſs of the corps with ſpunges, mundefied with the ſame ſpirit, and made heavy with powdered gums, to keep the body under the liquor, as alſo the ſculls with the ſame, the brains firſt taken out. Having been about ten days in this liquor, I took out the liquor, and adding more gums, diſtilled it over again, to ſuch a height, as it would all burn away; which hath ſo reſiſted all manner of putrifaction and diſcolouration, as it is gone for *London* for his majeſty's view, and after, for the whole country, that will. I have ſent, by *John Reynolds*, a ſmall glaſs of tinctura ſuccini, another of ſulphuris antimonii, deſiring your opinion, whether they are rightly prepared, and correction, where in an error. I am about a new way, and eaſy, of preparing ſpirit of ſalt, which, if it comes to perfection, I ſhall acquaint you with. So, hoping you will excuſe this ſaucineſs of troubling you, I humbly take leave, and reſt,

SIR,

your very humble ſervant,

HENRY DENNY.

From Mr. William Hann *to Mr.* Oldenburg.

Sarum, Tueſday, Nov. 29, 1664.

SIR,

I RECEIVED yours by the *Oxford* carrier, and underſtand, that my laſt, ſent by the *London* poſt, came ſafe to your hands, and that you have done me the favour to make my name known to your Royal Society. I am glad it was welcome to your honour; yet really both the deſcription and the letter were written in ſo much haſte, that I had ſcarce time to read them over before I ſent them away. I have now more leiſure to give your honour a fuller relation of what I then wrote. Being at the coffee-houſe the ſame morning that this monſter was born, amongſt other diſcourſe, an ancient miniſter being there, told the company the news of a ſtrange monſter, born that morning at *Fiſherton*, and withal ſeemed ſomewhat to wonder, how Mr. *Kent*, the miniſter of *Fiſherton*, could juſtify the baptiſing it with two names, adding, that it was a queſtion to be debated by divines, whether it were to be reckoned as two perſons, and whether it had two ſouls. I then replied, that the divines muſt be beholden to the phyſicians for the determination of it. And from the coffee-houſe I went to ſee it; but could not, without tarrying there ſome time, be admitted to the ſight of it, by reaſon of the multitude of perſons, which flocked thither, where I beheld it, in the lap of the nurſe, by a little fire, having only a linen cloth for its covering, which was taken off at the deſire of every new ſpectator; beſides the room was full of holes, to let in the air, which at that ſeaſon was pretty cold and ſharp. The Friday following, within half an hour after this monſter died, I went to the houſe, to ſee it a ſecond time, and earneſtly deſired the father of it, that he would permit us to diſſect it; but I then found him wholly averſe to it, ſaying, that if he ſhould ſuffer it, he ſhould offend God. The next day (after many ſolicitations by ſeveral perſons) he was prevailed withal to have it done; but would not be perſuaded to have the body preſerved after diſſection, till *argumentum ab utili* prevailed with him. The diſſector was one Mr. *Down*, a ſurgeon in *Cooke-horn*, and a ſtranger in this place, but an ancient acquaintance of Dr. *Turberville*'s (our town ſurgeon being then employed in the country.) I was aſſiſtant to him, and had both hands in the work; and had he not caſually come hither, I had done it myſelf. The diſſection was performed by candle-light, and that in ſuch a throng of ſpectators, that we had ſcarce elbow-room allowed us. There were preſent at the diſſection moſt of out town phyſicians; by name, Dr. *Turberville*, Dr. *Haughton*, Dr. *Whitewell*, and Dr. *Brown*. The diſſection being ended, Mr. *Denny* (an apothecary in this town) by the advice of Dr. *Haughton* and Dr. *Whitewell*, firſt waſhed the body with a lixivium, made of urine, bay-ſalt, colocynth, centaury and wormwood; after that, filled the cavities with bole-armonick finely powdered, and laid it in oil of ſpike, for that night. The next day (as I remember) its pickle was low drawn ſpirit of wine, and its laſt menſtruum was high-rectified ſpirit of wine, drawn off upon myrrh and olibanum firſt diſtilled with oil of turpentine. The diſſection being ended, our town phyſicians (with other company) went to the tavern, where I propoſed, that there might be a meeting of all us phyſicians, the Monday following, to draw up jointly a deſcription of this monſter: but this motion was refuſed; they anſwering me, that we all had ſeen it, and that I might write to my friends, to inform them,

and

and they would do the like to theirs: whereupon (as ſoon as my other occaſions would give leave) I drew up a deſcription of it: but before I had ended it, I had a ſummons from my father, to haſten home unto him, he acquainting me in his letter with his being in a ſad condition; yet, before I would take my journey, I reſolved to ſend your honour a deſcription of the Fiſherton monſter; and being over-importuned, I left the deſcription in the hands of a perſon in this town, which being ſince copied out, is (as I hear) too full of pſeudography; and, to gratify the importunity of others, I wrote out the deſcription of it in Engliſh alſo, which (as I have been told) hath ſince travelled eaſt and weſt. At my coming home, I found my father in a bad condition indeed; for having, about a fortnight before, cut his leg to the bone, and women-ſurgeons applying things wholly improper, and contrary to it, it brought my father into a fever, and his leg to an high tumour and inflammation, inſomuch, that I feared a gangreen to enſue, for ſome parts of his leg looked blackiſh and livid; and my mother ſhe feared death; but (bleſſed be God) by the uſe of good means, his fever hath left him, the tumour and inflammation in his leg are abated, and the wound brought to digeſtion; but that part in the calf of the leg, which formerly looked black and livid, is lately turned to fretting and corroding ulcers. I have been his ſurgeon about three weeks ſpace, and have dreſſed his leg almoſt every day, and am enjoined to be with him again to-morrow. Since my coming back to this town (which was four days ſince) I have taken a review of that deſcription I ſent unto your honour, and have added ſomething in two or three places, which I left out in the former; and although it be not much that I have inſerted, yet it is ſignificant to make the deſcription complete; withal I have adjoined unto it, that other deſcription in Engliſh, and have gotten it drawn forth ſomething more exactly than the former was; all which I here encloſed preſent unto your honour. I ſuppoſe, before this comes to your hands, the monſter will be in *London*; for the father and mother began their journey thither the laſt week, carrying it with them. I thank your honour for the receipt you were pleaſed to communicate to me againſt quartanes and obſtructions. I had the ſame (with very little alteration) imparted to me about five years ſince from a friend: when I uſe it, I add cremor tartari to the infuſion. I heartily wiſh I might any way ſerve your honour, by any communications of mine, in reference to the therapeutical part of phyſick. As to that of the tranſplantation of diſeaſes, I can truly ſay this, that what your honour hath in print, for a cure of the yellow-jaundice, by the party's urine made into a cake with aſhes and buried in a dunghill, I had ſome years ſince imparted to me by a gentlewoman, as a cure for that diſeaſe, where other medicines will not prevail; and (as I have been credibly informed) a maiden gentlewoman of this town hath cured many of obſtinate jaundice, having only the party's water ſent unto her; but what ſhe doth with it, they that told me of it, ſaid they knew not. Your honour (to the beſt of my remembrance, for I am not at preſent maſter of your book, I only borrowing it to read over, and was limitted to a certain number of days for the return of it) mentioneth not any thing in your book of the tranſplantation of agues: I can acquaint you with ſome particulars of that kind: about two years ſince, a near neighbour of my father's had a ſon much afflicted with an ague, for the cure of which I uſed many medicines, in particular, I applied the yarrow-bag to the ſtomach, but all to little purpoſe or effect: at laſt, a woman coming caſually thither, took the boy's urine, emitted a little before the coming of the fit, and made it into a cake with barley-meal, and gave it to a dog to eat; the ſucceſs whereof was this, the boy was freed of the ague, and the dog, which did eat the cake, had a viſible ſhaking ague-fit, as the father and mother affirmed to me (but they both thought it to be witchcaft.) Since that, I have been credibly informed, that a gentleman's ſon, about four miles from my father's houſe, was by the ſame means cured of a tedious ague, the dog, which did eat the cake, having the ague tranſplanted to him. When I was a ſchool-boy, I knew ſeveral freed of warts upon their hands, by taking an elder-ſtick, and cutting as many ſcotches in it, as they had warts, then rubbing it upon the warts, and burying it under a dunghill. As for charms (or ſpells) I have taken the pains to write ſeveral of them, and I think I have many of them yet amongſt my looſe papers; in particular, one for ſtopping of blood, they which uſe it deſiring nothing elſe but the party's name, though at a diſtance. My mother told me, that her mother cured ſeveral, when they have bled almoſt to death, though they have been many miles from her. Another againſt burning or ſcalding (which they call ſingeing out the fire;) another againſt the cramp; another againſt worms; another againſt agues; with which a ſchool-fellow of mine cured ſeveral, and imparted it to me, many years ſince, though I never yet made uſe of it. If your honour think any of them worth the ſending and writing out, you may command them. And, when time will give me leave to look out and tranſcribe that receipt, I uſed ſo ſucceſsfully for the king's-evil, your honour may expect to receive it from me. The biting of a dog hath been known to be cured by the cutting off the hairs of the dog, that grow on his breaſt between the ſhoulders, and applying them to the wound, without any thing elſe applied. Sir, I am enjoined to go down to my weak and aged father, either this day or to morrow, with a purpoſe to return as ſpeedily as I may. If your honour be pleaſed to let me know in a line or two, that this comes ſafe to your hands, and direct it to be left at my lodgings at Mr. *Beach*'s houſe in *Saliſbury*, it will be there received with welcome by, Sir, your honour's moſt humble ſervant, WILL. HANN.

HERE is a report in this town of another ſtrange monſter born in or near *Abington*.

MR. *Whitehead*, a gentleman at *Titherly* in *Hampſhire*, nine miles from this town, had a cow, which lately brought forth a calf with two heads.

I HAVE made a hyſteron proteron in the deſcription, for the brains were diſſected the laſt of all the parts.

Incloſed in the preceding.

MARIA uxor Johannis Waterman ſtabularii apud Fiſherton prope civitatem Sarum, poſt partum laborioſum die Mercurii, Octob. 26. 1664. *circa horam primam matutinam peperit filiam bene figuratam, et in quolibet membro accuratè proportionatam. Semihoræ ſpatio vix interjecto, iterùm parturiens peperit partum monſtroſum cum capitibus duobus, brachiis et manibus quatuor è diametro oppoſitis, cum pedibus duobus, femoribus, natibus, anu, pudendo muliebri circa medietatem corporis prominentibus, ac umbilico ſupra pudendum tres circiter pollices eminente. Horâ quartâ matutinâ ejuſdem diei partus iſte informis baptizatus eſt, cui nomina Marthæ et Mariæ impoſita ſunt; abhinc in diem tertium vixit, in quo temporis ſpatio (per vices) lacte ſaccharato enutritus eſt, plorabat, et per alvum excrementa dejiciebat. Dei Veneris Octob.* 28. *horâ nonâ matutinâ obiit Martha, et paulò poſt Maria.* [*Viraque dum vixit, faciei amabilis, et forſan utraque diutius vixiſſet, ni intempeſtiva viſitantium turba tenellum huncce partum inclementiori aeri expoſuiſſet.*]

Die Saturni, Octob. 29°. *horâ 4â pomeridianâ partes internas ſpectantium oculis ſubjecit culter anatomicus; quibus à cute, muſculis, et ſterno denudatis, viſui ſeſe offerebant,* 1°. *cerebrum cum ſuo cerebello, ventriculis, venis, arteriis, nervis, et menyngibus (utrumque cerebrum pendens uncias viginti cum ſemiſſe.)* 2°. *Cor cum ſuo pericardio in eodem latere utrinque collocatum.* 3°. *Pulmones cum arteriâ trachæâ.* 4°. *Mediaſtinum.* 5°. *Thymus,* 6°. *Diaphragma pervium tum gulæ, tum venæ cavæ, (ſingulis hinc inde partibus debitè conformatis.)* [*Bina omnia bina.*]

Cæterùm anomalia partium in infimo ventre conſpiciebatur, et

1°. *A pyloro utriuſque ventriculi inteſtina (poſt inflationem) ſeſe exporrigebant longitudine ſex pedes ad canalem (ſive ductum) communem, quò utrinque ſimul coaluerunt: à ductu communi ad inteſtinum cæcum longitudo erat pedem circiter unum, ac ab inteſtino cæco ad anum pedes duos.*

2°. *Utrumque hepar (cum veſicâ biliariâ, et venâ portæ) in eodem latere ſitum erat.*

3°. *Ex adverſo jecoris utriuſque ſiti ſunt lienes cum ſuis venulis et arteriis, una cum venis gaſtricis majoribus et minoribus ad ventriculum utrumque excurrentibus.*

4°. *Verſus finem quintæ lumborum vertebræ prope os ſacrum (quod hic incurvatum erat) hinc inde incumbebant renes bene figurati, excepto quod nimis grandiuſculi fuere) carunculas obtinentes papillares, tum venas et arterias emulgentes.*

5°. *A renum infundibulo principium ducebant ureteres, qui inferebantur in cervicem veſicæ, quæ inter inteſtinum rectum et uterum naturali ſitu poſita inveniebatur.*

6°. *In utero diſſecto cernere fas erat ejus fundum, cervicem, vaginam, cum pudendo muliebri, non alia quàm naturæ juſtâ lege confirmatos, præterquàm quod utrique unus communiter inſerviebat. Uterus (cum veſicâ, et inteſtino recto) intra oſſa eorum receptioni deſtinata continebatur.*

7°. *Vena cava cum arteriâ aortâ, omentum, pancreas, et meſenterium, locum et progreſſum ſuum regularem ſervabant.*

Quoad partes exteriores (viſceribus exemptis) tum in Marthâ tum in Mariâ viſæ ſunt, 1. *Coſtæ numero duodecim;* 2. *Sternum tribus partibus compactum cum appendice cartilagineâ;* 3. *Vertebræ colli ſeptem;* 4. *Dorſi vertebræ duodecim;* 5. *Lumborum vertebræ quinque. Os ſacrum cum partibus ſenis vertebrarum æmulis, os ilium, os coxendicis, os pubis ambabus communia fuere.*

Totum corpus longum erat pollices viginti, latum pollices tredecim cum ſemiſſe: ſcil. tranſverſim menſuratum à pedum extremitatibus ad extremum coſtarum.

Corpus hocce conditur, quò a putredine vindicetur, et diutius aſſervetur.

Filia primogenita Eefelet nominata è vivis diſceſſit die Mercurii 9°. *diebus quatuordecim ſupervivens.*

Mater adhuc ſuperſtes et incolumis manet.

London, Nov. 3, 1664.

SIR,

I MUST begin this with the affectionate thanks of the Society for your reſpects to them, in giving them part of ſo conſiderable an account, as that is of the monſtrous birth: they would be very glad to have that double atteſtation of the two phyſicians among their records; and you will farther oblige them in communicating what ſhall more of this matter, concerning either the life or death of theſe double bodies, come to your knowledge. Having *Rueffus* among my books, I looked upon him, and found the allegation, wherein I met with this particular, that the like monſter was anno 1552 born here in *England* alſo, and not far from *Oxford*, of the female ſex, whereof one part was very merry, the other ſad and ſleepy: the difference in the ſhape of that from this of *Fiſherton*, according to the hiſtory, conſiſts only in this; that the former had two legs on one ſide, and a third leg with two toes on the other ſide; whereas the latter hath but two legs, both on one ſide.

DR. *Charlton* being called to an account of his laſt diſſection, and particularly preſſed concerning the tranſpoſition, which I mentioned to you in my former from his own mouth in the preſence of others, who heard him, as well as I, alledge Dr. *Ent* for a witneſs of his aſſertion, was obliged at our yeſterday's aſſembly at *Greſham* to yield, that he was miſtaken; both Dr. *Ent*, who was with us, and Dr. *Scarborough*, having upon the unburying of the heart, and a ſtrict ſearch and examination, found no ſuch tranſpoſition; which diſcovery of the doctor's error, ſpread by his very poſitive affirmations (which made me without ſcruple deliver it alſo to you)

addeth

addeth but very little to his credit. In the mean time the other anatomical obſervation concerning the defect of the pectoral muſcle is confirmed, Dr. *Ent* himſelf upon my particular enquiry aſſerting it with all confidence, and that the perſon, whilſt alive, had not appeared defective in his motions.

WE have been lately examining the teeth of a viper, and ſomewhat of the ſtructure of the reſt of his body; and it hath been found, that the fang teeth, as they call them, being let alone till pretty dry, are hollow, which was perceived by means of ſeveral chains of bubbles appearing within theſe tranſparent hollow teeth, though, whilſt the viper was alive, the obſervers could not perceive the leaſt appearance of hollowneſs, but the teeth then ſeemed perfectly tranſparent conical bodies. Both Dr. *Ent* and Dr. *Merret* affirmed, that having examined the teeth of a rattleſnake (which animal they found very like a viper in all its other parts, and that therefore it was not unlikely, but the teeth of them alſo might reſemble each other) they obſerved, that they were very viſibly hollow, with a ſmall perforation running through the middle of them, from their roots to their tops; and Dr. *Merret* ſaid in particular, that he had proved them ſuch, by thruſting a horſehair clear through them.

THESE obſervations may direct us to find ſomething conſiderable to the purpoſe of the nature of poiſoning, done by theſe animals; which now ſeems to me to conſiſt only in the letting out of a liquor heterogeneous or contrary to the blood and its motion in the body, into which it is conveyed after the vein hath been opened by the ſtinging teeth.

IN the purſuing of our experiments of refraction, we find, that the proportions of the ſines of the angles of inclination to the ſines of the angles of refraction, are near the ſame, *viz.* as four to three. And we find, that as ſpirit of wine ſuffers a greater refraction than common water, ſo oil of turpentine, which is lighter than ſpirit of wine, bears a greater than not only common water, but much greater than ſalt water.

MONSIEUR *Zulichem*, in a new letter, hath given us notice by Sir *R. Moray*, that he hath farther penetrated into the matter of figured pendulums, and found general rules, to give pendules iſochrone as well to ſolid bodies, as to planes; in which he ſaith there occur as hard problems, as any he knows. He acquaints us alſo, to have received from Mr. *Sluſe* of *Liege* a new way of thermometer, (which yet was not new to our virtuoſi here) which is a cane of three foot long, and an inch broad, full of ſalt water, in which ſwims a litte ball of wax, mixed with ſomething more ponderous, to make the ball keep itſelf about the middle of the cane; and that this ball, according to the different degree of heat, riſeth and falls, though not ſuddenly, as the water in the common thermometer; but then, ſaith he, it is not ſubject to the various preſſure of the air, which changeth the other without change of heat. He hath made the experiment of it with ſucceſs.

The ſame gentleman reflecting upon the pretty large aperture in *Reeves*'s longeſt tube, ſuggeſts, that it would be a matter worthy of enquiry, to know, what may be the aperture in each glaſs of ſuch and ſuch a diſtance from the focus, which he judgeth to depend only upon experience. He adds, to have ſeen at *Paris* with wonder a glaſs of 12 foot of *Divini*'s workmanſhip, which did bear an aperture of two inches, Pariſian meaſure. Mr. *Hook* is now making his new inſtrument for grinding glaſſes, the ſucceſs whereof you will ſhortly hear of. But I muſt cut ſhort theſe philoſophical informations, to let you know, what my friend ſent me lately from *Amſterdam*, in anſwer to what you deſired by one of your former, concerning the Turkiſh tranſlation. Monſieur *de Geer*, ſaith he, and I, did rejoice to find your promptitude to propagate the goſpel of our Lord that way; and, if we had any thing printed, we would willingly have ſatisfied your deſire in ſending you ſheet: but the matter is thus; we have but a part of the old teſtament; the reſt we expect with the very next; and then, if God will, we ſhall not fail to fall upon the work. If in the interim (ſo he goes on) we might crave that favour from you or Mr. *Boyle*, as to let us ſee a ſheet of your printing of the new teſtament, thereby to conform ourſelves both in reſpect of the form and greatneſs of the character, you would oblige us very much. This (ſo he concludes) Monſieur *de Geer* deſired me to write, preſenting unto that excellent perſon Mr. *Boyle*, and you, his moſt kind ſalutation.

To add ſomething of political news, I ſhall tranſcribe to you, what came to my hands this week from *France*: *On ne ſonge icy, qu' à perdre les proteſtans. Depuis peu il à eſte ordonné par arreſt du Conſeil, que les temples de Niſmes et de Montauban ſeroient demolis, et qu'il ny en auroit plus qu'un en chacune de ces villes lá. On ruinera bientoſt les academies proteſtantes, et en fera tant d'indignites a ceux, qui demeureront fermes dans leur religion, qu'en fin le nombre en ſera petit et nullement conſiderable.*

Le Pape fait ſemblant d'eſtre faché contre le legat, et de n'approuver pas ce qu'il a fait en France, a fin que cela ne puiſſe nuire au papat, et qu'on ne 's en ſerve un jour. On dit, que la Maiſon de Mr. de Crequy a eſte inveſtie, par ce qu'il y avoit receu un homme, qui avoit aſſaſſiné une perſonne conſiderable.

On s'eſtonne, que le roy d'Angleterre ait trouvé mauvais, que la flotte Hollandoiſe, que eſtoit dans la mer Mediterranée, ſoit allée en Guinnee, ny ayant rien de plus naturel, que de ſe deffendre, quand on eſt attacqué injuſtement et qu'on veut vous ruiner. Il ſemble, qu'on accuſe ſans raiſon les Hollandois d'ingratitude, ne commencans point la guerre, et ne faiſans que ſonger a conſerver ce qu'ils poſſedent, qu'on veut leur oſter ſans aucun pretexte, puis qu'ils offrent de faire ſatisfaction, s'ils ont fait quelque tort aux Anglois. Ils offrent meſme de ſe ſoubmettre au jugement de tel parlement de France, ou de telle cour ſouveraine d'Allemagne, qu'on voudra, pour la deciſion de leur differents. J'ay vu la reſponce,

reſpouce, qu'ils ont faite a Downing, par laquelle ils ſouſtiennent, qu'ils n'ont rien fait contre les Anglois depuis le traité fait avec le roy d'Angleterre, qui a reglé toutes choſes: qu'en cas, qu'ils ayent contrevenu au traité, et qu'ils ayent pris quelque vaiſſeaux, ou fait quelque autre entrepriſe, ils ſont preſts de reparer tous les torts. Apres cela il eſt aiſé de voir, qu'on ne veut point de paix, mais qu'on veut avoir la Guinee, qui eſt a la bienſeance des Anglois. Cependant les Hollandois croyent, qu'il leur eſt plus expedient de courir la riſque d'une guerre, que de conſentir, qu'on leur prenne ce qu'ils poſſedent depuis long temps. Ils hazarderent tout pluſtoſt, que de ne ſe pas deffendre, autrement on ſe mocqueroit d'eux, et ils perdroient leur reputation. Mr. de la Boulaye part la ſemaine qui vient pour aller aux Indes pour la nouvelle compagnie. On ſe remue fort icy pour le commerce, et on a grande envie de l'eſtablir, et d'empeſcher nos voiſins de gagner ſur nous, comme ils ont fait. This ſhews what opinion the French have of our cauſe, and what advantage they intend to make of the war.

SIR, I received on Saturday laſt the beginning of your experimental Hiſtory of Cold, and it is gone to the preſs, whence I hope they have ſent you the ſheets printed off. But what you mention to have ſent by Monday carrier or coach, I have not yet received to this moment; but only the letter, which came unaccompanied with the roll of paper, mentioned in the ſuperſcription of the letter, but not obſerved by my maid, that received yeſterday's letter in my abſence. Your ſervant was with me yeſterday morning, and promiſed me to enquire after it; but I have not ſeen him ſince, nor heard of the roll, which troubles me exceedingly. Thoſe carriers and coachmen are incorrigible; for that letter, which would have coſt in all but two pence, if it had come by the poſt, they took a groat for at my houſe, beſides what you paid for it at *Oxford*. I am,

SIR,

your very humble faithful ſervant,

H. OLDENBURG.

London, Nov. 5, 1664.

SIR,

HAVING been, ſince my laſt, freed of the fear about your laſt papers, I thought myſelf bound to free you alſo of the ſame, into which my late mentioning of their not being come to my hands might juſtly caſt you. They are now very ſafe, and will be within this week in print, as Mr. *Crook* aſſureth, who will alſo take care of keeping them unexpoſed to the eye of a philoſophical robber. As for the Latin of the thermometrical experiments, I know not what inſtinct of mine, ſo well ſuited with your inclination of having it publiſhed by itſelf, made me begin it, as ſoon as the Engliſh thereof was begun to be printed. I hope in a very ſhort time to diſpatch this tranſlation; and I promiſe myſelf the happineſs of ſhortly ſeeing you here, as for many other reaſons, ſo for the ſubmitting the traduction to your review. I am troubled, I cannot get *Greenland* for you; having enquired in very many ſhops, I underſtood at length, in that of Mr. *Alleſtry*'s, that I ſhould hardly find it to be ſold in all *London*.

AFTER that *Religio Medici* is grown ſtale, we have lately printed *Religio Stoici*, which hath ſtrains of wit, and ſome very honeſt and healing maxims for broken Chriſtianity.

THE author no other, but *G. MK.* a moderate churchman, that placeth religion in the contemplation of God, and in ſubmiſſion to him, without quarrelling at innocent ceremonies of decency and order; but that wonders at men, who do legitimate perſecutions, that are uſed by others againſt themſelves by the perſecutions uſed by themſelves, againſt others; and that compareth hereticks and ſchiſmaticks to tops, which, as long as they are whipped, keep foot and run pleaſantly, but fall, as ſoon as they are neglected and left to themſelves.

BESIDES this, there is newly come abroad a certain epiſtle to the ſeveral congregations of the non-conformiſts, by one captain *Robert Everard*, an anabaptiſt before his change, who, being turned papiſt, ſhews the reaſons of his converſion, as he calls it, to the catholick church. Poor man, who deſtroyeth the ſcripture, and having done ſo, will prove the pope and the church by it; but maketh, in the mean time, his new brethren glory in having got one, that was ſo far remote from *Rome*, as an anabaptiſt, to be now a proſelyte of theirs.

THE Dutch uſe much of the fox in aſſerting their cauſe againſt the Engliſh; they bear the world in hand, they will ſubmit all to the arbitration of any prince or ſtate; and they inſinuate into the body of our merchants, that it is only to raiſe a particular royal company; not forgetting to perſuade their own people, that, at the bottom of all, there lieth a deſign to make the prince of *Orange* to domineer over them. But for all this, I believe, they will be outwitted, eſpecially at this preſent conjuncture of affairs, where, a league being in hand, between the pope, the emperor, and *Spain*, againſt *France*, the king of *France* begins to court *England*, and is not at all like to afford any aid to *Holland*.

THERE are new troubles at *Avignon*, raiſed by the new burthens, impoſed by the vice-legat, for a puniſhment to the inhabitants, for their former readineſs to comply with the king of *France*; who, upon the news given him of it by the nuncio in an audience, made anſwer, that he would hear firſt from the pope, what he deſired to have done upon this tumult, before he would pronounce in it.

I HAVE lately offered me a new correſpondence at *Paris*, for all the news and curioſities of *France* and *Italy*, where he affirms to have particular intereſt all over. It is a perſon of

quality, and philoſophically given; which maketh me unwilling to decline the offer, if I had but leiſure and means to entertain it as I ought. He expects nothing for a return, but the communicating to him, what conſiderable books are continually printing in England, whether in Engliſh, Latin, Greek, *&c.* and ſome general account of the progreſs and performances of the Royal Society. He hath already promiſed to ſend me the obſervations, which one of the very beſt philoſophers of *Paris* hath made upon the new book of optick Glaſſes, that are ſo much cried up, as far excelling thoſe of *Divini*. If I may but meet with three or four contributions here in England, I have a good mind to embrace the ſaid overture, believing, I may in a good proportion recompenſe the contributors, and being reſolved to endeavour to be very grateful to the perſons, that ſhall be pleaſed to aſſiſt in the procurement of ſuch. I remain always,

SIR,

your faithful and humble ſervant,

H. O.

London, Nov. 10, 1664.

SIR,

I AM now to redouble upon you the thanks of the Society, for the iterated communications you have gratified them with: you may aſſure yourſelf, that you could not have ſent them to any ſingle private man, that could have had more ſenſe of it than they had; their eſteem being great for all ſuch of their members, that bear the Society, and the concerns thereof, in their mind, as well abſent as preſent. They are unwilling to part with the original of the Sarum phyſician, enjoining me, to offer you a copy of it (ſince your letter ſaith, that haſte would not allow you to reſerve any copy) but yet, in caſe you did require again the reſtitution of the original, then to return it you. I would now, *in omnem eventum*, have ſent you a copy, but could not poſſibly redeem ſo much time, as to do it myſelf; and our amanuenſis is ſo full of matter to be tranſcribed, for our anniverſary election day, for our charter book, now preſently to be made ready for his majeſty's ſubſcription (which is to be done without his coming to *Greſham*) and for clearing a whole year's account, *&c.* that I durſt not charge him with any more. The company wiſhed, that the diſſector of this double-child had more diſtinctly and particularly expreſſed, what veſſels were common, and how they were terminated; which is all the chief matter to be lookt after in this fœtus. Your other obſervation of the perſon with one kidney was therefore pleaſing, becauſe it informed them of two ureters found in that one viſcus. Dr. *Ent* made mention, to have obſerved, that when one kidney was ſtopt, there commonly followed an iſchuria.

IF I am not prevented, I can, in ſome meaſure, for my own private ſhare, requite your anatomical preſents, by letting you know, how, by order of the Society, there was on Monday laſt opened a live dog by Mr. *Hook*, privately, there being only preſent of ſpectators *D. Goddard* and myſelf; and that by means of a pair of bellows (when the thorax was laid quite open, and the whole venter infimus alſo) and a certain cane thruſt into the windpipe of the animal, the heart continued beating for a long while, at the leaſt an hour, even after the diaphragm had been cut away in great part, and the pericardium removed from the heart. And from ſeveral trials it ſeemed very probable, that this motion might have been continued as long as there had been any blood left within the veſſels of the dog; for the motion of the heart ſeemed very briſk and lively, after an hour's time, from the firſt diſplaying the diaphragme; and, upon removing the bellows, the lungs would preſently begin to ſink, and the heart begin to have irregular, thick and convulſive motions; but, upon renewing the motion of the bellows, the heart recovered its former motion, and the irregular ones ceaſed. Though a ligature was made upon all the great veſſels, that went into the lower part of the body, we could not find any alteration in the pulſe of the heart, the circulation, it ſeems, being performed ſome other way. It could not be perceived diſtinctly, whether the air did mix with the blood paſſing to the left ventricle of the heart; nor did we in the leaſt find the heart to ſwell upon the extenſion of the lungs; nor did the lungs ſeem to ſwell upon the contraction of the heart. The phyſicians of the Society were deſired to conſider of the purſuing of this experiment, and of the diſcoveries to be made thereby, eſpecially concerning the communication between the lungs and the heart. I wiſh heartily you would pleaſe to ſuggeſt your thoughts hereof, and impart them with the ſooneſt. We inſiſt alſo upon our experiments of refraction, and found yeſterday, that pure ſalad oil hath a much greater refraction, than any liquor we yet tried, whether common water, ſalt water, ſpirit of wine, oil of turpentine. We intend, God willing, to examine all ſorts of liquors, and that in their various temper of hot and cold, pure and impure, *&c.* We have had lately good ſtore of diſcourſe concerning ſtar-ſhoots, Dr. *Merret* giving us the occaſion, by bringing in ſome of it, which was much clodded, and had a very rank ſmell, which he ſaid, he could not diſſolve by boiling it in water, nor by oil. Some were of opinion, it was a fungus-matter, ſpewed out of the ground, which would have turned into a fungus, but that the time for producing that plant was ſpent: but others were of opinion, that if it were ſuch a matter, it would turn to water; wherefore theſe gueſſed, it might be ſome ſpermatick or abortive matter of beaſts, and eſpecially of

ſheep; confirming their opinion by the obſervation frequently made, that this ſubſtance was not found, but in ſuch places, where cattle and ſheep had been feeding. Others thought, that it might be frogs diſſolved; ſeeing there were ſometimes little bones found in it. Dr. *Merret* was charged to endeavour to procure ſome quantity of it, and to make further experiments upon it.

OUR council is now preſſing to have an end of *Chelſea* college, which, we doubt not, but it will prove good; in which caſe, Mr. *Howard* will be the Society's gardener, without admitting of any competitor; and Dr. *Wilkins* the weeder. The Society did yeſterday chuſe Sir *John Cutler*, an honorary member, and ordered, that he having declared his reſolution to ſettle upon Mr. *Hook*, during his life, an annual ſtipend of fifty pounds, and to refer to the ſociety the direction of the kind of employment the ſtipendiat ſhall be put upon, ſhould have ſolemn thanks returned to him for this ſingular favour, expreſſed to one of their members, and for the reſpect and confidence ſhewed to the whole body; and that Sir *William Petty*, Dr. *Wilkins*, Dr. *Whiſtler*, and captain *Graunt*, ſhould attend the ſaid Sir *J. Cutler*, in the name of the Society, and to repreſent to him, what a ſenſe they have of his generoſity, which they have the more reaſon to value, as being the firſt donation they have been entruſted with, of this kind, and which they hope will procure a leading example to others.

THE biſhop of *Exeter* was yeſterday amongſt us, and did very ſolicitouſly enquire of me concerning your health, deſiring me to aſſure you of his humble ſervice.

THE duke of *York* is now upon the point of going, if he be not gone already, to ſea, accompanied with many gallants, as the dukes of *Monmouth*, *Buckingham*, the marquis *de Duras*, &c. We wiſh only, theſe courtiers may pleaſe the ſeamen, who love neither ceremony, nor imperiouſneſs. We have intelligence, that the Dutch have a fleet in *France*, conſiſting of about three hundred merchant men, laden with wines, brandy, ſalt and corn; which, if they ſhall come home, muſt be ſecured by an armed fleet of their countrymen, paſſing through the Channel, to meet and convey them home; which cannot but cauſe an encounter of the two fleets, and conſequently, as affairs are now heightened, blows. Yet, upon conſideration of all circumſtances, I can hardly perſuade myſelf, that the Dutch will fight, ſeeing they venture their all, whilſt they ſtand ſingle and alone, as, to human appearance, they now do, both *France* and *Spain* courting *England*, and *Sweden* being ready to aſſiſt *England*, much rather than *Holland*; and *Denmark* having not any conſiderable power nor inclination to do them any good. In the mean time, theſe Dutch have made ſure of a very ſubſtantial proviſion to maintain the war, in caſe they be neceſſitated to undergo it, they having taken a courſe to be furniſht with about 800000 *l.* ſterling a year for that purpoſe, as long as the war laſteth; and the people being unanimouſly willing to give the 200th peny; there being alſo order taken, to build every year, for ſome time, a conſiderable number of men of war, of third and fourth rate ſhips, which are thoſe, that do moſt ſervice.

HIS majeſty hath ſent away the lord *Fitzharding* for *France*, as envoy extraordinary, to negotiate buſineſs there of no ordinary conſequences, as every body thinks.

THE king of *France* is reſolved to maintain *Gigeri*, *couſte qu'il couſte*. He ſaith, * * * * * * * * *gloire, & que tout les deſpens, qu'il fait en ce regard la* * * * * * * * * * * * * * * * you have by this time received the printed ſheets; and that you are to impart more copy, as ſoon as conveniently you can. Nothing of the Latin concerning the thermometrical part is, as yet, gone to the preſs; but might now be begun, if I durſt venture it without your review. I have met with ſome particulars in the already printed Engliſh ſheets, of whoſe correctneſs, as to the matter itſelf, I did doubt; but I do not queſtion, but you will meet with them in your reading them over; and if any thing be amiſs, let notice be taken thereof, that it may be put in the errata. I am in haſte,

SIR,

your faithful humble ſervant,

H. O.

London, Nov. 17, 1664.

SIR,

MY not returning you a copy this week for the late original papers, you have been pleaſed to leave ſo readily among the records of the Society, (which civility I am again to acknowledge to you in their name) would trouble me much, if this conſideration did not eaſe me, that you would take in good part ſome little delay, which the preſent croud of employments, put by the Society upon their amanuenſis, indiſpenſably requires. For he being to enter many things into their books, before the approaching ſolemn day of election, and to write fair their charter, laws, liſt of fellows, *&c.* and to prepare a book for his majeſty's inſcription, and many other things and tranſcripts, that bear no delay, lying upon his hands, it was not poſſible for him to make a copy for you this week, which yet, I hope, ſhall be ready the next. I am ſorry the diſſector of the double child did not put his name to the account he gave of the operation; and we muſt contrive ſome way or other, to have it yet done, for the more authenticneſs of the relation, now it is be recorded by a Royal Society of ſevere philoſophers. I rejoice to find anatomical experiments and obſervations ſo well purſued, both here and at *Oxford*, perſuading myſelf, we ſhall at length find out more for the uſe of reſpiration

reſpiration, and the account upon which it is ſo abſolutely neceſſary, than ever was done. Will it not be made out at laſt, that Life is a kind of ſubtil and fine flame? to which the air muſt be applied, to keep both it in motion, and the blood, wherein it reſideth, which thence looks florid and ſprightly, when the air having been mingled with it, as it were, *per minima*, paſſeth along with it into the left ventricle of the heart, and thence into the arteries; after which, when the blood returns into the veins, it there begins to change its countenance, and looks dull and torpid, till it come again to the place, which can revive it. Thoſe particulars, which your ingenious gentleman promiſed you an account of in writing, I muſt put you in mind of, and beg a ſight of them for our Society, who is much pleaſed with whatſoever comes from you, it being conſtantly of conſiderable weight. They proſecute diligently the experiments of refraction, and find, by what they have already done, cauſe to think, that the ſimpleſt liquors have the leſſer, and thoſe, that conſiſt of ſeveral and differing parts, the greater refraction. We tried yeſterday with hot and cold common water, and they had an equal refraction; and then with ſalt water, whoſe refraction was two degrees greater than the former waters. Our preſident did urge, that both fixed and volatile ſalts ſhould be with ſeveral degrees, or quantities rather diſſolved in water, to ſee how the refractions vary, and thence to learn by the degrees of refractions the quantity of ſalt contained in liquors. We ſhall, God willing, proceed to all kinds of oils, wines, coloured and turbid waters, aqua regis, aqua fortis, milk; and, if we can contrive it, to the refractions of ſmokes and ſteams.

MY Lord *Brouncker* acquainted the company yeſterday, that he finds by ſtrict obſervations, for a long time continued, that by his barometers he knows as well the temper of the air, for its heat and cold, as for its preſſure and gravity, affirming, that the air had been very well exhauſted in them.

MR. *Howard* produced a ſubſtance, taken out of the grave of a man, that had been dead thirty years, and was in a manner all waſted, but that a piece of fat remained about the place of his belly, of which his preſent was a ſmall portion, which, being put upon the fire, burned and ſmelled like fat. We had a couple of your Oxonian doctors of phyſick amongſt us yeſterday, Dr. *Millington*, and Dr. *Needham*, the latter whereof related to us, how that at *Oxford* they had by blowing into the receptaculum chyli continued the pulſe of the heart, without (if I miſtook not) the exerciſe of the lungs. We did amongſt other things appoint a meeting on Monday next with ſome merchants of the *Eaſt India* company, upon information received, that ſome of them having been in the *Eaſt-Indies* themſelves, and being very well able to anſwer to our enquiries, drawn up for theſe parts, had declared a great readineſs to ſerve the Society with what they knew of thoſe particulars. Our preſident intends to be there himſelf, and we ſhould all be glad to have you one of the number: but this is much more a matter of wiſh, than hope. I had on Tueſday laſt the firſt fruits of my new correſpondence with the Pariſian gentleman, I lately mentioned to you. He ſent me a pretty big packet, containing both pamphlets and books, all polemical, both in divinity and philoſophy. Thoſe of divinity concern the conteſt betwixt Janſeniſts and Jeſuits, whereof the former fall upon the latter without mercy, and ſeem to me to do them more miſchief, than ever was done to them by the whole body of proteſtants ſince the reformation. One piece of this kind is called, *Examen de la lettre circulaire de l'aſſemblée tenue à Paris*, Oct. 2, 1663. which layeth the pope's infallibility, ſo much contended for by the Jeſuits, upon mere political grounds, as flat as proteſtants could do. Another is entitled, *Les pernicieuſes conſequences de la nouvelle hereſie des Jeſuites, contre le roy et contre l'eſtat.* This muſt needs make all kings, princes, and ſtates, more afraid of this order and the ſeed they ſow, than ever they were. The third is, *en vers burleſque*, under the name of *Onguent pour la brulure, ou, le ſecret pour expeſcher les Jeſuites de bruler les livres.* The philoſophical pieces are two; one is medicinal, called, *La phyſique d'uſage, contenant, apres un diſcours general ſur la medecine, la deſcription du corps humane: puis l'explication des maladies et de leur remedes, tirée des principes de la mechanique et de la philoſophie de Mr. Deſcartes, par meſſieurs d'Orlix et Plempius.* In which I find the latter part to be little elſe than a tranſlation of that Latin piece, which about a twelvemonth ſince I received from *Paris*, and gave you a view of. But the other book is a very bold piece, undertaking to refute *Paſcal*'s little book *de la peſanteur de l'air*, and with him all his partiſans, as he calls them. I had ſent it you by the next carrier, but that the Society yeſterday deſired their preſident to peruſe it, and give them his ſenſe thereof. I am of opinion, the author will rather beget ſport, than trouble to intelligent readers, who will hardly hold ſmiling at the title of his book, which is, *La verité du vuide contre le vuide de la verité, ou l'on decouvre la veritable cauſe des effets qui juſques icy ont eſté attribuez a l'horreur du vuide, contre l'erreur, qui les attribue a la peſanteur de la maſſe de l'air: par le P. Charles Bourgonis, religieux Auguſtin, a Paris*, 1664. He ſeems to be a great aſſertor of vacuum, affirming, that nature is ſo far from abhorring it, that ſhe loves and cheriſhes it, and can by no means be without it. I doubt he hath a great deal of it in his head. He is very poſitive, that all the phænomena, which uſed to be aſcribed to the fuga vacui, come from nothing elſe, but *de la difficulté de rarifier les liqueurs (y comprenant l'air) qui eſt plus grande* (ſaith he) *ou moindre, ſelon la diverſité de leur natures: et 2. de la tres intime union des corps fluides avec les ſolides, et des fluides avec des fluides, de ſemblable ou de diverſes eſpeces, quand ils ſont contigus, et qu'ils ſe touchent*

touchent immediatement. And ſo he makes all the things, which the vulgar hath hitherto attributed to the abhorrency of a void, and monſieur *Paſcal* to the weight of the air, the effects of rarefaction. He names you often in the book, and refers to your experiments, as they have been alledged by *Paſcal*; and he maketh it his buſineſs to maintain, that though the air have weight in itſelf, yet it actually weighs not, becauſe it is faſtned and glued to the heavens, *qu'il touche et eſt uni à la premiere ſphere.*

SIR, I muſt not conclude without telling you, that I have delivered your letter to Mr. *Evelyn*, and acquainted Mr. *Crook* with your orders, who tells me, that he diſpatches the printed ſheets away as faſt as he can by coach or carrier. He ſaith withal, that his preſs hath ſtood ſtill this whole week; and he hath given to Mr. *Hook* thoſe ſheets, that mention the ſchemes, which will be done according to your deſire. The Latin tranſlation of the preliminary Diſcourſes is near an end; and, ſince you give way to it, ſhall go to the preſs immediately. I am called upon to conſider with ſome company, of a roll of papers ſent to me by Mr. *Beale*, about the aſſerting and eſtabliſhing the reputation of the Society, both at home and abroad; and I am ſure I ſhall eaſe you by ſaying no more, ſince I have ſcribbled ſo much, than that I am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

I HUMBLY thank you, Sir, for your Turkiſh ſheet, and ſo will, I am confident, meſſieurs *de Geer* and *Serrarius.*

London, Nov. 19, 1664.

SIR,

THOUGH I gave you the trouble of a letter but very lately, yet could I not omit to haſten this after it, to acquaint you, that the ſequel of the Hiſtory of Cold is ſince my laſt come to my hands, and at this very time under the preſs, which will, we hope, bring the reſt hither as ſoon as may be. I have alſo delivered to another preſs, the beginning of the Latin tranſlation of the thermometrical Paradoxes, which will, I believe, be wholly diſpatched in a fortnight, and does therefore deſire your directions for a title, and, if you think it neceſſary, ſome preface. This was the errand of this ſcribble; but ſince I have begun, I am reſolved not to end with the beginning, but to give you the ſum of what the French poſt brought me ſince Thurſday. It is no leſs than the total loſs of *Gigery*, and of 48 guns with the king of *France*'s arms upon them, the Moors having with ſuch a number and vigour aſſaulted it, that the French were not able to bear up againſt them. This doth ſo nettle the king, that he is reſolved both to puniſh the authors of the miſcarriage, and to attempt another place with 20,000 men the next ſpring. *At multa cadunt inter calicem ſupremaque labra.* This is a conſiderable check to his fierceneſs, and is like to do him more miſchief than perhaps he is aware of.

THE queen of *France* is brought to bed of a daughter of eight months, which hath the ſhape of a Moor, and ſomewhat of that complexion; whence that king is ſo enraged, that he hath baniſhed all the Moors, dwarfs, and monkies, from his court, the queen having a little Moor about her, that ſeems to have ſo tainted her imagination, as to give ſuch a colour and ſuch features, that reſemble him. In the mean time the queen hath been very dangerouſly ill, and was given over by the phyſicians; but that madam *de Fouquet* came and preſented a medicine, which ſhe exalted highly as ſuch an one, that would infallibly cure her, by bringing away the ſecondina, which had caſt the queen into ſuch convulſions, as made her caſe appear deſperate. My letter ſaith thus: *Les medecins l'examineront, et quoy qu'ils ne ſoyent pas ordinairement favorables aux remedes, qu'ils n'ont pas ſuggeré eux meſmes, neantmoins ſoit qu'ils le jugeaſſent innocent, ou que par un reſte d'amitié pour monſieur Fouquet ils le vouluſſent favoriſer, ils trouverent bon, qu'elle donna ſon remede, qui fit de ſe admirables effets, que la reyne vuida entierement l'arrierefais, et fut extraordinairement ſoulageé, en ſorte qu'elle dit au roy, qu'elle ne tenoit la vie, que de madamoiſelle Fouquet. Les amis de ſon mary eſperent que cela produira quelque bon effect pour luy.* I am,

SIR,

your faithful humble ſervant,

HENRY OLDENBURG.

London, Nov. 24, 1664.

SIR,

WHAT was deferred to this week, you will find performed by the papers annexed; but how we ſhall get Mr. *Hann*'s name of his own writing to his own account, I know not; unleſs he be pleaſed by your ſolicitation to ſend us another draught of the ſame ſigned with his own hand. The Society always intended, and, I think, hath practiſed hitherto, what you recommend concerning the regiſtring of the time, when any obſervation or experiment is firſt mentioned; and they upon this occaſion have declared it again, that it ſhould be punctually obſerved: in regard of which Monſieur *de Zulichem* hath been written to, to communicate freely to the Society, what new diſcoveries he maketh, or what new experiments he trieth, the Society being very careful of regiſtring as well the perſon and time of any new matter, imparted to them, as the matter itſelf; whereby the honour of the invention will be inviolably preſerved to all poſterity. I know not, whether

ther as I intended, and was commanded, deſire your favour of acquainting Mr. *Hann* with the Society's being very well pleaſed with his curious diligence in his late diſſection and obſervation, as they ſend you their hearty thanks for that communication. If I have forgot it, I beſeech you to receive it now, and to take notice of what I have hinted of reſpect to Mr. *Hann*. Indeed I ſhall not have ſo much time left, as to read over the amanuenſis his tranſcript, if I ſhall ſay all, what I have to ſay to you at this time. No account yet of the Florentine experiments, however they were promiſed me to be ſent with the packet received. My new correſpondent, I hope, will be more punctual, if I can but be ſo to him. He hath given me notice by his laſt, that they have a deſign in *France* to publiſh from time to time a journal of all what paſſeth in *Europe* in matter of knowledge, both philoſophical and political: in order to which they will print, as he ſaith, (to give it you in his own words:) 1. *Tous les livres, qui ſe ſont imprimés depuis l'annee* 1664. *et ceux, qui s'imprimeront à l'advenir, ſoit qu'ils ſoient imprimés de nouveau, ou qu'ils ſoyent reinprimez ſur quelque ancienne edition.* 2. *Toutes les experiences et nouvelles deſcouvertes, qui ſe font dans tous les arts et toutes les ſciences, phyſique, aſtronomie, chymie, medicine, &c.* 3. *Le nom et les qualités des perſonnes, qui excellent en toutes ſortes de ſciences et arts, les ouvrages, qu'ils ont faits, et ceux, qu'ils ſe propoſent de faire; la mort de gens de lettres de quelque reputation; les choſes principales de leur vie avec le catalogue de tout ce qu'ils auront donné au public, pour en pouvoir compoſer l'eloge.* 4. *Les academies et bibliotheques plus celebres, et ce qui ſe trouve de rare et de beau dans les cabinets des perſonnes curieuſes.* 5. *Les conteſtations, qui ſurviennent entres les ſcavans, et les belles queſtions, qui ſe peuvent preſenter devant meſme qu'on en ait rien eſcrit.* 6. *Les deciſions les plus notables des tribunaux eccleſiaſtiques et ſeculiers. Enfin, tout ce qui ſe paſſe d'extraordinaire dans la republique des lettres, et qu'on jugera digne de la curioſité de ceux, qui font profeſſion d'eſtude.*

IN order to the execution of which deſign I am ſolicited to contribute what I can concerning *England*, and what is found there as to excellent perſons, things, books; being promiſed to be paid in the like coin from *France*, of what paſſeth there and in *Italy*, concerning thoſe particulars. I am very unwilling to decline this taſk; but yet how to undertake it, being ſo very ſingle, and having ſo much already charged upon me, I do not yet know. But I muſt remember my motto, *Providebit Dominus.*

WE had yeſterday at our aſſembly a noble appearance, and as much life as I ever ſaw there; and no queſtion this Society would prove a mighty and important body, if they had but any competent ſtock to carry on their deſigns; and if all the members thereof could but be induced to contribute every one their part and talent, for the growth, and health and welfare of their own body, which, methinks, is one of the moſt reaſonable things in the world, and conſequently ſhould be eaſy to be perſuaded to thoſe, that make profeſſion of reaſon and virtue. Our liſts for Nov. 30. were ſent abroad on Tueſday laſt; and we are ſorry, that that, which was deſigned for you, could not find you at *London*, nor *Chelſea*. There have been lately elected into the Society, Sir *Robert Atkins* the younger, Mr. *Godolphin*, Mr. *Bagnall*, Mr. *Thyn*, Mr. *Hoare* comptroller of the Mint, Mr. *Woodfort*, Sir *John Cutler*, (Mr. *Hook*'s benefactor) and yeſterday the preſident propoſed Mr. *Harvey*, the queen's treaſurer, for candidate, inſomuch that we are now full 150 men. Mr. *Sprat* intends to begin next week to print the Hiſtory of our Inſtitution, which hath been peruſed by lord *Brounker*, Sir *R. Moray*, Dr. *Wilkins*, Mr. *Evelyn*, and others; but we are troubled, that you cannot have a ſight of it, before the publication. I ſee the author hath divided his diſcourſe into three general heads: the firſt giveth a ſhort view of the ancient and modern philoſophy, and of the moſt famous attempts, that have been made for its advancement; that by obſerving, wherein others have excelled, and wherein they have been thought to fail, it may the better be ſhewn, what is to be expected from our new undertakers, and what moved them to enter upon a way of enquiry, different from that, on which the former have proceeded. The ſecond conſiſts of the narrative itſelf, and out of the regiſters and journals of the Society, which the author hath been permitted to peruſe, relateth the firſt occaſions of their meetings, the encouragement and patronage, which they have received, their patent, their ſtatutes, the whole order and ſcheme of their deſign, and the manner of their proceedings. The third trieth to aſſert the advantage and innocence of this work, in reſpect of all profeſſions, and religion itſelf; and how proper, above others, it is for the preſent temper of the age, wherein we live. I muſt confeſs, the ſtile is excellent, even, full, unaffected; but I know not, whether there be enough ſaid of particulars, or, to ſpeak more truly, whether there are performances enough for a Royal Society, that hath been at work ſo conſiderable a time.

I FIND I have digreſſed, I know not how, from what I would have mentioned above, when I hinted to you the vigour of our yeſterday's meeting. I would have acquainted you with the ſeveral ſubjects of our entertainment; as 1. of the account, which our preſident brought in out of Iceland, *viz.* that the mountains of ice are generally ſuppoſed to have their firſt matter from the freſh water falling from the mountains of *Greenland*, and being frozen before they come into the ſea, they then receive the impulſes of the ſalt water, which being broken by its own violence, is ſoon frozen to the firſt freſh cruſt, which by northern winds are driven down to Iceland, and by reiterated combats with the waves augment their bigneſs to thirty five, and ſometimes forty fathoms beneath the water. I am certainly informed (ſaith the writer) by a very ſkilful and honeſt maſter, that he obſerved

ſerved one of theſe mountains of ice to ground, and ſoon after upon the ſide it floated away, and he went directly to the place, and ſounded, and found it thirty five fathoms; and another, by the ſame experiment, had found it in another place, forty fathoms. Theſe iſlands, he adds, do yet receive a farther increaſe from the ſnow, which being melted by rains, and then frozen again, do make the upper part very hard, and compact, and in height above the water eight, ten, and ſometimes twelve foot. As to the tides, he ſaith, that they riſe and fall unequally in the ſeveral parts, as here in *England*, but very ſeldom above three foot, for the moſt part two, or two and a half: the ſpring and common tides happen much about the ſame time as they do here. Meats boiled or roaſted retain that accidental heat there, more than twice as long as here. The magnetical needle varies unequally, declining faſter (but ſtill unequally) as they come near the land. There is no wood, which grows there, except birch, which ſeldom grows big enough to be ſerviceable for building; but they are in ſome meaſure ſupplied with good fir trees, blown upon their coaſts, but not any ſatisfaction hath been given, from whence they come. The bodies of the ſun and moon ſeem much larger there, than here: the moon hath appeared within fourteen hours after the change.

THE nations are ſtrong, healthy, and very kind, though unhewn and dirty. Turf is their common firing, and the cover of their houſes. Whey, when it is ſour, is their beer; and ſtockfiſh is their bread; and beef and mutton (if it dye alone) is their food; for then, they ſay, it is of Chriſt's own killing, and ought to be reckoned in the number of delicacies.

ANOTHER letter in Latin and Greek, a great part whereof conſiſts in Icelandian compliments, mentions theſe particulars: *Nullus pinguis liquor gelu apud nos corripitur, neque ſpiritus vini: gelu, ubi maximè, tres pedes penetrat terram, ſæpiſſimè duos. Fontes calidi hîc multi, adeò ferventes, ut ad dimidium horæ caro bovina, ollæ cum frigida aqua impoſita, ſatis decoquatur, nedum ut ſufficiat ad deplumandam avem. Agricultura apud nos nulla, vaccæ fœno hyeme vivunt; equi, oves, gramine, quod à nive liberum eſt ſæpiſſimè.* After theſe letters, we had two experiments of refraction made upon oil of turpentine and ſallet oil, whereof the former, (the angle of inclination being 30.) had its angle of refraction 16. 50'. the latter (at the ſame angle of inclination) had an angle of refraction 46. 29'. This occaſioned a great deal of good and quick diſcourſe, and brought in a liſt of experiments to be tried of refraction; as to examine the refraction anſwering to ſeveral degrees of inclination. To examine the comparative refraction of ſeveral liquors to common water; as of all ſorts of oils made by expreſſion or diſtillation, all kinds of ſaline and ſpirituous liquors; and to do this with ſeveral degrees of inclination. To examine, how much the refractions of liquors are altered by mixing of ſeveral liquors together, that do, as it were, penetrate each other; as having examined the refraction of oil of vitriol and common water each of them apart, to mix them together, and to find what is the compounded refraction, by mixing alſo of acid and ſulphureous liquors, *&c.* To examine further the refraction of liquors, wherein hath been diſſolved a determinate quantity of ſome kind of ſalt, as of ſea ſalt, common ſalt, ſal-petre, alum, vitriol, alcali, tartar, *&c.* Again, to examine the comparative refraction of a liquor, when a greater quantity of the ſame ſalt is diſſolved in it, and when a leſs; as alſo the refraction of a liquor, when two or more liquors have been diſſolved in it: item, the refraction of ſeveral liquors, wherein colours have been diſſolved. And then to proceed to examine the refraction of all kinds of ſolid bodies, as diamonds, cryſtal, glaſs, ice, gummous and reſinous ſubſtances, horn, arſenick, and all other tranſparent bodies. Item, the refraction of ſeveral coloured glaſſes, and to find, by what means the refraction of glaſs may be augmented or diminiſhed; and to examine alſo the refraction and ſtructure of the ſeveral humours and parts of the eye; and to obſerve the refraction of the air of ſeveral denſities; and finally to examine, what will be the beſt figure and the beſt material to make dioptrick lens's. You ſee, Sir, what a field we have here before us. This being over, an account was brought in of a viper diſſected by Mr. *Hook*, according to a former order of the Society; the notable particulars whereof, becauſe I gueſs the diſſector himſelf will acquaint you with, I muſt not anticipate. Only this I cannot hold to ſay, that the lungs were a very curious and admirable workmanſhip, being blown up by a ſmall pipe; extending themſelves from the throat beyond the gall, and being nothing but one continued bladder, nôt ſeeming to have any kind of partition or parenchyma, but only to conſiſt of a very thin ſkin, whereof the upper part looked almoſt like a net, but the under part like a film, as clear as the bladder of a carp, without any kind of veſſel or muſcles in it, though examined by a microſcope. This experiment will, and ought to be proſecuted, and may conduce much to the enquiry about reſpiration.

OUR preſident gave, after this, an account to the company of the Anti-Paſcalian book, which I ſhall ſend you by the firſt coach, which will be to morrow. His lordſhip obſerved, that he did not ſo much refute *Paſcal*, as bring in another hypotheſis; whereby he could indeed ſolve all the phænomena, but, as he thought, not ſo rationally, as it was done the other way; putting all upon the ſtreſs of rarefaction, and the motus nexûs, an hypotheſis inconceivable to conſidering men. His lordſhip was very ready to comply with what you deſired in your letter, and drew up, with his own hand, as you ſee the annexed account about the barometers. He was earneſt with me, not to forget the preſentment of his humble ſervice to you; and he added ſuch ex-

preſſions concerning the eſteem his lordſhip hath for you, that no man can have greater: and when upon your return hither you ſhall know all, you will then ſay, I have ſaid too little of it now. I am not able to read over this long rhapſody, no more than the tranſcript of our clerk, leaving all to your goodneſs to pardon the faults of,

SIR,

your very faithful humble ſervant,

H. OLDENBURG.

SIR, I pray be pleaſed to hint to me, whether the ſame preface will ſerve in differing languages, for the Latin thermometrical, and for the Engliſh both thermometrical and hiſtorical Treatiſe.

HIS majeſty let the parliament know this day, how ill his neighbours had proved ſince he ſaw the parliament laſt; what preparation he had made to reduce them to reaſon, and the charges thereof (800,000 *l.* ſterl.) and his happineſs of doing it upon his own credit; together with the aſſurance he had, that they would do quickly, what they had promiſed to do, when they voted to aſſiſt him with their lives and fortunes in the undertaking of the war, and the carrying of it on; and, that he was reſolved to make no peace, but upon a firm bottom of the nation's honour and welfare to that purpoſe.

London, Nov. 26, 1664.

SIR,

YOUR laſt came very ſeaſonably, and all will be rectified and filled up according to your directions and ſupplies, both in the Engliſh and Latin. I hope, you will diſpatch to us all the remainder, belonging to the hiſtory of Cold, before the week's diverſion comes in; our Society having already, by the late froſt, excited one another to the proſecution of experiments of freezing, and mention having been there made of your hiſtory, that is a printing, for variety of excellent materials to work upon. I do here incloſe my draught for the publication of your thermometrical preliminaries; wherein I doubt, I come far ſhort of what ſhould be ſaid, and particularly about the communication of the ſealed thermometer, and the barometer; concerning which, ſince I have not the perfect and certain knowledge of their firſt inventor, I have minced, as you ſee, the intimation, I give of it; entreating you, that you would oblige me, by your private pen, to make ſuch additions and alterations, as you ſhall find neceſſary, and ſo to ſend it back ſpeedily, I having no copy of it.

I SEND here annexed, his majeſty's ſpeech, which I took from Mr. *Herringman* for you, thinking you would be very well pleaſed, to read, with the firſt, ſo kingly and ſo prudent a ſpeech; which had ſo great an effect, that yeſterday, which was the very next day after, the parliament voted for the king and the carrying on of the war 2500000 *l.* to be raiſed by aſſeſſments. If our neighbours could any way handſomly recoil, they would do it with all their hearts; and their ambaſſador never had a more uncomfortable ſupper, than he had yeſternight, when the news was brought him of ſo mighty a vote, the like was never given for any Engliſh king. It is thought, the ſword will not be put up now, till his majeſty be fully poſſeſſed of the dominion at ſea, and the diſpoſal of trade. It may produce at laſt that coalition, which hath been formerly deſigned by *England*. That righteouſneſs may be the foundation, and that proteſtantiſm may receive no diſadvantage, and that at length a good peace may cement all again, is the hearty wiſh of,

SIR,

your faithful humble ſervant,

H. O.

SIR, I humbly thank you for your preſent of *Stillingfleet*'s new book. Since you are pleaſed to make it by way of a dilemma, I take the freedom of embracing that part of it, which is moſt for my advantage, thinking, I may make a good uſe of it, as a Pariſian.

London, Dec. 3, 1664.

SIR,

IN hope, that the time of the reſpite, lately reſerved to yourſelf, will be near expired, when this ſhall come to your hands, I made no great ſcruple to overtake it, eſpecially ſince the chief occaſion of this letter is the incloſed, which containeth an account, that you and your Chriſtian friends will not be diſpleaſed with. It came from *Amſterdam* to me, by a ſpecial friend, ſince my laſt to you; but it ſeems, that at that time, when it was written, my letter to our correſpondents there, which was a cover to the printed Turkiſh ſheet, I ſent thither by your favour, was not yet come to their hands. It appears by the beginning of this copy of *Warnerus*'s letter, that he intends to tranſlate the new teſtament, as he hath done the old: wherefore it fell out very opportunely, that we diſpatched to *Amſterdam* a pattern of what is done here in that particular, perſuading myſelf, that they will with all ſpeed tranſmit the notice of it to *Conſtantinople*, to the end, that the ſaid *Warnerus* may not *actum agere*. I do intreat you, Sir, that you would oblige me, to have this Latin letter ſpeedily tranſcribed, if you ſhall have further occaſion of it, than to read it, that I may have it returned the next week to me, who had no time at all to take another copy of it.

MR. *Crook* was extremely ſurpriſed, when I read to him, what you ſaid in your laſt about the ſlowneſs of ſending you the printed ſheets of your book, proteſting to me, that he had ſent you all on Monday laſt, what was then printed off; and aſſuring, that on Monday next you ſhould not fail to receive two ſheets more, which would make in all ſeventeen

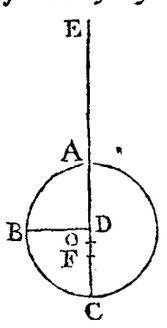
ſheets,

ſheets, if I miſtake not, the laſt ſheet being *S*, though I have at this time *T* alſo by me, to review it, to print it off on Monday next. I perceive by Mr. *Crook*, that Dr. *Merret* thinks, you will, both in the title of the book, and in the preface, take notice of his appendix; to which I made anſwer, that I did not doubt, but you would do ſo.

I CONCEIVE it neceſſary, if your leiſure would permit, to give yourſelf the trouble, in the peruſal of the printed ſheets, ſent you of your hiſtory of Cold, to ſet down the miſtakes, that will occur here and there, notwithſtanding all the care, that hath been taken in the correcting. For, though I have marked ſome of them (which yet are but very few) yet there are ſome paſſages, which I did not well ſee the ſenſe of, at the leaſt, it ſeemed imperfect to me: and they were, p. 48. unto the word *Beſides*; item, p. 239. N^a 3. lin. where a word ſeems wanting to determine the meaſure of the *Bolthead*; item, p. 83. I deſire to know, what is underſtood by *unfreeſing liquors*; whether ſuch, as do not cauſe, or thoſe that do not ſuffer congelation? item, p. 266. Q. whether there be not a word omitted, or miſwritten in N° III.

I SHALL ſay no more for this time, than that Mr. *Zulichem*, in a late letter of his to Sir *R. Moray*, hath given us this account, concerning an univerſal meaſure, which I beg may be even communicated to Dr. *Wallis*, with my humble ſervice, and whereupon I expect both your ſenſe. Theſe are his own words:

Pour ce qui eſt de la regle de my lord Brounker des pendules iſochrones, qu'il a pris la peine d'eſcrire dans le billet, que vous m'avez envoyé, elle s'accorde avec la miene en ce, qui eſt du mouvement de largeur des figures planes, mais ne s'eſtend pas à l'autre mouvement, que j'appelle lateral des meſmes figures, ou il y a beaucoup plus de difficulté, ny auſſi aux mouvements des corps ſolides, ou il y en a encor d'avantage. Vous m'avez deſia communiqué autrefois ce qu'il avoit determiné pour la meaſure univerſelle. Mais pour n'eſtre point obligé à une certaine proportion de grandeur de ſphere à la longueur de pendule, il eſt utile de ſcavoir le centre de vibration d'une ſphere pendue à quelque longueur de fil que ce ſoit, lequel centre je mettray icy comment ſe trouve. Soit la ſphere



A B C, dont le centre D, pendu au filet AE, attaché en E. el faut trouver aux lignes E D. D B. la troiſieme proportionelle D F. de la quelle DO. faiſant les ⅔, je dis, que O. eſt le centre de vibration de cette ſphere ainſi ſuſpendue, c'eſt à dire, que ſes vibrations ſeront iſochrones à un pendule ſimple, dont le plomb eſt conſideré comme ſans grandeur, de la longueur de E o. Tellement que pour la meaſure univerſelle il ſuffit, devoir quelque ſphere ſuſpendue, qui faſſe des vibrations d'une ſeconde ou demi-ſeconde, les plus peſantes & grandes eſtants les meilleures, à cauſe de la reſiſtance de l'air. Je trouve cette longueur E O fort exactement de 9½ pouces de Rhynlande, lorſque les vibrations ſont de demi-ſecondes.

THIS account was lately under the conſideration of the Society; and, when it was ſpoken of at their meeting, order was given, that it ſhould be punctually regiſtered at the ſame time, when it was firſt mentioned, to the end, that Mr. *Huygens* might have his due, and that his inventions be recorded for his honour to poſterity, as well as the inventions of the Engliſh virtuoſi. This juſtice and generoſity of our Society is exceedingly commendable, and doth rejoice me, as often as I think of it, chiefly upon this account, that I thence perſuade myſelf, that all ingenious men will be thereby encouraged to impart their knowledge and diſcoveries, as far as they may, not doubting of the obſervance of the old law, of *ſuum cuique tribuere*. I am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London, Dec. 10, 1664.

SIR,

I WAS lately deſired by my lord *Brounker* to acquaint you, beſides his humble ſervice, with your being elected into the company for the royal mines, and into that of battery, who will therefore be very glad, as well as *Greſham* college, to ſee you here with the ſooneſt. I found by my lord *Brounker*, that he would have been better pleaſed with your thoughts concerning his notes upon the real phænomena, than with your thanks. I told his lordſhip, when I perceived this (though it was only by way of gueſs) that I ſuppoſed, he would have your opinion upon the whole matter from your own mouth, at your return hither, which I hoped would be within a few days. At our laſt meeting (of which I could give you an account no ſooner, than to day, by reaſon of many impediments, taking me off till now) we were entertained partly by ſeveral experiments of refraction, made with vitriol, ſaltpetre, alum, whereof the two former ſuffered a little more, and the laſt, a great deal leſs refraction, than common water; partly, by trials made with pendulums, according to Mr. *Zulichem*'s rule, formerly ſent you, for an univerſal meaſure; which will require more experiments; partly, with the reading of a pretty long dedication, made by Mr. *Joſeph Glanville* to the Royal Society, and prefixed to his book (which was at the ſame time preſented them by lord *Brereton*) intitled, *Scepſis Scientifica*, or, *Confeſt Ignorance the way to Science*. In which dedication the author expreſſeth a very great reſpect to the ſaid body and their deſign; which I was very glad, and ſo were others, to find to be ſo well underſtood, at laſt, by ſome, though, I fear, the great expectation, he raiſeth of their enterpriſe, may be of more prejudice, than advantage to them, if they be not competently endowed with a revenue, to carry on their undertakings.

dertakings. Theſe particulars, thronging in, one upon another, and conſuming all our time, left me none, at that aſſembly, to acquaint the company neither with your conſiderable anatomical obſervation, nor with Mr. *Auſtin*'s propoſals, both which I am perſuaded they will be very well pleaſed with, and the latter, I think, you will not judge amiſs to have it repreſented, and recommended to them, to conſider of the carrying of it on; which I intend, God permitting, to do at our next meeting.

MR. *Henſhaw* (which in my former I intended to have given you notice of, but forgot it) brought lately in an account, concerning the nature of frogs ſpawn, from his own obſervation and experiment, which the company was much ſatisfied with: but it being pretty prolix, I ſhall not ſwell a letter with it, but reſerve the communication to your return.

I HAD no news from *France* this week. Our news at home is, that the parliament is exceedingly divided concerning the way of raiſing that ſum of money, they have voted: yeſterday they were mighty warm, and one of their number told me, they would be very hot this day upon that ſubject; and that yeſterday the manner of raiſing it by way of ſhip-money was ſo much urged, that the court party carried it that way, by ſome, though but few votes; the country gentlemen proteſting (ſome of them) that they dare not return into their country, if it be impoſed after that rate; and one of theſe affirming to me, that he had ſaid it plainly in the houſe, they ſhould take him, his wife and children, and ſend him rather in a ſhip againſt the Dutch, than back into his country, if they would take that courſe. This conteſt and diſagreement will put the Dutch into ſome heart again, eſpecially if it be true, what is now reported, that the king of *France* will, according to the league, aſſiſt them, at leaſt with very conſiderable ſums of money, and with men, if they need them. *Scotland* is mightily averſe from the war, and that upon the account of the deſtruction of all their trade and traffick with the Dutch; they having none, or very little, with *England*.

I HOPE, if I receive the favour of one letter more from you, before your coming home; you will forbid more writing to,

SIR,

your faithful humble ſervant,

H. O.

I RECEIVED the two laſt titles; and have given order for the ſcheme touching the conſervatory of ſnow.

[June 1665.]

SIR,

I ESTEEM it very hard fortune, not to ſee you, before you went out of town: I know not what fatality there was in it, that we could not meet, how much ſoever I endeavoured it. I confeſs, my occaſions of late have very much engaged me to be out of the way, and at the other end of *London*; but yet I did very often enquire in the mornings at my lady *Ranelagh*'s, whether you were in town, but could not hit the time when you were ſo. If I had but been advertiſed any day before, of an hour convenient for you, I would have contrived my affairs ſo, as to have waited on you. I ſhould have expreſſed my thanks for the favour of your communications concerning the comet, and the receipt againſt the ſickneſs (which I beſeech you to accept of herewith) and enquired, what quantity is to be taken of that medicine of *Septalius*, which, I hope, you will pleaſe to ſignify at your firſt conveniency. I did alſo intend to have had ſome diſcourſe with you concerning Mr. *Borreel*, of whom I underſtood, ſome weeks ſince, that he was very ſick, and not likely to recover. I can only ſay this of him at the preſent, that I wrote to *Amſterdam*, and entreated him to conſign his writings, that concern the proof of the truth of Chriſtian religion, to ſuch hands, that we might have a copy thereof at leaſt: whereupon I had this anſwer, that he had taken care for that particular, and that you and I ſhould have a copy thereof, if care were taken, and the expences borne to tranſcribe it. To which I returned, that I was perſuaded you would accept of that condition; nor do I believe now, that you will give me authority to revoke what I have ſaid.

THE firſt ſheet of the Latin, concerning the diſcourſes of thermometers, is printed off; which I alſo propoſed to have ſhewed you; and if I could have ſeen you, I would have adviſed with you, what preambles to make to thoſe two other pieces, concerning Antiperiſtaſis, and the Examen of Mr. *Hobbs*; for, ſince they are to be ſeparated, in the Latin, from the main body of the hiſtory of Cold, the advertiſements prefixed to them, ſeem to me to require ſome alteration; which, I believe, you will, upon looking upon them agree with me in; and, having done ſo, I promiſe to myſelf your care of letting me know your mind about it.

I THINK, the Society will adjourn on Wedneſday next, when I ſhall, if God permit, acquaint you with their letter, and what was annexed to it. They did order me, the other day, to enquire of you, whether that colt, whereof you gave them the monſtrous head, had no other monſtroſity in any other part of its body; ſome of the company being apt to believe, that, if it had not, it might very well be, that it had received a forcible kick on the tender head, whereby the eyes were diſlodged, and forced into one place. I pray, Sir, reſolve this queſtion, if you had the particulars of this colt's whole conſtitution? I hope you will give me leave to inſert it into my next tranſactions as alſo the contents of your letter concerning *Ruta capraria*; and I do entreat your favour and liberality,

of imparting now and then ſomething, that may enrich theſe papers, and aſſiſt me in continuing them, notwithſtanding the diſcouragement of this ſickly ſeaſon.

My laſt news from *Paris* was this. Monſieur *Hevelius a envoyé à monſieur Colbert*, (from whom he hath a penſion) *ce qu'il a obſervé de la comete. Mrs. Auzout & Petit ent trouvé eſtrange, qu'il l'a faite paſſer, par où'elle n'a point eſté, & que de plus il ne l'ait point obſervé au mois de Mars, mais ſeulement on Fevrier, quoy qu'on l'ait veue ce mois là par tout ailleurs.*

On a fait ſaigner un homme chez monſieur Bourdelot, à qui on a trouvè du lait dans la venie au lieu du ſang (I beſeech you, Sir, tell me, whether you have met with the like obſervation.) *Un chirurgion ayant arraché une corne, qui eſtoit venue à la teſte d'une femme, elle en eſt devenue folle.* (And this ſtory is not ordinary.) *Je donnay à un gentilhomme Anglois* (ſo my friend goes on) *le livre de monſieur Petit ſur la comete, où il y a des choſes curieuſes, on inprimera le* Redi delle Vipere *icy à Paris: quand il ſera fait, je vous l'envoyeray.*

Je vous avouë (ſo he paſſes to politicals) *que ſi nos veux eſtoient exaucez, les Anglois ſeroient bien battùs. Quoy qu'il ſoit arrivé, on eſt icy aſſuré, que le combat aura eſté funeſte & ſanglant. Si vous vous joignez à l'Eſpagne, voſtre guerre ne finira pas ſi toſt, & on vous pourra un jour donner de l'exercice.*

SINCE I wrote this, I ſaw a letter of Mr. *Hugenius* to Sir *R. Moray*, wherein he alſo ſeems to be diſſatisfied with monſieur *Hevelius*'s obſervations of the firſt comet. I will give you his own words. *Monſieur Hevelius m'a fait dire, qu'il a fait imprimer un traité du comete premier de 60 fueilles in fol. J'en ay vû quelques unes des figures, qui me ſemblent aſſez eſtranges: car, 1. Il depeint la teſte du comete, comme s'il l'avoit vuë fort grande & avec de certaines taches dedans, ce qui ne m'a aucunement paru* (Mr. *Hook* affirms, to have ſeen ſuch ſpots too) *mais avec mes meilleures lunettes elle m'a tous jours ſemblé tres petite comme les eſtoiles fixes, excepté la chevelure & à Rome on l'a obſervée de meſme. 2. Pour ce qui eſt du cours du comete, il en fait une ligne continuë, qui retourne en elle meſme; d'où je prevoy quelque bigarre hypotheſe; parce qu'il marque cette ligne courbe dans le ciel meſme à travers des ſignes, dont il a donné une figure: mais il faut attendre ſon explication.* I am,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, July 4, 1665.

SIR,

I MUST haſten to return you my humble thanks for that communication of your's, concerning the *Ruta capraria*, as alſo for what you intend to impart about milky blood; to the mention of the latter of which you do annex a parentheſis, which ſeems to imply your removal from *Oxford*; which, if ſo, I hope, it is not for any infection, that may have attacked that place, as it hath begun to do many others. The Almighty be entreated to chaſtiſe us in mercy, and diſpoſe our hearts not to abuſe his mercy. To my exceeding grief, our noble preſident's neighbourhood, but two houſes diſtant from his lordſhip's, is infected alſo: I know not, whether this dreadful neighbour will occaſion him to alter his thoughts for a removal. It is a great mercy, that *Southwark* and *Rotherhith*, where ſeamen are ſo numerous, and other people, that relate to, and work in the navy, remain ſo free yet of the contagion, that there are not above two houſes ſhut up in thoſe quarters. If it ſhould come into this row, where I am, I think I ſhould then change my thoughts, and retire into the country, if I could find a ſojourning corner. In the mean time, I am not a little perplexed, concerning the books and papers belonging to the Society, that are all in my cuſtody. All I can think of to do in this caſe, is, to make a liſt of them all, and to put them up by themſelves in a box, and ſeal them together with a ſuperſcription; that ſo, in caſe the Lord ſhould viſit me, as ſoon as I find myſelf not well, it may be ready to be immediately ſent away, out of mine, to a ſound houſe, *& ſic deinceps*. But theſe are but ſad ſtories, which I therefore leave, to come to let you know, that monſieur *Thevenot* hath ſent you the ſecond tome of his curious voyages in folio, fairly bound, wherein are contained, as far as my curſory peruſal could inform me, ſeveral things not unpleaſing, and inſtructive, both for navigation, policy, and natural philoſophy, though moſt of it be but traduction. I intend, God willing, to ſend it to morrow by the coach or carrier for *Oxford*. There came along with it two diſputations, anti-Carteſian ones, held at *Paris*, by the Jeſuits, in their college of *Clermont*; in the one whereof they endeavour in general to make him and his philoſophy ridiculous and abſurd, urging him with ſuch conſectaries, following from his doctrine, as theſe:

1. *Datur infinita multitudo, major infinities aliâ multitudine infinita.* 2. *In rebus materialibus, non tantum poſſibile eſt infinitum actu, ſed etiam neceſſarium.* 3. *Sunt plures in hoc mundo ſoles, quàm aut arenæ aut piſces* (well put together!) *in oceano.* 4. *Pars non eſt minor toto.* 5. *Nulla eſt hujus univerſi particula, quæ mutare locum poſſit.* 6. *Tam eſt immobilis navis, quæ Rhodani curſum ſequitur, quàm rupes in terra.* 7. *Si partes hujus, quem ſpiramus, aeris quieſcerent, eſſent illæ quovis metallo duriores.* 8. *Non magis propriè dicitur Deus creaſſe cœlum & terram, quàm ſitas in ea domos & urbes.* 9. *Nihil addere Deus huic univerſo poteſt aut detrahere, ne muſcam quidem aut atomum.* 10. *Quò leviora ſunt corpora, eò citius aguntur deorſum.* 11. *Plus eſt in aëre ſubtiliſſimo, ſi bene figitur, quàm in auro, ponderis.* 12. *Fieri naturaliter poteſt, ut homo reipſa mortuus perinde currat & comedat, ac ſi mortuus non eſſet.* 13. *Maximum eſt, ne brevi ſol totus obtenebreſcat, periculum.* 14. *Fatigari magis*

magis unuſquiſque debet ab aëre ſibi incumbente, quàm fatigetur ab onere graviſſimo bajulus. 15. *Horologium tam ægrotare poteſt ac interire, quàm equus.* 16. *Fieri vacuum divinâ virtute non poteſt, quia non poteſt ab humana mente concipi.* 17. *Nec ferrum à magnete trahitur, nec magnes à ferro.* 18. *Poteſt ex quolibet fieri quodlibet citra miraculum.* 19. *Idem ſidus ſine ulla ſui mutatione nunc fieri cometa poteſt, nunc planeta.* 20. *Nolim eſt id, de quo dubitatur à multis, quàm id, de quo nemo dubitat.*

THESE are ſome of the many, that are charged upon that ingenious philoſopher. And, to bring the charge home enough, he ſums up all in this theſis: *Ne plura dicam, neceſſe eſt, ut & mathematicæ, & philoſophiæ & theologiæ diſpliceat hypotheſis Carteſiana. Philoſophiæ, cujus omnia principia notioneſque multis abhinc ſeculis communi conſenſione receptas, evertit. Mathematicæ, quam ad res naturales, quæ ſunt alterius generis, explicandas, non ſine magna perturbatione ordinis traducit. Theologiæ, quatenus ex hac hypotheſi videtur eſſe conſequens,* 1. *Nimium aliquanto tribui corpuſculis fortuitò concurrentibus; quod favet Atheis.* 2. *Nihil eſſe neceſſarium, ſubſtantialem in homine formam admittere; quod impiis & diſciplinæ ſolutioris amantibus favet.* 3. *Nullam fieri in euchariſtia converſionem panis & vini in ipſum Chriſti corpus ac ſanguinem, nec aſſignari, quid in illa converſione deſtruatur, poſſe; quod favet hæreticis.* Who would not, for the moſt of theſe reaſons, be the more enamoured with the *Carteſian* principles?

The other diſputation is entitled, *De duplici cometa, vero & ficto, poſitiones mathematicæ:* wherein that particular opinion of *Des Cartes*, concerning comets is diſputed againſt, and that hypotheſis, which compounds comets out of a congreſs of many ſtars, contended for; which latter, it ſeems, hath been expunged at *Paris*, by a Carteſian, who, together with his maſter, muſt therefore ſmart for ſuch an attempt.

I AM promiſed other, and, I hope, better things, than theſe, from *Paris*, which ſhall be at your ſervice, if God permit.

DR. *Beale* (who received authority for that title, together with that of royal chaplain, from the king, when he was laſt in *London*) ſent me a letter this week, wherein he preſents his very humble ſervice to you, deſiring me withal, to acquaint you with this following ſecret, *viz.* that he was told, by ſeveral perſons, above ordinary ſagacity, that *Kuffler*'s fireworks were in our naval fight; and that a perſon of honour told him, that he ſaw my lord *Brounker* attending, and directing his majeſty, at a view of ſome ſuch execution, by way of diſcharging a ſtrange wildfire out of a gun; which he gueſſed to have ſome affinity with the other. He adds, that he ſhould ſuggeſt a ſecurity, that *Kuffler* (a Dutchman) be not retained againſt us.

I BELIEVE this to be a great miſtake and miſinformation; and I think, that both theſe things, mentioned by our friend, amount to one, and that very differing from *Kuffler*'s invention.

DR. *Beale*, in the ſame letter, tells me of a large diamond, as big as his hand-wriſt, ſent by a chemiſt to a lady, who ſhewed it to him very lately; which ſtone, he ſaith, the chemiſt made out of a black flint, commending it as very clear, and fair as any cryſtal, and fit for pendants, if not too hard for common workmen.

HE adds, that ſpirit of wine is by heat conſumed in one of his ſealed thermometers; and infers from thence, that though air be there commonly impriſoned, yet ſomething of weight and bulk does by heat get out: he will have even ethereal ſteams to have their weight alſo, otherwiſe we ſhould not retain them amongſt us, to fill up expanſions of air, or for our vital food. He had not, it ſeems, ſcales good enough to prove, that ſcaled thermometers loſe weight by inſolation, but by the manifeſt waſte of the liquor he gueſſed it.

OUR ſociety did actually declare a diſcontinuance of their meetings, on Wedneſday laſt; at which time thay had the company of monſieur *de Lionne*'s ſon, and of the agent of the French merchants, monſieur *Damas*, who were alſo both, upon their deſire, admitted as fellows of the Society, after they had been ſpectators of ſome of thoſe experiments, that were formerly made for the making out of that hypotheſis, concerning the air's being a diſſolvent to combuſtible bodies.

AFTER ſome lettice or other ſeeds of haſty growth had been ſown in earth, and left expoſed to the open air, and at the ſame time, ſome of them put in an exhauſted receiver, the former was ſprung up, two or three inches high, in a week; but the latter did not appear at all: whereupon air being admitted and continued to the latter, it did, within another week, ſhoot up as high as the other.

OUR news is, that a part of our fleet is returned to ſea under prince *Rupert*, the duke being at laſt prevailed with, to ſtay at home; and that we cured, the other day, two Dutchmen of their infidelity, concerning the life of the duke and the prince, by their own eyes, and by kiſſing both their hands. By Mr. *Dury*'s letter out of *Helvetia*, I find, that the fame is ſpread in remoter parts, that our fleet hath been worſted. The king hath further knighted *Tiddiman*, *Jordans*, and *Cuttings*. *Reynolds*, that was in *Guinea*, is at laſt come home by the *Barbadoes*, whence he hath conveyed into our ports eighteen or twenty ſugar-ſhips, and brought in his own veſſel, for ſome comfort of the Guinea company, ſome 20000 *l.* in gold, as Mr. *Slingſby* told me.

THE king's expected to morrow at St. *James*'s, to ſit there in council. The court is not like to ſtay long at *Hampton*, the contagion being in that town alſo; but to remove to *Saliſbury*, and thence to *Oxford*, in Auguſt, to meet the parliament there, if that place remain uninfected.

I DO not incloſe here my fifth tranſactions, for fear of ſwelling the letter to above their worth; yet there are ſome particulars in it, communicated by Sir *R. Moray*, about the working of * * * and mines without air-

ſhafts; and a way of breaking eaſily and ſpeedily the hardeſt rocks; which I think may be very uſeful. I hope my next will receive ſomething again out of your ſtore, which ſhall be acknowledged by,

SIR,

your very humble

and faithful ſervant,

H. OLDENBURG.

London, Aug. 10, 1665.

SIR,

THE Italian gentleman, now at *Oxford*, whom you hint to me in the favour of your laſt, I am, I think, not unknown to. I gueſs, it is ſignior *Ubaldini*, a nobleman of *Tuſcany*, a late proteſtant proſelyte, of good natural and acquired parts, as far as I have been able to diſcern, by the ſmall acquaintance I had with him, when he was at *London*. He is indeed, as you ſay, very likely to give a good account of the Roman affairs, if his charge have not cut off that entercourſe, whereby he might be enabled to do ſo; the conſiderableſt tranſactions there, being fallen out, I think, ſince he left that country. The laſt Pariſian letters relate this of it: *Nous ſommes tousjours mal avec le pape. On combat ſon infallibilité* (this will pleaſe Mr. *White*, as much as any proteſtant) *autant bien & avec autant de vigueur qu'il eſt poſſible. Le parliament & la Sorbonne dans cette rencontre agiſſent de concert, & font leur devoir. Je vous diray ce que produira leur union. On inprimera un traitté de monſieur Talon* (the French king's ſollicitor general) *ſur ce ſujet, que je vous envoyeray, quand je pourray.*

Je ne trouve perſonne (ſo he goes on upon another occaſion) *qui aille en Angleterre, & je ne ſcay, comment vous envoyer ce que je vous ay promis. Monſieur Petit m'a demandé, ſi je ne pourrois pas vous faire tenir ſon livre de la comete, mais je luy ay dit, que je ne ſcevois perſonne, qui paſſaſt la mer. De luy, & meſſieurs Auzout, Martel, Thevenot, & de tous ceux, qui ont l'honneur de vous conoitre* (thus he compliments) *j'ay ordre de vous exhorter à ſortir de Londres, le danger eſtant par trop grand. Une perſonne de &c. ne doit pas hazardée & exposée à un peril ſi grand. Vous y ſongerez, & vous conſervez pour vous & pour vos amis.*

THIS kindneſs, expreſſed in the laſt period, did ſomewhat ſurpriſe me, not thinking, the French had been guilty of that quality in ſo high a degree. I am likewiſe much obliged to you, Sir, for your favour of intereſting yourſelf, as you were pleaſed to ſhew it in your laſt, in my health; which I ſhall endeavour, if the Lord ſhall think good to continue it, to employ with as much zeal for your ſervice, as for myſelf.

BUT, to return to the matters of that French letter; it gives me the following extract of a burning-glaſs, made, it ſeems, at *Lyons*, which I entreat, Sir, you would pleaſe to compare with your own, that I have heard you commend, if I remember well, for burning pieces of ſilver; and having compared this deſcription with the beſt effects of your's, to acquaint me with the difference, and in particular with thoſe, that concern the dimenſions. If I find, that the glaſſes, we have of this kind in *England*, do not yet approach in goodneſs to that here deſcribed, I may, I think, in my next Tranſactions inſert it, if God give me life; and if you find it ſo too, I ſhall do well, I think, not to anticipate the printing thereof, by other multiplied communications. It is verbatim, as follows.

Lugduni, Julii 18, 1665.

De efficacia ſpeculi dom. Vilette, vera omnia perſcripſerat D. P. Bertet. Vidimus effectum repetitis vicibus, mane, meridie, à meridie: ſemper efficaciſſimè urit, & fundit, & liquat objecta quævis, pauciſſimis certè exceptis. Nobis præſentibus eliquavit argentum (une piece de 15 *ſols) cuprum (un liard) orichalcum, fruſta lebetis ferrei fuſi, minuta fruſta chalybis, capita minora clarorum ferreorum; nam ferrum à fabris cuſum aliàs non, aut ægrè, liquat: ſed calcinat vitrum, ſaxa ædificiorum (quæ in vitrum, fundendo, redegit, ſicut & oſſa animalium) etiam vitrum ab utraque parte politum eliquavit, quia pori ejus ſtrictiores, quàm ut radios à ſpeculo reflexos ſimul exciperent: candelam accendit promptiſſimè, baculos craſſos ligneos momento inflammat jucundo ſpectaculo. Radius ſpeculi eſt pedum* 4, *& pollicum* 8; *focus, pedum* 2, *&* 4. *pollicum; diameter circumferentiæ, pedum* 2, *pollicum* 6. *& linearum circiter* 2; *ſpeculum etiam à parte convexa politum cernitur; ſed rectius ab ea politura abſtinuiſſet artifex ob foramina quædam & hiatus, exteriorem faciem nonnihil deformantes, quanquam & hoc nihil detrahat perfectioni ſpeculi concavi. Speculum ipſum jam eſt cum ſuo pedamento abſolutum: æſtimatur* 150. *aureis Ludoviciis.*

SIR, I rejoice very much, to underſtand, that you have two ſuch excellent ſubjects ready again for the preſs; and I hope, that this extraordinary calamitous ſeaſon will not prove a real diſcouragement for the future. I aſſure you, I have done my part, both as to the tranſlation of the thermometrical piece, and to the preſſing of Mr. *Crook* to have it diſpatched. But the interrupting of the correſpondence with *Holland*, on one ſide, and this ſad viſitation, on the other, hath diſappointed all, for the preſent. I have begun to tranſlate the body itſelf of *The Hiſtory of Cold*; and what you ſhall think good to commit hereafter, when it can be done with more ſafety than now, to my hands, concerning the hydroſtaticks, and the forms, either for the printing, or tranſlating, or both, I ſhall, God willing, ſtudy to ſerve you in, with the beſt of my power.

I HAVE now put all my little affairs and my papers in order, ſevering what belongs to the Royal Society, to yourſelf, and to Mr. *Dury*'s child and eſtate, *&c.* from mine own, and intending, if the hand of the Almighty

ſhould viſit me, with others, at the very beginning of my indiſpoſition, to have thoſe books and papers (and particularly your's, and my tranſlations concerning you) conveighed to a healthy place, and ſo to recommend them there, that, in caſe of the like accident to them, they would take the like care for theſe things.

I AM very well pleaſed with the obſervation about the wood's being petrified in ſandy earth; and I humbly thank you for the communication thereof. I doubt not, but you will get a full proof concerning the matter of fact, and then give me leave to inſert it in my tranſactions, if I live to print any more. I wonder, whether thoſe experiments, you mention to have made with the poiſon drawn from tobacco, agree with thoſe, that were made at *Greſham*, and by Mr. *Daniel Coxe*.

I SEE I have no more paper left, than is neceſſary for folding up this letter: wherefore it is time to ſay, what I am really,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London, Aug. 24, 1665.

SIR,

AFTER ſuch long letters of mine, lately thronging in upon you, I thought it but fit to give you a little reſpite, and to promiſe you ſhorter ones hereafter. I cannot but return you my humble thanks for imparting to me ſomewhat of your philoſophical employments where you are. I am very glad to underſtand, ſome others of our Greſhamiſts are active alſo, and like to give us a good account of their ſpent time, at our meeting again, which I beſeech God to haſten, if it be his will. I ſhould be very glad, to hear your thoughts, concerning the Gas ſulphureum, I mentioned formerly to you; as alſo a further information of the dimenſions of your own burning-glaſs, if you have taken it out. Dr. *Wren* is well received at *Paris*, and conducted to ſome of their meetings; and made acquainted with meſſieurs *Auzout*, *Petit*, and *Thevenot*. My correſpondent tells me this: *Je l'ay mené chez monſieur Bourdelot, où ce jour là on dit quantité de belles choſes. Il approuva fort ce qu'on y dit, mais il ſouhaitoit, qu'on fit des experiences.* (This is like a member of the Royal Society.) *Le medecin de la reyne de Pologne y explique la nature d'une maladie, nommée plica, à laquelle les Polonois & les Coſaques ſeuls ſont ſujets. On y parla d'un ſourd & muet, qui danſe en cadence, & des pluſieurs autres choſes, qui luy plûrent aſſez. Nous l'avons auſſi mené chez le grand architecte le chevalier Bernini. Il a vû le buſte, qu'il fait du roy en marbre, & le deſſein, qu'il a fait du Louvre, dont il vous entrétiendra. Je luy ay fait voir ce matin la machine le monſieur Paſcal, avec laquelle on peut faire toutes ſortes de regles d'arithmetique.*

I FIND, by the ſame letter, that the king of *France* hath now openly declared for *Holland*, and withal made monſieur *de la Fueillade* general of the French forces to be ſent againſt *Munſter*; which doubtleſs will embroil all *Germany* afreſh: yet the ſaid biſhop is like to go on in his deſign, which is double, to attack the Dutch upon his own account, and, if he proſper there, to ſend his army to reinforce *Flanders* againſt the French.

THE two fleets are like to engage again very ſhortly. We were conſiderably foiled at *Bergen*, yet not without a great loſs to the Dutch, having, as we ſay, ſunk three of their ſhips, and deſtroyed above one thouſand men.

OUR own eight Eaſt-India ſhips, valued two hundred thouſand pounds ſterling, and our Eaſtland fleet, to the number of twenty, laden with ſubſtantial naval commodities, are all ſafe in our harbours. All were comfortable enough, if the Almighty were pleaſed to remove or mitigate this ſore calamity, that lies upon us. Yet I cannot but obſerve, becauſe very obvious, that not many houſes of perſons, that have healthy conſtitutions, and have not vitiated them by intemperance or otherwiſe, and do enjoy a comfortable ſubſiſtence (all theſe being taken together) are infected. But yet I think this very far from a demonſtration againſt the plague. Signior *Borrhi*, which I wonder at, remembers him to me, in a letter, written by a friend, and offers me (very kindly) his antidote for the plague, if I will aſſign a perſon, to whom he ſhall give it. I could eaſily find a perſon, if I could but find a way to have it ſent over. However the kindneſs and favour is the ſame, and I have let him know ſo much, by a few lines, I have inſerted for him in the anſwer to my friend. The ſame *Borrhi* had received news from *Vienna*, importing, that now the Chriſtians need not fear the Turks any more, there being work enough cut out for them at *Meccha*. And it ſeems, that that news is continued ſtill by letters to *Amſterdam*, the Jews of *Paleſtina* referring ſtill to their former letters, and alledging, that all their ſynagogues under the Turk, fearing a maſſacre, by reaſon of this matter, have ſtrictly forbidden the publiſhing of it, as yet. But my faith grows fainter and fainter, in this matter, finding, the news is not confirmed with that vigour, it began with. I remain,

SIR,

your faithful humble ſervant,

H. O.

London, Aug. 29, 1665.

SIR,

I MAKE the more haſte of acknowledging the favour of your laſt, becauſe I found myſelf urged by my thoughts, with ſpeed to offer ſome of my conſiderations upon the contents of a letter from Dr. *Beale*,

which I received yeſterday, almoſt at the ſame time with your's. If he be not miſinformed by one of his majeſty's chaplains, who now waits at *Saliſbury*, and laſt week gave him a viſit, you, Sir, are nominated provoſt of *Eton*; which, if ſo, our ſaid friend hopes, and ſo do I, you will not refuſe it, conſidering, that that place hath many opportunities of influence on the univerſities, and is able to oblige many: which ſtrengthens our hope, that you will accept of it, eſpecially ſince it is, as I underſtand, no burthen, and much accommodation; it being alſo but half a day's journey from thence to *London*, and not much more to *Oxford*. All God's bleſſings be upon you, and his power determine your deliberations for the beſt to yourſelf, and his honour. If you ſhould be ſo directed, as to embrace it, and there ſhould occur any laborious diſpatches, that might be devolved upon others; I know thoſe, that honour and love you, would be ready to eaſe you; and, among them, none more ready to do you ſervice than myſelf, as far as I am capable. I humbly thank you for your opinion of the Helmontian Gas, which is no ſmall encouragement to me to continue the uſe of it, as it is prepared by *D. Poleman*. I hope, that you will alſo oblige me, with communicating to me the dimenſions and effects of your burning glaſſes; the meltings of caſt iron, glaſs, and ſtone, in that of *Lyons*, look like impoſſibilities, ſo that I ſhall endeavour to get the thing well atteſted, before it be publiſhed in print. I heard as yet nothing of a new comet, ſeen by any in this town; only Dr. *Beale* intimated, a fortnight ſince, in general, that they talked afreſh of prodigies in the air, and ſome of another comet; but nothing in particular then, nor ſince. I ſhould be glad to underſtand, at what hour, and in what quarter of the heavens, it was ſeen by thoſe of your acquaintance in *Eſſex*. There were ſome of our Greſhamiſts, that thought one or the other of the two former comets might be ſeen again, after ſome time; whence it is a queſtion, whether this, that is pretended to be lately ſeen, be a new one, or one of the former, grown viſible again.

I CONCEIVE, it would be obliging to the publick, to print that catalogue, you mention, of the anti-peſtilential medicines: and, I think, it would be moſt conveniently done at *Oxford*, our ſtationers and printers having, for the moſt part, taken the country, as well as others.

I ACKNOWLEDGE, that that jealouſy, about the firſt authors of experiments, which you ſpeak of, is not groundleſs; and therefore offer myſelf, to regiſter all thoſe, you, or any perſon, ſhall pleaſe to communicate, as new, with that fidelity, which both the honour of my relation to the Royal Society (which is highly concerned in ſuch experiments) and my own inclinations, do ſtrongly oblige me to.

FROM ſea we hear of no late action; our fleet being yet at *Solebay*, repairing the damage received at *Bergen*, and by ſtorm. From *Paris*, I had this, by the yeſterday's poſt: *La public a bien de l'obligation à monſieur Boyle de travailler ſi genereuſement & ſi ſçavamment, comme il fait: il faut avouer, que l'Angleterre à grand nombre de gens ſçavans & de curieux, & en plus grand nombre, que le reſte de l'Europe: tout ce qui vient d'eux, eſt ſolide & particulier; le monde ayant eſté aſſez long temps amuſé des notions generales. Voſtre cour* (ſo he paſſes on) *a refuſé les propoſitions, que la roy luy a fait faire d'un accommodement; ce qui l'oblige à executer le traité fait avec meſſieurs les Eſtats. De plus, on ſcait ce que le Roy d'Angleterre fait avec l'Eſpagne: peut eſtre, qu' avec le temps il n'y trouvera pas ſon compte. L'eveſque de Munſter continue ſes levées, mais on croit; & il y a bièn de l'apparence, qu'elles ſe font en faveur de la maiſon d'Auſtreche. On a bièn des reſſources icy, le roy ayant de l'argent & des hommes, & quand il ſera joint aux Hollandois, il aura des vaiſſeaux, & vous incommodera peut eſtre autant, que vous le pourriez faire, quoy que les Anglois nous mepriſent, & croyent, qu'on ne peut pas leur reſiſter. Quand ils auront le ciel & la terre pour ennemis, il changeront de language, & ſeront, peut eſtre, eſtonnez, non obſtant leur fierté.*

La mort du duc de Mantouë eſt certaine. Monſieur l'Abbè de Beaufort eſt à la Baſtille, pour les affaires d'Angleterre. La reyne mere ſe porte mieux. Le roy a eſté ſeigné au pied, à cauſe de quelque petite indiſpoſition. Depuis un jour ou deux on eſpere beaucoup de la ſante de la reyne mere: mais avec tout cela ceux, qui conoiſſent ſon mal, ne croyent pas, qu'elle en puiſſe rechaper, la maſſe du ſang eſtant corrompue. Cependant un medecin de Bar, nommé Alliot, reuſſit aſſez bien, & fait tout ce qui ſe peut pour conſerver la reyne. Monſieur Colbert a en le cordon bleu par la mort de monſieur de Nouveau, qui eſtoit treſorier de l'ordre. Quoy qu'on face à Rome, il faudra, que le pape ſouffre, qu'on condamne icy ſon infallibilité, qui eſt contre la raiſon, & contre les loix de l'eſtat. Le roy d'Eſpagne diminue tous les jours: neantmoins ſa flotte d'argent eſt arrivée à Cadix, d'où on eſcrit, qu'il y a un galion de perdu, que les Corſaires ont pris. De peur, que les Anglois ne reviennent à Berguen, les matelots Hollandois ont fait des batteries au pied des chaſteaux pour pouvoir tirer à fleur d'eau: & l'on y a tendu une groſſe chaiſne, & mis des maſts liez enſemble à l'entree du port, en attendant qu'on les vienne tirer de là. En cas qu'ils ne puiſſent pas ſe deffendre, ils mettront le feu aux merchandiſes, pluſtoſt que de laiſſer entre les mains des Anglois un butin auſſi riche, qu'eſt celuy là.

BUT for fear of committing again, what I condemned in my laſt, I ſhall end with repeating the aſſurance of my being,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London, Sept. 18, 1665.

SIR,

SEEING you give me no authority to endeavour to deter the Dutchmen from printing

printing their book of Colours, I think, I ought not to appear in that buſineſs: monſieur *Herringman* may thank himſelf, and impute the loſs, it may cauſe to him, to his own delays. If the importunity of company do drive you away from *Oxford*, I hope, we ſhall hear betimes of the place you intend to remove to, where you are not like to be free from the perſecutions of my letters, if the Lord ſpare me farther, as he hath been pleaſed to do hitherto. Though we had ſome abatement in our laſt week's bill, yet we are much afraid, it will run as high this week as ever. M. *Graunt*, in his Appendix to his Obſervations upon thoſe bills, (now reprinted) takes notice, that foraſmuch as the people of *London* have, from *anno* 1625, to this time, encreaſed from eight to thirteen; ſo the mortality will not exceed that of 1625, except the burials ſhould exceed 8400 per week, which number we have been pretty near to. Signior *Borrhi* hath expreſſed a real favour and kindneſs to me, which, when he firſt mentioned it, I lookt upon as a mere compliment: for he hath ſent me his own Antiloimoides, ſo conveniently prepared, that he encloſed it (the medicine itſelf) in a fine bladder, which he ſo ſquared, that it was handſomly put up in a letter, and ſo came ſafely to my hands; but had that ſtrength of ſcent, that the man, who brought the letter, ſaid, it muſt be ſome rare medicine, come from beyond ſea, againſt the plague. It is made up in the conſiſtency of mithridate or treacle, and hath a very comfortable ſmell; yet I have not hitherto made uſe of it, but only taſted as much of it, as the bigneſs of a pin's head, but know not what to make of it. Methinks, I find, myrrh, and aloe, and mithridate or treacle in it; and I had ſent you a pattern of it, in this very letter, but that I thought you might be too much ſurpriſed by the ſcent thereof. Wherefore I conceived I did beſt to make this a forerunner, and, if you forbid me not, to let the thing itſelf follow by the next, God permitting; which I am the more deſirous to do, becauſe I have an opinion, you will be pleaſed with ſeeing and examining that medicine, which comes from ſuch a man, in ſuch a way, for ſuch an end, and with ſuch a character annexed to it by the author, that, if it were for a king, we know not to give any better, both for preventing and expelling the plague.

HAVING now received monſieur *Hevelius*'s preſent, which Dr. *Wallis* hath a ſhare in, I am now enquiring for a convenient and ſafe conveyance to him, which I ſhall have no ſooner found, but I ſhall, God willing, make uſe of it. It is, methinks, very pleaſant to read, and built upon an hypotheſis, which is ingenious, full of ſpeculation, and appearing ſufficient to ſolve all the phænomena of comets. This may *movere ſalivam*.

CALLING the other day at the Biſhop's head in *Paul's Churchyard*, where Mr. *Thompſon* abideth by it, I heard of him, that *Kircher's Mundus Subterraneus* is come over, and that he looks for the delivery within four or five days: I perceive, the price will amount to fifty ſhillings at leaſt, and yet but one volume. I find alſo, by his catalogue, that the ſame *Kircher* has publiſht a *Scrutinium Phyſico-medicum peſtis*, which I never ſaw before. There is alſo come over *Steno de Muſculis & Glandulis*, which I know not whether it hath been ſeen here formerly. I find nothing elſe, worth buying; except it be *Johannis Hooker Dantiſcani* (*Hevelius*'s kinſman) *Motuum Cæleſtium Ephemerides, ab anno* 1666, *ad* 1680; grounded upon the Tychonian obſervations, and Keplerian hypotheſes, and the Rudolphin tables, compoſed *ad Meridianum Uraneburgicum*.

I BELIEVE, our taking of ſome more Dutch ſhips, ſo that there are in all ten men of war, and twenty merchantmen, is come to *Oxford* ere this; as alſo that our fleet is returned to *Solebay*, having been ſomewhat diſperſed by the late high winds; yet, God be praiſed, without conſiderable damage to us. I humbly thank you for the favour you intend me, of ſending Mr. *Auſtin*'s new and reformed edition; and when you can conveniently ſend me your queries for the burning glaſs, they ſhall, I hope, be well recommended, by,

SIR,

your very humble,
and faithful ſervant,
H. OLDENBURG.

P. S. I FIND, Sir, by your ſilence, that you are not ſatisfied with the teſtimonials hitherto given of the Iriſh healer. Dr. *Beale* and Dr. *Sydenham* jump in a full aſſurance of the truth of the thing, and the latter of them ſaith, that for all he brought as much prejudice againſt it, as any man could, yet now he hath no more reaſon to doubt it, than to doubt, whether he is a man, or ſome other animal. He adds, that if I ſhall deſire particular accounts, he will take them for me, but that they are ſo many, that it may as reaſonably be demanded of me, who am at *London*, who in particular have died of the plague, and how they are taken, to the end it may be diſcovered certainly, whether there be ſuch a diſeaſe or no.

London, Sept. 18. 1665.

SIR,

I VENTURE to ſend you here encloſed a ſmall proportion of Signior *Borrhi*'s Antidote, which hitherto I have made no other uſe of, but barely to taſte it, much ſcrupling in this tickliſh time to ſtir the ſtate of my health, eſpecially by the uſe of a medicine I have no elogium of, but that of the author alone. Yet I do very much wiſh, in caſe you taſte it, or otherwiſe examine it, that you would favour me with a free communication of your judgment concerning it, as alſo of your advice about the beneficialneſs

cialneſs or conveniency of uſing it as a preſervative, for which the donor recommends it as much as for an expulſive. And this advice I do now take the greater liberty to entreat of you, ſince I am very credibly informed, that you have indulged to the academicans to degrade yourſelf to be doctor, and therefore am the more confident, you will both as ſuch, and as a noble friend, aſſiſt me with your counſel herein. I return you my humble thanks for communicating to me the ground of your hydroſtatical inſtrument, which I am much pleaſed with. Turning over a part of *Kircher*'s *Mundus Subterraneus* the other day at Mr. *Thompſon*'s (who will certainly keep an exemplar of it for you) I found him treat alſo ſomething of hydroſtaticks, as alſo of metallo-ſtaticks; but in what manner, a bare running over of ſome leaves could not enable me to give you an account of. In the mean while, I do much fear, he gives us rather collections, as his cuſtom is, of what is already extant and known, than any conſiderable new diſcoveries. The titles and heads of chapters are very auguſt: if the matter equal them, I ſhall not repent of what I muſt pay for it. I have already offered Mr. *Thompſon* the value of forty ſhillings in books, I intend to part with (which himſelf muſt acknowledge to be more worth) and yet he demurs to make the exchange, though *Kircher*'s book make but one middle-ſized volume, the cuts of it being alſo not very many, and moſt of them in wood. It is certain, this book takes in all the conſiderable particulars belonging to the world, waters, metals, ſtones, (where he forgets not that of the philoſophers) fires, earths, inſects, underground men and dæmons themſelves, *&c.* but how he acquits himſelf of it, you muſt judge. I have ſent this very day by water to *Oxford*, *Hevelius*'s *Prodromo Cometicus*, deſigned by the author for Dr. *Wallis*, accompanied with another for the biſhop of *Exeter*, and my letters for them both; and I hope, the roll will come ſafe, and the biſhop will meet his preſent, coming to ſit in parliament. When you are ready to ſend your queries about the great French concave, I ſhall be ſo alſo, to recommend them, I hope, to good purpoſe. A late letter from *Paris* to me hath this further, for its commendation. *La miroir de Monſieur Septalius* (which I gave lately a deſcription of to Sir *R. Moray*) *n'eſt pas à comparer à celuy de Lyon, que n'a pas ſon pareil au monde. Monſieur Auzout vous en entretiendra d'avantage au premier jour* (but this entertainment I have not had yet) *et vous en ſera bien d'autres effects, ou au moins plus conſiderables, que ceux, que je vous ay mandé: bien de gens le marchandent; et il y à bien de l'apparence, qu'il ſortira de France, nos François n'eſtans pas aſſez curieux.* I cannot imagine, after what manner the preſervation of bodies uncorrupted for many years, without embalming or other artifice, can be performed, except it be by intenſe natural cold, or by exſiccating ſands. I hope I ſhall have a ſhare in what the traveller, you mention, may impart to you concerning it; and I am very glad to find you remember a ſecond edition of the Uſefulneſs of experimental Philoſophy, which you can hardly think how much it is deſired by all ſorts of men. I have gone a good way in continuing the Latin traduction of it: the like I have done of your experimental Hiſtory of Cold; in regard of which latter it will be, methinks, not only unneceſſary, but alſo prejudicial to the printer of the Latin for Cold, to have the ſame tranſlated into Italian, for this latter would certainly hinder the ſale of the Latin copies in *Italy*, where they love every whit as well to read books in Italian, as the Engliſh do to read them in Engliſh. Wherefore I propoſe only, whether it might not do well, to give ſome indirect hint to that Italian gentleman, that has ſuch an intention, as you ſpeak, that the Latin verſion is like to be finiſhed within a month, or ſo, and that the copies thereof being ſent abroad into all the learned parts of the world, and conſequently into *Italy* too, will preoccupate the ſale of the Italian tranſlation, *&c.* What I mention of finiſhing it within a month or thereabouts, I hope, by the help of God, ſhall be performed.

Now for ſome ſtate news, and I have done. I received lately a letter from *Amſterdam*, which does not only acknowledge their late great loſs, but laments withal, that they ſee, that all the power they can make, and all the policy they can uſe, avails them nothing, divine providences appearing ſo adverſe to them. It ſeems by all the circumſtances of this letter, that they had contrived the greateſt power, and the beſt conduct they are maſters of, to come off well this ſecond time, and to fight their merchantmen home with good ſucceſs; but being extremely defeated in their expectation, the ſobereſt of them fall to conſider, what will be the event of it, eſpecially now the biſhop of *Munſter* is alſo actually upon their ſkirts, and finds as yet no conſiderable reſiſtance. I am perſuaded, that if they would yet come down from their haughtineſs, they would find much generoſity and equity in the Engliſh, of granting them ſuch terms, whereby they might handſomly continue their trade for a comfortable ſupport of their country; and they hardly deſerve more, in my opinion. I am apt to believe, that *France* will prove a broken reed to them; and that at laſt, ſeeing the ſea power of *England*, they will ſtrike in with them for a ſhare in trade; eſpecially now they ſeem to be ſet upon it more than ever, to advance the ſame in their country: for which purpoſe orders are already iſſued, as I find by letters, not only to promote the manufactures of cloth and ſilk, but alſo to ſet up ſeveral others, of which they ſpecify glaſs-making, inſomuch that no Venice-glaſs is any more to be imported into *France*; as alſo lace-making, of which latter commodities none is to be ſold henceforth in that kingdom, but what ſhall be made by their own people, and ſo of other manufactures, that ſo they may keep their monies at home, and make conqueſts with

with it abroad. The French king hath ſent an embaſſador *à la Porte Ottomanne*, which is the ſame, that was lately ſo ill treated there. To conclude; *La Reyne mere ſe porte beaucoup mieux de ſon cancer, le medicin Aliot luy mettant des poudres, qui font ſortir la chair pourrie. Il croit fort de la pouvoir guerir, ce qu'il a deſſein de faire en reduiſant la mammelle à rien par ſes poudres. Le roy ayant reconnu la foibleſſe de la medecine, et l'ignorance de ceux, qui la pratiquent, il les à tourné en ridicule dans une comedie, qu'il à fait jouër à Verſailles en ſa preſence.*

I DOUBT not, but you will rejoice at the decreaſe of the plague, ſo conſiderable this week, that the burials are leſs by 1837, than they were the week before. The Lord give us truly thankful hearts, and be pleaſed to enlarge his mercies more and more, and to ſtop the current of abuſing them. So prays,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

JUST as I was going to ſend away theſe letters, came ſome both of *France* and *Holland* to my hands, which are all conſiderable; but I have not time to add them now: only this I ſhall touch, that the French letters aſſure the death of the king of *Spain*, and the Dutch the Meccha news. M. *Serrarius* tells me, that the tranſcribing of Mr. *Borrel*'s manuſcript goes on apace, and deſires, that ſome money may be aſſigned, at firſt ſome thirty or forty gilders, which is about three pound ſterling: you may ſee his own letter, if you pleaſe.

London, Oct. 5, 1665.

SIR,

CONSIDERING with myſelf yeſternight, what my employment would be this day, I did not think I could poſſibly redeem ſo much time, as to ſcribble a few lines, to perform therein what I promiſed by my laſt. And I had already intimated ſo much to Sir *R. Moray* in a letter, which I wrote for him yeſternight late, after I had taken leave of a pipe of tobacco, ſuppoſing he would be gone from *Oxford* before my next ſhould come there. Yours of Septemb. 30, the ſame date with the laſt of Sir *R. Moray*'s, came not to me till this morning, whereas I received the other on Tueſday; the cauſe of this difference I cannot imagine, and not being at home when it was brought, I could neither enquire into it. I have mentioned ſome more particulars of Sieur *Borrhi*'s medicine in Sir *R. Moray*'s letter, which I know he will ſhew you; wherein you will alſo find, that it works chiefly by ſweat, and at laſt *par ſelle*, which circumſtance will perhaps make you gueſs the better at the chief ingredient thereof.

THE mentioned letter to Sir *Robert* contains all the ſtate news I have received ſince my laſt to you; and I am perſuaded they will not diſpleaſe you. For philoſophical news, I ſhall in thoſe few minutes I have remaining, haſten to give you that account, which I received laſt week from *Paris* concerning the *miroir ardent*, and which I thought I ſhould have been obliged to put off till another week. It came to me in French, in theſe very words: *La figure du miroir eſt ronde, du diametre de 30 pouces et quelque choſe de plus. Il eſt bordé d'un coſte d'un cercle d'acier, à fin qu'il demeure dans ſa juſte meſure. Il eſt aiſé de le remuer, quoy qu'il peſe plus d'un quintal, et l'on le met aiſement en toutes ſortes de ſituations. Le point brulant eſt diſtant du centre du miroir d'environ 3 pieds, le focus eſt large, comme d'un demy Louys d'or. On y peut paſſer la main, pourvû que ce ſoit avec precipitation, car ſi elle y demeure le temps d'une ſeconde, on ſeroit en danger de ſe faire beaucoup de mal. Le bois vert prend feu en un inſtant, comme pluſieurs autres corps. Un petit morceau de fer de marmite s'eſt mis en goute preſt à tomber à terre, en 40 ſecondes. La piece de 15 ſols à eſté percée en 24 ſecond. Le clou de payſan s'eſt mis en goute en 30 ſecond. Un bout de lame d'eſpee d'Olinde s'eſt bruſlé en 43 ſec. un jetton de letton à eſté percé en 43 ſec. un petit morceau de fer bleu à eſté percé en 6 ſec. Un morceau de cuivre rouge s'eſt mis en goute preſt à tomber en 42 ſec. Un morceau de quarreau de chambre s'eſt vitrifié et mis en bouteille en 45 ſec. L'acier, dont les horologers font leur reſſorts, s'eſt trouvé fondu en 9 ſec. La pierre de mine, que l'on met aux arquebuſes à rouët, s'eſt calciné et vitrifié en une minute juſte, et un morceau de mortier s'eſt vitrifié en 52 ſec. Enfin il n'y à point de corps, qui par ce feu lá ne ſe conſomme. Si l'on vouloit faire fondre quelque groſſe quantité de metal, il faudroit beaucoup plus de temps, outre que l'action ne ſe fait que dans la grandeur du focus, de ſorte qu'on n'y expoſe ordinairement, que de petits morceaux. Un, nommé Mr. D'Alibert, l'achepte, et en donne 1500 livres.*

SIR, I preſume this relation will be no diſcouragement to the queries and experiments you have deſigned for this glaſs, which I long to receive, and to ſend to my correſpondent.

I CANNOT now add any more, than to intimate in a word, that the Meccha news grows ſtronger; and to return you my humble thanks for giving me, though abſent, a ſhare in your philoſophical collection, which is ſome ſolace for my unhappineſs of not enjoying more. Methinks you are ſo many fellows of the Society, that you can make more than a quorum, but that you want the preſident. I rejoice to find by yours, that you intend to make ſo good uſe of that opportunity as you did; and I hope, ſince you are ſo many, and ſo conſiderable ones of our body, you will make it a part of your buſineſs, ſo to inſinuate the deſigns of the Royal Society into the Oxonians, that they may reliſh them as much, as moſt of them have been reported to diſguſt them, and give them cauſe to prefer that ſolidity of knowledge, the

ſaid Society aims at, before ſcholaſtical intentions. So ends abruptly,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

I ACKNOWLEDGE myſelf unworthy of the favour expreſſed to me in your collection by thoſe worthy perſons, you were pleaſed to name. I humbly entreat you, to aſſure them of the deep ſenſe I have of it, and of my very humble ſervice, particularly to Sir *William Petty*, Dr. *Wallis*, and Dr. *Coxe*.

I KNOW not, Sir, whether I mentioned to you in my laſt Mr. *Serrarius*'s deſire, about the diſburſing of ſome money for the tranſcribing of Mr. *Borrel*'s papers. I am ſure, I intended it; but often, I think, the concurrence of many particulars makes me forget ſome of them.

London, Oct. 10, 1665.

SIR,

I AM glad, you like the French burning-glaſs, which you will do the more, being aſſured by the letters ſent me, that the performances mentioned are ſo real, that no man there doubts of the truth thereof. Since I ſent you the tranſcript, I have loſt the original, at leaſt I have ſo miſlaid it, that I muſt uſe the freedom of deſiring a copy of what you have.

THE enquiry about ſounds is worthy of philoſophers; and I find, that *Kircher*, even under ground, could not forbear to meddle with it. For, in his *Mundus Subterraneus*, treating of the center of the earth, and of pendulums, he takes occaſion to treat *de chordarum harmonicarum motu*, affirming, that the motion of ſtrings in muſical inſtruments is after the ſame manner, as the motion of pendulums, and deriving thence all muſick. *Cum enim* (ſaith he) *ſonus quilibet componatur ex tot acuminis et gravitatis gradibus, quot diadromorum reflexorum puncta ſunt, quibus toties auris tympanum, dato aliquo tempore, à commoto aëre percutitur; luculenter patet, tam ſonos, quàm conſonantias diſſonantiáſve omnes, nil aliud eſſe, præter varios motuum aëris, ad aures appellentium, numeros, nervorum ſpirituumque acuſticorum ope ad cerebrum delatos.* And a little after, he propoſes this experiment; *tendantur duæ chordæ æqualis craſſitiei & longitudinis eodem pondere, ut utræque ad invicem uniſonum ſonent: tum ſicuti ſe habet chorda ad chordam, & pondus ad pondus intenſivum, ita ſe habebunt vibrationes ad ſe invicem: quoniam itaque chordæ ſunt æquales, eæ æquali tempore æquales vibrationes perficient.* Thence he goes on, by the diviſion of ſtrings, and a due application of weights, to give diapaſons, diſdiapaſons, *&c.* as you will better find in the book itſelf.

I WAS but yeſterday with Mr. *Thompſon*, who uſes to acquaint me with the new books that come abroad; but he neither then, nor afore, told me any thing of *Galilæo*'s ſecond tome: but I ſhall aſk him about it, God willing, the next time I paſs that way.

I AM very glad, that I have not been ſo forward, as ſome of my correſpondents would have had me, in diffuſing the wonders, ſaid to be performed by *Graterix*, into all parts of the world; and that with my own aſſeverations of the truth thereof; for I find your intelligence much differing from mine; though, indeed, I heard lately, that this healer did fail in ſome cures, but that it was about ſuch perſons, as had their ſinews quite withered, and their vitals totally deſtroyed, and the balls of their eyes loſt; and that therefore himſelf did ſadly complain over, and much commiſerate the ill adviſed journies of ſuch perſons, ſaying, that God had given him the gift of healing, but not creating limbs. By the very laſt, I received this information, that a child in Dr. *Beale*'s neighbourhood is cured of the ſtone, or other ſtoppage of urine, which came all, as he ſaith, with horrid pain, in threads, or ropy; but now, after the touch, is very perfectly natural, and without pain. Having related this, he adds, It cannot be denied, that innumerable great cures are done, and it is not poſſible, that all expectations ſhould be ſatisfied, without a general reſtoration, equivalent to a reſurrection. And then he concludes, that the ſame muſt ſuddenly fall, becauſe it is odious to many, and winter hinders the paſſage, and himſelf is tired with the infinite reſort, and men's expectations.

I HAVE heard the like, you are pleaſed to mention, concerning the effects of ſpirit of hart's-horn, of M. *Whitaker*, who is, perhaps, the young practitioner about *London*, you hint in your letter. But I do not underſtand, upon what account the ſulphur aur. diaphoreticum, being a vomit, as you intimate, ſhould be a ſafe medicine for the plague.

I HAVE here inſerted M. *Serrarius*'s own note of what is deſired at preſent for the copying of M. *Borrel*'s papers; you may do as you think fit: I have, in the mean while, written to him, that I have acquainted you with it, and that I doubt not, but you will give all reaſonable ſatisfaction for the pains taken in this matter. I have likewiſe encloſed M. *Auzout*'s printed paper, containing his cenſure of the Hevelian obſervations of the firſt comet, to the end, that our Oxonian members comparing both together, may be the abler to judge of the controverſy; concerning which, our preſident writes thus to me, in a letter (written on board of the Dutch Slothany prize) which came to my hands yeſterday: "I ſhall peruſe *Hevelius*'s "book you ſent me, and give you ſome "account of it; but it will be convenient, I "firſt ſee what M. *Auzout* objects, and not "amiſs too, to know the ſenſe of our mem-"bers at *Oxford*, the ſame being likely alſo "to be my opinion, and then my aſſent only "will ſave me further trouble; and if we "differ, it were fit to reconcile them firſt,

"before

" before a return be made to *Hevelius*. I a-
" gree with you, that it were not fit to return
" for anſwer, that the diſcontinuance of our
" uſual meetings, during the plague at *Lon-*
" *don*, incapacitates the Society to give their
" opinion of it, without ſending, at the ſame
" time, the judgment of thoſe you mention."
Sir, theſe perſons were, yourſelf, Sir *R. Moray*, Sir *William Petty*, Dr. *Wallis*. And you ſee, by this, how neceſſary it is, that this printed paper ſhould be with ſpeed peruſed and conſidered by the Oxonian club, that ſo it may quickly be returned hither for his lordſhip. On Saturday laſt I gave notice to Sir *R. Moray* by the poſt, that I had then ſent away two of *Hevelius*'s books for *Oxford* by a barge, whoſe owner is one Mr. *Moiſe*, carrying ſeveral things belonging to the duke of *York*, and prince *Rupert*, the duke's confectioner going along with it. I hear, the barge ſtays five miles ſhort of *Oxford*, and that there other conveyance is provided to carry it to *Oxford*; as alſo, that my roll is put up with the duke's goods. I doubt not, but Sir *Robert* will enquire, and take care, that it may be delivered to Dr. *Wallis*, who is moſt concerned therein. In the ſame letter to Sir *Robert*, I took notice to him of what a certain odd philoſopher (whom you know better than he, it being ſignior *Spinoza*) hath very lately written to me concerning M. *Huygens*'s tranſmigration into *France*, his pendulums, and his progreſs in diopticks, *&c.* The ſame *Spinoza* expreſſes a very great reſpect for you, and preſents you his moſt humble ſervice, and is diſpleaſed, that the Dutch ſtationers will, in ſpight of our teeth, ſell off one of their own Latin impreſſions of their hiſtory of Colours, before the tranſlation, made here, can be ſent thither.

To give you an extract of what he is thinking and doing, he writes thus; *Gaudeo, philoſophos veſtrates vivere, ſui ſuæque reipublicæ memores. Quid nuper fecerint, expectabo, quando bellatores ſanguine fuerint ſaturi, &, ad vires nonnihil inſtaurandas, quieverint. Si celebris ille irriſor hæc ætate viveret, riſu ſanè periret. Me tamen hæ turbæ nec ad riſum, nec etiam ad lacrymandum, ſed potius ad philoſophandum, & humanam naturam melius obſervandam, incitant. Nam nec naturam irridere, mihi fas exiſtimo, multò minùs ipſam deplorare, dum cogito, homines, ut reliqua, partem tantùm eſſe naturæ, meque ignorare, quomodo unaquæque pars naturæ cum ſuo toto conveniat, & quomodo cum reliquis cohæreat; & ex ſolo hujus cognitionis defectu reporio, quòd quædam naturæ, quæ ita ex parte & non niſi mutilatè percipio, & quæ cum noſtra mente philoſophica minimè conveniunt, mihi antehac vana, inordinata, abſurda, videbantur: jam verò unumquemque ex ſuo ingenio vivere ſino, & qui volunt, profectò ſuo bono moriantur, dummodò mihi pro vero vivere liceat. Compono jam tractatum de meo circa ſcripturam ſenſu; ad id verò faciendum me movent, 1. Præjudicia theologorum; ſciò enim, ea maximè impedire, quò minus homines animum ad philoſophiam applicare poſſint: ea igitur patefacere atque amoliri à mentibus prudentiorum ſatago. 2. Opinio, quam vulgus de me habet, qui me atheiſmi inſimulare non ceſſat: eam quoque averruncare, quoad fieri poteſt, cogor. 3. Libertas philoſophandi dicendique quæ ſentimus; quam aſſerere omnibus modis cupio, quæque hîc ob nimiam concionatorum authoritatem & petulantiam utcunque ſupprimitur. Nondum audio, Carteſianum aliquem ex Carteſ. hypotheſi, nuperorum cometarum phænomena explicare; & dubito, an ex illa ritè explicari poſſint.*

MONSIEUR *du Son*, being the other day at my houſe, where we talkt at random of many things, told me, among the reſt, that he had known the blind man at *Maeſtricht*, that ſees colours with his fingers ends, and had converſed with him a good while, during which, he had ſeen him play at cards, with better ſucceſs, than any man he played with; as alſo, to diſtinguiſh men and women from one another, by feeling their hands, or necks, and to diſcriminate the ſeveral colours of hair; and, laſtly, to diſcern the beauty of women by their voice.

OF ſtate news, we have the following particulars; that the whole Dutch fleet is come to *Solebay* for a bravado, our fleet being not there: that the French auxiliaries are upon their march, to join with the Holland forces againſt *Munſter*: that the French king hath given order to buy up 40000 new muſkets: that the king of *Spain* hath been dead theſe ſix months, and that, when they told us, ſome weeks ſince, of his being a ſpectator of a bull-baiting, it was his effigy, that looked on, ſo artificially made, that it moved *quaquaverſum*.

I PRAY, Sir, oblige me, by quickening our friends to peruſe this printed paper, that I may have it again ſpeedily; for I am unwilling to have M. *Hevelius*'s patience tried too long. I reſerve my writing to Sir *R. Moray*, till Thurſday, to whom, I pray, my humble ſervice. I heard not from him, when I did from you laſt.

London, Oct. 17, 1665.

SIR,

SELF-INTEREST makes me ſorry, you were laſt time hindred of the favour you intended me, of taking notice of more particulars of mine, than you did. I wiſh you more leiſure the next time for accompliſhing your intentions, that cannot be but very advantageous to me; and, in the interim, return you my humble thanks for thoſe informations you were pleaſed to impart to me, concerning the experiments of the tobacco poiſon, and that other, which, becauſe the chief word of the paragraph, relating of what kind that experiment was, had ſome odd ſtrokes paſſing through the letters thereof, I can only gueſs, by the context, to have been ſome mercurial one. You may be ſure, Sir, wherever I mention any thing, coming from you, I ſhall do you right; and, as I have mentioned in my next Tranſactions, ſome particulars, you have been liberal to impart, ſo I intend,

I intend, God willing, to do in the following, without omitting in either the fountain, whence I received it. I ſuppoſe, you did not think, when you gave an anſwer to my laſt, that I would ſo ſoon need that copy I begged of you, concerning the burning-glaſs of *Lyons*; but I have all ready for the next papers, to be printed, if God permit, the firſt Monday of November, and ſhould have ſent them by this very poſt, that they might come time enough, to be reviewed by my Oxonian friends at their leiſure, before their entring the preſs; but that I want that French copy to put it into Engliſh, having left a blank for it in thoſe papers. I beſeech you, therefore again, to favour me with giving your ſervant order to tranſcribe it for me, and to ſend it hither by the next poſt, by which I may receive it on Friday next, and ſo tranſmit my papers the very next day, as I wrote to Sir *R. Moray* I would do.

I WONDER ſomewhat, I hear nothing of the arrival of my roll, containing the prodromus, it going away from hence October 7. But, I believe, that ſome copies thereof were ſent by Mr. *Thompſon* to *Oxford*, before mine went; ſo that thoſe, who will take the pains of peruſing it, and compare both, may find the book at ſome ſtationers in the town, where you are.

AT this preſent I have no news, neither philoſophical, nor other, no letters being come to me, ſince my laſt, but Dutch, which ſpeak of their triumphs over ſome colliers and fiſhermen, as alſo of more ſtories from *Mecca*, confirming the former. Some mention is alſo made therein of the biſhop of *Munſter*'s diſturbances and miſchiefs he gives to the Dutch people in ſeveral parts. What is added of the rumour, as if the French king were killed by a ſhot, is here looked upon as fabulous, our laſt letters mentioning not a word of ſuch an accident; whereas I am ſure my correſpondent, from whom I then received two letters, would have given notice of it to,

SIR,

your faithful humble ſervant,

H. O.

WE hope for a decreaſe of 1500 this week; which God grant.

London, Oct. 31, 1665.

SIR,

THE unexpected favour of your letter this week, obliges me to a ſpeedy acknowledgment, which I return to you the more cordially, becauſe of the frankneſs therein expreſſed, of reſcinding ſome things of the Tranſactions, concerning which, the more freedom you and my other friends do uſe, the more obliging and ſatisfactory it will be to me. The ſtereometrical balance being mentioned immediately after your taking notice of the hydroſtatical papers being ready to go to the preſs, induced me to believe, that it was to be inſerted there. I heard nothing from Dr. *Wallis*, whom you ſeem to mention as inclined to write me ſome account of the ſaid Tranſactions: and it is almoſt a fortnight ſince I received any thing from Sir *R. Moray*, ſince which time I have ſent him ſeveral packets, both from others and myſelf. I hope he is well, and then I am ſure he will not forget me, though he be not in *Oxford*. I ſhall be very glad to ſee the book of injections, and ſhall then be better able to ſay what is fit, on the behalf of thoſe members of the Society, that had invented and practiſed the ſame way before any others known to us. And it would not be amiſs, if I might receive the information of ſome particulars, concerning that matter, of which, I think, I ſhall meet with nothing in your Uſefulneſs, *&c.*

IN my laſt I received from *Paris* what follows: *icy une perſonne, qui à travaillé à l'hiſtoire de l'Academie, , qui eſtoit compoſée de pluſieurs habiles gens: A Porta en eſtoit, et un Terrentius, et Molitor, qui à fait quantité d'obſervations touchant les animaux, dont on à quelques fragmens. S'il avoit trouvé en libraire, qui luy voulut faire une honeſte reconnoiſſance, il luy donneroit ſa copie, qui eſt preſque achevée. Il y parle de l'eſtabliſſement de cette academie, de ſes ſtatuts, des deſſeins du prince Ceſi, qui en eſtoit le chef, et* qui vouloit eſtablir des ſocietés par tout le monde, meſme en Afrique et en Amerique, à fin que d'eſtre bien informé de ce qui ſe trouve dans ces pais la: (this, methinks, the king ſhould know, if he does not already.) *Il parle auſſi de l'eſprit des academiciens, et de leurs ouvrages, et ne dit rien que ſur de bons memoires, qu'il à eus à Rome. Il à outre cela, un traité intitulé,* Philoſophia naturalis variorum, *que ne contient, que des obſervations faites ſur les choſes naturelles par des modernes. Il en à fait auſſi luy meſme, qui ſont curieuſes. Je l'obligerois à donner tout cela au public, ſi j'avois trouvé un libraire, qu'en voulut entreprendre l'impreſſion, et payer pour la copie. C'eſt homme là eſt grand ami de Redi, autheur du traité de la vipere, et de Tilman, ce grand anatomiſte, qui eſt au duc de Florence, comme auſſi d'un Corneli, qui à fait* Progymnaſmata Phyſica, *comme je vous manday par une de mes precedentes.*

I THINK I ſhall anſwer to this, that if the perſon, that is writing theſe things, and poſſeſſes theſe manuſcripts, be of repute, and the written papers compoſed by ſuch men alſo, printers cannot be wanting in this curious age, to publiſh ſuch matters.

I DOUBT Mr. *Sprat* muſt not know, that ſuch a relation is coming abroad of an Italian academy, for fear it ſhould yet more ſlacken his deſcription of ours, by begetting in him a curioſity to have a view of that for ſome advantage or other to this.

DR. *Beale* mentions, that in the late great ſtorms, Oct. 15. and 31, being the laſt day in the evening, his ☿ was ſubſided half an inch lower than has been theſe two years.

HAVE you heard nothing of the verſes made to the Royal Society, of which I had only ſent me the firſt ſtave, as follows:

Heroic conſtellations, diſpenſe
One ray of your celeſtial influence,
That with this teleſcope I may deſcry
The ſacred treaſures of your panſophy,
Elſe lockt up from the very Lyncean eye, &c.

I am promiſed the reſt, if my friend can get the true copy. The author ſubſcribes, I hear, *Galeazzo Victorio Villano di Stato*; and I hear there are twenty ſix ſtaves in all, in which they are taſked to the full, and without reproach.

I HOPE my lady *Angleſey*, and Mr. *Southwell*, are in *Oxford*, to receive thoſe letters I gave you the trouble of laſt week.

I WONDER I hear nothing yet of the roll with the Prodromus, and that the more, becauſe I underſtand, the man, that carried it, is already come back to *London*.

WE are much afraid here, that theſe Munſterian forces, that went into *Groninguerland*, are in great danger to be drowned there. And as to the ſhips taken and ſunk by the French, we ſay here, that they were carrying proviſion into *Tunis*, their enemies, and that one of them not only refuſed to ſtrike, being but a merchant, but alſo let fly a broad ſide againſt the French.

THOUGH the non-conformity preachers are ſaid to be baniſhed out of the corporations by act of parliament, yet they have great liberty at preſent here in *London*, many of them preaching publickly in ſeveral pariſh churches, *nemine contradicente*. It ſeems the governors of the land care as little to hinder the ſectary miniſters from preaching, as phyſicians do to keep apothecaries from practiſing phyſick.

I AM glad the count of *Waldeck* is taken off, he being a very good commander, both for conduct and action.

THIS is all at preſent from,

SIR,

your faithful humble ſervant,

H. O.

London, Nov. 21, 1665.

SIR,

SEEING you do not appoint me to addreſs my letters to you otherwiſe than I have done, though you withdraw to another place, I continue the former, not doubting, but it will come ſafely to your hands. I am ready to receive what ſhall be printed off, of your Hydroſtatical Paradoxes, if you pleaſe to ſend it, as you propoſe. I find Mr. *Huygens* is very buſy in making trials of optick glaſſes by a very fine engine, I hear, he has lately cauſed to be made for the purpoſe; but I heard nothing more concerning the book of Colours in *Holland*, though I had lately another letter from Signior *Spinoza*, who is very much your ſervant, and who entertains me with a diſcourſe of his concerning the agreement and coherence of the parts of the world with the whole; which is not unphiloſophical in my opinion, though it would perhaps be tedious to you to have a letter filled with it; and this makes me forbear to ſend it you. It is an ill omen, methinks, that the very firſt experiment ſingled out by us out of *Kircher* fails, and that it is likely the next will do ſo too. If it had been convenient for you, to have ſent me your obſervation about oaker, I ſhould have owned the favour, unleſs you had forbid me, in my next Tranſactions, which are almoſt ready to be ſent to Dr. *Wallis*.

THEY write me from *Paris*, that Monſieur *Voſſius* is at the preſent employed in writing a tract of the Origin of the Nile, in oppoſition to that Monſieur *de la Chambre*, who is opiniatre in maintaining, that the nitre is the principal cauſe of the inundation of that river. One Monſieur *de Farges* hath written a book *de l'Eſprit*, which I ſhould be glad to ſee, the author being a Carteſian; but patience till the commerce be revived.

MONSIEUR *de Son* has made ſome progreſs in his parabolical glaſſes. Monſieur *Auzout* has communicated to me his ſpeculations of the changes, likely to be diſcovered in the earth and moon by their reſpective inhabitants; and ſomewhat of a way he hath invented, to meaſure, by the means of a teleſcope, diſtances of objects upon the earth, by one ſtation, without the uſe of any other inſtrument. And out of *Germany* a friend hath ſome particulars imparted to me of ſalt ſprings, and of an odd ſpring in *Weſtphalia*; of which my next Tranſactions will give an account; where I alſo make a narration of the riſe and attempts of injections into veins, taking aſſiſtance from what you have recorded of that matter in your Uſefulneſs of experimental philoſophy; but wanting the preciſe time, when it was firſt ſtarted by Dr. *Wren* at *Oxford*, which if you do remember, or any of your friends, I pray let it be expreſſed, and corrected what I may have erred in, who have ſet down, that it is about ſix years ago, when the firſt mention of it was made in *England*, long before any others, as far as we know, thought on ſuch a thing. If I had had my own book, I lent to Dr. *Clerk*, and that which you had lately from *Hamburgh*, I ſhould have been a little more particular in that buſineſs; but I hope, what I have ſaid, will be ſufficient.

FOR ſtate-news, I can tell you, that *France* ſeems to careſs *Spain*, having lately ſent to *Madrid* an envoy, M. *de Belſont*, to declare, that the king will keep the treaty between the two crowns; which looks like a trick, to divert *Spain* from being too great with *England*. Though the French be generally for the Dutch, yet there are ſome, that wiſh very well to the Engliſh; and I hear, that libels have been lately ſcattered at *Paris*, importing, that the government of *England* is far to be preferred to that of *France*, and that it were better for them to declare for the king

of *England*. The ſame letter mentions, that the Dutch, who are at *Paris*, ſay, that *France* hath done them more miſchief, than good; for, if they had not been aſſured by them of ſea and land aſſiſtance, they had never begun the war. From *Bourdeaux* come high compliants, that their wines muſt lye this year upon their hands, there being no Dutch ſhips come or coming to fetch them away; which will certainly vex both the gentry and merchants extremely, whoſe eſtates, principally in thoſe parts, do for the moſt part conſiſt in wines.

ANOTHER letter from *Paris* mentions, that my lord St. *Albans* is coming over with new propoſitions for peace; and that the king of *France* thinks himſelf ſure of the Swedes, having augmented their penſion by 200,000 crowns *per annum*. It adds, *que le duc de Luneburg à declaré, qu'il ne vouloit point prendre le parte d'un preſte, quien hazardant tout, ne hazardoit rien du ſien.* This is an inſtructive conſideration in the opinion of,

SIR,

your very faithful humble ſervant,

H. OLDENBURG.

SIR R. *Moray* mentions, that I ſhould receive Mr. *Auzout*'s letter from you.

London, Dec. 5, 1665.

SIR,

THOUGH I have received the favour of your letter from Dec. 1. yet I have not ſeen thoſe two ſheets, which you therein mention, of the Hydroſtatical Paradoxes, nor that printed letter of M. *Auzout*'s, which, a fortnight ſince, Sir *R. Moray* told me it was in your hands; whence I was to receive it for my lord *Brounker*, in order to compare it with the Hevelian Prodromus. I think it will be moſt convenient every way, to remit Signior *Spinoza*'s diſcourſe *de conſenſu partium*, till our perſonal interview, which, I hope, the goodneſs of God will grant us ere long, the bills decreaſing more and more very comfortably. I humbly thank you for Dr. *Beale*'s letter, and I doubt not, but you ſaw a copy of the ſwelling verſes made upon our Society, and containing a bundle of big interrogatories, which did put me in mind of the old ſaying, that one fool can make more queſtions, than ten wiſe men can anſwer. But I will paſs to my philoſophical intelligence.

TAKE this, if you pleaſe, from *Rome*: *Campani* hath had the advantage over *Euſtachio de Divinis*; the great duke of *Tuſcany* and prince *Leopold*, after they had tried both, found thoſe of *Campani* better; with one whereof they ſaw men at four leagues diſtance, and diſtinguiſhed them eaſily. *Riccioli* is buſy at his Aſtronomical Tables. The Jeſuit *Grimaldi* has made a treatiſe *De Lumine et Coloribus*. *Redi* hath made other experiments of vipers ſince he publiſhed his book upon that ſubject; and hath obſerved, that thoſe herbs, which are ſaid to be mortal to them, are not ſo; but that ſalt and ſugar are. [I pray, Sir, if you have the convenience of trying this with ſalt and ſugar, let it be a part of your divertiſement, and oblige me to acquaint me with the ſucceſs.] Farther, at *Florence* they have been making experiments upon ſalts, and found, that the figures of them in each herb are different. And as to their experiments ſo long talked of, I now hear, that they will not be printed yet theſe four or five months. The book of vipers is printed at *Paris* in Italian, and I am promiſed it, with other things, at the firſt opportunity of ſending.

As for ſtate news, I ſhall give it you, as I received it lately from *France*: *Il y a un livre, dont l'autheur ſe veut mocquer des Hollandois et de François, parlant du roy aſſez librement; mais je ne le trouve pas bien ſpirituel. On croit, qu'enfin vous nous ferez la guerre; on s'y attend, et on s'y prepare. Les Hollandois de leur coſté s'y reſolvent, aimants mieux faire la guerre avec la France contre tous, que de faire une paix deſadvantageuſe, et dependre des Anglois. On ne parle icy que de milions et de ſommes ſi exceſſives, que ſi je vous les diſois, vous ne croiriez pas, que dans toute l'Europe il y eût tant de bien. Il eſt certain, que la France a des grands avantages a preſent: un roy jeune et entreprenant; point d-favory, pour cauſer des cabales; abondance d'argent, et partant de toutes choſes; un roy d'Eſpagne, et un empereur, foibles et pauvres tous deux.* (I confeſs theſe advantages are important, and to be conſidered.) *On a affiché au palais du roy d'Eſpagne, devant qu'il mourut, cette* Paſquinade: *el prencipe eſta malo; el rey es de palo; l'infanta ſe caſa: quien al quila eſta caſa.* You need no interpreter, nor, I hope, any aſſurance of my being,

SIR,

your very humble and faithful ſervant,

H. OLDENBURG.

P. S. I intreat, you, Sir, do me the favour, and impart to me your thoughts of the thriving of the mathematical or Carteſian philoſophy in our univerſities, whether there be not now more of the young pregnant men, that reliſh it, than formerly.

I DO intend, God willing, to write very ſhortly to Sir *John Finch*: if you pleaſe to command me any ſervice to him, I am ready to receive and to convey it.

I HUMBLY thank you for your intention of retrieving the *Hamburgh* book for me, and of communicating the obſervations about oaker, and the employments where now you are.

SIR,

London, Dec. 19, 1665.

SIR,

I SHALL begin this with taking notice of what you conclude your laſt with, concerning Dr. *Beale*'s barometrical obſervations. Theſe I received not, till after my laſt to you; and it ſeems, that our friend would have notice given to the publick of the baroſcope, in the Tranſactions; yet not without offering it firſt to your advice and directions. He intends then to ſend to you his calendar and ſome reſults, that they may be compared with Dr. *Power*'s calendar, and others of the ſouthern diſtance from him (Dr. *Power*) and the eaſt, from himſelf; that ſo it may be diſcovered, whether the air gravitates more in the eaſt, or weſt, north, or ſouth; towards ſea or land; in hotter or colder weather; and keeps the ſame ſeaſons of changes; and by this publication, to awaken others to explicate the phænomena, yet in the dark.

AFTER this, he abbreviates to me ſome particulars, viz.

" 1. MY wheel-barometer (ſaith he) I could " never fill ſo exactly, as to exclude all air, and " therefore I truſt more to a mercurial cane, " and take all my notes from it. It is but " 35 inches long, of a very ſlender cavity, " and thick glaſs. This may eaſily be con- " veyed to any place for trials. The mercu- " rial veſſel is about two inches wide; the " mercury ſo well filled, that for ſome days " it would not ſubſide, but hung to the top " of the glaſs-cane. I keep it in a cloſet, " pretty cloſe, 9 foot high, 8 foot broad, " 15 foot long, near a window. This I note " (ſaith he) becauſe poſſibly the cloſeneſs of " the room may hinder, that it gives not " the full of all changes, as it might in more " paſſable air.

" 2. IN all my obſervations, from May 28, " 1664, to the preſent, the mercury never " aſcended but very little above $30\frac{1}{4}$ inches.

" 3. IT aſcended very ſeldom to $30\frac{1}{4}$ inches, " chiefly in Dec. 13, 1664, the weather fickle- " fair, in the evening.

" 4. IN my calendar of June 22, 1664, I " find at five in the morning, in a time of " long ſettled fair weather, the mercury had " riſen about $\frac{1}{4}$ an inch higher than 30; but " I fear ſome miſtake, becauſe I then took " no impreſſion of wonder at it; yet for three " or four days, at that time, it continued " high in well ſettled, fair and warm weather, " moſt part above 30 inches; ſo that I may " note, the mercury to aſcend as high in the " hotteſt ſummer weather, as in the coldeſt " winter weather.

" 5. YET ſurely I have noted it to aſcend " a little higher for the coldneſs of the wea- " ther; as very frequently, both in winter " and ſummer, to be higher in the cold morn- " ings and evenings, than in the warmer mid- " day.

" 6. GENERALLY, in ſettled and fair wea- " ther, both of winter and ſummer, the " mercury is higher, than a little before, or " after, or in, rainy weather.

" 7. AND generally it deſcends lower after " rain, than it was before rain.

" 8. GENERALLY alſo it falls in great " winds, and ſomewhat it ſeemed to ſink, " when I have opened a wide door, to let in " ſtormy winds. Yet I have found it to " continue very high in a long ſtormy wind, " of three or four days.

" 9. AGAIN, generally it is higher in an " eaſt and north wind (*cæteris paribus*) than " in a ſouth and weſt wind.

" 10. I TRIED ſeveral times, by ſtrong " ſumes and thick ſmokes, to alter the air in " my cloſet; but I cannot affirm, that the " mercury yielded any more, than might be " expected from ſome increaſe of heat. Such " as have exact wheel-barometers, may try, " whether odors or fumes do alleviate the " air.

" 11. IN this cloſet, I have not, in all this " time, found the extremeſt changes of the " mercury to amount to more than $2\frac{7}{8}$ inches; " of $2\frac{3}{4}$ inches, I am full ſure." So far our obſerving friend.

SIR, if you think, that the publiſhing of ſuch particulars as theſe may aſſiſt to excite others to make the like obſervations, and ſhall pleaſe to inſtruct me with the orders for bounds and method in the publiſhing, I am moſt ready to follow your directions; though, I confeſs, Mr. *Davies* wrote me, the other day, ſo heavy a letter, that it would very much ſlacken any man's pace in continuing ſuch labour. For he tells me, that, of the firſt Tranſactions, he printed, he then, when he wrote (Dec. 16.) had not vended above three hundred; and that he fears, there will hardly ſell ſo many, as to repay the charge of paper and printing: ſo that, it ſeems, my pains and trouble would be of no avail to me. Yet he concludes, that, notwithſtanding theſe diſcouragements, if you and I do think fit to have any more printed at *Oxford*, he will readily ſerve us in the managing thereof, and the preſent diſburſing of the charge; intimating withal, that he undertook to print theſe papers, and to give the author, as his friends had propoſed, yet provided, he might be ſecured from being a loſer by it.

WHAT to ſay to this, I know not: if Mr. *Davies* give over, it will look very ill; and if he continue, I muſt ſuffer very much there too. He thinks, *London* being like to be open now for commerce, if he do ſend to three or four active ſtationers, in ſeveral quarters of the town; and beſides to *Cambridge*, *Exeter*, *Briſtol*, *&c. item* into *Ireland*, *Scotland*, a far greater number ſhould then go off: but if he be not a man of an active and large correſpondence, I had done much better, never to have committed it to him. He ſhould, when he ſends copies to Mr. *Thompſon*, ſend ſome to a good bookſeller about the *Exchange* (for there, I find, they are enquired after) and to another about *Dunſtan*'s in *Fleet-ſtreet*, and to another about *Weſtminſter*: and ſo diſperſe them

them to the chief parts of the city, eſpecially now carriers begin to return hither. Before I received this dull letter of his, I had already diſpatched away to Dr. *Wallis* my manuſcript, for the month of January; which, I think, he muſt print; but if in the interim he ſpeed not better, we muſt then conſider of another expedient, or let it fall. I am afraid, there being a kind of conjuration, and a very myſtical one, among ſtationers, and *Alleſtry* having taken a ſnuff, he does, it may be, ſo collogue with *Davies*, that, by not forwarding the vent of theſe Tranſactions, they may bring down the price to their lure. I muſt aſk your pardon, for troubling you with ſo faſtidious a ſtory; concerning which, I am willing to ſubmit to the advice of my friends. I have not yet received any ſheet of your hydroſtatical papers, nor a penny from Mr. *Davies*, beſides the five pounds you were pleaſed to make over for me.

SIR, I doubt, I ſhall not be ſo happy, as to receive a particular advice from you, touching this troubleſom buſineſs, ſeeing it muſt paſs through the hands of an amanuenſis; yet, though it be given a little ænigmatically, I truſt, I may find out the meaning.

THE performance of Mr. *Reeves*'s glaſs, of ſeeing the ſhape of windows, and the differing colours of the ſtones, and the weather-work upon the *Harrow*-ſteeple, I ſuppoſe to have been done by his ſixty foot glaſs; but, I believe, that of *Campani*'s, tried at *Florence*, was not above thirty five foot; whereof I expect more particulars ſhortly. As to the ſale of his longeſt glaſs to ſome virtuoſo abroad, that is not like to be, becauſe himſelf has obſtructed it, by what I find printed by Mr. *Auzout*, who ſaith, that, a while ago, a perſon of ſome quality having told *Reeves*, that at *Paris* there were glaſſes, drawing the ſame length with his, that did bear a greater aperture, & *des oculaires plus forts* (leaving him thereupon to judge, whether they were better) that perſon received no other anſwer from him, but that his glaſs was exceeding good, and that thoſe, who did not think the ſame, ſhould not think to have any of them. In the ſame place, the ſaid Mr. *Auzout* takes notice, that the teleſcope, ſent by his majeſty to the duke of *Orleans*, made by *Reeves*, bears no more aperture, than two inches and three lines French; and that that of the ſame *Reeves*, of ſixty foot, bears not much above three inches aperture; whereas his (Mr. *Auzout*'s) glaſs, of twenty one foot, has commonly two inches four or ſix lines aperture, French meaſure (which you know does ſomewhat exceed the Engliſh;) and another of his, of fifteen foot, bears two inches, which latter is the aperture of *Reeves*'s glaſs, of thirty foot long.

I AM ſorry I had not the favour of your laſt letter ſoon enough, to take notice of what you ſuggeſt, concerning your ſuſpenſion of making further experiments of cold, this winter, in the next Tranſactions, the manuſcript whereof I had ſent away two days before, making the more haſte, that it might be printed off before the feſtival days. If they be continued, the next to theſe may ſeaſonably enough, I think, make mention thereof.

I WRITE this very day to my lord *Brounker*, to ſend to him Mr. *Auzout*'s letter, together with your ſalute. I hope his lordſhip will now ſhortly be in town again, which fills apace; and the like I do of Dr. *Wilkins* and others. Did not I underſtand, that your book *De Origine qualitatum* was alſo begun to be printed? I long to hear, what ſubject of devotion you are employed upon, as alſo, what work Dr. *Wallis* has in hand; and am glad, you have retrieved thoſe philoſophical papers about ſenſation and occult quantities, &c. I met the other day, in the Aſtrological diſcourſe of Sir *Chriſtopher Heydon*, with an experiment, which he affirms to have tried himſelf, importing, that cold accompanies reflected light, by employing burning ſpherical concaves, or parabolical ſections, which, he ſaith, will as ſenſibly reflect the actual cold of ſnow, or ice, as it will the heat of the ſun. I would fain have this come *ex ore duorum aut trium*, the ſole teſtimony or affirmation of ſo deep an aſtrologer, as that gentleman was, being not likely to be received by ſevere philoſophers.

No letters came from *France* to me, ſince my laſt; but I hear from others, that they will make up a war fleet of thirty ſail for next ſummer, and that that king relies ſo much upon his money (which he thinks to exceed three or four times the treaſury of our king) and the ſtrength and number of the Dutch ſhipping, and the conjunction of *Sweden* and ſome German princes, that he ſhall be able to tire *England* out, whom he believes not capable to continue a long war. Our Eaſtland fleet, of thirty ſeven merchant-men, and ſeventeen men of war, is now come home, very well, God be thanked, laden with ſtore of naval ammunitions. A good ſquadron of Engliſh frigats are ſhortly to ſet ſail for the *Streights*, where they will find work enough, in the perſuaſion of,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, Dec. 30, 1665.

SIR,

YOUR laſt ſpeaks ſo much favour and care for my concerns, that I cannot write of any thing before I have given you the aſſurance of my humble and hearty acknowledgments, which I hope I ſhall have occaſion ſo to demonſtrate the realneſs of, as to convince you, I hate ingratitude.

I SHALL not trouble you with repeating here, what I ſaid on Tueſday laſt to Dr. *Wallis*, about the printing of the Tranſactions for the month

month of January, becauſe I find by your letter, that you did intend to be on that, or the next day, at *Oxford*, where you are likely to receive that trouble from my letter to the ſaid doctor. I wiſh only, there be no colluſion among the ſtationers, and that the deadneſs of trade and correſpondency, into which the reaſſuming of the printing of thoſe papers is fallen, may not prove too great a prejudice to the diſperſing of them for the future.

ON Thurſday Mr. *Hatherton* brought me the four pound, for which I gave him my receipt, and cannot but give you particular thanks; but am afraid, Mr. *Davies* will prove backward in repaying them. He ſeems to intimate in his letter to me, as if Dr. *Wallis* would bind him to that printer, who has hitherto done the Tranſactions, and as if the making uſe of another printer, who would duly ſupply him with copies, would conduce to the better diſperſing of them. I believe, if this were ſo, he might eaſily receive ſatisfaction in this point.

Mr. *Crook*, who was the other day in *London*, told me, that there were not above two hundred copies left of your Hiſtory of Cold, that he was ready to reprint the Sceptical Chemiſt, as ſoon as he could get men to work, many printers being carried away, among the reſt, by this ſad contagion, which, God be bleſſed, is now fallen to one hundred and fifty two.

I HAVE now received the ſix ſheets of your Hydroſtatical Paradoxes, which I have read with much ſatisfaction, as being very clear and inſtructive; and I ſpend now a part of my time in putting them into Latin; which if you think fit to have alſo printed at *Oxford*, and that with ſpeed, I am ready, from week to week to ſend you my ſheets, upon your order.

THIS very day I had an anſwer from my lord *Brounker* to my late letter to his lordſhip, and to Mr. *Auzout*'s printed animadverſions upon the *Hevelian Prodromus*. He ſaith, he cannot ground his opinion well upon what is in difference between thoſe two obſervers, until he ſees the laſt obſervations made by Mr. *Hook*, and what there are of February 18, or later; and he adds, that the difference depending upon matter of fact, it is the authority, number and reputation of other obſervers, that muſt caſt the balance. Thus far his lordſhip of this particular, which he concludes with returning his humble ſervice to you. Mr. *Hook* is now here, as well as Dr. *Wilkins*; and I find, that the former is not like at all to relieve *Hevelius* by his obſervations, extending to the 10th of *March*, which I have preſſed him to look out, and to communicate to thoſe perſons, that have read and conſidered both *Hevelius* and *Auzout*. This I intend alſo to acquaint Dr. *Wallis* with, by this very poſt.

MONSIEUR *de Son* hath now ready one of his new-faſhioned watches, furniſhed with a ſlender ſpring, inſtead of a pendulum, to regulate the balancer, which is ten times heavier, as he ſaith, than others, to command and bridle the wheels, and thereby to cauſe an equality in their motion. He tells me, he will, by the firſt conveniency, ſend it to his majeſty, having alſo one or two more in hand for the Duke of *York* and prince *Rupert*. He aſſured me alſo, the laſt time I ſaw him, that at his next viſit he would ſhew me his parabolical object-glaſs finiſhed; which I now, with great impatience, look for every hour.

FOR news of ſtate, I believe, Sir, you have heard ere this the diſcourſe, that fell out lately between the duke of *Albemarle* and the Dutch ambaſſador; the latter whereof, giving a viſit to the other, took occaſion to intimate to him, that, there lying upon him ſuch weighty affairs at land, he could ſurely not be diſpenſed with, to go to ſea. To which the duke is ſaid to have reſolutely anſwered, that if God granted him any meaſure of health, he would be with them before the middle of *April*, and ſee, whether they would do him reaſon. The ambaſſador replying, that he doubted not but his countrymen would acquit themſelves well, the duke made anſwer (as I was told by one, that ſaid he was preſent) that he would fight them any where, and give them the advantage of a fourth, both as to number of men, ſhips and guns; not doubting of the bleſſing of God againſt a people, that were ſo guilty of both ingratitude and breach of promiſe, the former being notorious to all the world, and the latter being alſo evident, by the not reſtoring of *Poleroon*. To which the ambaſſador replying, that the former charge was more eaſily made, than proved, and the latter did concern the Eaſt-India company, not the States General; the duke returned, that, as to the point of ingratitude, he was perſuaded, that they did find proof enough of it in their own conſciences; and as to the other, they were accuſtomed to it, to ſhift off from one to another the injuries they did to princes and other nations. Many other reciprocations there paſſed betwixt them, about the graſping of trade on one ſide, the want of money for carrying on a long war on the other, and the like, which would be too tedious for a letter.

IT is not unlikely, but ſome diſorders may ariſe in *France*, the prince of *Condé* being fallen into new diſcontents, and the king having lately by his declarations, in the Pariſian parliament, caſt a great conſternation into all ſorts of people, but thoſe, that are his creatures, and depend altogether upon his crown.

WE hear, the biſhop of *Munſter* is in a condition good enough, and hath more than once offered the enemy battle, which they avoided. The Lunenburg forces ſeeming to be backward for action, maketh many think, that the king of *England* hath good friends amongſt them, and count *Waldeck* himſelf.

SURELY I need not tell you from hence, what is ſaid here with great joy of the diſcovery of a north-weſt-paſſage, made by two Engliſh and one French man, lately repreſented by them to his majeſty at *Oxford*, and anſwered by a royal grant of a veſſel, to ſail into *Hudſon*'s bay, and thence into the *South-Sea*, theſe men affirming, as I hear, that with

a boat they went out of a lake in *Canada*, into a river, which diſcharged itſelf north-weſt into the *South-Sea*, into which they went, and returned north-eaſt into *Hudſon*'s bay. I hope, if this be truth, I ſhall receive the favour of your confirmation, together with a correction of miſtakes, as to the particulars.

I SEND here encloſed the ſequel of Dr. *Beale*'s barometrical obſervations, concerning which he will be very glad, as well as myſelf, to hear your judgment. I remain,

SIR,

your very humble

and faithful ſervant,

H. O.

The ſequel of Dr. Beale's *barometrical notes.*

1. VERY often I have found great changes in the air, without any perceptible change in the barometer; as in the dewy nights, when the moiſture deſcends in a great quantity, and ſometimes the thickneſs ſeems to hide the ſtars from us; in the days foregoing and following, the vapours have been drawn up ſo inviſibly, that the air and ſky ſeemed very clear all day: this I count a great change, between aſcending and deſcending dews and vapours (which import levity and weight) and between thick air and clear air; which changes do ſometimes continue in the alternative courſe of day and night, for a week or fortnight together, the barometer holding the ſame.

2. SOMETIMES (to this I ſay, not often) the barometer yields not to other very great changes of the air; as yeſterday (Dec. 18.) an extraordinary bright and clear day, and this day (Dec. 19.) quite darkened, ſome rain and ſnow now falling, the mercury the ſame. So in high winds, tempeſts, and calms, the ſame.

3. I DO conceive, that ſuch, as converſe much *ſub dio*, and walk much abroad, may find many particulars much more exactly, than I can undertake. To inſtance one of many; Saturday laſt (Dec. 16.) was a clear cold day, very ſharp and ſtrong eaſt winds, the mercury very near thirty inches high. About three in the afternoon, I ſaw a large black cloud, drawing near us, from the eaſt and ſouth-eaſt, with the eaſt wind. The mercury changed not that day, nor the day following; yet I laid a wager, the weather would change before the morning. The ſtars and moſt of the ſky were very bright and clear, till nine (Dec. 16.) and then ſuddenly all the ſky was darkened: yet I loſt my wager, no change of weather. Dec. 17, the froſt held, and a clear day; about two of the clock in the evening, many thick clouds low in the weſt; yet no change of weather (rain or ſnow) fell here: the wind, froſt and mercury the ſame. Dec. 18, the mercury fell almoſt a quarter of an inch, and the ſky and air ſo clear and bright and cold, and eaſt wind, that I wondered what could cauſe the mercury to deſcend. I expected, it ſhould have aſcended, as uſually in ſuch clear ſkies. Caſually I ſent my man abroad, and he diſcovered the remote hills, about twenty miles off, covered with ſnow. This ſeemed to diſcover, that the air being emptied of the clouds by ſnow, became lighter.

I PRAY you, take further notice for Mr. *Boyle*, that from Thurſday evening, to this preſent, *Dec.* 19, there has been a ſharp and hard forſt, the ice bearing the ſliding boys, and the froſt deep in the earth. This the country people here called a wind froſt. It was very cold within doors, as in great froſts, but no freezing within doors, or very little. Roſe-water did not freeze in my window; nor did any froſt or dew drops, in the leaſt, ſtick upon the glaſs in the windows. Tueſday, Saturday, and Sunday, the graſs continued green; Monday and Tueſday the graſs very white with froſt, yet no dew on the windows: not in a very little chamber, where four perſons lay near the window. This muſt be referred to Mr. *Boyle*'s examination, whether the freezing corpuſcles are more in force by the motion and agitation of the air and winds; and how far they paſs with the air. The air gets to my barometer, when the wind does not; and where the wind ſtrikes not much, the freezing is ineffectual.

I WISH alſo, that ſuch as have perfect ſcales, would try, whether mercury does not change its weight, or bulk, in ſome changes of air, and weather, cold, and heat, as by weighing it in a bladder, ſeveral times the ſame; and when the barometer does moſt of all diſappoint expectation; and at greateſt changes.

HENCEFORTH for ſome days I ſhall try another method upon the barometer, obſerving it, as it is before my eyes all day long, and eſpecially at all changes in the air and weather, *&c.*

THIS ſummer I had ſeveral ſmall funnels, of a ſmall hole at the bigger end, and a very ſmall ſhank, about eight inches long. I filled one with the oil or ſpirit of amber, the other with ſpirit of turpentine (both drawn, as it is commonly ſold, by the widow *Matthews*.) Other funnels I filled with ſpirit of wine, and then cloſed both ends with hard wax, to try, what the motion of amber and turpentine would be, compared with ſpirit of wine, to the purpoſe of Mr. *Boyle*'s note, in his Hiſtory of Cold, p. 63. I met with many diſappointments, but had them ſome ſummer weeks before my eyes in my ſtudy window. And ſometimes I ſaw the amber ſtir by ſtarts, as by a ſpring, which I gueſſed to be cauſed by the viſcous adheſion to the pipe of the glaſs. I told you about that time of a black ſtuff in my ſealed thermometer, which hath diſagreeing motions, ſometimes in five parts, at much diſtance, ſometimes nearer in two parts, ſometimes in three, ſometimes cloſe together in one, *&c.* This I regiſtered in ſummer, and now in winter, and it is ſomewhat ſtrange to me.

London, Jan. 16, 1665-6.

SIR,

THE favour of your laſt, without any date of time or place, I received this day, and was very glad to find therein your approbation of what Dr. *Beale* has obſerved of the barometer; whereof if any thing be publiſhed in the Tranſactions, I ſhall, God willing, punctually obſerve the orders of your letter. I rejoice alſo, to underſtand, you are upon ſuch a book of devotion, as you have now been pleaſed to expreſs to me; ſuch treatiſes, ſolidly done, being too much wanting, to keep men in this curious and nice age from the diſreliſh of divinity. Mr. *Crook* being now returned for good and all, will be acquainted with what you mention about the printing of the Scept. Chemiſt, as ſoon as I ſhall paſs that way. The laſt time I ſaw him, he expreſſed deſire enough to go on in the printing of the Latin hiſtory of Cold, as ſoon as workmen could but be obtained, which of that trade have died in very great numbers. When the preſs is ready for the Latin of the Hydroſtatical Paradoxes, I hope not to be unready to comply with it. I am ſorry you had not a ſight of the manuſcript for the laſt Tranſactions, when it was in Dr. *Wallis*'s hands, that you might have ordered the title of the book of Forms, *&c.* according to your mind. But I may take occaſion hereafter, to accuſe myſelf for miſtaking the title. If the Tranſactions be printed at *London* again, (which yet is very doubtful, becauſe of the plague keeping ſtill on foot, and diſcouraging all ſorts of people from ſettling to buſineſs) you are like to find in the next ſome account of the particulars, contained in the Italian treatiſe of vipers, which has the reputation, I perceive, to have been compoſed with much care and accurateneſs. It ſeems, the author lodges that poiſon in the two veſicles, that are about the vipers teeth, and maintains by experiments, that all the wounds of animals, that he rubbed with the liquor, contained in thoſe bags, proved mortal. But I refer to the print. From *Paris* I did lately receive an experiment, made of the lungs of a human fœtus, which I ſhall give you in my author's own words.

Un de mes amis ayant mis le poumon d'un fœtus dans un ſceau plein d'eau, ce poulmon eſt deſcendu auſſi toſt au fond, & en ſouffiant dedans il eſt monté au deſſus. Tous les poumons (ſo he goes on) *des autres animaux ne deſcendent pas, ce qui fait voir, que dans le ventre de la mere les enfans ne reſpirent pas, & que leur poumons n' agiſſent point.*

FROM *Amſterdam* I have an humble ſalutation for you from Mr. *Laurenz de Geer*, and Mr. *Serrarius*; the former whereof having lately received the whole remainder of the traſlation of the Old Teſtament into the Turkiſh language, entreats you to favour him with an anſwer to the following queries, for the encouragement of the printing that part of the holy Scriptures.

1. WHETHER in *England*, they print with vowels, or without?

2. How much is paid to the printer per ſheet; and whether the printer muſt pay the correctors?

3. WHETHER the Engliſh have alſo letters with vowels on top; and whether Mr. *Boyle* hath cauſed the letters to be cut or graven at his own charge; or whether the printer has paid them; and how many there are of them; and how much they coſt?

4. WHAT the paper amounts to?

5. WHAT number of copies are to be printed?

6. To ſend over one ſheet, as it is maculated with the corrections. This is, I ſuppoſe, a periphraſis of what we call a proof-ſheet corrected.

THESE things reſolved being likely to ſerve them for the better printing of the Old Teſtament, I doubt not, Sir, but you will give yourſelf the trouble of ſatisfying them therein.

M. *Serrarius* tells me, that he is watching for a ſafe conveniency to tranſmit Mr. *Borrel*'s copied manuſcript; but adds (which I am ſurpriſed at) that the account of the copies amounts to ſixty-ſeven gilders, and ten ſtivers, there being an hundred thirty-five leaves, each ten ſtivers. The three pounds, which you furniſhed, I have already ſent; witneſs his friend's acquittance, not only for that ſum, but for two pounds more, which I added, and would have made up the reſt, if I had been able. In the mean time, I have intimated to *Serrarius*, that it is a pretty big ſum for a writing not yet ſeen by us; and that he needs not doubt, after we have ſeen it, to receive all reaſonable ſatisfaction for it from hence.

I AM now caſting about, how I may procure for our aſtronomers here ſome perſon or other in remote parts, that would join their endeavours with us, for the finding out the true diſtance of the ſun and moon from the earth, by an agreement made on certain times between the two obſervators, furniſhed with good teleſcopes, prepared for that purpoſe, by a meaſuring rod placed within the eye-glaſs at a convenient diſtance, as will be more largely directed, when the ſaid correſpondency ſhall be procured. I have *Portugal* and St. *Helens* in my thoughts; but am afraid, the former is too near us, and the latter deſtitute of a fit apparatus. Yeſterday I wrote to Mr. *Hevelius* his doom, ſhewing my letter to our preſident, who fully approved of it.

To add the ſtate-news, I have only theſe French particulars.

1. *Les eſperances de la paix s'evanouiſſent, & on croit, que la rupture eſt aſſurée entre les deux couronnes. Cependant le nombre des malcontens augmente icy tous les jours à cauſe des taxes, qu'on fait paier aux gens d'affaires, & de l'evaluation, qu'on a faite des charges. Mais les peuples ne ſont jamais contens. Ceux, qui gouvernent, ne ſe ſoucient pas d'eux, pourvû qu'ils les craignent.*

2. *On leve icy des troupes, mais on aura de la peine à faire une armee comme celle qui a eſté caſſee: il faut plus de 20 ans de guerre pour en faire une ſemblable.*

3. *Quand l'empereur aura eſpouſé l'infante, il tachera d'obliger l'Allemagne à deffendre les Païs Bas, qui eſt le cercle de Bourgogne, qu'il aura à cauſe de ſa femme.*

4. *Les Suedois en veulent à Breme, & on ne croit pas, qu'ils agiront contre l'eveſque de Munſter, ny contre l'Angleterre.*

5. *On dit, que la ligue entre la maiſon d'Auſtriche & voſtre Roy eſt ſignée. Si le Portugal s'accommode avec l'Eſpagne, la choſe eſt hors de doubte.*

THE encloſed is an extract of what was further received of Dr. *Beale*'s barometrical obſervations by,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

SIR, I doubt, the good news, we had here, of the diſcovery of a northweſt paſſage, is not true, becauſe you would elſe, I am perſuaded, have done me the favour of confirming it by a word or two.

Extract of more barometrical obſervations.

I MUST obtrude upon you more barometricals, as occaſioned by the good news you give me of honourable Mr. *Boyle*'s Hydroſtaticks coming abroad. For it ſeems to me, that the barometer ought to be an appendage to hydroſtaticks; and no man ſo fit or ſo able to give an account of it, as Mr. *Boyle*, whoſe right it is. And to me, it ſeems the moſt wonderful diſcovery, that ever was in the world; I dare not except magnetiſms, if we ſpeak of ſtrangeneſs, and juſt wonder, and philoſophical importance, ſeparated from the intereſt of lucre. For who could ever expect, that we men ſhould find an art, to weigh all the air, that hangs over our heads, in all changes of it, and as it were to weigh and diſtinguiſh by weight the winds and the clouds? Or who could believe, that by palpable evidence we ſhould be able to prove, the ſereneſt air to be moſt heavy; that thick air, and when darkeſt clouds hang neareſt to us, ready to diſſolve, or dropping, then to be lighteſt. To ſend a ſervant any hour of day or night, to bring information what the weight of the air, winds, or clouds. And ſurely this belongs to hydroſtaticks: and though we cannot yet reach to all the uſes and applications of it, yet we ſhould be entertained by the inventor for a while upon the delight and wonder. The main I now can add to my former notes, is, that I have ſeldom ſeen the change to be very great at any one time. I do not now take a deliberate view of my notes, but I wondered once to ſee, that in one day it ſunk about $\frac{3}{4}$ of an inch. Of late I have altered my method, and am watching (by day, and much of the night) for the moments of every particular change, to examine what cauſe may appear of every change. And now my wonder is to ſee, how ſlow it is, and how little it does change at a time: it holds moſt between the 29th and 30th inch, of late.

MAY it belong to hydroſtaticks to enquire, whether a pound of ſugar grows heavier, when it gathers mixture in damp air? A grocer's wife would ſo perſuade us; and pretends to betray another's fraudulent frugality, whilſt ſhe kept her ſugar by the fire, and ſold the more for the money and weight. So ſalt ſeems to draw the aquatick particles of air, for encreaſe of weight; and yet conſumes and waſtes by expiration. And I cannot tell, whether ſalts (ſome more than other) may not expire, and operate through a ſealed glaſs. I have ſeen them diſſolve through diſhes, and wooden veſſels, which retain water; and water paſſes through ſome wooden veſſels, which retained mercury; and yet mercury paſſes through other ſmall poroſities, where water is arreſted. This was in my thoughts, when I read in Mr. *Boyle*'s Cold, pag. 51. that ſome liquors have peculiar textures; and ibid. pag. 59, 60, 61. of a thermometer yielding to an irregular contagion.

JANUARY 5 and 6, in the mornings, the glaſs windows were full of drops, though the weather very fair and warm. It was not ſo, ſince I wrote of it before, though ſometimes great froſts, and ſometimes rain, and much dew without, and on our marbles within. And now a ſaltſeller, which I had emptied of the ſalt, had taken a good quantity of ſalt water, which I conceive to be drawn thither by the ſpirit of ſalt, reſiding in the metal. Is no kind of liquor ſometimes heavier, than at other times, by change of weather, drought or moiſture, heat or cold?

THESE alſo, I pray you, with my humble ſervice to the truly honourable Mr. *Boyle*.

London, January 27, 1665-6.

SIR,

THE favour of your laſt of January 20, came not to me till this morning; after I had ſpoken with Mr. *Crook* about the reprinting of the Sceptical Chemiſt, concerning which I found him ſo eager, that he aſſured, he would, as ſoon as he had the promiſed additions, immediately give order for another impreſſion, adding, that if he had not been unwilling to offend you, he might have printed and ſold a ſecond edition of another 500 copies ere this, to good advantage; and therefore entreats you, that you would pleaſe, as ſoon as conveniently you can, to expedite to him, what is to be added; and engages withal, to cauſe the Latin hiſtory of Cold to be likewiſe diſpatched forthwith. I find, that *Micrography*'s Latin tranſlation is advanced to obſervation 50 excluſive; where, I ſuppoſe, it is chiefly, that omiſſions are expected; the directions whereof would now, I think, be ſeaſonable, if addreſſed to Dr. *Wilkins* (with whom the buſineſs was tranſ-

acted)

acted) without naming me for this intimation. As for the Latin of the Uſefulneſs, &c. which is with me, it begins (as I remember you directed, when it was undertaken) at the fifth Eſſay of the ſecond part, and is thence advanced to the thirteenth chapter; where it is not like to ſtick long, my purpoſe being, God granting me further health, to finiſh it with all poſſible ſpeed, now I have done what has been ſent to me of the Hydroſtaticks, which is to pag. 128, having as yet received no more of it; and when more comes, that and the ſequel of the Uſefulneſs may employ me by turns. I have this day ſent *Schottus* to M. *Hatherton*, humbly thanking you for it, and begging your pardon for keeping it ſo long; which yet I would not have preſumed to do, if it had not been for the ſad calamity we have ſo long lain under. Sir, you will much oblige me by the communication of the particulars of the earthquake you mention, (but we have heard as yet nothing of) and of thoſe relations of gigantick bones, you intimate to have received formerly. When I ſee Mr. *Hook*, I ſhall tell him what you bid me. He is now buſy about his pocket-watches (which he thinks *de Son* hath taken from him) and his new-faſhioned chariot, which our preſident, who went in it from *London* to colonel *Blount*'s houſe, finds not unexceptionable, no more than he does that of the ſaid colonel: but it is hoped, that the defects in both do admit of emendations, which, I ſuppoſe, the inventors are now employed about. We hear, the earl of St. *Albans* has brought alſo one from *Paris*, finer than any yet ſeen, of which I ſhall be glad to hear more certain and more particular news. I waited yeſterday upon our preſident to Mr. *de Son*'s houſe, who ſhewed us three of his pretended parabolar object glaſſes, but evaded the putting them into a tube for a trial, by pretending, that one of them, which he looked upon as very good (being of Venice glaſs, the other being but of ordinary Engliſh glaſs) was not yet perfectly poliſhed. My lord thinks the figure rather hyperbolical (and therefore fitter for teleſcopes) than parabolical: and this artiſt profeſſing himſelf no critick, nor ſo much as at all verſed in the terms of art, is likely enough to miſtake the one for the other, and to do better in this caſe than he ſpeaks; which error we ſhall early pardon him. Thoſe of the Society, that are now in *London*, do endeavour to get a good collection of natural and artificial curioſities for the Society's repoſitory; and they hope to make ſhortly an acqueſt of a very good ſtock of that kind, which will look as ſomething towards a foundation, and will invite generous men to increaſe it from time to time. We have thoughts of engaging as many of the Society as are cordial, and have opportunity to obſerve and bring in what is any ways conſiderable of natural productions in *England*, *Ireland*, *Scotland*, every one his ſymbol, for the bringing together a natural hiſtory of what is in the ſaid kingdom, as well as we intend to collect what is abroad, by enlarging our correſpondences every where we can. I doubt not, Sir, but you will prevail with all your ingenious friends, both in *England* and *Ireland*, to contribute to this work what is in their power.

MR. *Hook* has alſo ready (having ſhewed it me and others) a method for writing a natural hiſtory, which, I think, cuts out work enough for all naturaliſts in the world; and intends, as I hear, to print it ere long: for the mentioning of which, I deſire, I may not be named. Mean while, I wiſh moſt heartily, both yours and his were publick, conſidering the great good it would do to philoſophy, moſt men not knowing what to enquire after, and how.

Now the French king hath declared war againſt *England* (which he did, it ſeems, very briſkly, when he ſent word to the queen-mother of *England*, that he muſt do it within two days) we ſhall, I fear, meet with ſome interruption of our philoſophical commerce, as we cannot but do with a total one of merchant-trade. I have ſince preſſed an Engliſh gentleman, that intends to come over with our embaſſador (who is now arreſted by the gout) to bring over ſuch curious books, as, I have been by ſeveral letters informed, are to be found at *Paris*, as *Redi de vipera*, *Mariana de la Chine*, *Des Cartes de homine* in French, *Petit des Cometes*, &c.

THE proclamation of the war, I find, was very ſolemnly made at *Paris* by heralds; and they ſay, the ſame proclamators are to be ſent hither, to give us fair warning. We think here, this will unite *England* as one man. I am ſure, the duke of *Albemarle* bends all his thoughts and power to put things into ſuch a poſture, as the importance of this affair requires, making ſure of proviſions, ammunitions, and payments, for a whole year, and of captains, that know their work, and have courage to perform. Our merchants ſeem now reſolved, as they muſt be, to ſuſpend all traffick, and to obſerve, *hoc age*; which, if well and ſucceſsfully done, will amply compenſate that intermiſſion.

SINCE I wrote this, I had a viſit from Dr. *Poleman*, who tells me, that he has received *Comenius*'s new edition of the Drabician Prophecies, maintained by the publiſher, as truly divine: whereupon, when I ſhewed him Mr. *Spencer*'s Animadverſions, I had for anſwer, that all that, and much more, was anſwered in this edition; of which there is no more than one or two in *England* as yet. When I ſhall have ſeen any of them, you are like to hear of ſome particulars thereof from,

SIR,

your faithful humble ſervant,

H. O.

London, Feb. 24, 1665-6.

SIR,

I WAS very glad to ſee yours of Feb. 19. (which came but yeſternight to my hands) and there to find your being freed from the late

late indiſpoſition, as alſo your thoughts of coming nearer to us. Such perſons, as you, Sir, we highly need, to aſſert and promote the deſign and intereſt of the Society, and to ſuggeſt the proper ways of carrying on their work. There are ſo few of ſuch, that unleſs either they redouble their zeal, or their number encreaſe, that noble inſtitution will come far ſhort of its end. We are now undertaking ſeveral good things, as the collecting a repoſitory, the ſetting up a chemical laboratory, a mechanical operatory, an aſtronomical obſervatory, and an optick chamber; but the paucity of the undertakers is ſuch, that it muſt needs ſtick, unleſs more come in, and put their ſhoulders to the work. We know, Sir, you can and will do much to advance theſe attempts; and we hope, the heavens are reconciled to us, to free us from the infection, and to return you to *London*. Our preſident is to ſummon us to aſſemble again on the 14th of March next, if in the mean time he ſee no cauſe to the contrary. The arrears of the Society amount to above 600 *l.* How to get them paid is the queſtion. Mr. *Colwall* has lately preſented us with another 50 *l.* therewith, and with the former 50 *l.* of his liberality, to purchaſe a very handſom collection of natural things for our repoſitory, which may be ſome part of an eſtabliſhment. My lord *Brounker* will now by all means be releaſed of his preſidentſhip, and he is ſo peremptory in his reſolution, that it will be very hard to engage his lordſhip for another year. I know, Sir, they have an eye upon you for his ſucceſſor, thinking it very important to chooſe perſons into that chair, in whom birth and ability are in conjunction: and I would fain perſuade myſelf, you will neither injure them nor yourſelf ſo much, as to decline that honour, eſpecially ſince it will not oblige you to ſuch an aſſiduity, as is indiſpenſible, proviſion being ready to ſupply your place upon occaſion.

I HOPE, Mr. *Williamſon* and I have ſo ordered the matter in the point of correſpondency, that there will be no exception taken of it. I could have as eaſily engaged Mr. *Godolphin* for the ſame purpoſe, but that he is gone to *Spain* with the earl of *Sandwich*, for which kingdom they both have received as well philoſophical as political inſtructions.

I RECEIVED the ſequel of the Hydroſtatical Paradoxes but on Thurſday laſt (Feb. 22.) If the ſheets had come to me, as they were printed off at *Oxford*, the verſion would have been near ready by this time. However, if the printer will, he may preſently begin the Latin, of which more than half is done; and I promiſe him, that God vouchſafing me health, he ſhall be furniſhed weekly with matter ſufficient for two printed ſheets; only let him give me directions by whom to ſend conſtantly. I long to ſee alſo the Origin of Forms, and hope, an examplar of it will come along with the other promiſed favour of the Hydroſtaticks. Whatever enquiries you can ſpare, whether about inſects, or other parts of natural Hiſtory, all will be exceeding welcome; and the ſame I ſay of the obſervations about the Baroſcope, intending carefully to obey your orders, that reſpect M. *Hook*.

I NOW expect daily more than one friend from *Paris*, bringing along ſeveral treatiſes I have looked for this twelvemonth. Monſieur *Auzout* and others offer to continue their philoſophical commerce, though that of ſtate and merchants be interrupted; and I hope, I ſhall not be deficient in entertaining it. The ſaid *Auzout* let me lately know of two perſons of quality and good eſtates, that have ſet, with others, upon optick glaſſes; one is Signior *Burattini*, grand maſter of the Mint of *Poland*, rich, curious, and a good mechanician: the other Monſieur *de la Son*, (not *de Son*) a French gentleman, who has promiſed to be ſhortly at *Paris*, and there to produce glaſſes of his faſhion. *Burattini* is ſaid to have already made good ones of 60 foot, and with them to have ſeen in *Venus* ſome inequalities, as we ſee in the moon: beſides, to be now at work about one of 120 foot, and to have hopes to advance to 200 foot and above. He pretends alſo to make looking-glaſſes two or three times greater than thoſe of *Venice*, that is to ſay, of eight or nine foot: and he affirms to have a method perfectly to poliſh his optick glaſſes in his forms, without the interpoſition of any linen or woollen cloth, or paper, *&c.* and to give them an admirable poliſh. The other, M. *de la Son*, affirms to have found a turn, whereby he can give what figure he pleaſes to glaſſes, and ſeems to excel *Campani* at *Rome*. We ſhall ſee in time, what truth there is in theſe matters; and I look every day for ſomething alſo of this nature from M. *Huygens*, and I hope too, we ſhall not be behind in *England*.

I INTEND within a few days, to write to *Hevelius*, and to engage him to give or procure us an account of the way of making pot-aſhes, and of the ſal gemmæ mines in *Poland*. If any thing elſe come in your mind worthy to be enquired after in *Boruſſia*, *Poland*, *Liefland*, I pray ſend it me, and I ſhall diligently recommend it. Some enquiries about amber would not be amiſs for thoſe parts.

I MUST haſten to annex the civil news, that lately came to my hands. *Sweden* gives out, that in caſe the Lunenburgh forces fall into the country of *Munſter*, they will join with the biſhop. It is conceived, (and very rationally I think) that there cannot now be that confidence between *France* and *Sweden*, which has been formerly, and that upon the account of *Poland*, where *Sweden* will be very loth, that a king of the French nation, now ſo powerful, ſhould take root. The mareſchal of *Turenne* is preſſed upon the States for general, which is a point of a far reach, if it be complied with. The French king will then need no towns of ſecurity from them.

EIGHT Dutch men of war have joined with the duke of *Beaufort* at *Toulon*. We ſay, that if Sir *Jeremy Smith*, who is ſafe with his ſhips, can be but enforced with half a

ſcore frigates more, he will never decline any encounter with all the ſtrength, that is like to be made in the *Streights*. The Scots will all come away from *France*, notwithſtanding all the fair offers made to ſtay them. I can add no more, than,

SIR,

your very humble faithful ſervant,

H. OLDENBURG.

March 6, 1665-6.

SIR,

I HAVE received the two hydroſtatical books, but ſhall have no opportunity to deliver that, which is intended for the Society, till to morrow come ſevennight, when we hope to meet again in a body. Our preſident returns you his humble thanks and ſervice for the exemplar, preſented to him. Dr. *Wren* is returned, and very kindly enquired after you. He is very well ſatisfied with the civilities he has received in *France*, and commends particularly Mr. *Auzout*; and ſo, I think, will every ingenious and learned man. In the packet, he brought over with him for me, I do not find all I expected; which makes me think, my lord *Anneſley* will bring the reſt. There is nothing elſe, but monſieur *Redi delle Vipere*, in Italian, and ſhort; and monſieur *Petit Of the two Comets*, in French, pretty large, and all their *Journaux des Scavans*, from the beginning of January laſt, till now; in moſt of which I find, what is philoſophical to be taken out of our Tranſactions; the reſt being, generally, extracts and abbreviations of theological, hiſtorical, political, and ſuch like books. Monſieur *Petit*, in the annexed letter to me, preſents you his humble ſervice, and enquires particularly after your health and preſent occupation.

DR. *Wallis* promiſed the other day to give me what he knows of the earthquake, time enough for the next Tranſactions, which will not be printed till the middle of this month, the next precedent having been printed ſomewhat later in the former month, than uſually. If the addition, you are pleaſed to mention, of your own, might be here by Saturday next, it would enrich thoſe papers; and ſo would the obſervations about the baroſcope, you alſo are pleaſed to give me hopes of by the next. My letter to monſieur *Hevelius* is to be ſent away, God willing, next week; and thoſe queries about amber would, doubtleſs, obtain from him, or his acquaintance, a ſatisfactory anſwer. And what other inquiries about natural things you have ready, and ſhall think fit to communicate to me for foreign parts, I ſhall take more than ordinary care to recommend. Monſieur *Hevelius* inquires particularly after the Hiſtory of the Society, and the Latin verſions of your late books. The former is in lazy hands; the latter are fallen into troubleſom times, when ſtationers complain of the great rate of paper, and of the difficulty of getting books diſperſed abroad, when printed.

MR. *Crook* hath very much deſired, that he might not now be preſſed to print off the Latin of your *Hiſtory of Cold*, hoping, that within five or ſix weeks he ſhall get paper at an eaſier rate, than now he can procure. What to ſay to this, I know not.

THE laſt letters from *Holland* mention, that now Chriſtians, as well as Jews, write from *Conſtantinople* the confirmation of the reports concerning the motion of the Iſraelites, and the great hopes the Jews entertain of recovering their land very ſhortly. I ſhall refer you to theſe extracts of letters, as I receive them from *Amſterdam*.

Copie d'une lettre de Conſtantinople, eſcrite de monſieur Chaumont, ambaſſadeur, à ſon frere, reſident à Venice, le 18. *Dec.* 1665.

Il y a icy de grandes nouvelles touchant le roy des Juifs; on l'attend icy en bref: & on dit, que le Grand Seigneur ſe contentera de luy ceder la couronne de la Paleſtine. Et la plus part d'entre les Juifs ne font plus de negoce, mais s'appreſtent pour s'on allez à Jeruſalem. Au commencement monſieur le Gendre & moy nous nous mocquions d'eux, faiſans peu de conte de tout cecy; mais à cette heure, par les apparences qu'il y a, nous craignons que ce ne ſoit tout de bon.

Copie de la lettre d'un conſul François de Smyrne, eſcrite à un Chreſtien, ſeigneur Joſeph Roſano.

Il y a icy de nouvelles conſiderables avec l'arrivée en cette ville d'un roy des Juifs, qui eſt une perſonne de grande conſideration & de grande ſapience, de qui les Turcs meſmes ſont grand eſtat. Noſtre nation demeure avec quelque peur. Dieu veuille, qu'il ne nous cauſe quelque dommage.

De Paris, le 19. *Fevr.* 1666.

Les bruits continuent icy journellement touchant les Juifs, & qu'ils s'aſſemblent ſous un certain perſonage, qui ne ſe dit pas eſtre le Meſſiah, mais qu'il eſt divinement ſuſcité & envoyé pour raſſembler la nation Judaique de tous les bouts de la terre, à fin qu'ils apprennent à conoiſtre le Meſſiah venu, qui juſques à preſent leur a eſté inconnu. L'on dit, qu'on remarque de la divinité en luy.

I SAW a letter from *Marſeilles*, that informs us, that the French fleet intended to be out by the beginning of this month, conſiſting of but thirty two men of war, the Dutch compriſed, beſides ſix fireſhips.

SIR *Jeremy Smith* is ſeventeen men of war, two fireſhips, and a ketch.

I HAVE no more to add, than that I am,

SIR,

your very humble
and faithful ſervant,

H. OLDENBURG.

SIR,

London, March 13, 1665-6.

SIR,

A DOUBLE preſent obliges to double acknowledgments, which I humbly deſire your acceptance of, for the barometrical obſervations and advertiſements, as well as for the relation concerning the earthquake and the concomitants thereof; which will enrich my next Tranſactions, God willing; my papers for this month having been ſent away to the preſs on Saturday laſt, as ſoon as they were compleated for two ſheets, it being high time to have them diſpatched, leſt the printing of them ſhould fall out too late this month. I find obſervers, and, amongſt them, my lord *Brounker*, concur in the taking notice, that in long dry weather the mercury keeps very high; and when I mentioned ſome other particulars, contained in your letters, to his lordſhip, he preſently intimated, it would do very well to publiſh, next time, your communications, before I had taken notice to him, that for that very purpoſe I had procured that favour from you. I am now about inviting monſieur *Auzout*, Mr. *Hevelius*, and others, to join with us in making ſuch obſervations, and ſending them ſome directions and cautions for the better performance thereof; ſuch as are, the careful excluſions of all air, the employing of pretty large tubes, and leaving a good ſpace above the mercury, or providing a cane with a bolthead, that in caſe there ſhould be left any air, its ſpring may be ſo weakened by expanſion, as not to be able to produce any conſiderable effect. Where, if you have any other advertiſements to give, beſides thoſe you have been pleaſed to expreſs in your former, ſuch as the noting the hours of the day, the weather and winds, the ſituation of the place, where the barometers ſtand, they will be very acceptable to all. There occurs a paragraph in yours of March 7, which the tranſcriber has miſrepreſented, inſomuch that I cannot reach your ſenſe in it. For after you had related the difference, you find betwixt your barometers at *Oxford* and *Staunton*, you annex a certain inſtruction, which the amanuenſis ſets down in theſe words:

"WHICH obſervations may teach us, that "the ſubterraneous ſteams, which aſcend into "the air, or the *other* (this word *other* ſure "is miſtaken for *æther*) and of the varying "weight of the atmoſphere, do, many times, "and, at ſome places, uniformly enough, "affect the air, to a greater height in the air, "than, till I had this trial, I durſt conclude."

So far your note: which, I am ſure, is punctually tranſcribed, as I found it; but has certainly a miſtake (beſides that obvious one in the word, *other*) which I cannot remove, and ſeems to lye in the words, *and of the varying weight of the atmoſphere*. You will pardon me this trouble, and favour me with rectifying the error. And ſince it falls out ſo, that your relation of the earthquake cannot be printed, till next month, I ſhall beg the timely communication of that further account, you give me hopes of, in your laſt; if we ſee you not here before that time.

I SHALL ſtay one week longer, before I ſend away my letter and enquiries to Mr. *Hevelius*, hoping you will ſuggeſt ſome others, proper for thoſe parts. Mine do concern the optick glaſſes of *Burattini*, the hiſtory of potaſhes, an account of amber, ſal gem, frozen and revived ſwallows, freezing of animals to death, concentring of colours, and altering the electrical faculty of amber, and the properties of the magnet, by cold; and ſuch like, as you intimate a deſire to have enquiries made after, in your hiſtory of that quality.

I DO intend alſo to recommend ſome queries to Sir *Gervaſe Lucas*, who next week is to embark for the *Eaſt-Indies*, to be governor of *Bombaii*, and has offered his ſervice for philoſophical purpoſes; which he will, I am perſuaded, perform the more effectually, if he may receive ſome inſtructions from you.

I AM ready to furniſh the printer weekly with two or three ſheets of the Latin tranſlate of your Hydroſtaticks, if he be ready for diſpatch. And if I might be allowed an exemplar of the Origin of Forms, I would endeavour to give ſome account of it in the next Tranſactions, as I have done of the former book, in thoſe, that are now printing.

ONE of the French journals takes notice of a letter, lately written from *Amſterdam*, of a propoſition made there of a way of preſerving ſhips from being worm-eaten; conjectured to be performed by the means of a certain bitter and penetrating lixivium, reſembling that bitterneſs, which is related to be found in a kind of wild Indian pear-tree, not at all ſubject to be damnified by any worms. Methinks this ſhould excite the curious and knowing men in *England* to deviſe ſuch a preſervative of timber, as is eaſy to be made, and of ſmall charges; without which it would be of no avail. I have ſeen a preſcription of Sir *Thomas Mayerne*'s, conſiſting of ſulphur and aqua fortis; which, upon this occaſion, I ſhall look after; and, if I find it, preſent it to your view, if you have not ſeen it already.

IN another of thoſe journals an account is given of the uſe of chocolate, together with the deciſion of a pleaſant caſe of conſcience, *viz.* whether a draught of that ſubſtance breaks a faſt enjoined by the church? Which having been ventilated pro and con, is at length determined by a cardinal in the negative. Surely *Hudibras* would jeer ſomebody out of *England*, if he ſhould find ſuch caſes and deciſions in his monthly book.

GREATRIX does certainly ſome cures by his frictions, inſinuating (perhaps) ſome ſalubrious ſteams or ſpirits of his own into ſickly people's bodies. Monſieur *de Son* hath been ſtroked by him, and he tells me, that whereas he hath been for ſeveral years troubled with great back-aches (which indeed have been ſometimes ſuch, in my preſence, that he could not ſtir or turn himſelf without great pain, which ſometimes forced him to cry out)

he now finds himſelf, upon being ſtroked, very well, inſomuch that he purpoſes, in caſe of continuance, to go to ſea with prince *Rupert*, in whoſe lodgings this cure was performed; his highneſs, as the patient told me, having urged him to ſuffer that friction.

WE have not any conſiderable news from abroad, that I hear of. Sir *Chriſtopher Mings* is in the *Elve*, to prevent the deſign of Daniſh ſhips from obſtructing the return of our merchant-men from thence. The Jews ſeem to promote their enterpriſe with vigour in *Arabia* and *Paleſtina*; two or three dozen prophets, that are ſaid to be amongſt them, doing good ſervice to the pretended king, who is ſaid not to aſſume the dignity and office of the Meſſiah, but to lead to him.

I HOPE you will now haſten to viſit *London* again, eſpecially ſince, I hear, ſo good a conveniency is found out for you at *Newington*; whereof you will hear more from another hand, I ſuppoſe, by this very poſt. The election of a new preſident muſt be left to the genius of the body, that is to chooſe, whoſe members are to employ themſelves for its ſervice, every one according to their ſeveral abilities, whereof, I do not queſtion, but impartial judgment will be made by competent judges: which is all, I had to ſay, at this time, as,

SIR,

your very faithful and

humble ſervant,

H. O.

London, March 17, 1665-6.

SIR,

I MUST begin this letter with giving you the thanks of our ſociety for your late reſpect of preſenting them with one of your laſt books; of which the preſident, as having it peruſed before, gave that character to the company, it deſerves; ſeveral of them were inquiſitive after the other, concerning the origin of forms; to whom I gave anſwer, that I thought, they would ſee that alſo, ere long, in *London*.

I DID preſume to give ſome account of the hydroſtatical book in the Tranſactions of this month, come out but Thurſday laſt, chiefly *ad movendam ſalivam exteris*; to ſome of whom at *Paris* and in *Holland*, the ſaid Tranſactions will be ſent by poſt. What was inſerted in number 9, about the ways of ſounding depths and fetching up of water, I am apt to think, that if the words, employed by me, be examined, they will not be found to import a new invention, but only, a new contrivance of a way already ſtarted; ſince it is there ſaid, that "the following ways were contrived by "*M. H.*" which cannot well be otherwiſe interpreted, than that the ways, as they follow, were contrived by him; not, that he firſt invented the notion of this practice: and he affures me, that that way of ſounding with a round leaden or ſtone ball, he borrowed from no author; which makes me conclude, I ſpoke truly and candidly, when I ſaid, that that way, as it is deſcribed there, was contrived by him. I am ſure, I was, in my thoughts, as far from derogating any thing from another, as any perſon alive, whatſoever, can be; and I am perſuaded, it will appear, by all the Tranſactions, that I have been all along ſcrupulouſly careful, not only to give every one his own, but alſo to vindicate that to the owner, which others have appeared to rob him of. But if this ſhould not be thought ſatisfactory, I would beg, Sir, that the farther remonſtrating of it may be deferred till our perſonal meeting; an amanuenſis being, in my opinion, leſs proper to receive into his pen a matter, wherein a man's candor is, or but ſeems to be, called in queſtion. I doubt not, but you have received a full account of the lodging-place, deſigned for you at *Newington*. Mr. *Coxe* ſoliciting me to give him a viſit there, I walked thither on Thurſday laſt; and, though I was not within the houſe, that is to be taken up for you, yet I looked upon the places about it; and muſt needs ſay, that it ſeems to me very convenient for you; there being a large orchard, a walk for ſolitary meditation, a dry ground round about, and, in all appearance, a good air; all which Mr. *Coxe* affirms to be accompanied with a civil landlord, and fair landlady.

AT our meeting on Wedneſday laſt at *Greſham*, the preſident took ſome account, of what ſeveral of the members then preſent had been employed in, during the late ſad and long receſs. Some related what had been done by them in the matter of chariots and watches; others, what in maſonry, and the extraction of lead out of the ore; others, what in the hiſtory of the nature of ſalts; others, what in the perfecting of the experiments touching the injection into veins, and particularly about the transfuſing of blood out of one animal into another; concerning the laſt whereof, Dr. *Clerk* affirmed, that he had tried that experiment two years ago, but found it ſo difficult, that he gave it over: whereupon Sir *R. Moray* mentioned, that Mr. *Boyle* had hopes of maſtering the difficulties, that are met with in that experiment. Dr. *Wallis* being preſent, and deſired to acquaint the company, what had been chiefly done at the meeting in *Oxford* laſt ſummer, related ſame of the muſical experiments, that had been made; and being ſolicited to give them in writing, he made anſwer, that Mr. *Boyle* had recorded them. Whereupon the ſecretary was ordered to take notice of it in writing, that Mr. *Boyle* be deſired to impart the ſaid experiments, with all their circumſtances.

DR. *Beale* in his late letter preſents his moſt humble ſervice to you; and having delivered ſeveral hints and obſervations, he adds, that you uſe not to deſpiſe any of that kind; which makes me conclude, that he would have them communicated to you.

THEY are theſe:

" 1. If ſuch ſcales ſhould be deviſed, as Mr. *Boyle* acknowledges himſelf to uſe, and with this addition, that one ſcale be fitted to gather all the weight of air that may be, the other ſide to decline and avoid the preſſure of air, by this the difference of weight at one, two, or three inches in the mercurial cane, may be taken. And it is probable, that the ſhowers expected in the ſpring at hand will in few days or weeks bring down the mercury for this calculation. And (as I ſaid formerly, and do now preſs) hence by calculations we may advance, upon Mr. *Boyle*'s principles to compare the air of the whole atmoſphere (at the ſeveral great ſtages) with the weight of mercury or water, which it depreſſes, *&c.*

2. And hence alſo may be calculated, what a cylinder of air, which takes up ſo many inches, feet or yards breadth, does amount unto; and may caſt up, what the weight of air is in a cloſet, or gallery, according to the dimenſion of the room, and the ſtation of the mercury.

3. And this may be referred to the ſtatick rules of ſanity. And certainly, I have noted, that ſome men do require a far larger ſtore of air for their ſuſtenance, than others. Mr. *Mede*, the famous divine, a great ſtudent, and of a ſtomach ſomewhat greater, than is uſual in ſtudents, could not take his ſleep, nor reſt, except all the curtains and chamber windows were wide open. And this plenty of air he repaid with ſuch a ſteam conſtantly expiring out of his body, as ſtained all his clothes, and that as ſoon as he could renew them. His body always bound. And I knew a vivacious perſon, of great underſtanding, who could not ſleep, except the curtains and lodgings were open. He died lately, 102 years old. I took notice, that in that great age, or near it, he could not endure to ſleep with any cap (though but of linen) on his head. He had no baldneſs, but bred much hair.

4. Certainly my friendlieſt medicines are thoſe, which procure or aſſiſt tranſpirations; and thoſe require more freſhneſs and frankneſs of air. May not that be one cauſe of the benefit of perambulations, in oppilating diſtempers, that, beſides the motion, the air may be freſh?

5. May not a ruſh-candle, or watch-candle, be deviſed of ſuch tender flame, as may diſtinguiſh ponderous air from lighter? If by any device we could put a poſitive eſtimate upon the weight of the air in any dimenſion, I mean from the whole atmoſphere, it would much ſurpriſe and amuſe our common philoſophers, who do ſeldom conſider, that we are encompaſſed with ſuch a weight of air."

So far he: And I can go no farther, than to add, that I am,

SIR,

your faithful and humble ſervant,

Sir, ſome of your thoughts upon Dr. *Beale*'s paragraphs would be very acceptable to us both.

2

March. 24, 1665.

SIR,

BOTH your favours, the written and printed, I have received, and do now return you my humble and hearty thanks for them: the like will be heaped on you by the publick, when they ſhall ſee your barometrical obſervations and directions, together with the two treatiſes, of hydroſtaticks, and mechanical forms and qualities, both ſurpriſing and moſt uſeful books. In the former you have fully eſtabliſhed and cleared that ſubject: in the latter, you have driven out that devil of ſubſtantial forms, that, as it has hitherto done all the feats, the ſchools have been entertained with, ſo it has ſtopt the progreſs of true philoſophy, and made the beſt of ſcholars not more knowing, as to the nature of particular bodies, than the meaneſt ploughman. Since I gave notice of them in the Tranſactions, that they were coming abroad, I have been ſolicited from foreign parts, to haſten the Latin verſion of them: to comply with which, I have done my part, as to the former, being ready to ſend for the preſs half a dozen ſheets a week (the reaſon why I offer not the whole at once, being, that I would have ſome time to review) but I find no anſwer to what I ſaid in my former letters about it; as to M. *Davies* readineſs to print, if you ſhall give me order to undertake the other, *Of Forms*, &c. I am ready for that too, and ſhall diſpatch it, God vouchſafing me health, with all poſſible expedition. But I would advertiſe, that the title-pages might be forthwith printed, and immediately after ſent abroad, as *John Crook* has done, with that of the hiſtory of Cold, to which he has alſo received an anſwer from his correſponding bookſellers in *Holland*, that they will take off the whole Latin impreſſion. And this is the only way, I know, to prevent foreign tranſlations; which if *Herringman* had taken, the Latin Colours would not have lain upon his hands.

In the peruſing of the Hydroſtaticks, I met with one place, that certainly wants ſomething to make up the ſenſe; *vid.* pag. 188. in the paragraph that begins with, But let us ſuppoſe, *&c.* The defect poſed Dr. *Wallis*, when he was here, as well as myſelf, and needs a timely ſupplement, both before more of the Engliſh copies be diſperſed, and before I ſend away the Latin to be printed. There are one or two errata more, but very obvious to mend by any reader, as pag. 189. line 13. ſurfaces, for ſurface; and pag. 76. line antepenult. water in ſpecie, for water is in ſpecie.

In the reading of the *Origin of Forms*, (which my curioſity haſtened me to do yeſterday, as ſoon as I had received that preſent) I met with the following faults: in the laſt page of the publiſher to the reader, there is lin. penult. a correction, that needs another, *vid. till* pag. 169. for pag. 269. Again, pag. 64. lin. 6. *thoſe*, ſeems to be put for *though*, to anſwer the *yet*, in the next line: and pag.

325.

325. lin. 4. I gueſs, that *two inflammable*, is put for *two uninflammable*. There ſeems to be a defect alſo in pag. 369, in the latter part, beginning lin. 19. to the 2d line of pag. 370. Pag. 396. I think *ſtand* is put for *ſand:* and pag. 397. lin. 13. *it all*, for *it at all:* and in the ſame page, line 6. *& ſeq.* I do not find, that the words, *not only*, have that particle, that anſwers them. The chief of theſe may eaſily be mended by the pen, before diſtribution.

IT ſeems, that at *Florence* they have been laſt winter engaged, among other experiments, to make trials of congelation; a correſpondent of mine writing me word, that they had expoſed four veſſels, filled with common water, to the four points of the world, and found, that to the eaſt freeze firſt, that to the weſt next, and then that to the ſouth, and laſt of all, that to the north, though this laſt was frozen hardeſt of all; which I underſtand not; the particular ſituation of the place not being deſcribed, nor what fence there might be more to one part of the houſe than the other, againſt the power of the froſt. They have made, it ſeems, many others, in all ſorts of veſſels, open and cloſe, and with all ſorts of metals and glaſſes, whereof I am promiſed *le detail* hereafter.

ANOTHER friend from beyond ſeas takes notice of an obſervation made about glow-worms, that they have a red humour in them very fine and pleaſant to look upon. If I miſtake not, I have heard curious men affirm, that their ſhining quality is gone when they are dead.

MY Pariſian acquaintance endeavours the promoting of the Natural Hiſtory, telling me, upon my former ſolicitations of it, this; *Je parle par tout de beau deſſein, que vous* (meaning the Society) *avez de faire une hiſtoire naturelle, à fin de donner de l'emulation à nos meſſieurs, & les exciter à vous imiter.* I know, they will be much pleaſed, and ſet on, by thoſe comprehenſive general queries, you give me leave to enrich the next tranſactions with; and they will be much more, if they ſhall ſee thoſe particular ones (ſubordinated to ſome of the general points) which you ſo generouſly offer, and I moſt ardently deſire the communication of. Sir, you will ſee, I doubt not, great effects of theſe ſolicitations and directions, induſtry and guidance being much more wanting in this age, than abilities.

LET princes and ſtates make war, and ſhed blood; let us cultivate virtue and philoſophy, and ſtudy to do good to mankind. *Non ſileant amplius leges nec muſæ inter arma; ſed vocales ſint quàm maximè in maximo ſtrepitu bellorum.*

I AM particularly obliged to you for your favourable concern for me in my Latin tranſlations. If ever they be done and printed, I ſhall moſt greedily embrace your kindneſs. I wonder ſomewhat at Mr. *Davies*, that he ſhould make ſuch a noiſe, among our ſtationers, even by letters, concerning the Tranſactions, and the ſcarcity of their vent. Methinks, he does what he can to decry them, and has already effected ſo much, that, if they go on to be printed, I ſhall be the worſe for it by forty ſhillings a month, which is a great loſs to one, that has no other way of ſubſiſtence for ſerving the Society. And I wonder the more at him, becauſe I have not at all preſſed him to pay the reſt of what he was contracted for with, contenting myſelf (by reaſon of the troubleſom time that was, when he printed) with the nine pounds; whereas thoſe three tracts would have amounted to twenty pounds ten ſhillings. In the interim, I had a letter lately from Dr. *Beale*, who beſpeaks ſeveral copies of all the numbers hitherto printed, for ſeveral of his acquaintance in the country; and, methinks, it is probable, that thoſe, that had any of them, ſhould in time look for all the reſt; and I am ſure, I cannot get myſelf not ſo much as one copy of Numb. I. no where, having given away all thoſe I had of it, and the ſtationer alledging, he can find none of them in his warehouſe, but only ſome few ſheets of a part of it. I am apt to believe, that if Mr. *Davis* ſends thoſe copies he has left, they may in a little time be diſperſed, if the town remain in health; and then ſure his clamorous complaints may be ſatisfied. What was hoped might have brought me in about 150*l. per annum*, Engliſh and Latin together, will now ſcarce amount to 50, as the matter is like to be ordered, eſpecially ſince the ſtationers, by reaſon of the war, refuſe to print the Latin. But I am aſhamed, Sir, to trouble you with this ſtuff; that, which moſt urges me to it, is the conſideration I have, that, by the fall of this aſſiſtance, I may be diſabled to ſerve the Society.

ON Wedneſday laſt, at our meeting at *Greſham*, there was no common entertainment, about the vermination of the air, as a probable cauſe of the plague; about the rain of aſhes, that fell ſome years ago in the *Archipelago*, far off at ſea, and covered the ſhip-decks one foot deep, *&c.* ſome of thoſe aſhes being produced by M. *Evelyn*, who alſo preſented us with above forty kinds of very pretty moſſes, gathered in one wood *in Surrey*; about the retrieving of the old way to prepare and temper tools for the cutting of porphyry; about ſome experiments of gravity, made in a deep well by M. *Hook*, who produced the ſcheme of an inſtrument for finding the difference of the weight, (if any) between a body placed on the ſurface of the earth, or at a conſiderable diſtance from it, either upwards or downwards; by the advantage of which, many experiments of gravity, and magnetiſm, are like to be made before the Society. Mr. *Colwall* was publickly thanked for his new generous preſent of the collection of natural things, and a committee was appointed, for the reducing it into good order, and for the preſerving and encreaſing it.

BUT it is high time I ſhould eaſe you, and ſubſcribe myſelf, what I am really,

SIR,

your very humble,
and faithful ſervant,
H. OLDENBURG.

SIR,

London, March 27, 1666.

SIR,

YOU will find by and by, that the encloſed hath occaſioned my preſent importunity. Dr. *Beale* thinks, that in ſome of his late letters to me are contained particulars, not unfit to be prepared for your nice ſcales, whilſt you are employed in the ſtaticks, about the quantity and weight of air, that is required for the health of human bodies. Sir, I cannot doubt, but you have conſidered that matter to the bottom ere this, and therefore ſhould be unwilling to offer any thing to you about it, but only to ſatisfy the deſires of our common friend, who conceives, that the ſcales mentioned by you in Hiſtory of Cold, page 19, are eaſily applicable to the purpoſe, he urges, by a fit receiver of a preſſure of air in one ſcale, *&c.* the broader the better: or, as he hath it more fully, in another letter, if ſuch ſcales ſhould be deviſed, as you make uſe of, with this addition, that one ſcale be fitted to gather all the weight of air, that may be; and the other ſide to incline and avoid the preſſure of air; that by this the difference of weight, at one, two or three inches, may be taken. To which he adds, that it is probable, that the expected ſpring-ſhowers will, in few days or weeks, bring down the mercury for this calculation. And hence alſo, ſaith he, there may be calculated, what a cylinder of air, which takes up ſo many inches, feet, or yards breadth, does amount unto; and one may caſt up, what the weight of air is in a cloſet, or gallery, according to the dimenſions of the room, and the ſtation of the mercury. Which he would have referred to the ſtatick rules of health; he having noted, that ſome men do require a far larger ſtore of air for their ſuſtenance than others. He propoſes a ſcale for this purpoſe of extraordinary breadth, of ſome very light matter, thin whalebone, or yet lighter, to account the proportions of inequality of weight, from 27 to 30 inches.

I WISH Dr. *Beale* had digeſted his own ſenſe for you, and not commiſſionated me to cull it out of his letters here and there. However, I would not omit acquainting you with his propoſal, knowing, you will take all in good part, both from him, and,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

London, June 8, 1666.

SIR,

IF we had not expected you here every day ſince the firſt week after your departure, you would have been ere this waited upon by my ſcribbles. As we have had at *Greſham* an experiment, explicating the inflexion of a direct motion into a curve, by a ſupervening attractive principle, ſo I may preſume to gueſs, that your intentions of returning to *London* within a fortnight, were diverted by the powerful magnetiſm, that reigns at *Lees*. Thoſe load-ſtones being like to maintain their vigour, I doubt you will hardly keep your reſolution of coming to us next week, as your ſervant gave us hopes of. Mean while I ſhall mention to you ſomewhat more particularly what the experiment was, I juſt now alluded to, ſhewing, that circular motion is compounded of an endeavour by a direct motion by the targent, and of another endeavour tending to the centre. I ſay then, that for that purpoſe, there was a pendulum faſtned to the roof of the room, where we met, with a large wooden ball of lignum vitæ on the end of it: and it was found, that if the impetus of the endeavour by the tangent, at the firſt ſetting out, was ſtronger than the endeavour to the centre, there was then generated an elliptical motion, whoſe longeſt diameter was parallel to the direct endeavour of the body in the firſt point of impulſe; but if that impetus was weaker than the endeavour to the centre, there was generated ſuch an ellipſis, whoſe ſhorter diameter was parallel to the direct endeavour of the body in the firſt point of impulſe: and if they were both equal, there was made a perfect circular motion.

AFTER this there was made this other experiment. Another ſmaller pendulous body was faſtned by a ſhorter ſtring, on the lower part of the wire, which the greater ball was ſuſpended by, that it might freely make a circular or elliptical motion round about the bigger, whilſt the bigger moved circularly or elliptically about another centre. The intention whereof was, to explicate (in favour of Dr. *Wallis*'s Hypotheſis about the flux and reflux of the ſea, which has been pretty well fifted among us) the manner of the moon's motion about the earth, it evidently appearing thereby, that neither the bigger ball, which repreſented the earth, nor the leſs, which repreſented the moon, were moved in ſo perfect a circle or ellipſis, as otherwiſe they would have moved, if either of them had been ſuſpended and moved ſingly; but that a certain point, which ſeemed to be the centre of graviry of thoſe two bodies, howſoever poſited (conſidered as one) ſeemed to be regularly moved in ſuch a circle or ellipſis; the two balls having other peculiar motions in ſmall epicycles about the ſaid point.

THIS latter experiment I imparted to Dr. *Wallis*, who is, as I found by his anſwer, very well pleaſed with it; and hopes withall, that that theory of his will anſwer all the main phænomena of the tides; though he pretends not, to give thereby a ſatisfactory account of the particular varieties of them in ſeveral places of the world, for want of a full hiſtory of the ſame.

SIR *Th. de Vaux*, at the ſame meeting, preſented the company with a bundle of conſiderable papers touching coloration, drawn up by a very famous and curious phyſician, from the mouth of the moſt knowing and expe-

rienced dyers of *England* and *Holland* in his time; the Society ordered thereupon a committee, to conſider of theſe papers, and to diſtribute them among themſelves to be Engliſhed, they being almoſt all in French, and then to digeſt them: which being done, I am perſuaded, that many notable particulars will be there met with, to illuſtrate the philoſophy of dying, *&c.*

THERE was alſo, at the ſame time, brought in a diſcourſe by Sir *Gilbert Talbot*, of a rare ſtone, to be found in *Sweden*, yielding four different ſubſtances, *viz.* ſulphur, vitriol, alum, and minium: of which the preſenter was deſired to procure us a good quantity for trial, which he promiſed to do.

MONSIEUR *Auzout* was then elected into the Society, *nemine contradicente*; and a diploma is to be diſpatched to him, as was done to Mr. *Hevelius*. The ſame, I find by my laſt from *Paris*, is nominated for one of thoſe choice perſons, that are to conſtitute their academy; ſome of the reſt, that are pitched upon, being M. *Roberval*, M. *Carchavy*, M. *Frenicle*, M. *Picard*, M. *Huygens*, all very able men, appointed to meet and to conſider of the beſt way of framing a philoſophical Society, and the beſt method of carrying on its deſign. I perceive, they will chiefly purſue mechanical and chemical experiments, they having already in their eye a couple of good chemiſts, and ſome able mechanicks, that ſhall work by their directions. *On ſera faire* (ſaith my author) *tout ce qu'il faudra pour travailler utilement. On à deſia commencé de s'aſſembler pour faire quelques reglemens. C'eſt un beau et grand deſſein, qui ne peut eſtre qu'utile et glorieux à la France.* He adds, *on pourroit faire auſſi quelque choſe en Denmark, parce qu'il s'y trouve des ſujets capables et tres intelligens.* Indeed they have ſome there, that are very learned men, as *Eraſmus Bartholin* the mathematician, *Thom. Bartholin* the phyſician, and *Steno* the anatomiſt; the laſt of which has been, I find, much courted in *France*, and is now ſo in *Italy* at *Florence*. I hope our Society will in time ferment all *Europe* at leaſt: I wiſh only, we had a little more zeal, and a great deal more aſſiſtance, to do our work thoroughly, as I am apt to believe the French will ſtudy to do theirs (they being like to be endowed) were it but out of emulation. So good be done to our generation, and a ground laid to do the like to poſterity, no great matter what paſſions do concur for the performance.

THE Venetian embaſſador *Juſtiniani*, now at *Paris*, hath ſent me, by the hands of my correſpondent there, a conſiderable printed paper, (for the Society) publiſhed in *Italy* by Signior *Caſſini*, containing many notable obſervations, made in February, March and April laſt, with ſome of *Campani*'s glaſſes, touching the converſion of *Mars* about his axis, performed (as he affirms to be aſſured of by very good obſervations) in the ſpace of twenty four hours, forty minutes. You remember, Sir, that the ſame was obſerved here in *England* in the ſame months, witneſs one of our Tranſactions, num. 11. which I am now very glad took timely notice of it in publick.

DR. *Beale* preſents you his hearty ſervice: is very buſy upon ſome new ſubject; commends *Parker*'s Cenſure of the Platonick Philoſophy, and thinks, that the ſame arms againſt *Glanvil*'s Pre-exiſtence of ſouls. Mr. *Glanvil* is, I find, of an excellent temper for argument; and, I believe, that he will rather yield and fly the field, than handle a weapon unhandſomly.

I PRESUME to ſwell this letter with this month's Tranſactions. If *Eſſex* breeds curioſity, thoſe papers may be made known there by your influence; and the chief place of the concourſe of the gentry there being intimated to the printers of them, they may monthly ſend them thither, as they do to many other parts of *England*.

I NEED not, I ſuppoſe, entertain you with the relation of the late rude, and obſtinate fight, or the ſucceſs thereof. I ſhall only ſay this of it, that as the engagement will not eaſily be paralleled, ſo we ſhall find the ſucceſs, all things conſidered, a great deliverance and a dear victory to us. Mean while, God be thanked, both our generals are well, having done prodigious things, and the king in a condition to ſet out very ſpeedily another fleet; which that it may be done ſo, as to prevent our enemies, is of the higheſt concernment in this buſineſs.

WE know not where the French fleet is: ſome ſay, turned back to *Cadiz*; others in their way to come about the north of *Scotland*, to join the Dutch, and to make them appear again preſently. My laſt letter from *Paris* hath only this; *Les Suedois pourront bien eſtre mediateurs et arbitres de la paix. La France obligera la Hollande de leur donner ſatiſfaction, et de renoncer au traitté d'Elbing.*

BUT I am tired, it being paſt midnight; and I believe, you have cauſe to be ſo much more at the rhapſody of,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, Sept. 10, 1666.

SIR,

I WAS very ſorry I was abſent, when, as I heard, you did me the favour of calling at my lodging before you went out of town. If I had known the leaſt word of your intention of retiring to *Oxford*, I ſhould have made a ſhift to have waited on you at *Chelſea* before. However, I am very glad you are ſo well, as to travel: Almighty God keep and ſtrengthen you in it. I cannot omit acquainting you, that never a calamity, and ſuch an one, was ſo well born, as this is. It is incredible, how little the ſufferers, though great ones, do complain of their loſſes. I was yeſterday in many meetings of the principal citizens, whoſe houſes

are laid in aſhes, who inſtead of complaining, diſcourſed almoſt of nothing, but of a ſurvey of *London*, and a deſign for rebuilding, and that in ſuch a manner (with bricks, and large ſtreets, leaving great intervals and partitions in ſeveral places) that for the future they may not be ſo eaſily ſubject to the like deſtruction. I hope, that ſome of our Society will ſignalize themſelves in this ſurvey and deſign, which, when done to the ſatisfaction of the king, may by his majeſty be offered and recommended to the parliament. I was this very morning with our preſident, and ſuggeſted this buſineſs to his lordſhip, who liked it ſo well, that he intends to move it to morrow at the council of the Society, which is ſummoned to meet at *Greſham* in ſome other room, than formerly our ordinary meeting places, both for the council and the Society, being, as I hear, taken up by the lord mayor and the court of aldermen, as is the quadrangle for the meeting of the merchants, *pro tempore*.

I DOUBT, I ſhall find it very difficult to continue the printing of the Tranſactions, *Martyn* and *Alleſtry* being undone with the reſt of the ſtationers at *Paul*'s church-yard, and all their books burnt they had carried for ſafety into St. *Faith*'s church, as they call it; beſides, that the city lying deſolate now, it will be very hard to vend them at the preſent. I had hopes to have once waited on you to dinner to Sir *William Morrice*'s, there to have opened to him my deſires of thinking on me, in caſe the Latin ſecretary's place ſhould fall vacant, eſpecially now there is ſmaller hopes than ever, of benefactors to the Society, and the Tranſactions like to be interrupted, but charges to encreaſe; I having been neceſſitated within this ten days to pay twenty four ſhillings to the publick, for chimnies, taxes, and watching; which if it hold long, will force me to run away. Sir, if you would not think it a trouble, to ſolicit, by a line or two of your own hand, my lord *Brounker* and Sir *R. Moray* to recommend me for the ſaid employment, you would exceedingly oblige me: for though I think they both have an affection for me, yet I am aſſured, their care for me in this particular would be redoubled upon the recommendation. I leave all to your own diſcretion, who am,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

London, Sept. 18, 1666.

SIR,

YOUR very obliging letter I received, and delivered the annexed to my lord *Brounker*, who preſents his affectionate ſervice to you, and deſires you will pleaſe to ſend the mentioned experiment to me, and reſt perſuaded, he will do what is in his power for the perſon recommended. And I believe verily, his lordſhip will not come ſhort of his word; and which is more, I am perſuaded, if he had known my condition ſooner, that is ſo very low, as indeed it is, whatever face I have put upon it, he would have ſooner taken care for me. For he was pleaſed to ſay as much to me, when upon this occaſion I related to him, that my dear wife had brought me 400 *l.* whereof, upon our agreement of marriage, ſhe called in 200, laying out 100 upon furniſhing our houſe, and the other 100, partly upon the fine for the houſe, partly for other neceſſary occaſions, as far as it would go. And before ſhe died, left me the other 200 *l.* then in the hands of Sir *Brocket Spencer* and Sir *John Cotton*, from whom I received them (being neceſſitated to call them in alſo) and ſpent them partly for her funeral and payment of debts, and partly upon my ſubſiſtence hitherto; that, which the Tranſactions have yielded, being conſumed in my houſe-rent, and taxes, and duties, thoſe ſums not amounting alſo by far to what was at firſt imagined, and being now like to fall lower yet. Having been forced to repreſent this to his lordſhip, and added, that I had declined ſeveral offers of conducting young noblemen abroad, which would at leaſt have been worth to me 100 *l. per ann.* if not alſo ſome annuity *ad vitam*, after the employment ended; his lordſhip told me plainly, that if he had known ſo much betimes, I ſhould not have ſuffered ſo much, expreſſing particularly what advantageous employment in the navy (but now provided for) he could have conferred on me, which he believed I would have performed to more ſatisfaction than he, that is now in it; but yet he would be mindful of me, and not ſuffer me to want. The ſtationers of *Paul*'s inſiſt, to give them the Tranſactions for a while, till they can ſomewhat recover their loſs, which indeed is very great, all their books, carried by them into St. *Faith*'s church under *Paul*'s, being burnt, and amongſt them the hitherto printed Tranſactions. I tell them, that I ſhould not want generoſity to do ſo, if I had ability to bear that retrenchment: mean while, I have given them the Tranſactions of this month freely, if that will do them any kindneſs, or at leaſt be any encouragement to them to continue; which they ſay it will, and make them ſtretch as far as they can thereafter. In this confuſion and general unſettlement I know not where to faſten it, or to meet with any tolerable conditions for it: that made me venture the continuation with them, leaving the iſſue to providence; which, I hope, will, upon our deep humiliation before it, and a true remorſe of our impieties, raiſe this deſolated city into a far better condition than ever. Dr. *Wren* has, ſince my laſt, drawn a model for a new city, and preſented it to the king, who produced it himſelf before his council, and manifeſted much approbation of it. I was yeſterday morning with the doctor, and ſaw the model; which, methinks, does ſo well provide for ſecurity, conveniency, and beauty, that I can ſee nothing

thing wanting as to thoſe three main articles; but whether it has conſulted with the populouſneſs of a great city, and whether reaſon of ſtate would have that conſulted with, is a query to me. I then told the doctor, that if I had had an opportunity to ſpeak with him ſooner, I ſhould have ſuggeſted to him, that ſuch a model, contrived by him, and received and approved by the Royal Society, or a committee thereof, before it had come to the view of his majeſty, would have given the Society a name, and made it popular, and availed not a little to ſilence thoſe, who aſk continually, what have they done? He anſwered, that he had been ſo preſſed to haſten it, before other deſigns came in, that he could not poſſibly conſult the Society about it. However, ſince it is done without taking in the Society, it muſt ſuffice, that it is a member thereof, that hath done it, and, by what I ſee, hath done it ſo, that other models will not equal it; and I hope, that when it comes to be preſented to the parliament, as the author will be named, ſo his relation to the Society will not be omitted.

THE parliament was adjourned from this day to Friday next; his majeſty ſending them word, that he deſired to meet them in a fuller houſe. It is conjectured, that ſome news is expected ſhortly from the fleet, whence a meaſure is to be taken of a part, at leaſt, of the ſpeech intended for the parliament. The French fleet hath at laſt appeared about the iſle of *Wight*. I conceive, that another engagement between us and the Dutch being expected, they would draw nigh, to be in readineſs to come in, as a reſerve in the midſt of the combat, and to try their fortune upon a tired, and at leaſt ſomewhat diſabled fleet. But the ſtorm, that has been very violent this night, and continues ſtill, though not ſo fierce, is like to have diſappointed all the three fleets (if they have not fought before it) and damnified them exceedingly.

SIR, I intended to have given you an account of what counſel was given on Sunday laſt to the king, in a ſermon; as alſo of ſome particulars ſent me from *Paris*; but that I have been tedious enough already, and muſt alſo ſpare my eyes; who am,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, Sept. 21, 1665.

SIR,

I HAVE good hopes, the generous inclinations of thoſe two worthy perſons, the lord *Brounker* and Sir *R. Moray*, thus excited by the ready favour of your recommendation, will prove effectual for my relief. I am ſure, I am eternally obliged to you for your ſo careful a concern for me. Your commands to me for my lord *Brounker* I hope I ſhall have occaſion to obey to morrow, when we meet at *Greſham*; which perhaps will be the laſt meeting in that place, the city ſtriving hard to get that college totally into their hands for this time of diſtreſs: which if they obtain, the Society are provided with another place to meet in, to wit, in *Arundel* houſe, by the generoſity of Mr. *Howard*. I doubt not, but they will be very well pleaſed with the account of the way of transfuſing blood out of one dog into another; and accordingly order me to return their thanks. I believe Mr. *Martyn* has ſent ſome copies of this month's Tranſactions, printed with ſome difficulty, for *Oxford*; which makes me forbear to charge this letter with an exemplar. If you thought fit, Sir, to gratify the publick and me with your excellent queries of mines and petrifying waters, for the approaching month of *October*, in which my Hungarian friend intends to depart hence for his country, it would be a very ſeaſonable favour; and the notification of your thoughts concerning it by the firſt conveniency would be a great addition to it.

THE French news I would have written laſt week, are, that at *Paris* they apprehend a peace between *Spain* and *Portugal*; and that they hear, a league is concluded between *England* and the houſe of *Auſtria*; which they ſay muſt needs be followed by a conqueſt of *Flanders*, and, they hope, of all the *Low Countries*.

MY philoſophical friend tells me, that another volume of *Des Cartes*'s letters is printed, promiſing to ſend me a copy by the firſt opportunity.

I KNOW not, Sir, whether you heard any thing of the advice given to his majeſty on Sunday was ſev'night, in a ſermon preached before him by Mr. *Frampton*, lately returned from *Aleppo*. It contained theſe particulars; that his majeſty, for the bringing of virtue and piety into faſhion, would pleaſe to put in execution all his laws againſt impiety and vice; invite ſeriouſly his whole court, the nobility and gentry, to countenance virtue and diſcountenance vice; deny his favour to all libertines and profane perſons; and remove out of his own breaſt, if any thing ſhould lodge there, capable to provoke God's diſpleaſure. All which being done, he aſſured himſelf, that it would not only caſt ſuch a light and ſplendor about his majeſty's throne, as to ſcatter all the works of darkneſs, but alſo bring ſuch a flood of bleſſings upon him and the whole kingdom, that *England* would be the wonder of the world for proſperity.

THE parliament hath voted in general a ſupply proportionable to the king's preſent occaſions. They are to review the account of the expences for the war; and to ſtate, for the rebuilding of *London*, that grand query, how much ſuch a quantity of ground, in ſuch a place, is worth to build upon?

THE Dutch, hearing we were all on fire in *London*, reſolved immediately to come out again, and are now in *Margate* road. Our fleet, upon the hearing thereof, will quickly come to them with this wind, and

then

then there may be another fight, if they ſtand it. It is ſomewhat happy, that our fleet of ſome thirty merchantmen, lately come from *Livorno* and *Scanderoon*, gone into *Portſmouth*, are there ſtill (as we hear they are:) for if they had been at ſea at this time, and in their way for *London*, they would hardly have eſcaped falling into the Dutch fleet.

I CAN hear nothing of my lord *Brereton*: if I meet Mr. *Haak* to morrow at *Greſham*, I ſhall enquire after the letter you mention; who am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

I SUPPOSE Dr. *Lower* will give me leave, to make his way of bleeding one dog into another publick, to invite others to the like experiments.

London, Oct. 2, 1666.

SIR,

YOUR laſt, without date, came to my hands this morning. The mention therein made of the extraordinary weight of the atmoſphere at ſuch a morning, and on ſuch a day, makes me take notice of the omiſſion of the date, becauſe it relates to the time of the writing of the letter, which is not expreſſed.

SIR, I ſhall very carefully intimate, what you ſuggeſt concerning the queries of mines, if you pleaſe to communicate them to the publick; which if you ſhall give your conſent to, will be more largely obliging and more generally beneficial, than if given only in writing to this or that perſon. I heartily thank you for the hopes, you are pleaſed to give me of other queries, or papers, in lieu of thoſe of petrifying ſprings; begging withal your pardon for my importunities. I met this morning our good friend Mr. *Dan. Coxe* at Sir *R. Moray*'s, and perceived by him, that he is very anxious at your being abſent from *London*, at a time, when there is an important cauſe to wiſh you here preſent; which yet he did not declare to me, but thus in general.

MY laſt from *Paris* contained an encloſed, from M. *de la Quintinie*, the gentleman gardiner, who preſents his humble ſervice to you, among ſeveral others, and ſhews his conſtant addiction to the improvement of gardening; wherein I find he has attained that excellency of ſkill, that he is courted by all the grandees in *France* for it.

MY lord of *Eſſex* hath found the experience of his knowledge of that kind; who being lately returned from *Paris*, was pleaſed to charge himſelf, for my uſe, with a couple of new *French* books; whereof one is of Mr. *Paſcal*, entitled, *Traité de trianglé arithmetique, avec quelque autres petits traitéz ſur la meſme matiere*; the other, *Une Relation du Voyage de l'Eveſque de Beryte par la Turquie, Perſe, les Indes, &c. juſques au royaume de Siam, & autres lieux.* I had only leiſure, ſince I received them, to ſkim over the latter; which has much more of the miſſionary in it, than of the philoſopher. That, which pleaſes me beſt in him, is, the deſcription of the beſt way of traveling into the *Eaſt-Indies* by land, and in what ſeaſon, and in what length of time it may be performed. He notes ſomething of the finding of diamonds in thoſe parts, which I know not well what to make of. It may be, Sir, you will not be diſpleaſed to ſee it; wherefore I ſhall here tranſcribe him verbatim:

Pour trouver les diamans, on prend de la terre, que l'on croit propre à les former (I ſuppoſe he means the earth, that is found in diamond mines) *qui eſt rougeaſtre, entrecoupée de veins blanches & remplies de cailloux, & de mettes dures. On diſpoſe proche des endroits, que l'on veut foüiller, une terre, qui ſoit unie & egalle: On y porte celles, que l'on a tirees de la mine; on l'eſtend doucement, & on la laiſſe exposée au ſoleil durant deux jours* (this, methinks, is a very ſhort time) *lors qu'elle eſt aſſez deſſeichée, on la bat pour la reduire en poudre, & criblant cette terre ils trouvent les diamans, & reconnoiſſent les cailloux, où la nature les a enchaſſez.* Thus he. I underſtand not, whether theſe expoſed earths in ſuch places, that are ſuſpected to have diamond mines, being found afterwards to have little diamonds generated in them, ſhall ſerve for a ſign of ſuch mines, or not?

OUR news from ſea is none other, than that our fleet is well, and has ſuffered none, but very ſlight, damage in the late ſtorms; which yet have been very unfortunate to us, upon this account, that they have hindered us twice to give the enemy battle, when we had him at very great advantage, and might, in all probability, have obtained a very important victory over him, and thereby neceſſitated him to a peace. Both the enemies fleets, French and Dutch, have ſuſtained ſome loſs by the winds; whereof I expect the particulars by the next.

THE rebuilding of the city, as to the model, is ſtill very perplexed; there appearing three parties in the Houſe of Commons about it. Some are for a quite new model, according to Dr. *Wren*'s draught; ſome for the old, yet to build with bricks; others for a middle way, by building a key, and enlarging ſome ſtreets, but keeping the old foundations and vaults. I hear, this very day, there is a meeting of ſome of his majeſty's council and others of the nobility with the leading men of the city, to confer about this great work, and to try, whether they can bring it to ſome iſſue, before the people, that inhabited *London*, do ſcatter into other parts.

THE great ſtreſs will be, how to raiſe money for carrying on the war, and to rebuild the city, at the ſame time.

SIR, I muſt not omit to tell you, that my Pariſian friend acquaints me, there is one, that has anſwered Mr. *Hobbes*'s book *de cive*, but the anſwer not yet printed. He adds;

Ce luy, qui y a travaillé, a de l'eſprit, & a bien reuſſy.

THEY are troubled at *Paris* at the death of Mr. *Manſart*, their beſt architect, who vied with the chevalier *Bernini*.

ONE monſieur *Varin* hath lately made *le buſte du roy* in marble; which they eſteem no leſs than that of the ſaid *Bernini*.

SIR, if you favour us with the abovementioned queries, and they come to my hands next Monday, they will come ſeaſonably for the Tranſactions of this month to,

SIR,

your faithful humble ſervant,

H. O.

London, Oct. 16, 1666.

SIR,

THOUGH I muſt confeſs, I reckoned upon the queries touching the mines for the Tranſactions of this month, and that the more, becauſe of my *Hungarian*'s readineſs to return into his country, as alſo (which came but lately to my knowledge) of Mr. *Thynn*'s, who is of the Royal Society, intended voyage for *Sweden*, whither he is to go within this week, as envoy from the king; yet, ſince the communication thereof is but deferred till next month, I am ſtill to give you my humble thanks for continuing your favour and intentions of imparting them to the publick by my hand: which acknowledgments I am to redouble for the heads, you have been pleaſed to ſend me, concerning ſea-waters; in the publiſhing whereof I ſhall endeavour to obſerve your directions. My firſt to Dr. *Beale* will, if God permit, give him notice of what you propoſe about trials and obſervations for the diſcovery of the nature of petrification, if there be any petrifying ſprings in his neighbourhood.

THE two laſt Wedneſdays, having been days of humiliation, we have had no meetings at *Greſham* college. And the ſtationers and printers having ſuſtained great loſſes in the late fire, and not knowing, as yet, how to ſettle and to reaſſume their trade, ſo as to make gain thereby; do very much ſcruple to print any thing, except it concern the preſent affairs of the war, and of the city: in regard whereof, it will be very difficult to perſuade them to continue the printing of the Tranſactions, unleſs I let them be printed without conſideration for the charges and pains, I am at in the digeſting of them; as I did the laſt: which my condition will not bear, however my ſoul be free enough to conſent to it, if I could.

THE vote for the raiſing of 1800000 *l.* you cannot but know; as alſo, that a committee is appointed, to conſider of the beſt way of raiſing it; which, it is thought by many, will be by continuing the tax upon real and perſonal eſtates.

THE other grand affair, about rebuilding the city, is not neglected neither; ſtrict injunction being now iſſued by the lord mayor, in the king's name, to clear the foundations of all burnt houſes of the rubbiſh, within a fortnight, which done, the ſurvey and admeaſurement of all ſuch foundations is to be forthwith taken in hand, and that by the care and management of Dr. *Wren* and Mr. *Hooke*: which ſurvey is to be exactly regiſtered, for the better ſtating hereafter every one's right and propreity. And then the method of building will be taken into nearer conſideration, and, it is hoped, within a ſhort time reſolved upon. All which may be more fully ſeen in the printed paper, for that purpoſe made publick by the lord mayor.

FROM *Holland* we have received the printed ſentence of death, pronounced (and ſince executed) by the States General againſt monſieur *Buat*; the ſum whereof is: That he having maintained, beſides a known and allowed correſpondence, another ſecret and forbidden one, with certain miniſters of *England*, and thereby made the world believe, that the States General might make peace with *England*, when they would, if they would but ſend perſons thither to treat, and that many of the ſaid ſtates were of the ſame opinion with him: beſides, having entertained motions from *England* for ſeparating from *France*, and for ſending commiſſioners thither, without the French, as alſo, having conferred with an Engliſh envoy at *Antwerp*, and there contrived a model of a letter, to be written by the king of *England* to the States, to perſuade them to diſpatch ſome perſon to him: which being done, he and his complices in the government would employ themſelves vigorouſly to preſs, in the States aſſembly, that the king's deſire might be complied with. Of which conference in *Antwerp*, a report being made to the king of *England*, his majeſty, though he thought not fit in that conjuncture to write ſuch a letter, yet did very much approve of the deſign of procuring an embaſſy to him: which particulars being written from *England* to *Buat*, he, by a miſtake, delivered that letter, among others, to *De Witt*, and thereby diſcovered his double correſpondency, whereof the unallowed one tended ſo much, as they conceive, to the traducing of their government, and the cauſing of diſturbance and diviſion among their people. That therefore the ſovereign court of *Holland*, *Zealand*, and *Frieſland* did condemn the ſaid *Buat* to have his head cut off, and his goods confiſcated.

FROM *Paris* the letters mention the reſolution there taken by the king, *de pouſſer la guerre vigoureuſement, pour reduire les Anglois à la raiſon.* They ſpeak likewiſe of a deſign, that the king hath of reforming *Paris*, by freeing it from dirt, rogues, and the tricks of the law: this I ſhall give you in my friend's own words: *Il y a un conſeil de police, qui conſiſte de* 8 *conſeillers d'eſtat, nommez pour avoir ſoin de la police de Paris, qu'on a diviſé en autant de quartiers. Si on pouvoit nous delivrer de bouës, de filous, & de la chicane, Paris ſeroit*

une demeure admirable, & il n'y en auroit point au monde de ſemblable. (There muſt be a river of *Thames* too, to make good ſuch an encomium.) *Outre cela, on pretend mettre un prix fixe au pain, à la viande, au bois, & à toutes autres ſortes de denrees. On pourſuit desja les filles de joye* (this is like to make them *filles triſtes*) *qu'on veut exterminer, parce que leur logis ſervent de retraites aux filoux. Si vous avez quelque bon avis à nous donner, vous nous obligerez, & ſervirez le public.*

I AM hereupon enquiring, what good order there is in *London*, worth imitation, and I mean to addreſs my friend to the regulations of *Rome*, as to the ſet prizes of victuals; though there be ſet prizes alſo of ſuch houſes, as they intend to rout at *Paris*.

FROM *Italy* I underſtand, that the pope is in a departing condition, and that there is already great bandying for the next election, which will hardly be made without much diſorder and diſſatisfaction.

FROM *Spain* comes news, that the peace between that kingdom and *Portugal* is not deſpaired of; the Engliſh miniſters there employing themſelves vigorouſly for the procurement thereof.

SIR, I ſuppoſe your eyes are tired; and mine being ſo too, I ſhall ſay no more, than that I am,

SIR,

your faithful humble ſervant,

H. O.

London, Oct. 23, 1666.

SIR,

I MUST wait for your conveniency of ſending the queries for mines; and in the mean time give you my humble thanks for the favour of your concern in the Tranſactions. To this very hour I have got none yet to print them; and unleſs Mr. *Crook* (whom I do what I can to encourage to it, by promiſing him, that I will endeavour the beſt I can to procure for him the printing ſome good vendible books, as occaſion ſhall ſerve) undertake it, I deſpair of the continuation: however they write to me from *Paris*, that they are very glad to find our Tranſactions go on, notwithſtanding the ſpoil made by the late fire, (which they take occaſion to ſay, upon the ſight of number 17, which was printed after the fire, gratis.)

I SHALL take occaſion to enquire after that hiſtory of *Africa*, you mention. We hear, ſome French gentleman or other is to come over, to condole with the king for the loſs of *London*, and to preſent him with ſome pipes of claret. I hope, to procure *Des Cartes*'s new volume of letters, and *Honoratus Fabri*, and *Voſſius de Nilo*, &c. to be ſent over by that opportunity.

I BELIEVE, Sir, you have ſeen, or will ſee by this poſt, his majeſty's printed declaration of war (which is a very reſolute one) againſt the king of *Denmark*, as his greateſt enemy. The truth is, that king (as is made out by the printed book) has ſo palpably prevaricated, and ſo manifeſtly broken his faith with our king, and acted againſt all honour, even ſo far, as to act double with the Dutch themſelves, that he will be the moſt contemptible prince in the world, and never be able to waſh out a ſtain of ſo deep a dye. The Dutch themſelves, though now they muſt make uſe of him, and his own people will deſpiſe him, let him varniſh it over, as he pleaſeth; the whole charge being grounded upon plain matter of fact, proved by writings, drawn by the privity of the miniſters of three kingdoms, *England*, *Denmark* and *Sweden*. His majeſty could not avoid the remonſtrating hereof, unleſs himſelf would have been contented to lie under the aſperſions of being a violator of the laws of nations; to remove which, he has proved, that the king of *Denmark* invited him, of his own accord, to that hoſtility againſt the Dutch, at *Bergen*, which he is by him reproached of, &c.

THIS war againſt *Denmark* being like to prove implacable, we muſt caſt about, how to get the Daniſh commodities another way; which may be done by Swediſh and Hanſe-town veſſels.

FROM *Paris* they write, that they hope, there will ſhortly be a peace between them and *England:* which, I confeſs, I underſtand not, how it ſhould be effected, as affairs ſtand; unleſs it be, that our ſolicitations in *Spain* of concluding a truce with *Portugal*, in order to make us enter into a ſtrict league with both, ſhould frighten the French king into a timely peace with us, to prevent that confederation.

THE words of the letter, becauſe of their weight, I will give you themſelves: *Si j'oſois eſcrire de nouvelles, je vous en manderois de tres bonnes; & que vous apprendrez d'ailleurs, pourvû qu'on vous en diſe toutes les circonſtances. Je veux croire, que la paix ſe fera dans peu de temps.* This, I ſay again, I underſtand not.

CONCERNING the Swedes, another French correſpondent writes thus, from *Paris: Tous les princes de l'empire haïſſent mortellement les Suedois, qui ne ſont plus ſi redoutables, qu'ils ont eſté. Leurs vieux ſoldats ſont morts, & ils peu de bons officiers; l'argent leur marque, & ils n'en peuvent avoir de nulle part. La France a intereſt, qu'ils ſoyent un peu bas, parceque dans la proſperité ils ſont trop fiers. Cependant la ville de Breme court riſque: il faudra, qu'elle renonce au droit, qu'elle avoit d'aſſiſter aux dietes de l'empire; les Suedois ſouſtenans qu'elle n'eſt pas immediate.*

OUR parliament has not yet concluded any thing about the way of raiſing the 1800000 *l.* nor is the model as yet agreed upon, by which the city is to be rebuilded.

THOUGH the Society meets, yet they can do but little in this confuſion of things. The new Pariſian Academy goes on, but will conſiſt only of a few, intending to ſet upon mechanicks, chemiſtry, and anatomy, and chuſing perſons fit for the ordering and executing of things neceſſary to improve thoſe parts.

DR. *Beale* writes me word, that he hath received a ſummons for *London*, which he muſt obey, and therefore intends to come up as ſoon as his horſes, gone into Herefordſhire, do return. He confirms, by new atteſtations, what he formerly wrote of the trees taken up in the moors near *Bridgwater*; of which many were found within a foot or two of the ſurface of the ground; no branches to be found, only the main bodies, and they as black as ebony.

HE tells me, that they have no petrifying ſprings in his neighbourhood; but that they have excellent ſprings there, for terſive and ſalubrious waters; and one, called *Ruſty-well*, giving ſtones a tincture of ruſty iron. And here he adds, that they want Mr. *Boyle*'s directions for trials of waters: of which kind, if you pleaſe to ſend any, they ſhall be faithfully recommended to him by,

SIR,

your faithful humble ſervant,

H. O.

London, Nov. 15, 1666.

SIR,

I AM ſure, that on the Monday of that week, in which your laſt mentions, that M. *Davis* expected down ſome copies of October's Tranſactions, there were ſent two or three pacquets, containing ſome dozens of them, to *Oxford*; but, I believe, to other ſtationers, than M. *Davis*. I muſt not ſwell theſe letters with printed papers of that nature, though I preſume to offer them to your view, when you are near at hand.

THAT, which occaſioned my ſilence to the new magnet, when I wrote laſt, was, that your taking no notice at all of it in your anſwer, begot in me a ſuſpicion of your thinking it time enough to have an account of it at your return to *London*. But, though I hope, you will not now defer that long, yet ſince you are pleaſed to expect an explication of what I then touched, I ſhall give it you briefly, having firſt precautioned you, that it comes from a perſon, though much addicted to magneticks, yet eſteemed not very knowing or diſcerning in them: it is Sir *W. Pers*: he ſaith, "That there is a rock of loadſtones "in the iſle of *Angleſey*, hanging over the "ſea, of a greeniſh colour, which he went "lately to ſee, and, breaking off ſome ſtones, "found, they were perfect magnets, becauſe "they would nimbly excite a verſorium. But "as to their attraction, they would hardly "take up a needle, though every ſtone was "full as big as a man's hand; though poſſi-"bly towards the middle the attraction may "prove more vigorous, the virtue of the out-"ward parts, becauſe expoſed to the cold "air and winds, being, perhaps, much im-"paired. I took an obſervation (ſo he goes "on) which gave me great ſatisfaction, in "order to confute *Des Cartes*'s opinion (which "imports, that the heat of the torrid zone, "draws the *particulæ ſtriatæ* from the north, "which paſſing, by a kind of tranation, "through the bodies of magnets, gives them "the influence of their conſtant poſition to "north and ſouth;) for I made trial by the "help of a verſorium, and going about ſe-"veral parts, I found ſome out-parts of the "rock, wherein the weather and tempeſts "had made great cavities, that ſome of the "poles were directly north-eaſt, and in two "places directly eaſt and weſt." So far he. The Society has given me order to recommend to Mr. *Bagnall*, one of our body, and of power, as is ſuppoſed, in *Angleſey*, that he would get the rock there cut, and ſome innermoſt pieces ſent hither: which I intend, God willing, to perform, as ſoon as poſſibly I can meet with the perſon.

WE have now conquered the difficulty of bleeding one animal into another. Some perſons, appointed by the Society, performed the operation firſt by themſelves upon a couple of ſheep, with good ſucceſs, as they reported: but then they did it yeſterday, before the Society, very ſucceſsfully alſo, upon a bull-maſtiff, and a ſpaniel, the former being the emittent, the other the recipient. It took up ſo much time, that there was very little left to conſider and diſcourſe of the improvement, eſpecially there being ſo many perſons to be balotted, whereof five were to audit the account, and three more to be received into the Society, which were, the lord Privy Seal, the biſhop of *Lincoln*, and Mr. *Mercator*; (my lord *Manchester*, and my lord *Carliſle*, having been alſo not long ſince elected into that corporation.) Colonel *Blunt* preſented the company with ſeveral not diſpleaſing particulars; with two ſorts of Engliſh wines, new and old; with excellent ſcorzoneras, which he ſaid might be propagated in *England*, as much as parſnips; with a pea, of an almoſt incredible fertility; and with a ſpirit of cherry wine, of a ſingular ſtrength.

FOR news, there is not very much at preſent. We have almoſt every week a fire. Our peace will be ſtrangely hindred by *France*. The money to carry on the war is debated of (as to the moſt ſatisfactory way of raiſing it) with great deliberation, but not without ſcratching. The building work is cool for the preſent, but will quickly grow warm again, as ſoon as the way of raiſing the money is once reſolved on, and the method of building determined. Our winter fleet is ready to go to ſea, and to fetch home the Gottenberg fleet, ſo neceſſary for our next ſetting out againſt our enemies.

DR. *Beale* went this day out of town, much diſſatisfied with what has paſſed in Mr. *Hopton*'s cauſe.

I HUMBLY thank you, for your permiſſion of printing the Mine-Enquiries; and I am,

SIR,

your very faithful

and humble ſervant,

H. O.

THE

THE proclamation for baniſhing Romiſh prieſts and Jeſuits, and for putting the other laws againſt recuſants in execution, is publick: and two others will ſhortly follow; one againſt French commodities; the other againſt Canary wines.

London, Sept. 3, 1667.

SIR,

I WAS ſo ſtifled by the priſon air, that as ſoon as I had my enlargement from the *Tower*, I widened it, and took it from *London* into the country, to fan myſelf for ſome days in the good air of *Craford* in *Kent*. Being now returned, and having recovered my ſtomach, which I had in a manner quite loſt, I intend, if God will, to fall to my old trade, if I have any ſupport to follow it. My late misfortune, I fear, will much prejudice me; many perſons, unacquainted with me, and hearing me to be a ſtranger, being apt to derive a ſuſpicion upon me. Not a few came to the *Tower*, merely to enquire after my crime, and to ſee the warrant; in which, when they found, that it was for dangerous deſigns and practices, they ſpread it over *London*, and made others have no good opinion of me. *Incarcera audaciter, ſemper aliquid hæret.* Before I went into the country, I waited on my lord *Arlington*, kiſſing the rod. I hope, I ſhall live, fully to ſatisfy his majeſty, and all honeſt Engliſhmen, of my integrity, and of my real zeal to ſpend the remainder of my life in doing faithful ſervice to the nation, to the very utmoſt of my abilities. I have learned, during this commitment, to know my real friends. God almighty bleſs them, and enable me to convince them all of my gratitude. Sir, I acknowledge and beg pardon for the importunities I gave you at the beginning; aſſuring you, that you cannot lay any commands on me, I ſhall not cheerfully obey, to the beſt of my power.

THE box, you mention, I doubt, is only addreſſed to me for another, who, I gueſs, is Mr. *Shirley*; conſidering, that he and I engaged a friend (that went over with our ambaſſadors to *Breda*) to make it a part of his buſineſs, to find ſome of the ludus at *Antwerp*, (whither he intended to make an excurſion) and having found a quantity, to ſend it over, directing it rather to me, whoſe houſe is well known, than to M. *Shirley*, who is now releaſed of his military commands, and reſolved to fall to his practice of phyſick in good earneſt, being very much your ſervant. If you pleaſe, Sir, you have the freedom to open the box, and then ſend it to me, together with your judgment of its being the genuine ludus, or not. I come but juſt now out of the country, ſo that I have ſeen no body ſince my return, nor heard of any news, but the change of the lord chancellor. Certainly my friends abroad think me either dead, or very ſick; which will oblige me to haſten the renewing of my commerce, thereby to obtain the better occaſion to expreſs myſelf,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

MY hearty ſervice, I pray, to Dr. *Wallis*, and thoſe other friends of mine, that perhaps may enquire after me.

London, Sept. 12. 1667.

SIR,

THOUGH it be above a fortnight ſince I gave notice to ſome of my correſponding friends, that I was returned to my former ſtation, yet have I received as yet no anſwer from any but yourſelf and Dr. *Beale*, (for which I am the more obliged to you) which makes me conjecture, that foreigners, eſpecially in the neighbouring parts, may be grown ſhy to reaſſume that commerce they were wont to entertain with me, out of ſome tenderneſs and concern for my ſafety, which they may judge may be endangered as well by their freeneſs of writing to me, as by mine of writing to them. But I intend to take them off from ſuch apprehenſions, if I find really they are poſſeſſed with them, by confining our communications to matters of a philoſophical nature; or, if there be a mixture of civil things, to ſuch of them, as cannot be miſinterpreted, or ſuſpected of any ill deſign.

THE transfuſing experiment, I find, grows famous; our friend at *Yeovill* offering ſome ſubjects to try it upon. They are, one a gentleman of the biggeſt account of that country, and a ſad example of draining away too much of his blood (to allay the diſtemper of his brain) now emaſculated, and for theſe many years changed from the moſt haughty and couragious temper to the moſt puſillanimous: it is Sir *John Stowell*, elder brother to the high ſheriff colonel *Stowell*. Perchance a ſupply of lamb's blood had done better, or might yet give ſome degree of recovery. But younger brothers perhaps would not be much obliged for the performance of ſuch cures, no more than cardinals will for the confirmation of the health of popes this way. Another in the ſame country is one Mr. *Thomas Hawker*, who hath been outragiouſly diſtracted above a year, upon whom two famed empericks have had their turns in trying all old ways in vain. Concerning this latter our friend ſaith, that he believes he could perſuade his wife to ſend him to *Oxford*, ſhe being well able and willing to gratify the phyſician. Sir, think of this, I pray, and give me your advice, when you ſhall have communicated it with ſome of thoſe, that are verſed in making the experiment, and have been informed, how ſucceſsfully this trial hath been already made upon men, both ſick and well at *Paris*.

DR. *Beale* adds in theſe very words, "We "do extremely want Mr. *Boyle*'s diſcourſe of "heat and flame, and his other good pro- "miſes:" and he adds this query, "Did we "not hear of ſubordinate forms and qualities "to be adjoined to the reimpreſſion of Hy- "droſtaticks; and of the other part of Uſe- "fulneſs, and of more Pneumaticks?"

I ANSWER him, that you muſt be left to go your own pace, which is faſter and to more purpoſe, than that of any naturaliſt within ken. Mean time, Sir, if you have any of thoſe ſubjects in the preſs, I hope you will favour me with informing me of it.

SIR, if you have thoſe papers of mine I received from Mr. *Colepreſſe* by you, I would beg the return of them to me, who have now occaſion for them, though Mr. *Martyn* is ſcrupulous afreſh to continue the printing of the Tranſactions; and that forſooth, becauſe the book, printed in June (that diſtracted month) ſold ſo ill, as to make him loſe by it. The moroſity and fickleneſs of theſe men is mighty tedious to me. I wiſh I had another way for ſubſiſtence. I ſhould be, if I know myſelf well, generous enough to let them have it upon their own terms.

I WOULD gladly know, whether Dr. *Willis*'s book *de Scorbuto* be near furniſhed to be printed. I hear Dr. *Needham*'s *Diſſertatio de fœtu formato* will come abroad ere long.

DR. *Shirley* wiſhes you here, as well as others of your friends. The box of the ludus is not yet come to the hands of,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, Sept. 17, 1667.

SIR,

YESTERDAY, when I received the favour of yours, I received alſo the firſt foreign letter ſince my enlargement; which puts me in good hope of re-eſtabliſhing my former philoſophical commerce. By it I perceive the Pariſian virtuoſi employ themſelves much in anatomical diſquiſitions. They have lately made diſſections of ſome fiſhes, and of a lion, the account whereof I look for in part by the firſt opportunity. At *Caen* they have diſſected the eye of an owl, which alſo I expect the particulars of. Monſieur *Steno*, I hear, has publiſhed a treatiſe *de motu Muſculorum*; and *Godartius* an addition to his book *de Inſectis*; another Dutchman being alſo at work upon the ſame ſubject.

I KNOW not, whether during my confinement, you had, or heard of the *Tetras anatomicarum epiſtolarum Malpighii (Siculi) et Fracaſſati (Piſani) de lingua et cerebro*; together with an exercitation *de omento*. It is in print, and written for by me, to be ſent over. I pray, Sir, if you can conveniently, order the injecting into the veins of a dog ſome oil of ſulphur, and ſee what will be the conſequence of it, and obſerve particularly, whether the dog will feed with an extraordinary avidity upon it. I wiſh alſo, that an injection might be made with oil of tartar; and in caſe the dog die (as it is like he will) that he may be opened, and his blood well obſerved.

THE Royal Society hath not met theſe two months, but I hope they will ſhortly meet again. I know not, what deadneſs there is upon the members of it. I intend to urge, God willing, that thoſe, who have hitherto appeared to be cordial for the advancement of its deſign, may combine together with a new zeal, and try to inſpire the like concern and fervor into others, that have been cool enough hitherto, to the end, that ſo noble and uſeful an inſtitution may not fall to the ground, in an age ſo full of knowledge and curioſity, and enjoying ſo conſiderable advantages to improve and increaſe the ſame.

SIR, how declining ſoever the words of your laſt letter ſeem to be, as to the publiſhing of thoſe good things, you are known to have yet in ſtore, I am confident, you cannot obtain of your generoſity the hiding of your reſidue of your talent. And I ſhall be very glad to ſee what you have retrieved of your treatiſe of Heat and Flame, and, if you will allow me, to communicate the liſt of thoſe experiments to the publick, to provoke others to make trials accordingly. I humbly thank you for the copy of the augmented treatiſe of Forms you intend me; and I am perſuaded, the Society would take it very ill, if you ſhould paſs them by, without preſenting them with an exemplar of the ſame. I intend one for Dr. *Beale*, as ſoon as any member of them comes hither, he being one of the moſt inquiſitive men after all your productions.

MR. *Colepreſſe*'s papers to me will certainly be found in your ſcrutore, ſince I cannot find them, upon the ſearch through all my papers: and I remember, that though I mentioned them once, and you were ready to return them me, yet I ſtopped you, ſaying, I had not yet occaſion for them.

FOR civil affairs, we look every day for the arrival of the Dutch embaſſadors; and I wonder, they were not here ſooner to prevent Monſieur *Ravigny*, who is ſaid to endeavour a ſtricter alliance between us and *France*. It is diſcourſed, that the United Provinces have furniſhed great ſums of money for the defence of the Spaniſh provinces, for which they are to receive by way of ſecurity, *Antwerp* and ſome others of the Spaniſh towns; which, if true, how it will ſerve to keep the peace between *France* and *Holland*, I underſtand not.

MY Pariſian friend hath theſe particulars:

1. *Le roy eſt maitre d'une bonne partie de la Flandre, et en eſtat de pouſſer ſes conqueſtes bien plus avant.*

2. *Monſieur de Turenne fortifié Deynſe, et à des troupes à Aloſt pour incommoder les ennemis & ruiner leur quartiers. Cependant, l'armee ſubſiſtera en Flandres des contributions, et le roy ne ſera pas obligé de faire de grandes deſpenſes.*

3. *Les*

3. *Les princes du Rhin ſons dans nos intereſts.*

4. *La Suede doit envoyer Monſieur de Dona pour travailler à la paix: le pape s'en meſle auſſi; mais avec tout cela on ne croit pas, qu'elle ſe face.*

5. *Le ſiege de Candie continue toujours: ceux de la ville ſe defendent vailliament. Il y à quatre mois, qu'ils reſiſtent au Grand Viſir, qui avoit pres de* 60,000 *hommes.*

6. *Le G. Seigneur veut, que la Pologne rompe avec le Moſcovite, et qu'elle laiſſe les Coſaques en paix, qui ſont ſoubs ſa protection: cela obligera l'empereur d'avoir des troupes ſur la frontiere.*

THE duke of *York*'s ſon was baptiſed Sunday laſt, and named *Edgar*. This maketh many look back upon that brave Saxon king *Edgar*, who reduced *ſeculo decimo* (if I miſtake not) the Saxon heptarchy into a monarchy, and had a very numerous fleet, conſiſting of above three thouſand ſhips, with part of which he ſailed every year in perſon round about theſe iſlands, ſcouring them from all pirates. He alſo preſſed very much the due execution of juſtice, and bound all his judges with great ſtrictneſs to an entire performance of their duty in that particular. It is the ſame, that is ſo famous for making ſo notable a game of his falſe favourite *Ethelwoolf*, becauſe he had ſo deceitfully uſurped from him the fair *Elfrida*, to whom he was ſent by *Edgar* to view her celebrated beauty, and to engage her for his nuptial bed, if the thing agreed with the fame. I leave you to think the reſt, remaining,

SIR,

your very humble ſervant,

H. OLDENBURG.

DR. *Shirley* is now with me, and your humble ſervant.

MY humble ſervice to Dr. *Wallis*, I pray, to whom the communication both of the philoſophical and civil part of this letter will perhaps not be unacceptable.

I DO not find by your laſt letter, that ſuch an attempt of transfuſion, for which I ſuggeſted in my examples in my former, will be undertaken by any body there.

London, Sept. 24, 1667.

SIR,

I LAY hold of your favour, which engages you to be particular at your next conveniency of writing; as alſo to allow me a copy of Mr. *Colepreſſe*'s papers, which I may be able to acknowledge with ſome others from the ſame hand. I hope, Sir, you will be pleaſed now and then to furniſh my Tranſactions with new philoſophical enquiries, they proving ſo uſeful to the publick, and ſo exciting the thoughts and diſquiſitions of ingenious men. Mr. *Martyn* is now printing the Tranſactions of this month, which will compriſe alſo the two next precedent; and contain in the beginning an animadverſion on the Engliſhed letter of Monſieur *Denys* concerning the transfuſion; which tranſlation I diſown for mine, inſcribing this tract with num. 27. which the ſtationer too boldly preſumed to give to that tranſlated letter.

I HOPE, my cenſure on the there mentioned ten years conception before its birth here in *England*, will ſatisfy thoſe ingenious gentlemen of *England*, that are concerned in that invention; of which I alſo diſcourſed lately with Dr. *Lower*, who gave me a kind viſit, and took occaſion to ſpeak of that particular; whom I aſſured, that I had no hand at all in the tranſlation of that letter; which I was ſo far from, that though I had the French original before any body had it in *England*, which was the ſame day of my confinement, yet would I not impart it to any perſon, becauſe I fully intended not to publiſh it without ſuch an animadverſion, as I now have ſent to the preſs. Mean time Mr. *Martyn* deals very mercenarily with me; for knowing, that others will hardly undertake the printing of theſe papers, now ſo many of them have been printed by ſeveral, which renders it difficult for one to complete them, without redeeming the intereſt of others; he knowing this, I ſay, hath conſtrained me to abate him the rate yet lower, ſo that after the proportion, he allows now, I ſhall hardly bring it to 30*l.* a year.

SIR, I find the now biſhop of *Saliſbury*, Dr. *Ward*, is concerned for me; and I know, that he hath occaſions to advance perſons to beneficial employments, and that frequently there fall places, that come to his knowledge, and for the ſupply whereof his advice is deſired. If it were not, that you muſt employ an amanuenſis, I could preſume to intreat your favour of recommending me to him, and to his remembrance, in caſe any ſuch place ſhould fall, that he ſhould hear of, and think conſiſtent with my office to the Royal Society.

JUST now comes in the French poſt, acquainting me in a letter with the following particulars.

1. *On ſe prepare icy à la guerre plus que jamais. Le roy aura plus de* 80,000 *hommes l'année qui vient, et il ſera en eſtat de reſiſter à tous ceux, qui voudroient s'oppoſer à ſes deſſeins. Il ſemble, que les Suedois meſmes ont de la jalouſie de ſes conqueſtes, auſſi bien que pluſieurs autres princes. Meſſieurs les eſtats ne ſont pas peu en peine.*

2. *Les Eſpagnols offrent aux Provinces Unies, de leur mettre les places de Gueldres entre les mains, moyennant une ſomme conſiderable, qu'ils leur donneront.*

3. *Le pape veut eſtre le grand mediateur de la paix. Mais on aura de la peine de ſe fier à luy. Cette paix ſera aſſez difficile à faire, parce qu'on ne peut donner aucune ſeureté, que l'Eſpagne demandera en quittant ſon pays, et en donnant ſatisfaction au roy.*

4. *Monſieur de Roquelaure ira en embaſſade en Angleterre.*

5. *On croit icy, que la flotte Americane d'Eſpagne eſt arrivée.*

6. *Les*

6. *Les Tartares, les Coſaques, et les Turcs marchent pour entrer en Pologne. Ils veulent attaquer Kammel-podoſki. Les Turcs ſont aſſurez de la Volinie, Podolie et de l'Ukraine. Les Polonois ſont diviſez, et n'ont que* 15 *ou* 20,000 *hommes. Enfin, ce pauvre pais là eſt à la veille de ſa ruine. Avec le temps, ſi les Turcs en ſont maiſtres, ils ne laiſſeront pas l'Allemagne en repos.*

7. *Candie ne pourra pas reſiſter long temps. L'Europe, qui ſe va affoiblir, pourra bien avec le temps avoir ſujet de craindre.*

8. *On travaille à executer un arreſt en parlement, qui ordonne, que les moines, qui ont du bien, ne prendront plus d'argent, ny de penſions viageres. Ceux qui ſont pauvres, ne prendront que ces rentes viageres, et point de dot. On reglera auſſi le nombre, qui doit eſtre dans chaque couvent.*

9. *Nous aurons la ſeconde partie du code dans* 3 *mois, au pluſtard.*

A FRIEND of mine here informs me, that the Dutch embaſſador at his late audience of Conge at *Paris*, inſiſting, that that king would pleaſe to expreſs himſelf ſomewhat more clearly as to his pretenſions to the Spaniſh Netherlands; the king anſwered, he had already declared himſelf plainly enough as to that matter, and proteſted, that he pretended no farther than to what was in the preſent poſſeſſion of the king of *Spain*. Whereupon the embaſſador deſiring, that the declaration might be verified in parliament, the king replied, that he gave his parole for it: but the miniſter urging the verification, the king at laſt anſwered, *ſi vous ne voulez pas prendre ma parole, prenez vos meſures.*

I RECEIVED very lately a letter from a new correſpondent in *Milan*, Signior *Septalio*, a very knowing and curious gentleman. By him I underſtand, that M. *Steno*'s book, entitled, *Elementorum Myologiæ Specimen, ſeu Muſculi Deſcriptio Geometrica*, is now publick, dedicated to the great duke of *Tuſcany*. The other particulars in this letter, you are like to find in the Tranſactions, which are now a printing by the care of,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

MY humble ſervice, I pray, to Dr. *Wallis*.

London, Oct. 1, 1667.

SIR,

THE two books, you mention in your laſt to have ſent by the coach the day before the date of your letter (which muſt be Thurſday laſt, the ſaid date being of Sept. 27.) are not yet come to hand. When they do, they ſhall be diſpoſed of, God permitting, as you have ordered me. I humbly thank you both for the preſent of one of thoſe books, to be furniſhed by M. *Heringman*, and for the communication of the four paradoxes concerning flame. If they were not forbid to be made publick, they would certainly kindle many of the curiouſeſt of philoſophers to try concluſions. But you may be ſure, I ſhall keep them ſecret, as long as I receive no leave to divulge them. The like you may be confident of, whenever you ſhall pleaſe to impart to me thoſe wild heads, as you term them, of your Sceptical Naturaliſt.

THERE is a certain gentleman, a florid writer, one of our royal collegiates, who intends to print ſhortly ſome paralipomena, relating to the hiſtory of our Society; wherein he means to take more notice of the performances of ſome eminent members thereof, than hath been done by M. *Sprat*, and farther to recommend and vindicate the modern experimental philoſophers, by repreſenting the advantages of this way of trials, both for light and uſe, above that of former times. It had been extant, I find by his letter, ere this, but that he ſtayed for M. *Sprat*, to ſee what room he would leave for his thoughts; and finding now, that he hath not throughout prevented him, he ſeems reſolved to purſue his deſign, though it will make not above half a dozen ſheets, and therein to acknowledge ſome grand contributions to philoſophy, that have been omitted by the other. This is but juſt, and hath therefore received encouragement from me, together with the ſuggeſtion of ſome particulars, which this author could not be acquainted with, ſo well as the ſuggeſtor.

I HOPED to have here included the Tranſactions of September; but they are not yet come from the preſs. They will be to morrow, I think; and then the ſtationer will take care to ſend ſome of them to *Oxford*. There are mixed, among the contents, ſome experiments and obſervations, ſent out of *Italy*, and from *Meſſina*, about injections into veins, the tongue and brain, the optick nerve in fiſhes, *&c.* which perhaps will not diſpleaſe you. There is alſo an account of Dr. *Needham*'s new book *De Fœtu*; to whom I ſhall deliver any thing, you command me. I could not, ſince I received your letter, ſee Mr. *Crook*; but as ſoon as I can, I ſhall diſcharge your commiſſion. I did, very lately, among other things, ſend to *Paris*, being ſolicited to do ſo, two of your books in Latin, that of Colours and the Phyſiological Eſſays. Methinks, that the experiments of the air in the rarifying engine ſhould have a ſecond edition, as well as the Eſſays, it being altogether out of print. I am ſure, I can get none of them, ſince I have lent my exemplar to one, who forgets to return it, as well as I have forgot, who he is.

MR. *Glanville* hath ſent me an anſwer to ſome of the mineral enquiries, formerly printed in the Tranſactions, and promiſeth more. I think, I muſt now publiſh ſome of thoſe anſwers, that it may appear to the world, how uſeful the publication of ſuch queries is to the increaſe of knowledge: elſe they are apt to ſay, he fills his books with queries, but we never ſee an anſwer to any of them.

FOR ſtate news, there is but little at preſent, that I know. The act againſt importing cattle out of *Ireland* is enforced by a proclamation,

on, deſigned to prevent fraud and colluſion. Moſt people here look for an act of comprehenſion; but how far it ſhall extend, and whether it ſhall take the ſubjects of this favour into the church, and to church livings, or only tolerate them in the free exerciſe of their way, is yet uncertain.

THE French king appears more and more to have vaſt deſigns. He graſps on all ſides, *Germany*, *Italy*, and *Catalonia*, as well as *Flanders*. The prince of *Condé*, and the duke of *Enguien*, his ſon, are to command an army of twenty thouſand men in *Germany*, monſieur *de Turenne* having induced his maſter to give the ſaid prince that command. The duke of *Orleans* is to be general in *Catalonia*, and the duke of *Savoy* in *Italy*: ſo that we are like to ſee great actions next ſummer. *Sweden* cannot but look upon this war as very advantageous to them, and likely to make them to be courted by both ſides. How *Holland* will be able to keep themſelves from engaging in it, appears not, at leaſt to me; and what *England* will do in reference to it, I ſuppoſe, very few can tell. The emperor is now reſolved to ſend a conſiderable army into *Flanders* for their relief; and it is affirmed, that *Germany* hath incorporated the Spaniſh Netherlands into the empire, and will therefore appear in the defence thereof, as a member of it.

SUMMONS are this very day ſent about for re-aſſembling of our Society on Thurſday next in *Arundel* houſe. And though the council expreſſed to Mr. *Howard* their tenderneſs and ſcruple of continuing their meetings there, ſeeing his ſons are come home, who need many rooms with their attendants; yet is the Society urged by that noble perſon to go on there, as they have begun, alledging it to be an honour and reputation to him, to do ſo. Some of us are ſo ſanguine, as to believe, we ſhall have a college of our own erected before the end of next ſummer. I know many infidels, in this caſe, of whom he profeſſes himſelf to be one, that is,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

London, Oct. 8, 1667.

SIR,

I RECEIVED the two gilt books the next day after my laſt to you, and I have preſented them both, *præmiſſis præmittendis*, as you ordered me; and both the Society and my lord *Brounker* enjoined me to return you their hearty thanks, expreſſing withall their kind reception of it. The ſame day was preſented them Dr. *Needham*'s diſquiſition on the *fœtu formato*. He was lately elected into the Society, as Sir *Maurice Berkley* was propoſed candidate on Thurſday laſt: which meeting, though it was deſtitute of experiments; yet was it not ill ſpent, in taking account of the many communications, both foreign and domeſtick, that were come to hand during the vacation. Among the foreign were thoſe of *Malpighi*, *Fracaſſati*, and *Septalio*, as alſo that of Sir *William Curtius* about a kind of maſtick, made by ants in *Franconia*, in *Sylva Ottoniana*, which was looked upon as a new diſcovery. Both the matter itſelf, and the deſcription of it, you will find here at your return. The domeſtick came from Mr. *Glanville* and Mr. *Colepreſſe*, both concerning mines; and from one Mr. *John Burton* of *Norfolk*, who being encouraged, as his letter to me intimateth, by our Hiſtory and the Tranſactions, imparted ſome obſervations of his, deſcribed in Latin, 1. *De gallina Indica nummulos deglutiente, quorum planè lævigata fuit ſuperficies, ne minimo quidem effigiei regiæ veſtigio relicto.* 2. *De aqua petrifica in loco quodam nemoroſo, plano, & uliginoſo Norfolciæ*, called *Deepham*. 3. *De tumulo mobili in ſtagno aquæ reſidis*, in the ſame country. Of all which you may ſee the particulars at convenient time and place.

DR. *Beale* hath ſince recommended and much preſſed the conſideration of the aids of hearing, taking notice of a long, deep, narrow and dry trench (which was intended for an aqueduct) in a low vale, wherein he received and diſtinguiſhed audibles very perfectly; not being able to hear any noiſe at all, at any diſtance from that trench. Some like aid, he ſaith, he had from a wood of very tall and old oaks upon a higher ground (not a hill) about a mile diſtant from that trench. He is of opinion, that the beſt time to try the trench were in the ſilence of the night and of the winds: and for the woods, when the froſt hath ſtripped them of their leaves, and perchance when the ſap is leaſt buſy.

AGAIN, for odors, the ſame perſon repreſents, that the theory of it may be much better perfected, than we have yet ſeen it; adding, that ſome of human race, by ſlender diet, drink of water only, bread, and food of little odor, clean lodgings, *&c.* may have (for ought we know) a more univerſal extent in ſmelling, than dogs or vultures: where he inſtances in himſelf, how ſubtle his ſmell was, when he was accuſtomed only to drink water mixed with a very ſmall quantity of wine; the like not being to be looked for from beer-drinkers and high feeders. He would have us enquire the ſeveral degrees of ſmelling in vulturs, ravens, cormorants, kites, hounds of ſeveral guizes and ſizes, and ſpaniels, *&c.* and their anatomical differences in their narine parts, pores, or moiſture adherent within or without; what animals diſtinguiſh flowers, as we do; and how ſome odors do become ſo pleaſing to ſome, and ſo intolerable to others, *&c.*

HAVING diſcourſed of theſe and the like particulars, he tells me, that I would oblige many, if in my next Tranſactions I would give a brief liſt of all your writings in publick, what in Engliſh and what in Latin, in what volume, and what later editions; where he mentions the Experiments of Air, *&c.* reprinted with additions, againſt *Hobbes* and

Linus, all in one volume, in 4to; which laſt, I confeſs, I have not ſeen.

AFTER this, he concludes thus; "If we had his Dialogue of Heat and Flame; his Experiments concerning the Nature of Fire; his Sceptical Naturaliſt; his Eſſays of Spontaneous Generations, and the improbable Truths; there would be work enough for all the tongues and pens in both our univerſities; and fully ſufficient to rout all their notions concerning the generalities of nature."

SIR, I cannot but expect your declaration hereupon. I could not yet come to ſpeak with Mr. *Crook*; but I ſhall bear in mind your concerns. I am glad, you will ſay ſomething in anſwer to Dr. *Beale*'s former queries about ſome particulars in your book of Cold. I am confident, he will be very glad of an exemplar of the ſecond edition of Forms and Qualities; which will make me preſume upon the intimation given in your laſt, to beſpeak one for him from M. *Herringman*.

SIR, if you look for civil news, I can tell you, what my Pariſian friend writes; *viz.*

1. *Tout le monde attend avec impatience la reſolution, qu'on prendra dans voſtre iſle pour l'affaire des Païs Bas. Toute l'Allemagne eſt en armes. On croit, que les electeurs de Baviere & de Saxe ne ſeront pas pour nous, non plus que les Suedois. Cela ne nous fait pas peur, parce-qu'on aura une armee conſiderable en Flandre, & deux autres, au moins, en Allemagne & en Catalogne, pour attaquer la maiſon d'Auſtriche par tout.*

2. *Les Hollandois ne s'endorment pas, & ils ne peuvent ſonger au voiſinage de la France, qu'avec frayeur, craignant qu'on n'ait deſſein de ruiner leur commerce, & de demander les places du Braband.*

3. *On a cenſuré à Rome la traduction du nouveau teſtament de meſſieurs du Port Royal.* (Theſe you know to be the Janſeniſts.) *Il y a* 12. *docteurs de Sorbonne, qui l'examinent. Peut eſtre, que par complaiſance ils pourront bien auſſi la condamner, quoy qu'il n'y ait que de petites fautes.*

4. *Nous aurons bientoſt un traitté pour faire voir, que le roy peut fixer le nombre des Moines, parce qu'il eſt maiſtre de la police eccleſiaſtique & executive des Canons.*

I FORGOT, in the philoſophical part of my communications, that a curious Pariſian writes me word, that ſome ſubſtances were ſent to *Paris* from *Tholouſe*, much reſembling teeth, and for their extraordinary bigneſs, reputed to be the teeth of a giant. But, after examination, it was found to be a *luſus naturæ*. Expoſing it to the fire with ſpirit of wine, they make now blue ſtones of them, as fair as topaſes, which they wear in rings.

THE experiment of transfuſion was tried at *Paris* upon a baron of *Sweden*; but he dying, his inteſtines were found all gangrened, ſo that it was not poſſible to have recovered him by any known natural means. This invention is hugely diſputed abroad pro and con; of which I alſo received lately ſome ſpecimina in print, both French and Latin; whereof he may ſhortly give a fuller account in publick, who is,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London fills extremely both with people and with expectations from the parliament, in reference chiefly to the chancellor and the church.

London, Oct. 15, 1667.

SIR,

AS I return you my humble thanks for your favour of imparting to me the relation about the growth of a magnet, ſo I am fully of your opinion, that it ought not to be publiſhed till farther confirmation. When your leiſure will permit, I doubt not, but you will endeavour to ſatisfy Dr. *Beale* in the particular about the liquor of amber.

SIR, the declaration deſired of you in my laſt, refers only to Dr. *Beale*'s motion about publiſhing a liſt of your writings, already printed; you formerly expreſſed your thoughts of what you have in ſtore, and of what is to be expected as to their publications. I think, that ſince there is a liſt of your printed books, as well as of others, half promiſed, in print already, *viz.* annexed to your Hiſtory of Cold, it will be better, if there be occaſion, to refer thither, than to reprint ſuch a liſt.

As ſoon as I can obtain the exemplars of your reprinted *Origin of Forms*, I ſhall diſpoſe of them as you have directed. I have not yet got thoſe two, you were pleaſed to allow me to call for, one for Dr. *Beale*, and one for myſelf, who would give ſome account of the appendix, in the Tranſactions of this month. I read to Mr. *Herringman*, what you ſaid about it in one of your laſt to me; and he again read to me another of Mr. *Maires* to him, importing, that he ſhould bind ſix of them, and ſend two of them gilt to my lady *Ranelagh*, and keep the reſt till farther order. I know not yet what was writ to him by the yeſterday's poſt. On Thurſday laſt we repeated at our meeting, that notable experiment of opening a dog, and laying bare his lungs, and blowing into him with bellows, keeping him thus alive as long as we pleaſed; which occaſioned ſome diſcourſe about the nature and uſe of reſpiration; ſome of the company declaring, that this experiment made out, what was not the uſe of reſpiration; others intimating, that it ſeemed to teach, that the principal end of reſpiration was the diſcharging of the fumes of the blood; the animal keeping alive, and lying ſtill, as long as the lungs were ſupplied, and kept extended with freſh air; and falling ſoon into convulſions, when we ceaſed to blow.

AT our next meeting, Dr. *Lower* has promiſed to make the experiment of breaking a nerve of the diaphragm, to render an animal broken-winded.

MANY things come to my hands from all parts; but I want hands extremely to diſperſe them

them to my friends, as I wiſh. I am very buſy this day in making diſpatches, for ſeveral parts of the world, of divers books of our Hiſtory; and they muſt all be accompanied with letters: beſides thoſe, I intend to tranſmit to *Florence*, for prince *Leopold*; to *Madrid*, for the earl of *Sandwich*; to *Paris*, for our fellow-members there; to *Dantzick*, for *Hevelius*; I cannot but ſend alſo one to *New-England*, for Mr. *Winthrop*, having now a very good opportunity for doing ſo; and, at the ſame time, in my letter, ſolicit him to endeavour to ſeaſon the youth of *New-England* with our experimental philoſophy.

FOR matter of ſtate news, I ſhall only hint theſe particulars, that regard foreign parts; ſuppoſing you have what is domeſtick, from better hands.

FROM *Paris*,

1. *Les Eſpagnols negocient par tout. Ils eſperent, que la Hollande, la Suede, & le Brandeburg ſe declarerent pour eux. Ils n'attendent de l'Angleterre, qu'une neutralité. Ils ſe flattent, que Baviere pourra revenir, & eſtre pour eux. Les ducs de Lunenburg ont des troupes, & pourront bien eſtre pour la France, où ils ont un envoyé.*

2. *Le pape fait d'aſſez bonnes choſes; mais on ne croit pas, qu'il vive long-temps.*

3. *Nous avons de mauvaiſes nouvelles de Candie cette ſemaine, neantmoins ils ſe deffendent touſjours bien.*

4. *Un, nomme Aubry, qui avoit fait un traité des pretenſions du roy ſur l'empire, ſans aveu, à eſté mis à la Baſtille; le livre n'eſt pas bien fait.*

5. *Le duc de Loraine avoit tiré de l'argent de ſes ſujets, dans l'eſperance, qu'ils ſeroient neutres; mais le roy n'a pas voulu luy accorder la neutralité. Il leve des troupes pour ſe garentir, s'il peut, des incurſions des uns & des autres; mais il faudra, qu'il marche droit.*

ANOTHER friend in *France* writes this philoſophical particular:

Nos gens apportent du plomb de l'Amerique, qui eſt preſque pur metal. J'en ay donné à un homme expert dans cette matiere, qui en doit faire l'eſſay. Je vous diray ce qu'il en aura obſervé.

SIR, if I miſtake not, Mr. *Winthrop* gave you ſome ſuch, and not only of pure lead, but alſo of copper.

FOR all my haſte, I cannot let this go, without annexing the verſes, lately made by a philoſopher of *Paris*, (who is M. *de Monmor*) upon the preſent undertaking of his king.

Fulminat attonitas Scaldis Lodoicus ad arces,
Intrepiduſqne hoſtes terret & ille ſuos.
Dum tamen Auguſtum caput objectare periclis
Non timet, heu! populos terret & ille ſuos.

This was put into French, by *Corneille*, thus.

Sur l'Eſcault eſtonné tu lances ta tempeſte,
Grand prince, & fais trembler par tout les ennemis;
Mais quand dans les perils tu hazardes ta teſte,
Tu fais trembler auſſi ceux, que Dieu t' à ſoubmis.

I CANNOT review, but remain,
SIR, your faithful humble ſervant,
H. O.

I AM deſired to ſend to *Paris* a Chriſtian Catechiſm in Turkiſh; but I know not where they are to be had.

London, Oct. 24, 1667.

SIR,

SEEING publick affairs require ſome ſuſpenſion of your favour of communicating your news to me, I muſt ſubmit (though I ſhould be angry with almoſt any other but of that nature) and ſhall only wiſh a ſpeedy removal of this impediment. In the mean time, be pleaſed to receive my humble thanks for the kindneſs of your laſt bill to Mr. *Lindſey*; for which I ſend the encloſed diſcharge to Mr. *Davis*, according to your order. The tranſcript of the account of the burning-glaſs being alſo come to my hands, and being preſently inſerted into my Tranſactions, I do by this very poſt ſend them to Sir *R. Moray*, and, with them, the particulars, both political and philoſophical, I received yeſterday from *Paris*, and other parts, ſcrupling to interrupt you with prolix letters, during the time of the extraordinary diverſions you have lately met with. But this one thing I cannot omit to acquaint you with, as a thing hardly ever attempted afore, *viz.* that one Mr. *Thompſon*, a perſon, that is between a doctor and an apothecary, and hath the reputation of having done much good in this mortality, had the courage to open the body of one, that died of the plague; the conſequence whereof was (as it was related to me by ſeveral, and, among them, by a very honeſt and intelligent merchant, who, a month ſince, was by this very *Thompſon* recovered of the ſame diſeaſe) that when he handled the viſcera, and had his hands embrued with the blood, he ſoon found one of them much benumbed; which made him diſpatch the faſter, and to go home to bed, taking ſuch medicine, as he had provided and prepared for ſuch an event; and finding himſelf pretty well again the next day, he went abroad, but relapſed, and then apprehended himſelf in much more danger than afore; yet uſing his own remedies (which I hear are a powder, that is ſudorifick, and an excellent cordial) did perfectly recover, and hath ever ſince viſited infected perſons with great ſucceſs. Enquiring, whether he had obſerved any thing in that dangerous diſſection, I had this anſwer, from the ſaid merchant, that he heard him affirm, he had diſcovered ſome things, which, in due time, he would bring to light, looking upon them, as very conſiderable in the theory of the plague, and uſeful for the cure thereof.

I SHALL conclude with a requeſt, that you would pleaſe to gratify my lord *Anneſley* with ſending the encloſed to my lady his mother, to whom I underſtand, by letter from his governor, he hath written ſeveral times, without hearing a word of return. I ſuppoſe, her ladyſhip does viſit *Oxford* ſometimes, ſhe living ſo near it; or ſends frequently thither;

by which means this note of mine may eaſily be conveyed to her. I ſuppoſe alſo, that Mr. *Southwell* is, where you are; and it will be ſtill an encreaſe of your favours, to ſend the other letter, here annexed, to him, from,

SIR,

your faithful humble ſervant,

HENRY OLDENBURG.

I HAVE dated the diſcharge the ſame day, I ſuppoſe the firſt Tranſaction will be printed at *Oxford*, and left a blank for the name of the printer, in caſe it ſhould not be Mr. *Davis*.

THE notice you received from Mr. *Williamſon*, concerning injections, I gueſs to be ſent him from *Hamburgh*; and then they are very likely to be the ſame with thoſe I received a good many months ſince, which I did ſhew you, and afterwards lent them to Dr. *Clerk*, who hath it ſtill. One Dr. *Major* is the author thereof.

London, Nov. 12, 1667.

SIR,

I SHOULD be very glad to ſee you here upon many accounts, and ſome of them of a publick nature; and then poſſibly you might alſo take an opportunity of beſpeaking reaſon to M. *Crook*. I do not well underſtand, by what you ſay of the Uſefulneſs, whether it be an encouragement to make an end of the Latin verſion of what remains to be tranſlated of the Engliſh book already in print, or not. But am very much pleaſed to find, that you are about to communicate to the world the ſequel; concerning which I intreat you, that you would not let us want that eſſay, which you ſay tends directly to the deſigns driven by the Royal Society, who are now continuing a way to do ſomething, that may more nearly concern their perpetual eſtabliſhment.

WHAT you have commanded me on the behalf of Dr. *Beale* and Mr. *Colepreſſe*, I ſhall be very careful to perform. And Mr. *Glanvill*'s book I have ſent to Mr. *Hatherton* for you, according to your order.

DR. *Beale* hath lately ſent me ſome new barometrical obſervations, which are too long to inſert here, but may be thought proper enough to put into the Tranſactions of the next month; thoſe of this month being full already, and now in the preſs, whence they will come forth by the end of this week.

DR. *Lower* hath been making ſeveral trials amongſt us, of giving a dropſy to a dog in a very ſhort time, by tying up of the vena cava; which, it ſeems, hath given him matter enough to write a tract, that may, together with ſome other experiments, conduce much to the clearing up of the doctrine of Pathology. He, in conjunction with ſeveral others, are like to do philoſophy great ſervice by anatomical diſcoveries.

I FIND by letters from abroad, that the young prince of *Florence*, having left *Italy* to travel, is like to viſit *Germany*, *Holland*, and perhaps *England* too, and in doing the laſt, do honour to our Society, if Sir *Bernard Gaſcoigne*'s intelligence meet with no diſappointment.

THE particulars of the laſt French letters to me, are;

1. *Les experiences de Florence ſeront bientôt achevées. Nos libraires en feront venir aſſurement.*

2. *Nous attendons ce que reſoudra l'Angleterre et la Suede. Les eſtats de Hollande ont pris quelques reſolutions importantes, qui ſont fort ſecretes. Ils ſe preparent à tout evenement.*

3. *L'electeur de Brandenbourg et les ducs de Lunenbourg ſeront dans les intereſts de l'empereur. Les princes du Rhin ſont pour nous, et particulierement l'eveſque de Munſter, qui à fait demanteler ſa ville capitale.*

4. *Les Eſpagnols ont encore eſte battus en Flanders, et ont perdu bien du monde.*

5. *Il n'y à pas d'apparence, que la paix ſe face dans l'eſtat, ou ſont les choſes. L'Europe va retomber dans une guerre, qui achevera de la conſommer et de la perdre.*

6. *Les Tartares ſont venus à 18 lieues de Cracovie.*

7. *Candie à eſte ſecourüe: neantmoins le grand Viſir ne l'abandonne pas. Il eſt à craindre, qu' avec le temps elle ne periſſe.*

FROM *Dantzick* I underſtand by a letter of Mr. *Hevelius*, that his cometography is very near finiſhed; and that he intends very ſhortly to ſend me by ſea ſome exemplars thereof; together with a farther account of not ordinary obſervations concerning the Succinum.

ANY competent aſſiſtance would, by God's bleſſing, enable me to bring from all parts of the world into *England*, as to a centre, whatever ingenuities, diſcoveries, obſervations and experiments lye ſcattered up and down every where. But no man, that I ſee, does effectually conſider this, which muſt needs overwhelm and oppreſs,

SIR,

your very humble

and faithful ſervant,

H. OLDENBURG.

London, Nov 25, 1667.

SIR,

I AM reſolved not to ſhew myſelf ungrateful for the excellent entertainment I received from you this night, firſt by your paper of the experiments of Light, ſent by coach, but not delivered till this very evening; next, by your letter, referring to the ſame, and coming to my hands an hour after the ſaid paper. I take a folio ſheet, to try, whether I can in ſome meaſure be revenged of you, and fall to work this very evening, becauſe I much doubt, I ſhall want leiſure to morrow.

FIRST

FIRST then, receive my moſt hearty private thanks both for thoſe extraordinary communications, and for the liberty you are pleaſed to allow me of diffuſing them by the preſs, for their farther improvement by philoſophical men in all parts. Theſe private thanks of mine, I am ſure, will ſoon be followed by the publick ones of the Society, when I ſhall have expoſed them there, as I mean to do, God willing, on Thurſday next. And ſince I have your leave of making them publick (which certainly will be a ſingular gratification to the learned and curious) I ſhall endeavour to do it both in Engliſh and Latin in the ſame month, or as to the Latin, ſoon after. I deſire only your favour, to direct me a little more particularly about the diſtinct title page, you would have it publiſhed with; as alſo to enrich me, with all convenient ſpeed, with the reſt of the experiments of this ſubject, and thoſe other experimental things you mention you had to add, but could not ſend them by the laſt; becauſe I am now ready to compoſe the next month's Tranſactions, and would by no means have this part of yours omitted therein, they being to be read in the Society ſo ſoon, and the uſurpation of others to be timely prevented. I long alſo to ſee that catalogue of the new way of ſealing of glaſſes, which I hope I ſhall at laſt find the underſtanding of, by the contumacy of my attention. And this, if you thought fit to give way, would alſo much pleaſe the Society for another meeting, entertainment.

ON Thurſday next, God willing, a report will be made of the good ſucceſs of the firſt trial of transfuſion practiſed on a man, which was by order of the Society, and the approbation of a number of phyſicians, performed on Saturday laſt in *Arundel* houſe, in the preſence of many ſpectators, among whom were Mr. *Howard* and both his ſons, the biſhop of *Saliſbury*, four or five phyſicians, ſome parliament men, *&c.* by the management and operation of Dr. *Lower* and Dr. *King*, the latter of whom performed the chief part with great dexterity, and with ſo much eaſe to the patient, that he made not the leaſt complaint, nor ſo much as any grimace during the whole time of the operation; in which the blood of a young ſheep, to the quantity of about eight or nine ounces by conjecture, was tranſmitted into the great vein of the right arm, after the man had let out ſome ſix or ſeven ounces of his own blood. All which was done by the method of Dr. *King*'s, which I publiſhed in num. 20. of the Tranſactions, without any change at all of it, ſave only in the ſhape of one of the ſilver pipes, for more conveniency. Having let out, before the transfuſion, into a porringer, ſo much of the ſheep's blood, as would run out in about a minute (which amounted to twelve ounces) to direct us as to the quantity to be transfuſed into the man, he, when he ſaw that florid arterial blood in the porringer, was ſo well pleaſed with it, that he took ſome of it upon a knife, and taſted it, and finding it of a good reliſh, he went the more couragiouſly to its tranſmiſſion into his veins, taking a cup or two of ſack before, and a glaſs of wormwood wine and a pipe of tobacco after the operation, which no more diſordered him, both by his own confeſſion, and by appearance to all by-ſtanders, than it did any of thoſe that were in the room with him. The pipe being taken out of the man, the blood of the ſheep ran a very free ſtream, to aſſure the ſpectators of an uninterrupted courſe of blood. The patient found himſelf very well upon it, his pulſe better than before, and ſo his appetite. His ſleep good, his body as ſoluble as uſual, it being obſerved, that the ſame day of his operation he had three or four ſtools, as he uſed to have before. This morning our preſident (who by very preſſing buſineſs could not be preſent in *Arundel* houſe) and I went to ſee him pretty early, and found him a bed, very well, as he aſſured us, and more compoſed, as his hoſt affirmed, than he had been before, he being looked upon as a very freakiſh and extravagant man; who hath ſtudied at *Cambridge*, and is ſaid to be a batchelor of divinity, called *Arthur Coga*, an indigent perſon, and receiving a guinea for undergoing the experiment; which reward maketh him willing to have it repeated upon him, wherein he will eaſily be complied with, and that, I think, before the end of this very week, if circumſtances ſhall perſuade it. But I doubt, I do here *actum agere*, and trouble you with the repetition of what Dr. *King* hath related in this annexed letter, which he deſired me to convey to you.

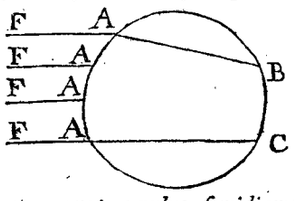
SINCE my laſt, I have received a packet of books from *Hamburgh*, *viz.* the *Prodromus Hiſtoriæ Literariæ* (after the model of Sir *Francis Bacon*) begun by Dr. *Lambecius*, now hiſtoriographer and bibliothecarius to the emperor: then the *Sarepta Matheſii*, and *Jungius*'s Logick; which are at your ſervice, when you ſhall be returned to *London*.

I RECEIVED alſo very lately a letter from one of the new correſpondents, an excellent mathematician, *Francis Renatus Sluſius*, at *Liege*, the author of the celebrated *Meſolabe*, who ſends me ſeveral particulars, whereof I ſhall preſume to trouble you with a couple, and communicate a third to Dr. *Wallis*, as moſt proper for his examination. Theſe two are concerning his ſenſe of our royal inſtitution, and a certain deduction from the Carteſian Hypotheſis of a rainbow. I ſhall give you both in his own words:

1. *Exprimere verbis non poſſum, quàm mihi jucundum acciderit noſſe ex literis tuis Regiæ Societatis inſtitutum. Dignum ſanè, cui quicquid eſt uſquam eruditorum applaudat, et quod communibus ſtudiis promoveat. Ejus enim virtute futurum exiſtimo, ut ſcientia naturalis pomœria (quod illuſtriſſimuſque Baconus optabat et enixè ſatagebat) in immenſum proferantur. Sed res, ut arbitror, non unius ætatis eſt, et ſemper ſupererit, in quo ſe exerceat grata poſteritas, ſi iiſdem ſtudiis teneatur. Non vanè enim mihi tecum augurari poſſe videor, hanc ſocietatem eſſe perennaturam. Apud nos, ut liberè tecum agam, frigent hæc ſtudia, et viri docti, juriſprudentia, vel aliis ſcientiis, quæ vulgo magis*

magis notæ ſunt, operam impendunt. Sunt quidem nonnulli chymiæ ſtudioſi, ſed vel medicinæ vel lucri cauſâ. Nemo, quod ſciam, naturæ arcana ſcrutatur, ut ea tantùm cognoſcat, ſi quos tamen in poſterum reperire me contigerit, eos ad tam præclaros conatus adjuvandos hortari non intermittam. Me quod attinet, pauca omnino promittere poſſum, variis curis diſtractus, ſed ſi quid occurrerit (neque enim ſpem omnem abjeci) optimâ fide tibi me relaturum polliceor.

2. *Leve eſt, quod addam in anteceſſum, licet fortaſſe hîc adſcribi non mereatur, cum non niſi ex hypotheſi verum ſit: non tamen ingratum accidet, ut ſpero, ſi hactenus non animadverteris. Si celeberrimi Carteſii doctrina circa iridem et refractionum menſuram admittatur, facilè experimento ſciri poteſt, dato liquore quolibet, angulus ſemidiametri iridis ex illo orituræ; ut ab annis bene multis oſtendi. Opponatur enim ſoli globus liquoris dati (vitro incluſus, nam hoc ſenſibilem differentiam non faciet) et retrò conſideretur pars illuminata: hæc tot gradus circuli maximi ejuſdem globi, bifariam ipſam ſecantis, complectetur, quot conſtat angulus quæſitus. In figura hîc adjuncta ſint radii ſolis paralleli FA, FA, &c. incidentes in globum, cujus ſectio per circulum maximum ſit ABC, qui refracti conveniant omnes intra ſpatium BC; erit arcus BC tot graduum, quot angulus ſemidiametri iridis, nempe 42. circiter, in aqua communi, ſecundùm Carteſii tabulas; quibus tamen, ut hoc obiter adjungam, non eſt opus; poteſt enim arcus ille geometricè determinari, et quidem per locum planum.*



I DOUBT not, Sir, but you will communicate theſe particulars to Dr. *Wallis*, as I believe he will not fail to ſhew you his.

I MUST haſten to annex my foreign ſtate-news, *viz.*

Les Hollandois ne ſcavent où ils en ſont, et ont de la peine à prendre parti, et à ſe reſoudre, avec qui ils traiteront, ou avec les Suedois, ou avec l'electeur de Brandebourg. Il y en à qui ſont d'avis de faire des levées, et d'avoir quarante ou cinquante millé hommes pour la conſervation de leur places frontieres et de leur voiſinage: mais les autres provinces ne ſont pas de cet avis là.

Les Eſpagnols font les fiers: mais ils trouveront à qui parler, et auront bien de la peine à empeſcher la perte des Pais Bas. Les princes d'Allemagne ne ſongent qu' à eux, et ne feront rien, s'ils ny trouvent leur compte (and who does otherwiſe?) *A la fin ils periront tous, et dum ſinguli pugnant, univerſi vincuntur. Ils le meritent. Il n'y à que le roy, qui ſache agir et regner.* (This is right French.)

La bruit court, que les Portugais ne ſont pas eloignez de faire la paix avec l'Eſpagne, ne la pouvant jamais faire en une conjecture plus heureuſe pour eux.

AT the end this correſpondent intimates to me, that that excellent perſon, Monſieur *Carcavi*, (who, he ſaith, is preſident of the new experimental academy at *Paris*) hath expreſſed a deſire to entertain a correſpondence with me. Which certainly I ought to embrace with all readineſs and particular acknowledgments. I ſee my paper fails me, though I could fetch another ſheet, and ſcribble it full, if it were not an hour paſt midnight, nor I to riſe to morrow early. This releaſes you from the troubleſom pen of,

SIR,

your very humble,

and faithful ſervant,

H. O.

How large and uſeful a philoſophical trade could I derive, had I but any competent aſſiſtance?

London, Dec. 3, 1667.

SIR,

SINCE the Society applauded ſo much, as they did at their laſt meeting, the experiments of light contained in your firſt paper (the ſecond being then not yet come to my hands, as now it is) you will, I hope, reform that thought of yours, which looked upon my reſentments of it as complimental. At their next meeting they will ſee, God permitting, that ſecond part, I have ſince received and peruſed, highly ſuitable to the firſt, and therefore ſure to meet with the like eſtimation. I am very glad, it is come ſo ſeaſonably, and juſt upon the order, which laſt Thurſday was made, of trying the experiment with compreſſed air, ſince it will appear to them, by your ſecond papers, that you are beforehand in that trial. I ſhall be very punctual in obſerving your orders about the liſts, and the ſet of queries about ſhining wood, and the ways of ſealing up glaſſes exhauſted of air, and all ſuch other particulars, as you enjoin me ſilence of. I thought indeed, and am confirmed in it, by looking upon your letter, of Octob. 17, that I had permiſſion to make mention of what formerly you had acquainted the Society with, concerning acid liquors injected; and if I went too far, in mentioning the clauſe about the anatomical matters, you have in ſtore, it was my reſpect to you, that carried me, and the conſideration, that if you ſhould perhaps be prevented by others in the publication of any of the ſame, you have lying by you, the general intimation I gave of ſuch matters, according to the hint of that letter of yours, might the rather incline others to believe, they were not unknown to you. However, I ſhall eſteem it a favour, when I chance to fail in exceeding my commiſſions, or the indulgencies allowed me (which I believe I ſhall be very ſeldom guilty of) if you would reſerve the reprimand for our perſonal meetings.

I HAD indeed prepared for enriching the Tranſactions of this month with your experiments of Light; but ſince you will have them deferred to the next, I am to acquieſce; being, mean time, very deſirous to ſee the liſt of your experiments tried in the ſealed

glaſſes exhauſted of air, and the methods uſed therein; which you may reſt aſſured ſhall be kept as ſecret, as you can deſire.

ON Saturday laſt (St. *Andrew*'s day) we had a very numerous meeting at *Arundel* houſe, never ſo great a one before; we being about threeſcore, and of them about fifty at dinner, for which his majeſty ſent in a doe, as Mr. *Howard* another; which I doubt will prove precedents for ever after, and thoſe not likely to be liable to diſpute, as ſome are in a high place. You, Sir, are one of thoſe, that were then elected into the new council; and the reſt are:

Lord *Aſhley*
Lord *Brereton*
Mr. *Charles Howard*
Sir *John Lowther*
Sir *Philip Carteret*
Sir *George Ent*
Mr. *Thomas Neile* (that married the rich widow)
Mr. *Hayes*
Mr. *Creed.*

The eleven, that are continued,

Lord *Brounker*
Biſhop of *Saliſbury*
Mr. *Henry Howard*
Mr. *Erſkin*
Sir *R. Moray*
Sir *P. Neile*
Sir *Anthony Morgan*
Dr. *Wilkins*
Mr. *Hoſkins*
Mr. *Colwall*
Oldenburg.

WE hope, we ſhall ſhortly enjoy your company. I have diſcourſed with M. *Martyn* about the printing the principal matters of the Tranſactions in Latin, with a ſmall letter, for a pocket book, that the Dutch may not be able to print upon him with advantage. This he ſeems to like well of, and ready to undertake. I want Sir *R. Moray* to deal with him about the conſideration, I think, I deſerve for the labour the verſion will coſt me.

I HAVE lately received very many letters and papers, ſtored with philoſophical matters, from *Antwerp*, *Dantzick*, *Sweden*, *Poland*, the *Bermudas*, and *Holland*. I am offered from *Antwerp*, what quantity I pleaſe to have of the ludus; only I am to ſend thither, in exchange, the philoſophical and medicinal books, that have been lately printed in *England*. I ſhall not refuſe that offer, you will eaſily believe, ſuppoſing, that thoſe perſons, that deſire to ſhare in it, will not be unwilling to refund my expences. Mr. *Norwood* at the *Bermudas* is certainly a ſolid, knowing and ſober man. It is he, from whom I have the communications come from that place; which you may command, when you come to *London*, they being too large for a letter, as alſo are thoſe, that were ſent me from the other places: only I muſt intimate to you, that among the papers, that come from the *Baltick*, I find one, written by a phyſician of *Dantzick*, relating, that there they have cured the *lues venerea*, and convulſions, by injecting liquors into veins: which I intend, God willing, to read at our next meeting, to occaſion the Society to urge Dr. *Clerke*'s publication of his experiments of that nature, though they come ſhort of ſuch effects. As far as I ſee, both thoſe experiments, that met with ſo much difficulty and contradiction at firſt (I mean that of infuſion and transfuſion) may at laſt prove very beneficial to the health of men. The perſon, that hath the ſheeps blood in his veins, is ſtill very well, and like to continue ſo. If we durſt believe himſelf, who is flatterouſly given, he is much better, than he was before, as he tells us in a Latin account, he brought in to the Society.

STATE news from abroad I received but little this week. What I had, was this.

Voſtre chancelier ſe ſauuera à la fin. (This is ambiguous.) *On ne parle plus de paix. Les Suedois doivent envoyer à une aſſemblée, qu'on doit faire à Brunſwick. Ils deliberent encore auſſi bien, que meſſieurs les Eſtats. Juſques a cette heure ils n'ont encore rien reſolu. Candie n'eſt pas ſi bien qu'on l'a cru. Nous ne ſcaurons rien des affaires que dans deux mois, tout le monde negociant & prenant ſes meſures.*

THE houſe of commons ſat yeſterday about the grand affair, till four at night; and then came to this vote:

"THAT the refuſing of the Houſe of "Lords to commit the earl of *Clarendon*, at "the accuſation of the Commons of *England*, "is an obſtruction to parliamentary proceed-"ings (ſome add, and to juſtice) and of dan-"gerous conſequence."

WHAT this conſequence will prove, and how they will further proceed in this matter, is hard to predict, to him, who is,

SIR,

your faithful humble ſervant,

H. O.

I DO not write this week to Dr. *Wallis*, becauſe I could not ſhew his letter, as he would have me, to my Lord *Brounker*, by reaſon of his lordſhip's abſence from *London*, he being now at *Chatham*, and like to continue there this fortnight, employed in paying off ſhips. Mean time, my humble ſervice to the doctor, I beſeech you.

London, Dec. 10, 1667.

SIR,

THE letter-carrier, inſtead of delivering your and other inland letters yeſternight, delivered them not till this day in the afternoon, when they found me at home, but in ſuch company, as were pleaſed to ſtay till a good while after candle-light; which hath deprived me of the ſatisfaction, I deſigned to allow myſelf in converſing more largely with you, than now I ſhall be able to do for want of time. In ſhort, I am firſt to acquaint you with the ſecond thanks of the Society, for your ſecond entertainment of them with your rare experiments about light. I am ſure, they will be very glad, to receive that third, you intimate to me in your laſt. Next, you will pleaſe to accept of my humble acknowledgments for the favours, you particularly deſign me, in communicating, for my

private

private ſatisfaction, your queries about ſhining wood and ſhining fiſhes, together with the experiments relating thereto. I confeſs, I think the time long, till I ſee the experiments tried in the ſealed receivers, imagining they muſt be no leſs inſtructive than delightful. Your ſervant certainly forgot to mention to me a book to be directed to M. *Hook* from *Herringman*. It will come time enough yet, if the bookſeller be but in a line or two written to, about it. I think, I mentioned in my former ſome of the heads of the particulars, lately ſent me from the *Baltick* by *Hevelius*, *&c. viz.* of the ſurpriſing effects of injections into veins; of obſervations of cold, amber, pot-aſhes, hints for new materials for optick glaſſes, *&c.* That part, which concerns the injections, was read at our laſt aſſembly, and containing an account of three perſons, it had been tried upon, whereof two received great benefit, but the third died (though that was by the perſon's own neglect,) a certain phyſician then preſent (elſe a learned and ingenious man) was to my great trouble, ſo precipitate, as to ſay, that he would engage, that that one, *viz.* with the ill ſucceſs, was only true, but the other two both falſe. I could not but take him afterwards aſide, and repreſent to him, how he would reſent it, if he ſhould communicate upon his own knowledge an unuſual experiment to the curious at *Dantzick*, and they in publick brand it with the mark of falſhood: that ſuch expreſſions in ſo publick a place, and in ſo mixed an aſſembly, would certainly prove very deſtructive to all philoſophical commerce, if the curious abroad ſhould be once informed, how their ſymbolas were received at the Royal Society. On Thurſday next the transfuſion, which was omitted at our laſt meeting, for want of fit preparations, is ordered to be made, and will doubtleſs have a croud of ſpectators; it being diſcourſed of in moſt companies one reſorts to.

THE foreign news of this week are:

1. *Les Hollandois ne veulent pas s'attirer la haine de la France, ny faire la deſpence de la guerre, comme la Suede, Brandeburg & Luneburg ſe l'eſtoient imaginé. Si le roy ſe veut contenter de la ſatisfaction, qu'il leur a fait propoſer, ils contraindront l'Eſpagne à luy faire raiſon. Cependant ils levent des troupes, & traiteront avec la Suede, à fin de n'eſtre pas ſurpris. Ainſi nous ſerons maitres de la Flandre l'année qui vient, les Eſpagnols ne faiſants rien, & l'empereur n'agiſſant pas luy meſme; ils ſont inſenſibles à leur maux, & il ſemble, qu'ils ont perdu le ſens.*

2. *L'Abbé Roſpiglioſi, neveu du pape, a fait des preſens magnifiques. Jamais pape n'a tant depensé pour ſes parens que celuy-cy. L'Abbé Le Tellier eſt fort conſideré à Rome, d'où il reviendra au mois de Mars.*

3. THERE has been ſo great a hurricane in Auguſt laſt about our *Leeward-Iſlands*, *Mevis*, St. *Chriſtophers*, *&c.* that it hath ruined all the houſes both of our and the French plantations, and the caſtles alſo, and likewiſe deſtroyed all the ſugar-works and the proviſions on the ground, inſomuch that our people have ſent to the governor of *Barbados*, that, unleſs they be forthwith ſupplied with victuals, they muſt, if they will not ſtarve, abandon the iſlands. I have no more time left me, than to ſay, what really I am,

SIR,

your faithful humble ſervant,

H. OLDENBURG.

London, Dec. 17, 1667.

SIR,

THE particulars ſent from *Dantzick* are ſo various and large, that I know not where to begin, nor how to redeem ſo much time, as to tranſcribe them. I think, you will be much better pleaſed, to have them read to you, when you ſhall be returned to *London*; and then you will alſo find with more ſatisfaction divers things, wherein you are deſervedly mentioned with honour, tranſmitted from the ſame parts. I am ſure, no man imagines, what ſtore of papers and writings paſs to and from me in a week, from time to time; which I muſt rid myſelf of, without any aſſiſtance. I have no leſs at preſent, than thirty correſpondents, partly domeſtick, partly foreign. Many of them I am not only to write to, but alſo to do buſineſs for; which requires much time to enquire after ſuch particulars, and diſpatch ſuch buſineſſes as they deſire, if I mean to be gratified reciprocally in ſuch things, as I beſpeak of them. Beſides my conſtant attendance on the meetings of the Society and Council, and preſerving what is ſaid and done there, and giving order to have all regiſtred, and reviewing all the entries; ſoliciting alſo the performances of the manifold taſks, recommended and undertaken by the members of the Society; and diſtributing and ſending abroad ſuch directions and enquiries, as are thought conducive to advance our deſign, *&c.* I confeſs, I extend my patience as far as I can; but I am afraid, I have ſtretched it ſo far already, that it will break, unleſs ſomething be done to fortify it in ſome meaſure, which I find not, that any of thoſe, who are upon the place, and cannot but ſee my daily labours and toil, are in the leaſt ſolicitous of; though ſome of them are forced to acknowledge, even in my hearing, that no man in *England* would do, what I do, upon the terms I go away with.

SIR, pardon me for this ſally; I am confident you do not much blame me for this complaint, which I dare lodge in the boſom of ſo good and noble a friend, that in great meaſure knows my work and my condition, and, upon occaſion, repreſents it too. I have ſome ground to believe, that there are perſons, who think, the Tranſactions bring me in a ſufficient revenue. But I will make it out to any man, that I never received above forty pounds a year upon their account (and

that is little more than my houſe-rent.) And now by a new agreement, I have been obliged to make, I ſhall not bring it to above thirty-ſix pounds a year at moſt. How ſtrangely therefore I muſt needs ſhift for my ſubſiſtence, and with what diſtraction I muſt perform my tedious work, let any ſober man judge.

SIR, I ſhall not fail, God permitting, to convey the *Logica Hamburgenſis* to you, as you have directed; and you will find ſome books taken notice of in the Tranſactions of this month (whereof ſome are to be ſent away this day to *Oxford*) which I believe you have not met with before, except it be, perhaps, the *Hiſtoriæ Litterariæ Prodromus Lambecii*; which, I hear, ſome few perſons have ſeen ere this. I ſhall be very glad to ſee, what you are pleaſed to intend me farther, in reference to the queries about ſhining wood, which I received on Wedneſday laſt, and was much pleaſed with ſome of your experiments upon that ſubject, which could not be read the week before, were read at our laſt meeting, and gave great ſatisfaction, with expreſs order, to redouble to you the ſolemn thanks of the company; who have not yet made any trials of that kind, having of late been engaged in abundance of other things, brought before them from within and without, and in the experiments of transfuſion, which on Thurſday laſt was repeated upon the ſame man, in the preſence of a ſtrange crowd, both of foreigners and domeſticks; the recipient enduring the operation with as little concern, as before; and finding himſelf at preſent, very well in health, though ſtocked with a far greater quantity this time, than before; which made him a day or two after the operation a little feveriſh; though that may be juſtly imputed to his diſordering himſelf by intemperate drinking of wine.

I HOPE, I ſhall not omit to ſuggeſt, what is neceſſary for the clearing thoſe circumſtances in your experiments of light, you are concerned about; yet without giving any hint of that particular, which relateth to the making of ſome of thoſe experiments in ſealed receivers.

FROM *Caën* I lately received the following account about the diſſection of an owl's eye.

En faiſant la diſſection de l'oeil d'un hibou, on a remarqué, que la partie lucide de la cornée eſt fort prominente; qu' en la regardant de travers, on voit une partie du Chriſtalline; qu'elle eſt couverte obliquement de l'adnata, qui s'avance plus ſur la cornée vers l'angle interieure que vers l'exterieure; que cette adnata eſt fort dure & preſque de ſubſtance cornée, comme à tous les autres oiſeaux, autour de l'oeil: mais elle eſt fort molaſſe & tranſparente au fonds de l'oeil, c'eſt à dire, dans la partie diametralement oppoſée à la partie lucide. Elle eſt tranſparente à tel point, que l'ayant nottoyée des chairs des muſcles, on y voit les eſpeces renverſées ſe prendre fort diſtinctement; mais cela luy eſt commun avec les yeux de preſque tous les oiſeaux, & de pluſieurs autres animaux. Ce qu'il y a icy de particulier, c'eſt cette prominence extraordinaire de la partie anterieure de la cornee; l'humeur aqueuſe eſt en aſſez grande quantité & fort gluante, & l'humeur vitrée en petite quantité & fort fluide, contre l'ordinaire des autres animaux, dont l'humeur aqueuſe eſt en mediocre quantité & fluide comme de l'eau, & l'humeur vitree eſt en abondance & fort conſiſtente. L'humeur chriſtalline eſt preſque ſpherique, les deux ſegmens de globe, qui le compoſent, ſont egaux contre l'ordinaire des autres animaux, dont le chriſtallin eſt plus plat à la partie anterieure & plus boſſu dans la poſterieure. Son iris ne ſe reſſerre point à la maniere des autres animaux, & cela eſtant, il ne faut pas s'eſtonner, que le grand jour, dont nous nous parens en reſſerrant l'iris de noſtre oeil, bleſſe le chahuant; joint que la groſſeur de ſon chriſtallin fait une trop forte refraction à cauſe de ſa figure.

I MUST ſtop here, adding only, that I am,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

P. S. SIR, I had almoſt forgot to deſire you, that you would pleaſe, timely to give me directions about the title to your Experiments concerning light and air; and whether I am to expect any additions to them: for I intend, God permitting, to print the Tranſactions for the next month ſo early, as that they may, if poſſible, be abroad the firſt week in January.

SIR, I entreat you to oblige me, by preſenting my humble ſervice to Dr. *Wallis*, whoſe excuſe I beg, for not doing it myſelf by an anſwer to his laſt; which I hope to do next week, God willing. I know, Sir, you will communicate to him the philoſophical part of this paper, if you think fit.

London, Dec. 24, 1667.

SIR,

THE favour of your laſt letter, and your excellent both poſtſcript and appendix, came yeſternight to my hands in one hour. Now I have received ſo full inſtructions concerning them, I ſhall haſten them, God willing, to be publiſhed, as ſoon as thoſe feſtivals, ſo much generally abuſed to idleneſs and irreligion, are paſt; expecting mean while that experiment you intimate to have made for confirmation of the laſt in the poſtſcript.

SIR, ſince you have done me the honour of addreſſing theſe noble experiments to me, ſome words of your papers being alſo directed to a particular perſon more than once, I think, you will permit me to fill up the two blanks thus:

MADE by the honourable *Robert Boyle*, and by him addreſſed to the publiſher; and further communicated to the Royal Society, before whom they were read at their publick meeting December 5. with much applauſe.

THE Society ſhall not meet till January 2. at which time, I believe, they will receive a good account of a pretty hermaphrodite, now in

in *London*, which was lately viſited by Dr. *Allen* and myſelf, and viewed at our leiſure, having the parts of both ſexes very diſtinct and perfect enough. I think, I ſhall be deſired to publiſh it, which if I do, I ſhall do in Latin.

I RECEIVED in my laſt letter from *Paris* a ſhort relation of a mare, that caſt a horſe-colt, and two hours after, a mule, doubtleſs by a ſuperfœtation. The ſame letter tells me poſitively, that the Florentine experiments are now printed, but not yet ſent abroad: but that thoſe two conſiderable books, *De vi Percuſſionis*, of *Borelli* the Italian, and *De Myologia*, of *Steno*, are on the way for me, by the ſingular favour of Monſieur *Auzout*, (to whom they were ſent by P. *Leopold* himſelf, who ſent two couples more of them to two other philoſophers at *Paris*, no more being come out of *Italy* as yet, if I am not miſinformed) parted with to ſatisfy my curioſity, which, it ſeems, he found by ſeveral of my letters lately written to my ordinary correſpondent at *Paris*.

IF thoſe Pariſians miſrelate not, there hath been freſhly made in that town an experiment of transfuſion on a madman, with a ſurpriſing ſucceſs; which I ſhall give you in my author's own words, *viz.*

Nous avons fait la transfuſion ces jours paſſez ſur un fol de la derniere extravagance, qui couroit les ruës tout nud, et qui faiſoit compaſſion à tout le monde. Nous luy transfuſe du ſang de veau par 2 fois differentes, et apres la derniere, qui fut plus ample, et en preſence de 8 medecins capables, il fit paroitre quelques emotions, qui furent ſuivies d'un profond aſſoupiſſement pendant toute la nuit, au revueil duquel il donna tout teſmoignage d'un ſens fort raſſis, et comme il apprit, que nous eſtions au temps du jubilé, il demanda à ſe confeſſer, et ſon confeſſeur le trouva ſi raiſonnable et ſi exact en toutes choſes, qu'il jugea à propos de la laiſſer approcher de la communion. Nous ne ſcavons pas encore, quel en ſera le ſucces. Je vous en apprenderay le detail au plus-toſt.

THIS is confirmed from another hand of the ſame place, with very little variation: which, together with an account of the preſent condition of the former patients of this operation, I ſhall be obliged to inſert into the next Tranſactions; which, I think, will be all I ſhall have room for that month; your papers about Light being ſo rich and ample, that they will abundantly ſtore me for three ſheets in print. I hope, I ſhall take that care of ordering all what concerns the right publiſhing of them, that you will find no fault with me in that particular.

MONSIEUR *de Launay* hath tranſmitted to me his printed Eſſay *du Lieu, de Temps, et du Viude*, wherein I find great acuteneſs and much learning, clearing up thoſe three particulars (ſo nice and perplexed) with more ſatisfaction to me, than I have met with elſewhere; and falling in cloſe, yet civilly enough, with *Des Cartes*, and diſcuſſing his notion *de corpore & vacuo* thoroughly, if I much miſtake not.

I AM like to enter into a correſpondence with the excellent *Carcavy*, a great mathematician, and one that knows moſt of the intelligent and curious men in the world, his French majeſty's bibliothecarius, and the chief director of the new experimental academy at *Paris*. He deſires of me, for the compleating of the library he hath charge of, to ſend him a catalogue of all the conſiderable books, whether hiſtorical, political, philoſophical, eccleſiaſtical, that have been printed in England theſe laſt dozen years, whether in Engliſh or Latin. I muſt confeſs, that I can meet with none of our ſtationers here, that can give me a ſatisfactory account hereof. Methinks, the Oxonian library receives an exemplar of every good book, that is printed in *England*. If the ſub-bibliothecarius could be prevailed with to cauſe ſuch a catalogue of the twelve laſt years to be made, I know it would be a kindneſs to that gentleman, and provoke him to good communications.

To annex ſome ſtate news, my friend at *Paris* writeth thus:

1. *On mande, que la reyne d'Eſpagne a accepté la mediation du pape; qu'elle agree la ville d'Aix la Chapelle, où les plenipotentiaires ſe doivent trouver. Elle a nommé Caſtel-Rodrigo pour s'y trouver de ſa part. On eſcrit de Rome, que les Eſpagnols faiſoient ſemblant de ne vouloir pas la paix, quoy qu'en effet ils la ſouhaitent.*

2. *Les Eſtats de Holland ont preſté le ſerment pour la ſuppreſſion de gauverneur de province.*

3. *L'electeur de Baviere ſuivra les ſentimens de l'empire, & les Suedois auſſi apparemment. On n'eſt pas trop ſatisfait des ducs de Lunenbourg.*

4. *On ne preſſe pas encore les levées icy; neantmoins on ſe diſpoſe à tout evenement. Le roy eſt en eſtat de reſiſter à tous les ennemis, qu'on luy ſuſcitera. Les Hollandois ne ſe declarent point contre luy. Au contraire, ils ſont d'advis d'obliger les Eſpagnols de luy donner ſatisfaction. Nous ſcaurons ce qui arrivera de toutes ces negociations devant la fin de Mars.*

5. *Le frere du roy de Portugal a desja commencé d'agir. La reyne eſt encore dans le couvent. On la marie avec ce nouveau roy ou regent.*

I MUST end with the paper, after I ſhall have told you, that Dr. *Beale* writes me word, that Mr. *Baxter* inveighs in his book, written to aſſert the reaſons of the Chriſtian religion, againſt the corpuſcularian (called by him the ſomatical) philoſophy, and traduces it, as if it ſupplanted our future eſtate. This our good friend, who preſents his humble ſervice to you, would fain have obviated and rightly ſtated, to prevent ill effects, like to follow the popular diſcourſing of a popular man. I am,

SIR,

your very humble

and faithful ſervant,

H. OLDENBURG.

SIR,

I MUST beg your excuſe for not ſeeing Dr. *Sydenham*, who hath been the only man, that I hear of, who, when I was ſhut up, thought fit (God knows without cauſe) to

rail againſt me, and that was ſuch a coward, as afterwards to diſown it, though undeniable. I confeſs, that with ſo mean and unmoral a ſpirit I cannot well aſſociate.

London, Dec. 31, 1667.

SIR,

I CAN aſſure you of the validity of my warrant for what I ſaid formerly concerning the title of your experiments; though the genius and cuſtom of the Society, touching the making publick their judgment about any matter, and their nicety in it, may be a ſecond conſideration.

I HAVE received your poſtſcript, and the concluſion of it. I find it will take up three full printed ſheets, if I publiſh all at once, what you have been pleaſed to communicate; I would propoſe to refer the agreement and diſagreement between a live coal and ſhining wood, till the next month; becauſe I have been often told, that variety of arguments is expected in theſe philoſophical Occurrences. I confeſs, I think it long to ſee thoſe aerial experiments you mention as diſcovering more obſervables in that element. I do religiouſly obſerve your injunctions about the precautioned ſealed paper you lately ſent me. If I hear by your next, that you intend to ſtay yet any time at *Oxford*, I ſhall ſend you monſieur *De Launay*'s eſſay of Place, Time, and Vacuum.

THE intimation you give me about taking notice in the Latiniſed Tranſactions of ſome particulars concerning ſome of your books, I ſhall take care of, God willing.

I FIND by the laſt Pariſian letters, which I received ſince my laſt to you, that that madman is relapſed, and piſſeth blood, ſuppoſed to proceed from too large a transfuſion.

I AM in extraordinary haſt at this time, which maketh me annex only the particulars of the ſtate-news, that came by the laſt poſt, *viz.*

1. *Meſſieurs les eſtats doivent envoyer monſieur Van Beuning en France en qualité d'ambaſſadeur extraordinaire, il demandera une ſuſpenſion juſques à ce que la paix ſoit faite, ce qu'on luy refuſera apparemment. L'electeur de Brandebourg envoye trois de ſes miniſtres, qui ne feront pas grand choſe.*

2. *Il y a bien de l'apparence, que la paix ne ſe fera pas. La revolution arrivée en Portugal eſt tout à fait en noſtre faveur. On parle qu' à Naples il y a des meſcontentemens. Nous ſerons aſſez heureux pour en voir par tout, & cependant on avancera en Flanders, & petit à petit on eſtendra bien loin les frontiers du royaume. Il n'y a perſonne de s'oppoſer à nos forces, qui ſeront conſidérables, quoy qu'on puiſſe dire.*

3. *Le conſeil d'Eſpagne n'eſt pas bien uni, & il ſemble de la maniere, dont on agit en ce païs là, que les Eſpagnols ayent perdu le ſens. La France profitera de tous ces avantages là, & rendra inutiles tous les deſſeins de ſes ennemis. Vous verrez à la campagne, qui vient, la verité de ce que je vous predis.*

SIR, I humbly thank you for your favour in inquiring after the books for monſieur *Carcavy*. I have got catalogues for ſome few years of thoſe twelve, that are deſired, *viz.* for 57. 58. 63. Thoſe catalogues, that were kept in the Stationers-Hall, they tell me, are burned. I muſt very abruptly ſubſcribe, what I really am,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

SIR, much happineſs to you with this new year, and to all our common friends at *Oxford*.

London, Jan. 7, 1667-8.

SIR,

I CANNOT but humbly thank you for returning to me with ſo much ſpeed my late letter, together with the emendations. I find ſince, to my trouble, that theſe holidays are ſo much turned into drinking-days, that this month's Tranſactions will come out, at leaſt one week later, than was intended, when I gave you the trouble of the forementioned letter. I received, four or five days ago, a book, made by *Van Helmont* (which, I doubt, will prove no great commendation to it) entitled, *Alphabetum Naturæ*, in the German tongue, though it be alſo printed in Latin; of which edition an exemplar, formerly ſent over for me, miſcarried at ſea, and are no more copies to be had in *Holland* at preſent, though I hope to procure ſome from *Germany* in time, if they be thought worth ſending for. It pretends to make out, that the very figures of the Hebrew alphabet do repreſent the motions and configurations of the mouth and tongue, *&c.* requiſite to frame ſuch ſounds, as make thoſe letters; attributing more therein to the characters of the Hebrew alphabet, than to thoſe of any other. By ſchemes it exhibits the ſeveral poſtures and figures of the tongue, as paint the very letters. And there is alledged an example of a quite deaf and dumb man, who by theſe principles was made to anſwer to every thing, that was ſlowly ſpoken to him, in the ſpace of three weeks. Of which, and the other particulars contained in this book, I am ſolicited to give a full account in the Tranſactions, now a printing.

MR. *Hook* brought in lately, at the Society's meeting, a contrivance for diſcovering the various preſſure of the air at ſea, thereby to foretel approaching ſtorms. If he did not acquaint you with it before this, I think I may take the liberty to do it, if you ſhall command it, the thing being made publick in ſo publick a place.

I HEAR from *Paris*, that monſieur *Steno* hath written a treatiſe *De Cerebro*, as Dr. *Willis* hath done, and that it will be printed ere long.

THE philoſophers at *Caen* find, that their ſalt water, being made ſweet with little charge and

and in great quantities, hath *quelque gouſt de fumier*, which yet they hope to correct, intending thereupon to give it to beaſts firſt, to try its wholeſomneſs, before they give it to men.

THE madman, who found ſo notable a change by the transfuſion, I think, I told you of, to have been lately experimented at *Paris*, is ſomewhat relapſed, and piſſeth blood; perhaps from too plentiful a tranſmiſſion. It muſt be known, both how much blood is transfuſed, and how much is fit to be tranſfuſed, to go ſure.

STATE news is this: The French king hath ſent to the pope his laſt reſolutions of what he will agree to in the treaty. The Swediſh ambaſſador, when come, will revive the Dutch treaty here, and probably help to bring it to a good iſſue. The queen of Portugal hath got from the quondam king there a ſworn declaration, that he hath not performed the part of a huſband to her; and conſequently is like to marry the brother.

WHEN I ſee Mr. *Crook*, I hope I ſhall remember the commiſſion you have given me to him. I ſhall preſume to give you ſhortly notice of the time and manner of the intended Latin edition of the Tranſactions. I am very glad to hear, I ſhall quickly receive the firſt part of the papers ſealed. By the end of this week you are like to receive the French tract of *Launay* from,

SIR,

your very humble,

and faithful ſervant,

H. O.

I PRAY, Sir, pardon this haſty ſcribble.

I WAS lately deſired, by a very ingenious French proteſtant at *Paris*, to inform myſelf, *s'il y a dans la bibliotheque d'Oxford quelque traité des Grecs modernes, qui prouve, que les Grecs ne croyent point la tranſubſtantiation.*

THEY ſay, it is true enough, that the Greeks do not believe it, but it is difficult, to juſtify it. And therefore they would fain have proofs of this truth, by books written theſe laſt fifty years. I beſeech you, Sir, as you have opportunity, be pleaſed to enquire after this, and let me alſo intreat Dr. *Wallis* to join with you in the enquiry.

Ways of diſcovering the various preſſure of the air at ſea, by Mr. Hook.

"CONSIDERING with myſelf, of how "great uſe the being able to diſcover the va- "rious preſſure of the air at ſea might be, "for the foretelling the alterations of wea- "ther, to provide againſt approaching ſtorms, "I was very deſirous to find ſome contrivance "for its diſcovery, which might be eaſily "made uſe of at ſea. And finding it very "difficult to make uſe of the common or "wheel-barometer with mercury, by reaſon "of the ſhaking of the ſhip, which would "cauſe a very great dancing and vibration of "the ſurface of the mercury, I contrived "ſeveral ways for the preventing that incon- "venience in good part. Now though I "found, that very much of that might be "taken off, by having an exceeding ſmall "hole at the open end of the tube, to admit "the air, whereby the air on the top of the "mercury was as it were impriſoned, or "(which is much better) by having a ſmall "ſtop-cock placed juſt in the bending of the "two pipes, ſo as after they have been filled "and inverted, according to the uſual man- "ner, the key of the ſtop-cock may be juſt "ſo far turned, as to leave the leaſt imagina- "ble paſſage for the mercury between the "two ſtems; yet the inconvenience of the "vibration was not wholly removed, though "I believe, by this laſt expedient, a wheel- "barometer may be very well uſed at ſea by "a judicious man; and therefore for ſuch "a perſon I think it preferable before any "other way whatſoever. But becauſe every "one is not ſo well able to give an eſtimate "of the middle of ſuch kind of vibration, "I bethought myſelf of ſome other ways of "diſcovering the preſſure of the air, wherein "no ſuch motion is to be feared. And for "this, I think, nothing can be better than a "weather-glaſs, made with pure air and mer- "cury, wherein the mercury is left open to "the preſſure of the air, and ſo becomes "agitated by a double principle of motion, "heat and the preſſure of the air. In this "inſtrument I make uſe of cleanſed mercury, "1. that it may not by the great heats of "the air under the torrid zone be evaporated "and diminiſhed; 2. that it may not be "frozen by the colds of the frigid zone; and "3. that the included air may not be aug- "mented by any ſteams, that may ariſe from "almoſt any other ſubjacent liquor. For "this I take to be very ſecure from any mu- "tation of the air, as to heat and cold. To "diſtinguiſh therefore, what part of its mo- "tion is aſcribable to the heat of the air, I "would have another thermometer made with "ſpirit of wine, and ſealed, as I have elſe- "where deſcribed. Now both theſe thermo- "meters ought to be graduated together in a "ſtove, or ſome ſuch place, at once, where- "by the correſponding degrees of expanſion, "ariſing from heat and cold, may be viſible. "And if, by making obſervations with them "at land, the diſcrepancy of them to one "another be compared to the mercurial "ſtandard, it will be very eaſy to calculate "a table of differences, which ſhall exhibit "all the various degrees of preſſure anſwer- "ing to all the various degrees of heat and "cold. And ſo, only by the help of two "ſuch weather-glaſſes, all the various preſſure "of the air may be very practicably diſ- "covered at ſea, and conſequently the mu- "tations of the weather may perhaps, in "great meaſure, be timely enough diſcovered, "by the inquiſitive and diligent mariner."

So far he. The Society is deſirous, that all the objections, that may lie againſt this contrivance,

contrivance, may be brought in, to diſcern the better, whether and how far it will do. I doubt not, Sir, but you, Dr. *Wallis*, and Dr. *Wren*, will thoroughly examine it, as ſome are doing here, and impart unto us your thoughts concerning it, as ſoon as you can. For, if it ſhall be approved of, we intend to furniſh immediately ſome ſhips with it, that are now going out.

London, Jan. 14, 1667.

SIR,

I HOPE, when you have received a good information about the Greek books, (for which I ſhould eſteem Dr. *Barlow*'s account chiefly) you will not delay the favour of tranſmitting it to me. Mr. *Hook*'s way of meaſuring the preſſure at ſea you have here annexed; and he knows of the order given by you to M. *Herringman*, for a book of yours to be delivered him. I have not now any leiſure to look into your book of Cold, where, if I remember well, you have mentioned, if not deſcribed, a way of making baroſcopes ſo, as that they may be ſafely tranſported from place to place; but ſince you intimate, you would have made no mention of it, I ſhall be altogether ſilent.

DR. *Willis* hath examined the powders come from *Briſtol*, and ſaith, that that powder, which is to make the Spa water, is either vitriolum Martis at the beſt, or rather only a common Engliſh coperas dried and powdered. For the other powders, each of them being a ſeveral calx (he ſaith) of mineral water evaporated, there is no uſe of them, nor any thing worth enquiry to be inſiſted on about any of them.

I SOMEWHAT ſuſpect this judgment, for a reaſon you may eaſily imagine. Dr. *Merret* is ſomewhat more particular concerning the ſame, nor doth he undervalue them. He gave it in writing, and produced it before the Society, that num. 1. entitled, *Simple Extract of St.* Vincent's *Water*, is a creta with ſome vitriolate juice mixed with it. Num. 2. entitled, *Compound Extract*, hath vitriol in greater quantity apparently in it. Num. 3. is vitriolate too. Num. 4. ſaid to be made of ſteel, is nothing but a preparation of common vitriol, which by another preparation may be made only diuretick as other medicinal waters are; and that he hath found by frequent experiments, that *Tunbridge* and other purging waters are purely vitriolate.

THIS puts me in mind of a paſſage, contained among the particulars lately ſent from *Dantzick* by another conſul of that town, called *Michael Behm*, who ſeems to be a philoſopher as well as a ſtates-man, and one alſo, that hath no ordinary eſteem of the Engliſh virtuoſi, and particularly of yourſelf. This gentleman, after he had given a ſingular good character of your books *De Fluiditate*, *&c.* and *De Coloribus*, goes on thus:

Utinam illuſtris vir (meaning you) *de natura ſalium experimenta ſua ampliora edere dignaretur, quomodo alcalia ſive lixivialia utpote fixa ab aliis acidis auſteriſque non minus ferè fixis diſcrepent, et utraque à volatilibus atque aliis ſpeciebus ſalium ſatis explicatis, atque craſi nomineque diſtinctis. Nam inter volatilia differre videmus ſal urinoſum à ſale, quod ineſt ſpiritui vini aliiſque inflammabilibus; quia commixta coagulantur et novam indolem acquirunt. Taceo mixturas liquoris ex nitro fixo cum ejuſdem ſpiritu acido, de quibus bene egit Dn. Boyle aliique. Magnam ſpem habeo inveniendi liquorem, qui veſicæ injectus blandè comminuat calculos, aliaſque mixturas, quæ in ventriculo et meſenterio noxias atque varias viſciditates (quas tartaro immeritò adſcribunt plurimi) præcaveant vel attenuent. Utinam Dn. Gliſſon, Wharton aliique ex anatomicis chymiciſque experimentis explicare vellent lymphæ, ſanguinis ſerique ejus degenerationes, et conglutinationis atque corruptionis modos et cauſas. Nuper ſerum ex ſanguine brutorum examinavi, et levi calore coagulari vidi, ferè inſtar albuminis ovi; potiſſimum addito acido indurabatur; ſed ab admixto ſpiritu vini ſerum tenebatur diu liquidum, magis tamen ab alcalibus: propediem accuratiora tentabo. Faciebam id, dum à podagra vexabar, quæ me à curis politicis invitum adegit hactenus ad hæc et talia medicinalia. Notavi ſanè morbos podagricos oriri, ubi urinoſa putrilago non ſeparatur per renes aut ſudores à maſſa ſanguinea, ſed cum ea diſtribuitur, et circa juncturas in frigidioribus ligamentis hæret; ubi propter ſalis acredinem dolores acriores, difficiles tamen, vel propter glutinoſitatem tophos aut rigores junctuarum efficit. Utinam hujus mali cauſas atque medelas ſublimia Anglorum ingenia penitius inveſtigare et orbi communicare vellent, ne inter medicos amplius incurabile cenſeatur. Idipſum initio me valdè fecit anxium, præſertim cum diligenter notarem, apud ægros nil prodeſſe purgantia et ſanguinis miſſiones, parùm ſudores et cauteria; obeſſe emplaſtra oleoſa, et refrigentia omnia: imò et ſpir. vini et ſalis armoniaci non ſatis elicere aut diſcutere totam materiam. Thermas* (this is the thing I chiefly intend this tranſcript for) *valdè ſalubres eſſe, norunt omnes, et ipſe expertus ſum, præſertim quæ urinam provocant. Sed quia non ubique extant thermæ, præbuit mihi curioſitas liquorem, qui odore, ſapore, virtute, ſatis exactè emulatur thermas; ita, membra ægra, reliquum verò corpus ſimplici calida balneando, magnum levamen ſentio. Porrò expertus ſum proprio auſu inſignem medelam per pilulas, quæ urinam promovent, ſanguinem depurant, fluidioremque reddunt, calculi materiam atque ſcorbuticas in meſenterio viſciditates referant, abſque alvi turbatione. Verùm per veſicatoria (diſſuadentibus licet medicis) dolenti parti adhibita, optimam, promptam, atque tutam hactenus per aliquot annos mihi aliiſque amicis inveni medelam; quamvis eam aliis, ad fiſtuloſa ulcera pronis, non ſuadeam. Utinam alii ſuas quoque medelas candidè efferrent; non enim omnia proſunt omnibus.*

THERE are ſeveral other not inconſiderable particulars both in this, and in another letter of the ſame conſul, which I have not now time to tranſcribe, and which may perhaps be of the ingredients in a number of the following Tranſactions.

I SENT

I SENT on Saturday laſt by poſt the French printed paper, it being not bulky, and hope, it is well arrived. I wiſh your amanuenſis did not diſappoint you ſo often. Since Mr. *Davis* intends to print thoſe two books of yours mentioned in your letter, I am ready to furniſh him with the verſion of the Paradoxes, leaving it to you, what conſideration he is to allow for it, it having required no ſmall pains and time to perform it. I purpoſe, God willing, to read it over as ſoon as poſſibly I can; which, I hope, I ſhall have done within this fortnight; at or about the end of which I ſhall be able to ſend it you, if ordered to do ſo.

I HAD lately from Mr. *Colepreſſe* a letter with ſome of his own obſervations concerning the tides, anſwerable to the queries printed in the Tranſactions; in which hereafter thoſe anſwers of his may likewiſe be publiſhed. He acknowledges in the ſame letter the receipt of your book, and I believe he hath alſo thanked you for it ere this.

THERE are no French letters come to me ſince my laſt, nor any others from abroad. We diſcourſe of ſetting out a fleet in the ſpring; I hope it will be in conjunction with the Dutch, to repreſs the conquering neighbour; which will ſoon appear, when the Swediſh embaſſador ſhall be arrived here. Sir, I cannot conclude this, without acquainting you of the deſign of the Society's council, whereof you are a member, of building a college, as one of the moſt probable means of their eſtabliſhment. They did, on Saturday laſt, conſider of it in a full council, where *H. Howard* of *Norfolk* was alſo preſent (who intends to continue his nobleneſs, either by contributing to this work a good ſum of money, or by giving us ground about *Arundel* houſe to build upon) and proceeded ſo far as to view a draught, and to ſelect out of the Society's liſt ſuch perſons, as they thought both willing and able for ſuch contributions: and to carry it on the more effectually, they appointed a committee of beggars (as they were pleaſed to term it merrily) or ſolicitors, to ſpeak to ſuch as were called out for that purpoſe, and to recommend this work to their liberality. Our preſident biſhop of *Saliſbury*, Mr. *Howard*, Dr. *Wilkins*, and myſelf, are the principal beggars; we want Sir *R. Moray* exceedingly in this employment. Thoſe, that came to my ſhare, are ſet down in the encloſed liſt; and I was particularly deſired to acquaint you with this intention, and alſo Sir *R. Moray*, to engage him to beg in *Scotland* among the noblemen there, that are of the Society, on our behalf. I believe, Sir, you will not be diſpleaſed, if I am open and particular to you in this buſineſs; which I think myſelf obliged to be, as tending to your better direction and information. They gueſs there will be four claſſes of contributions: ſome of an 100 *l.* ſome of 60 or 50, ſome of 40, ſome of 20. Our preſident hath already declared for 100; and I think, the biſhop of *Saliſbury* for the like ſum. Dr. *Wilkins* for 50, Mr. *Hayes* for 40, Sir *Phil. Carteret* for 50, and if there be occaſion, for more. We begin with the council, and proceed to the Society; that, when we go on to beg of others not of our body, they may not object, we would load others, and draw our own necks out of the yoke. The council, when they ran over the liſt of the Society, thought you, Sir, the fitteſt perſon to beſpeak my lord *Clifford*'s generoſity in this matter, thinking it ſuperfluous to invite yourſelf otherwiſe, than by a bare intimation. I am confident, you take in good part both the council's and my freedom in this diſcourſe, which ſtops my pen of ſaying more by way of excuſe of it. I muſt now paſs to make a tranſcript of Mr. *Hook*'s paper, which was promiſed you in the beginning of this letter, by,

SIR,

your very humble,
and faithful ſervant,
H. OLDENBURG.

London, Jan. 18, 1667.

SIR,
